All Automobile and Equipment Manufacturers

Kept Up-to-Date By Loose Leaf Supplements

NATIONAL AUTOMOTIVE SERVICE
SAN FRANCISCO

Automatic Choke Adjustment—Standard setting for ordinary fuel is with mark 'R' on thermostatic spring case lined up with reference projection on housing. If this setting too rich (engine overchokes or loads up), rotate case to 'M' mark (leaner setting). Use 'H' position for highly volatile fuel.

Air Cleaner:—AC #1528631 oil-wetted type Std., #1528256 heavy duty oil-bath type Optl. (this type standard in severe dust condition states).
NOTE—AC #1528665 oil-vent air cleaner used with oil-wetted type air-cleaner, #1528629 heavy duty type with oil-bath cleaners.

Fuel Pump:—AC Type J #1521797 combination fuel-and-vacuum pump.
See article in Carburetion Equipment Section.

Gasoline Gauge:—Auto-Lite (Motometer) Electric. Model No. NG-8711D (dash unit).
See article in Carburetion Equipment Section.

MANIFOLD HEAT CONTROL:—Thermostatic coil type. To check valve, unlatch thermostatic coil (free outer end from bracket on manifold), operate valve by hand and see that shaft is free (shaft can be cleaned with emery if necessary). Make certain that thermostatic coil is properly latched to bracket and that tension spring (from shaft to clip on flange) is in place.

VALVE TIMING:—To Check—Set tappet cl. #1 intake at .020". This valve should open with piston 15° or .0915" before top dead center when mark 'IN.OP/1-8' on vibration dampener at front of engine lines up with pointer on timing gear cover. Reset tappet clearance at .016" cold.
Motor Gauge—Weidenhoff Adapter # 104. Rod #2.

Tappet Clearance:—.016" all valve, engine cold.

Valve Spring Pressure:—125-135 lbs. at 1¾" (valve open).

LUBRICATION:—Crankcase Capacity—8 qts.
Normal Oil Pressure—40 lbs. at 40 MPH. (warm oil).

BATTERY:—Willard, Type WHT-2-105. 6 volt, 15 plate, 105 ampere hour capacity (20 hour rate).
Starting Capacity—133 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.9 minutes. Five second voltage—4.27 volts.
Grounded Terminal—Positive (+) terminal.
Battery grounded to frame. Engine grounded by separate ground strap at front engine mounting.
Dimensions—Width 7 1/16". Length 10 5/16". Height 8 13/16".
Location—On left hand side under front seat.

STARTER:—Model No. 1107903. Armature No. 820158.
Drive—Overrunning Clutch (solenoid pinion shift).
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.
Cranking Engine—110 RPM., 150-200 amperes, 5-5.5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	6000	5.0	60
16 "	Lock	3.0	600

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws (remove starter and solenoid switch as an assembly).

Starting Switch:—Solenoid Switch Type 1546. Mounted on starter field frame and controlled through relay (in switch case) by pushbutton switch on instrument panel.
See article in Electrical Equipment Section.

Solenoid Switch

Closes against 70 lb. pull with ½" air gap drawing 65-71 amperes at 5 volts. Holds switch closed with current draw of 12-14 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—1.9 volts Max. **Open**—1.0-1.2 volts.
Contact Gap—.035". **Air Gap**—.010".

GENERATOR:—Model No. 1102653. Armature No. 1857866. Shunt (two brush) type with external vibrating voltage and current regulation. Ventilated by fan on drive pulley.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output controlled by Current Regulator. See Control Unit section below.
Maximum Charging Rate—26 amperes (cold) with discharged battery as indicated on test ammeter connected in charging line at regulator 'BAT' terminal. Decreases as battery comes up on charge. Generator output constant at all speeds above 1750 R.P.M. or 21.1 M.P.H.

Performance Data—Generator Cold

Amperes	Volts	R.P.M.
25	8.0	1650

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ounces each.
Field Current—2.0-2.2 amperes at 6.0 volts.

Removal:—Generator now pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.

Belt Adjustment:—Loosen pivot and clamp bolts, pull generator out or away from engine until fan can just be turned with belt held stationary.

CONTROL UNIT:—Model 5818. Mounted on dash. Consists of Cutout Relay, vibrating type Voltage Regulator, and Current Regulator in a single case.
NOTE—Cover is sealed and units serviced on exchange basis if seals not broken. Unit can be checked without breaking seal but cover must be removed to make adjustments.
See article in Electrical Equipment Section.

Cutout Relay

Cuts In—6.7-7.6 volts, 800-850 R.P.M., 9.7 M.P.H.
Cuts Out—0-3.0 amperes discharge current.
Contact Gap—.020". **Air Gap**—.020" (closed).

Voltage Regulator

Setting—7.5-7.95 volts (70°F.), 7.4-7.6 volts (150°F). Regulator over-compensated for temperature and must be checked at these points.
To Check (without breaking seal)—Disconnect lead at 'IGN' terminal on regulator, connect jumper between 'IGN' and 'BAT' terminals, connect ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3400 R.P.M., adjust charging rate to 8-10 amperes (use variable rheostat or AVR set). Voltmeter reading should check with setting given above.
To Adjust (with cover removed)—Change armature spring tension by bending spring hanger at lower end of spring slightly. Check performance as directed above.
NOTE—Voltmeter regulator readings must be taken with cover in place and setting should be checked by decreasing speed until Cutout Relay contacts open, and then increasing speed to original point.
Contact Gap—.020". **Contact Spring Tension**—3.5 oz. **Air Gap**—.063" between armature and core with armature down so that fibre bumper just touches stop. .010" between fibre bumper and stop with armature up.

Current Regulator

Setting—26 amperes.
To Check (without breaking seal)—Disconnect lead on 'IGN' terminal of regulator, connect ammeter in charging line at 'BAT' terminal, operate generator and check output.
NOTE—Generator voltage must not be allowed to exceed 8.5 volts with Voltage Regulator disconnected.
To Adjust (with cover removed)—Change armature spring tension by bending spring hanger at lower end of spring slightly. Check performance as directed above.
Contact Gap—.020". **Contact Spring Tension**—3.5 oz. **Air Gap**—.075" between armature and core with armature down so that fibre bumper just touches stop. .010" between fibre bumper and stop with armature up.
NOTE—Repolarize generator whenever Control Unit disconnected or removed by connecting jumper between 'GEN' and 'BAT' terminals momentarily after all leads have been connected. Do not operate engine.

LIGHTING:—Headlamps—Corcoran-Brown, prefocused type. Upper and lower beams controlled by selector switch on toeboard (lower beam deflected slightly to right).
Headlamp Adjustment—With car unloaded, on level floor 25' from screen, and with upper beams lighted, aim each headlamp so that upper edge of beam is slightly above horizontal line at lamp-center height, and beam is centered on vertical line directly ahead of lamp center. Adjusting screw for horizontal movement located on side of lamp body (remove hood side panel for access to screw), screw for vertical movement at rear of lamp body.
Beam Indicator—Green dot on face of speedometer dial, illuminated whenever upper beams in use.

Switches

Lighting—Douglas.
Beam Selector—R.B.M. #1081.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Headlamps (Export)	32-32	2330
Parking, Ign., Instrument	1½	55
Stop & Tail	21-3	1158
License	3	63
Trunk	6	81
Dome	15	87

FUSES:—Lighting—20 ampere. On back of lighting switch (nearest to instrument panel).
Accessory—20 ampere. On back of lighting switch (protects Heaters, Radio, etc.)

HORNS:—Klaxon, Model K-33-S. Type 2077 (Low Note, L.H. horn), Type 2078 (High Note, R.H. horn). Vibrator type, matched tone, twin horns operated by horn relay.

Type	Current (at 6 volts)	Air Gap
2077 (low note)	12-14 amperes	.032-.036"
2078 (high note)	11-13 amperes	.042-.046"

Horn Relay:—Delco-Remy Model No. 1116756.
Contacts Close—2.7-4.0 volts.
Contact Gap—.020". **Air Gap**—.015".

NOTE:—Engine hood hinged at cowl and lifts from forward end. To raise hood, pull out hood lock handle (radiator emblem) at bottom, lift hood up at forward end. Hood side panels secured by wing nut at radiator, 2 wing nuts at lower edge and one nut at engine dash on upper edge of panel.

SERIAL NUMBER:—On plate riveted to frame side rail under left front fender. First number G-00001 (South Bend), G-800001 (Los Angeles).

ENGINE NUMBER:—Stamped on pad at upper left front corner of engine. First number 101.

COMPRESSION:—**Ratio**—6.5-1 std. cast-iron head. **Pressure**—100 lbs. at 130 RPM. (cranking speed).

VACUUM READING:—17-18" steady at 8 MPH. idle spd.

IGNITION:—**Coil Model CE-4636.** Service coil (less switch and cable) CE-3264S. Mounted on dash. **Ignition Current**—½-1½ ampere idling, 4-5 stopped.

Ignition Switch:—Mitchellock. Connected to coil by armored cable.

Distributor Model IGW-4131. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control and Octane Selector adjustment.

Breaker Gap—Set at .020".

Breaker Arm Spring Tension—16-20 ounces.

Cam Angle or Dwell—35° closed, 25° open (distr.).

Rotation—Counter-clockwise viewed from top.

Condenser—No. IGB-1025. Capacity .20-.25 mfds.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	400	0	800
.8	500	1.6	1000
3	830	6	1660
5	1120	10	2240
7	1400	14	2800

Vacuum Spark Control Model VC-4009—Mounted below distributor and linked to advance plate. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring within unit. Starts at approximately 4" of HG., max. advance 9° (distr.), 18° (eng.) at approximately 14" of HG.

Distributor Removal:—Mounted on left side of engine. To remove, loosen advance arm clamp bolt (not necessary to disturb vacuum unit connection). NOTE—When installing distributor, insert .016" feeler between hold-down plate and advance plate while tightening advance plate clamp bolt to prevent binding and allow free advance plate motion.

IGNITION TIMING:—Standard setting as follows (see Octane Selector Setting following for correction dependent on fuel regularly used):

Flywheel Degrees	Piston Position
2° BTDC	.0015" BTDC.

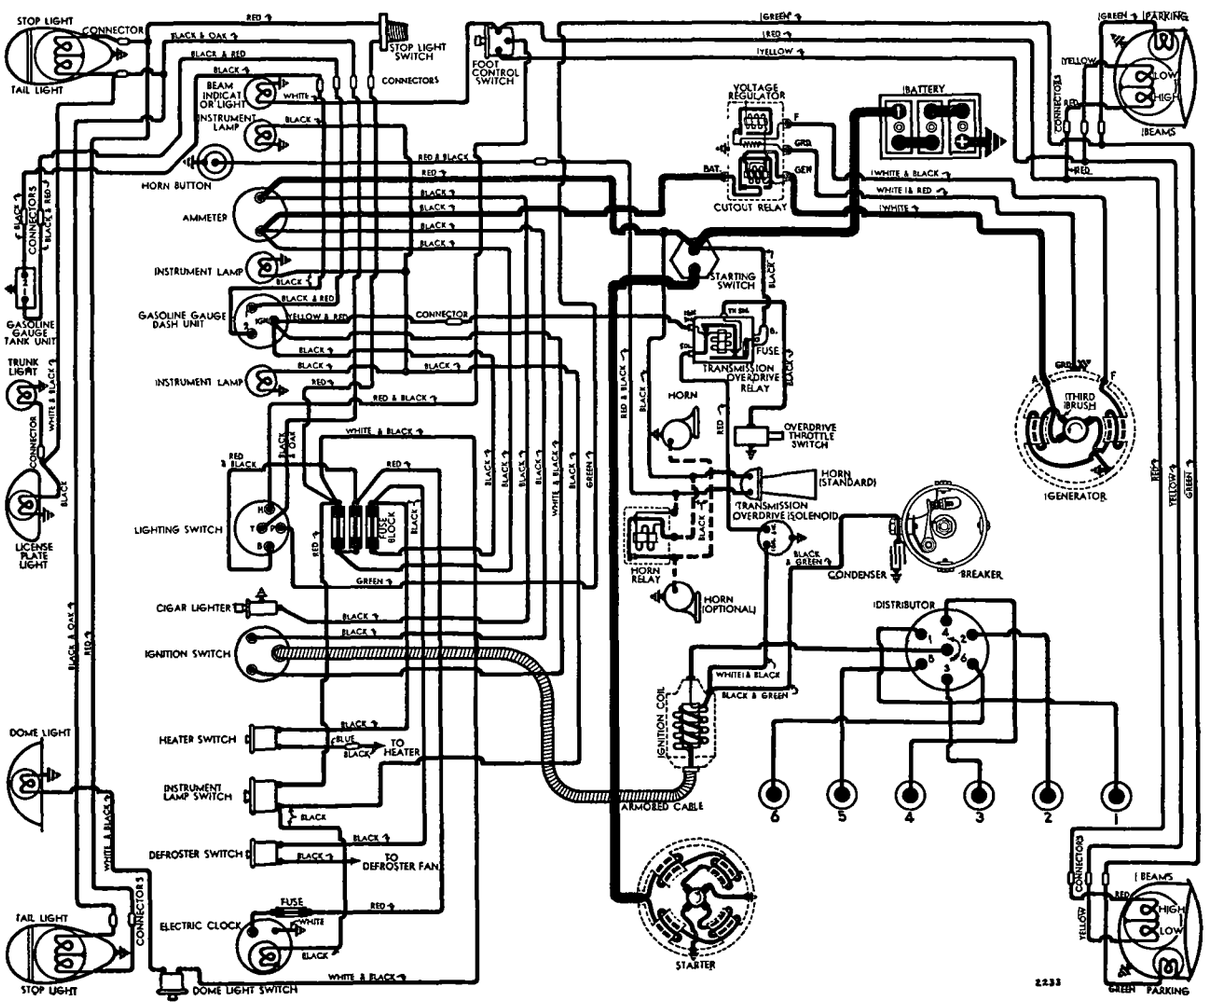
To Set Timing—Crank engine by engaging gears and rolling car on floor. With #1 piston on compression, turn engine over until 'IGN' mark (approx. 13/16" ahead of U.D.C.1-6 mark) on flywheel is in line with pointer on engine rear plate on left side of car. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, insert .016" feeler between advance arm and hold-down plate (to insure clearance for free advance arm movement), tighten clamp bolt, remove feeler gauge. NOTE—Car manufacturer recommends use of Neon timing light.

Octane Selector Setting—With engine at normal operating temperature, adjust Octane Selector so that slight ping evident when accelerating with wide open throttle (rotate distributor clockwise if no ping, counter-clockwise if ping too severe).

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion No. 8. 18 MM. Metric. NOTE—Champion No. 7 or 13 (colder plugs) may be used for extremely fast driving in hot weather.

Spark Plug Gaps—Set at .025".



CARBURETION:—**Carburetor**—Carter Model WO Type 444-S (Early—may de identified by #229 cast on flange), Type 453-S (Later cars). New type, single barrel, 1¼" downdraft type. IMPORTANT PRODUCTION CHANGE NOTE—See Carburetor article for part changes for Type 444-S to change over to latest type 453-S.

See article in Carburetor Section for data.

Idle Adjustment—With engine warm and choke valve wide open (fast idle inoperative), adjust throttle stopscrew so that engine idles at 600 RPM. or 8 MPH. Turn idle adjusting screw in until engine begins to miss or lag, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Final setting should be ¾-1¼ turns of screw open from inner or closed position. Readjust throttle stopscrew for correct idle speed.

Accelerating Pump—Non-adjustable type.

Fast Idle:—Inter-connected to choke valve. Throttle in fast idle position with choke valve closed. With 3/32" diameter drill inserted between throttle valve and body and choke valve in wide open position, choke connector link upper hole should just slide over pin.

Air Cleaner:—AC. oil-wetted type standard. Heavy duty oil-bath type optional.

Fuel Pump:—AC. Diaphragm type standard.

Gasoline Gauge:—Auto-Lite (Motometer) electric. No. NG-9211D (dash unit).
See article in Carburetion Equipment Section.

MANIFOLD HEAT CONTROL:—Thermostatic coil type. To check, unhook coil from pin (valve in closed position, counterweight up). Hooked end of coil should be ¼ revolution away from pin (replace coil if not within this limit). Car manufacturer recommends application (every 1000 miles) of kerosene and baking soda solution on shaft at coil to insure free operation of valve shaft.

VALVE TIMING:—To Check. Set tappet clearance #1 intake valve at .020". This valve should open with piston 15° or .0835" before top dead center when flywheel mark 'IN-OP.1-6/' lines up with pointer on left rear engine plate. Reset tappet clearance at .016" (cold).

Tappet Clearance:—.016" all valves with engine cold. NOTE—Self-locking tappet screws used (no locknuts).

Valve Spring Pressure:—77-83 lbs. at 1 7/16" (valve open).

LUBRICATION:—Crankcase Capacity—5 quarts.

Normal Oil Pressure—40 lbs. at high speeds.

Oil Pressure Regulator—On right front corner of engine block. Opens at 40 lbs.

COOLING SYSTEM:—Capacity—10½ quarts.

Thermostat—In cylinder head water outlet. Starts to open at 156° F. to 160°F.

Temperature Gauge—Auto-Lite (Motometer) Vapor tension type. Part No. H-9210.
See article in Mechanical Equipment Section for data.

TRANSMISSION OVERDRIVE CONTROL:—Electric type with accelerator pedal operated 'kick-down' switch.
See article in Mechanical Equipment Section for data.

Overdrive Solenoid—Delco-Remy Model 1569.

Control Switch—Hersee #1687S. Adjust so that shoe on idler lever just contacts switch plunger with throttle valve wide open (lever against stop). See Mechanical Equipment Section for complete data.

Control Relay—Auto-Lite Model HR-4201S. NOTE—Use only 14 ampere fuse on relay.

BATTERY:—Willard, Type SW-1-90. 6 volt, 13 plate, 90 Ampere Hour capacity (20 hour rate).

Starting Capacity—114 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.0 minutes. Five second voltage—4.1 volts.

Grounded Terminal—Positive (+) grounded to dash.

Engine Ground—Strap connector at right front mounting bolt.

Dimensions—Length & Height 9". Width 7".

Location—In carrier on left front side of dash in engine compartment.

STARTER:—Model MZ-4066. Armature MZ-2120 (early). Model MZ-4074. Armature MZ-2130 (later).

Drive—Barrel type Bendix No. A-2033 (similar in design to Ford '60' type A-1806).

IMPORTANT—A-2033 drive marked 'D' on pinion barrel. Must not be interchanged with Ford type due to difference in structure of pinion teeth.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Cranking Engine—160 amperes, 5.2 volts, 130 RPM.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.5	70
.65 " "	2500	5.5	100
2.55 " "	1325	5.0	200
4.95 " "	750	4.5	300
7.65 " "	220	4.0	400
7.8 " "	Lock	3.0	420
11.8 " "	Lock	4.0	560

Removal:—Starter flange mounted on right rear engine plate. To remove take out mounting bolts and lift starter off.

Starting Switch:—A-L Model SW-4011. Mounted on left side of car below clutch pedal. Operated by depressing clutch pedal fully.

GENERATOR:—Model GDF-4812A. Armature GDF-2006. Third brush control type with external vibrating voltage regulation. Ventilated by fan on drive pulley.

Maximum Charging Rate—30 amperes (cold), 28 amperes (hot), at 8.0 volts, 3000 R.P.M. (generator), 32.5 M.P.H. Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Charging Rate Adjustment—Maximum output controlled by third brush. Do not adjust third brush for output greater than shown in table below (with field terminal grounded to render regulator inoperative). See Regulator Section (following). NOTE—Third brush setting 2 bars 1 mica strip to 2 bars 2 mica strips from insulated main brush.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
Start	6.4	920	0	6.4	1000
4	6.6	1030	4	6.6	1140
8	6.8	1140	8	6.85	1280
12	7.0	1300	12	7.1	1440
16	7.25	1460	16	7.3	1640
20	7.45	1650	20	7.55	1840
24	7.65	1880	24	7.75	2220
28	7.9	2220	28.3	8.0	3200
32	8.0	3100			

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—53 ozs. max. (new brushes).

Field Current—1.90-2.10 amperes at 6.0 volts.

Motoring Current—5.3-5.9 amperes at 6.0 volts.

Removal:—Pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.

Belt Adjustment:—Loosen pivot and clamp bolts, move generator out away from engine until fan can just be rotated with belt held stationary.

REGULATOR:—Model VRD-4006B. Voltage Type. Consists of cutout relay and vibrating volage regulator in a single case on engine side of dash.
See article in Electrical Equipment Section for data.
NOTE—Regulator cover sealed. Serviced on exchange basis if seals not broken.

Cutout Relay

Cuts In—6.4-7.0 volts Cold, 900 RPM., 9.1 MPH.

Cuts Out—.5-3.0 amperes discharge current.

Contact Gap—.015" minimum.

Air Gap—.034-.038". Contacts open—measure at hinge end of core.

Voltage Regulator

Setting—7.3-7.6 volts at 70° F.

To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal, voltmeter between 'B' and 'GD' terminals. Operate generator at speed equivalent to 30 MPH., charging battery, until voltage is steady. Voltage reading should be 7.4-7.9 volts.

To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger. See Electrical Equipment Section for complete directions.

Contact Gap—.010-.020" (armature against stop pin).

Air Gap—.0595-.0625" with contacts just opening.

LIGHTING:—Headlamps—Corcoran-Brown, pre-focused type. Upper and lower beams controlled by selector switch on toeboard (lower beam deflected slightly to right—special 2331 bulb).

Headlamp Adjustment—With car unloaded, 25' from screen, and with upper beams lighted, aim each headlamp so that top of beam is 2" below horizontal line at lamp-center height, and beam is centered on lamp vertical center-line. Brass adjusting screws located behind lamp rim at top (vertical movement), at side (horizontal movement).

Beam Indicator—Red dot on speedometer face. Lighted when upper beams in use.

Switches

Lighting—Douglas No. 5724.

Beam Selector—R-B-M No. 1081.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Headlamps (Export)	32-32	2330
Parking, Ign. Sw., Trunk	1½	55
Instrument	1½	55
Stop & Tail	21-3	1158
License Plate	3	63
Dome	15	87

FUSES:—Lighting—Three 20 ampere. On fuse block on back of instrument panel at center. Protects circuits as follows: **Top**—Clock, Dome, Stop, Instrument lamps. **Center**—Head and Tail lamps. **Lower**—Accessories.

Transmission Overdrive Control—14 ampere. On Relay.

HORNS:—Delco-Remy. Model K-26-H Single Horn Std., Model K-33-S No. 601 (low note—right), 602 (high note—left) twin horns with horn relay Optl.

Model	Current (at 6 volts)
K-26-H	6.5-8.5 amperes
K-33-S 601	10-12 amperes
K-33-S 602	9-11 amperes

Horn Relay:—Delco-Remy Model 1116792.

Closing Voltage—2.3-3.5 volts.

Contact Gap—.020". **Air Gap**—.015" (closed).

SERIAL NUMBER:—First number 4110001 (South Bend), 4802301 (Los Angeles). Stamped on plate on left frame member under left front fender.

ENGINE NUMBER:—First number H-42501. Stamped on boss on left hand side of cylinder block.

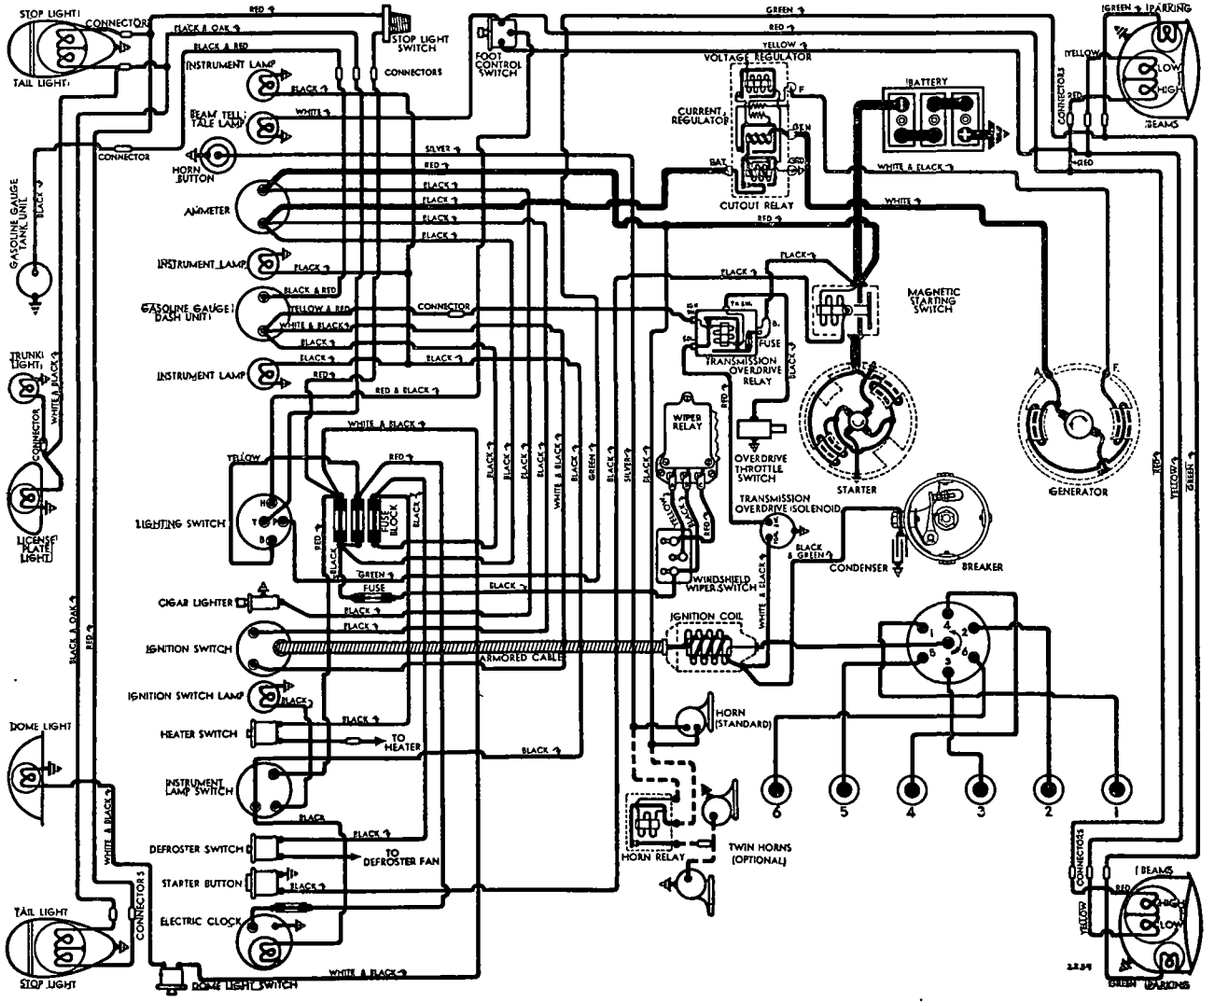
COMPRESSION:—**Ratio**—6.0-1 Std., 7.0-1 Optl. (High Alt.).
Pressure—105 lbs. (6.0-1 head), 110 lbs. (7.0-1 head) at 150 RPM. cranking speed.

VACUUM READING:—18-20" steady at 8 MPH. idling speed.

IGNITION:—**Coil Model IG-4653.** Mounted on the dash. Service Coil IG-3033ZS (less switch & cable).
Ignition Current—½-1½ ampere idling, 4-5 stopped.
Ignition Switch:—Mitchellock Model 24-R, No. 8056.
Ignition Lock—Yale & Towne. Mitchellock #8078.
Distributor Model IGW-4101, IGW 4111—With Tachometer Drive. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control and Octane Selector Adjustment.
Breaker Gap—Set at .020".
Cam Angle or Dwell—35° (closed), 25° (open).
Breaker Arm Spring Tension—16-20 ozs.
Rotation—Counter-clockwise viewed from top.
Condenser—No. IGB-1025. Capacity .20-.25 mfd.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	400	0	800
3	700	6	1400
6	1000	12	2000
10	1400	20	2800



Vacuum Spark Control Model VC-4004:—Mounted below distributor and linked to advance plate. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring within unit. Maximum vacuum advance 6° (Distr.). 12° (Eng.) on IGW-4101, 3° (Distr.), 6° (Eng.) on IGW-4111.
Distributor Removal:—Mounted on left side of engine. To remove, loosen advance arm clamp bolt (not necessary to disturb vacuum unit connection).
NOTE—When installing distributor, insert .016" feeler between hold-down plate and advance plate while tightening advance plate clamp bolt to prevent binding and allow free advance plate motion.

IGNITION TIMING:—For all engines as follows (see Octane Selector Setting following for correction dependent on fuel regularly used):

Flywheel Degrees	Piston Position
2° BTDC	.0016" BTDC.

To Set Timing—Crank engine by engaging gears and rolling car on floor. With #1 piston on compression, turn engine over until 'IGN/' mark on vibration dampener at front of engine lines up with pointer on timing gear cover (this mark is 2° or 9/64" before top dead center mark '/UDC.1-6'). Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, insert .016" feeler between advance arm and hold-down plate(to insure clearance for free advance arm movement), tighten clamp bolt, remove feeler gauge.
Motor Gauge—Weldenhoff Adapter #104, Rod #2.
Octane Selector Setting—With engine at normal operating temperature, adjust Octane Selector so that slight ping evident when accelerating with wide open throttle (rotate distributor clockwise if no ping, counter-clockwise if ping too severe).
Firing Order:—1-5-3-6-2-4 (see diagram).
Spark Plugs:—Champion No. 8. 18 MM. Metric.
NOTE—Champion No. 7 or 13 (colder plugs) may be used for extremely fast driving in hot weather.
Spark Plug Gaps—.025".

CARBURETION:—**Carburetor**—Stromberg Model BXO-26, 1¼" single, downdraft type.
See article in Carburetor Section for data.
NOTE—Metering jets need not be changed when heavy duty oil-bath type air cleaner installed. First size smaller main metering jet can be installed to secure greater fuel economy with slight loss of performance. ***See Jet Specification table in Carburetion Section for complete jet data.***
Idle Adjustment—With engine warm, Fast Idle and Automatic Choke inoperative so that engine idles at hot or slow idle speed, set throttle stopscrew so that idling speed is 7-8 MPH., turn idle adjusting screw in until engine begins to miss or lag, turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Readjust stopscrew for correct idling speed.
Accelerating Pump Adjustment—Three holes provided in throttle lever for pump link engagement. Change setting for seasonal requirements.
Inner Hole (Min. stroke)—Extreme warm weather.
Center Hole—Normal operating conditions.
Outer Hole (Max. stroke)—Extreme cold weather.
Fast Idle:—Integral (Built-in carburetor).
See article in Carburetion Equipment Section.
Setting—No adjustment required (if stopscrew set for correct hot or slow idle speed above). See that stopscrew rests on highest step of fast idle cam with choke valve fully closed.
Automatic Choke:—Integral (built-in carburetor).
See article in Carburetion Equipment Section.
Setting—Mark 'R' on thermostatic spring case should line up with projection on housing (ordinary fuel). If this setting too rich (engine loads up), rotate case to 'M' mark (leaner setting). Use 'H' position only for very volatile fuels.
Air Cleaner:—AC #1528630 oil-wetted type Std., #1528632 oil-bath type Optl. (Std. in severe-dust states).
NOTE—AC #1528665 oil-vent air cleaner Std., #1528629 type used with oil-bath air cleaners.

Fuel Pump:—AC Type W #1522227. Diaphragm type. *See article in Carburetion Equipment Section.*

Gasoline Gauge:—Stewart (Stewart-Warner) Electric type. No. G-99370. *See article in Carburetion Equipment Section.*

MANIFOLD HEAT CONTROL:—Thermostatic coil type. To check valve, unlatch thermostatic coil by freeing outer end from bracket on manifold, operate valve by hand and see that valve is free (shaft can be cleaned with emery if necessary). Make certain that coil is properly latched on bracket and that tension spring (from shaft to clip on manifold flange) is in place.

VALVE TIMING:—To Check—Set tappet clearance #1 intake valve at .020". This valve should open with piston 15° or .0942" before top dead center when mark 'IN-OP.1-6/' on vibration dampener at front of engine lines up with pointer on gear case cover. Reset tappet clearance at .016" cold.
Motor Gauge—Weidenhoff Adapter #104, Rod #2

Tappet Clearance:—.016" all valves, engine cold.

Valve Spring Pressure—125-135 lbs. at 1¾" (valve open).

LUBRICATION:—Crankcase Capacity—6 qts.
Normal Oil Pressure—40 lbs. at 40 MPH.

COOLING SYSTEM:—Capacity—14½ qts.
Thermostat—Bishop & Babcock or Fulton. In cylinder head outlet. Starts to open 156-160°F.
Temperature Gauge—Stewart (Stewart-Warner) No. G-99386.

TRANSMISSION OVERDRIVE CONTROL:—Electric type with accelerator pedal operated 'kick-down' switch. *See article in Mechanical Equipment Section for data.*
Overdrive Solenoid—Delco-Remy Model 1569.
Control Switch—Hersee #1687S. Adjust so that shoe on idler lever just contacts switch plunger with throttle valve wide open (lever against stop). *See Mechanical Equipment Section for complete data.*
Control Relay—Auto-Lite Model HR-4201S. NOTE—Use only 14 ampere fuse on relay.

BATTERY:—Willard Type SW-1-95. 6 volt, 15 plate, 95 A H. capacity (20 hour rate).
Starting Capacity—117 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.1 minutes. Five second voltage 4.2 volts.
Grounded Terminal—Positive (+) grounded to frame.
Engine Ground—Separate ground strap.
Dimensions—Length 9". Width 7". Height 8 13/16".
Location—In engine compartment on left side.

STARTER:—Model MAW-4015. Armature MAW-2091.
Drive—Outboard Barrel Type Bendix No. A-1719.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—43-52 ozs. (new brushes).
Cranking Engine—130 RPM., approximately 175 amperes at 5 0-5.5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4900	5.5	65
.6 "	3300	5.5.	100
2.75 "	1480	5.0	200
5.45 "	820	4.5.	300
8.5 "	400	4.0	400
11.5 "	Lock	3.0	505
18.0 "	Lock	4.0	670

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out two flange mounting screws, remove starter and switch as assembly.

Starting Switch:—R.B.M. Model 2214. Magnetic type. Mounted on starter and controlled by Douglas #5701 pushbutton switch on instrument panel.

GENERATOR:—Model GDA-4804A. Armature GDA-2606F. Two brush, shunt wound type with vibrating voltage and current regulation. Ventilated by fan on drive pulley.
Charging Rate Adjustment—Adjusted by changing Voltage & Current Regulator settings (no adjustment at generator). See Regulator data below.
Maximum Charging Rate—28 amperes, 8.0 volts, 2025 R.P.M., 20.5 M.P.H. with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	930	0	6 4	1010
4	6.6	1060	4	6 6	1180
8	6.85	1210	8	6.85	1350
12	7.1	1350	12	7 1	1530
16	7.3	1500	16	7 3	1730
20	7.5	1660	20	7 5	1950
24	7 75	1830	24	7 75	2220
28	8 0	2025	28	8 0	2520

NOTE—28 amperes is Current Regulator setting.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. Max. (new brushes)
Field Current—1.66-1.84 amperes at 6.0 volts.
Motoring Current—3 50-4.15 amperes at 6.0 volts.

Removal:—Pivot mounted at left front of engine. To remove, take out pivot bolts and clamp bolts.

Belt Adjustment:—Swing generator out until it is just possible to rotate fan with belt held stationary.

REGULATOR:—Model VRB-4012A. Consists of Cutout Relay, Vibrating Voltage Regulator and Current Regulator in case on left hand side of dash. *See article in Electrical Equipment Section.*
NOTE—Regulator cover is sealed. Serviced on exchange basis if seals not broken.

Cutout Relay

Cuts In—6.4-7.0 Volts Cold. 900 RPM., 7.8 MPH.
Cuts Out—.5-3.0 ampere discharge current.
Contact Gap—.015" minimum.
Air Gap—.034-.038" Contacts open—measure at hinge end of core.

Voltage Regulator

Setting—7.3-7.6 volts at 70°F.

To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal, voltmeter between 'B' and 'GD' terminals. Operate generator at speed equivalent to 30 MPH., charging battery, until voltage is steady. Voltage reading should be 7.3-7 6 volts (Cold—70°F), 7.1-7.4 volts (Hot—140°F).

To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section for complete directions.

Contact Gap—.010-.020" (armature against stop pin).

Air Gap—.0595-.0625" with contacts just opening.

Current Regulator

Setting—27-29 amperes (marked '28' on cover).

To Check (without breaking seals)—Connect test meters as for Voltage check (above). Operate generator at 30 MPH., charging battery, add load (use bank of headlamp bulbs, or turn on car lights and discharge battery) so that generator charges at peak rate and Current Regulator operates. Charging current should not exceed 28 amperes. If more than slight excess noted, regulator is defective.
Adjustment, Contact Gap, Air Gap—Same as for Voltage Regulator (above).

LIGHTING:—Headlamps—Corcoran-Brown pre-focused type. Upper and lower beams controlled by selector switch on toeboard (lower beam deflected slightly to right).

Headlamp Adjustment—With car unloaded, 25' from screen, and with upper beams lighted, aim each headlamp so that top of beam is on horizontal line at lamp-center height, and beam is centered on lamp vertical center-line. Adjusting screws located behind lamp rim at top (vertical movement), at side (horizontal movement).

Beam Indicator—Red dot on speedometer dial Illuminated when upper beams in use.

Switches

Lighting—Douglas, #5740.
Beam Selector—R.B.M. #1081.
Instrument—Douglas, #5697.

Bulb Specifications

Position	Candlepower	Mazda No
Headlamps	32-32	2331
Headlamps (Export)	32-32	2330
Parking, Ign , Trunk	1½	55
Instrument	1 & 1½	51 & 55
Stop & Tail	21-3	1158
License Plate	3	63
Dome	15	87

FUSES—Lighting—Three 20 ampere On fuse block on back of instrument board at center Protect circuits as follows: **Top**—Clock, Dome, Stop, Instrument Lamps.
Center—Head and Tail Lamps **Lower**—Accessories.
Transmission Overdrive Control—14 ampere. On Relay.
Windshield Wiper—20 ampere. In control switch lead.

HORNS:—Klaxon. Delco-Remy Model K-33-S, type 601 (right hand, low note), 602 (left hand, high note). Vibrator type, matched tone, twin horns operated by relay.

Horn Current—10-12 amperes (601), 9-12 (602).

Horn Relay:—Delco-Remy No. 1116756. Closing Voltage 2.3-3.5 volts.

Contact Gap—.020". **Air Gap**—.015" (closed).

WINDSHIELD WIPER:—Auto-Lite Model EW-5003 (early cars), **EW-5103** (later cars). Electric type.
Windshield Wiper Switch—A-L No. XA-535. *See article in Mechanical Equipment Section.*
NOTE—Use only 20 ampere fuse in wiper switch lead.

SERIAL NUMBER:—First number 7125501 (South Bend), 7802501 (Los Angeles). Stamped on plate on left frame member under left front fender.

ENGINE NUMBER:—First number B-30201. Stamped on boss on left rear of cylinder block.

COMPRESSION:—Ratio—6.0-1 Std. cast-iron head.
Pressure—105 lbs. at 150 R.P.M.

VACUUM READING:—Steady 18" at 450 RPM., 8 MPH.

IGNITION:—Coil Model 1115021. Mounted on dash.
Ignition Current—2.5 amperes idling, 4.0 stopped.
Ignition Switch:—Mitchellock Model 24-R, No. 8056. Delco-Remy No. 1116268 (switch & cable).
Ignition Lock—Yale & Towne. Mitchell #8078.
Distributor Model 662-M:—Double breaker, 4 lobe cam, full automatic advance type with auxiliary vacuum spark control and Octane Selector adjustment. NOTE—Contacts must be synchronized (See Timing).
Firing Interval—Movable contacts open 45° (distr.) after fixed set.
Breaker Gap—Set at .020". Limits .018-.024".
Cam Angle or Dwell—33° (closed), 12° (open). Both sets operating together and synchronized.
Breaker Arm Spring Tension—22 ounces.
Rotation—Clockwise viewed from top.
Condenser—Part No. 1838163. Capacity .18-.25 mfd.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	300	2.5	600
14.5	1800	29	3600

Vacuum Spark Control Model 681-S.—Mounted under distributor and linked to advance arm. Provides additional advance at speeds above idling except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit. Plunger travel—17/64".

Vacuum Advance

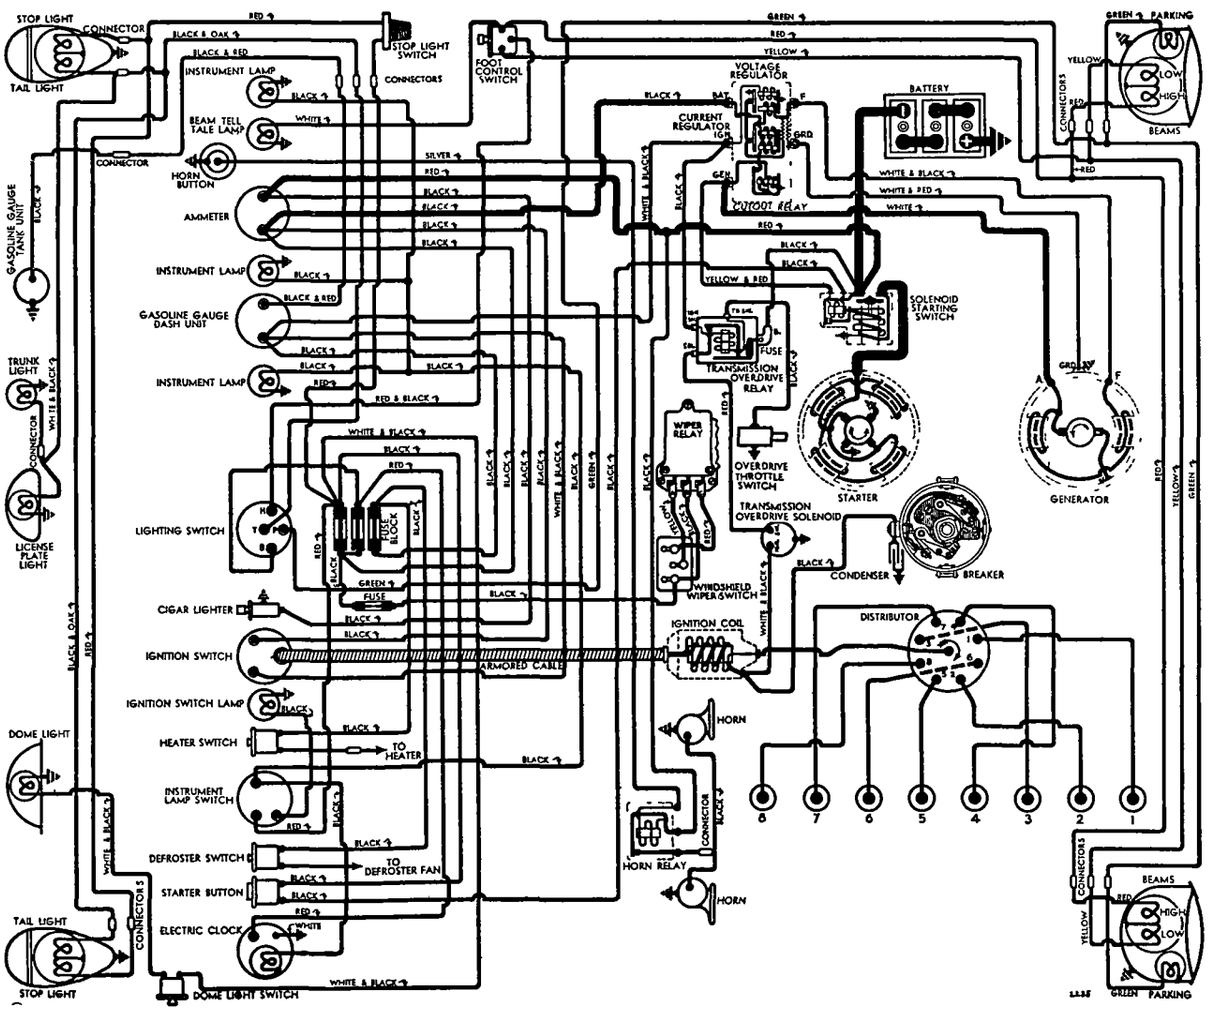
Dist. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	5-7"
6°	12°	13-16"

Removal:—Mounted on right hand side of cylinder head. To remove, loosen advance arm clamp bolt (not necessary to disturb vacuum unit or vacuum connections).

IGNITION TIMING:—Standard setting as follows (see Octane Selector Setting following for correction dependent on fuel regularly used):

Flywheel Degrees	Piston Position
0° (At TDC.)	.0000" TDC.

To Set Timing (Stationary Contacts)—Crank engine by engaging gears and rolling car on floor. With #1 piston on compression, turn engine over until piston reaches top dead center, stop when dead center mark 'U.D.C.1-8' on vibration dampener at front of engine lines up with pointer on timing gear cover. Loosen advance arm clamp bolt, rotate distributor until stationary breaker contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt, then synchronize movable contacts.
Synchronization (On Engine)—Turn engine over 90° to #6 firing position with vibration dampener mark 'U.D.C.3-6' lined up with pointer on timing gear cover. Loosen lockscrews on movable sub-plate carrying second set of contacts, turn eccentric adjusting screw until contacts begin to open, tighten lockscrews.
Synchronization (Using Tool)—Use Delco-Remy tool #1838182. See Distributor Synchronization in Electrical Equipment Section for complete instructions. Distributor firing intervals regular 45-45-45°.
Motor Gauge—Weldenhoff Adapter #104. Rod #2.
Octane Selector Setting—With engine at normal operating temperature, adjust Octane Selector so that slight ping secured when accelerating with wide open throttle (rotate distributor counter-clockwise if no ping noted, clockwise if ping too severe).



Firing Order:—1-6-2-5-8-3-7-4 (see diagram).

Spark Plugs:—Champion No. 8. 18 MM. Metric.
NOTE—Champion No. 7 or 13 (cooler plugs) may be used for extremely fast driving in hot weather.
Spark Plug Gaps—.025".

CARBURETION:—Carburetor—Stromberg Model AAO-161, 1" Dual Downdraft type.
See article in Carburetor Section for data.
NOTE—Metering jets can be changed to first smaller size for increased fuel economy with slight loss in performance (jets for both barrels must be same size and should be changed as a unit). ***See Stromberg Jet Specifications in Carburetor Section for complete jet data.***
Idle Adjustment—With engine warm so that Fast Idle and Automatic Choke inoperative and engine idling at hot or slow idling speed, set throttle stop-screw for 7-8 MPH. idling speed, turn idle adjusting screw for each carburetor barrel (in succession) in until engine begins to lag or miss, out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Readjust throttle stopscrew for correct idling speed.
Accelerating Pump Adjustment—Two holes provided in throttle lever for pump link engagement. Adjust for seasonal requirements as follows:
Inner Hole (Min. stroke)—Summer temperatures.
Outer Hole (Max. stroke)—Winter temperatures.

Fast Idle:—Integral (Built-in carburetor).
See article in Carburetion Equipment Section.
Setting—No adjustment provided.

Automatic Choke:—Integral (built-in carburetor).
See article in Carburetion Equipment Section.
Setting—Mark 'R' on thermostatic coil case should line up with projection on housing (ordinary fuel).

If this setting too rich (engine loads up), rotate case to 'M' mark (leaner setting). Use 'H' position only for very volatile fuels.

Air Cleaner:—AC #1528631 oil-wetted type Std., #1528256 oil-bath type Optl. (std. in severe-dust states).

NOTE—AC #1528665 oil-filler air cleaner Std., #1528629 heavy duty type with oil-bath cleaner.

Fuel Pump:—AC Type J #1521797. Diaphragm type combination fuel-and-vacuum pump.

See article in Carburetion Equipment Section.

Gasoline Gauge:—Stewart (Stewart-Warner) Electric type. No. G-99370.

See article in Carburetion Equipment Section.

MANIFOLD HEAT CONTROL:—Thermostatic coil type. To check valve, unlatch thermostatic coil (free outer end from bracket on manifold), operate valve by hand and see that shaft is free (shaft can be cleaned with emery if necessary). Make certain that thermostatic coil is properly latched to bracket and that tension spring (from shaft to clip on flange) is in place.

VALVE TIMING:—**To Check**—Set tappet clearance #1 intake valve at .020". This valve should open with piston 15° or .0915" before top dead center when mark 'IN.OP/1-8' on vibration dampener at front of engine lines up with pointer on timing gear cover. Reset tappet clearance at .016" cold.

Motor Gauge—Weidenhoff Adapter #104. Rod #2.

Tappet Clearance:—016" all valves, engine cold.

Valve Spring Pressure:—125-135 lbs. at 1¾" (valve open).

LUBRICATION:—**Crankcase Capacity**—8 qts.

Normal Oil Pressure—40 lbs. at 40 MPH. (warm oil).

COOLING SYSTEM:—**Capacity**—17 qts.

Thermostat—Bishop & Babcock or Fulton. In cylinder head outlet. Starts to open 156-160°F.

Temperature Gauge—Stewart (Stewart-Warner) No. G-99386.

TRANSMISSION OVERDRIVE CONTROL:—Electric type with accelerator pedal operated 'kick-down' switch.

See article in Mechanical Equipment Section for data.

Overdrive Solenoid—Delco-Remy No. 1569, 1573 (12 volt Exp.).

Control Switch—Hersee #1687S. Adjust so that end of throttle rod just contacts switch plunger with throttle valve wide open (lever against stop). See Mechanical Equipment Section for complete instructions.

Control Relay—Auto-Lite Model HR-4201. NOTE—Use only 14 ampere fuse on relay.

BATTERY:—**Willard Type SW-1-95.** 6 volt, 15 plate, 95 A.H. capacity (20 hour rate).

Starting Capacity—117 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.1 minutes. Five second voltage 4.2 volts.

Grounded Terminal—Positive (+) grounded to frame.

Engine Ground—Separate strap connector.

Dimensions—Length 9". Width 7". Height 8 13/16".

Location—In engine compartment on left side.

STARTER:—**Model No. 1107903. Armature No. 820158.**

Drive—Solenoid pinion shift & overrunning clutch.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-28 ozs. each.

Cranking Engine—110 RPM., 150-200 amperes, 5-5.5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	6000	5.0	60
16 "	Lock	3.0	600

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws (remove starter and solenoid switch as an assembly).

Starting Switch:—Solenoid Switch Type 1546. Mounted on starter and controlled through relay (in switch case) by pushbutton switch (Douglas #5701) on instrument panel.

See article in Electrical Equipment Section.

Solenoid Switch

Closes against 70 lb. pull with ½" gap drawing 65-71 amperes at 5 volts. Holds switch closed with 12-14 ampere current (hold-in coil only).

Solenoid Relay

Contacts Close—1.9 volts Max. **Open**—1.0-1.2 volts.

Contact Gap—.035". **Air Gap**—.010" (closed).

GENERATOR:—**Model No. 1102656. Armature No. 1873866.** Two brush, shunt type with external vibrating Voltage and Current regulation. Ventilated by fan on drive pulley.

Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator. See Regulator data below.

Maximum Charging Rate—30 amperes (cold), 8.0 volts, 1700 R.P.M., 20 M.P.H. and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

	Amperes	Volts	R.P.M.
Cold	30	8.0	1700

Rotation—Counter-clockwise at comutator end.

Brush Spring Tension—25 ounces each.

Field Current—2.0-2.2 amperes at 6.0 volts.

Removal:—Pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.

Belt Adjustment:—Swing generator out until fan can just be turned with belt held stationary.

REGULATOR:—**Model 5861 (Vibrating Voltage & Current Type).** Consists of Cutout Relay, vibrating Voltage Regulator and Current Regulator in case on dash.

See article in Electrical Equipment Section.

NOTE—Regulator cover sealed. Serviced on exchange basis if seals not broken.

Cutout Relay

Cuts In—6.9-7.6 volts, 800-850 RPM., 9.7 MPH.

Cuts Out—0-4.0 ampere discharge current.

Contact Gap—.020". **Air Gap**—.020" (closed).

Voltage Regulator

Setting—7.5-7.9 volts at 70°F. 7.4-7.6 volts at 150°F. Regulator over-compensated for temperature and must be checked at these points.

To Check (without breaking seals)—Disconnect charging lead at regulator 'BAT' terminal, connect ¾ ohm fixed resistance (Nicrome wire capable of carrying 10 amperes) between this terminal and ground, disconnect lead on 'IGN' terminal, connect jumper between this terminal and 'BAT' terminal. Connect voltmeter between 'IGN' and 'GRD' terminals. Operate generator and increase speed to 2800-3000 R.P.M., note voltmeter reading (see setting above). NOTE—This test method recommended by manufacturer, does not require adjusting charging rate as with other methods (see Electrical Equipment Section for alternative checking directions).

To adjust (with cover removed)—Change armature spring tension by bending spring hanger at lower end of spring slightly. Recheck performance.

NOTE—Cover must be in place when regulator tests made. Check setting by decreasing speed until Cutout contacts open and then increasing speed to original point.

Contact Gap—.020". **Contact Spring Tension**—3.5 ozs.

Air Gap—.063" between armature and core (armature down so that fibre bumper just touches stop). .010" between fibre bumper and stop (armature up).

Current Regulator

Setting—28-30 amperes.

To Check (without breaking seals)—Connect ammeter in charging line at regulator 'BAT' terminal, disconnect lead at 'IGN' terminal (to eliminate regulator action), turn on car lights. Operate generator and increase speed until Current Regulator limits output, note ammeter reading.

NOTE—Generator must not be operated on open-circuit and voltage must not be allowed to exceed 8.5 volts with Voltage Regulator disconnected.

To adjust (with cover removed)—Same as for Voltage Regulator (see directions above).

Specifications—Contact Gap, Contact Spring Tension, Fibre bumper clearance same as for Voltage Regulator (above). Armature Air Gap should be .075".

LIGHTING:—**Headlamps**—Corcoran-Brown pre-focused type. Upper and lower beams controlled by beam selector switch on toeboard (lower beam deflected slightly to right).

Headlamp Adjustment—With car unloaded, 25' from screen, and with upper beams lighted, aim each headlamp so that top of beam is on horizontal line at lamp center height, and beam is centered on vertical lamp center-line. Adjusting screws located behind lamp rim at top (vertical movement), one side (horizontal movement).

Beam Indicator—Red dot on face of speedometer dial. Illuminated whenever upper beams lighted.

Switches

Lighting—Douglas #5740.

Beam Selector—R.B.M. # 1081.

Instrument—Douglas #5697.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Headlamps (Export)	32-32	2330
Parking, Ign., Trunk	1½	55
Instrument	1 & 1½	51 & 55
Stop & Tail	21-3	1158
License Plate	3	63
Dome	15	87

FUSES:—**Lighting**—Three 20 ampere. On fuse block on back of instrument board at center. Protect circuits as follows: **Top**—Clock, Dome, Stop, Instrument lamps.

Center—Head and Tail lamps. **Lower**—Accessories.

Transmission Overdrive Control—14 amp. On Relay.

Windshield Wiper—20 ampere. In control switch lead.

HORNS:—**Klaxon.** Delco-Remy Model K-33-S, Type 1999601 (right-low note), 1999602 (left-high note). Vibrator type, matched tone, twin horns operated by relay.

Horn Relay:—Delco-Remy No. 1116756. Closing voltage 2.3-3.5 volts.

Contact Gap—.020". **Air Gap**—.015" (closed).

WINDSHIELD WIPER:—**Auto-Lite Model EW-5003 (first cars), EW-5103 (later cars).** Electric type.

See article in Mechanical Equipment Section.

NOTE—Use only 20 ampere fuse in wiper switch lead.

CAR SERIAL NUMBER:—Stamped on plate on right front side of dash and on right top side of front frame cross member (forward engine support).

ENGINE NUMBER:—Stamped on plate on right side of cylinder cover and on right crankcase wall back of distributor.

BATTERY:—**Prest-O-Lite, Type A-617-SP,** 6 volt, 17 plate, 160 ampere hour capacity (5 ampere rate). Starting capacity 170 amperes for 20 minutes. Negative (—) terminal grounded. Battery mounted under driver's seat. Battery size 7 inches wide, 13 inches long, 9⅝ inches high.

IGNITION:—**Coil Model 528-C** (two used). Coils are mounted under the hood on the right side. Ignition current is 10 amperes at 6 volts with engine stopped and 6 amperes at 6 volts with engine running. The ignition switch is a Delco-Remy Dual-lock Model 426-K.

Distributor Model 4043. Breaker contact gap exactly .017". Set contact gap by loosening lock nut on stationary contact mounting stud and turning up stud until correct gap is obtained with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension 17-21 ounces (measured at tip of breaker arm with spring scale at right angles to contact surface). There are two sets of contacts operating on a six lobe cam. Contacts open simultaneously to fire both spark plugs in each cylinder. Contacts must be synchronized (see Timing). Distributor is semi-automatic. Maximum manual advance is 38° (engine).

Cam Angles—Closed 36°. Open 24° (distributor) each set independently.

		Automatic Advance			
Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	2		600
6		700	12		1400
11		1275	22		2550

Mounting:—Distributor is mounted on accessory bracket at right of engine. To remove distributor, disconnect manual advance rod and primary leads and remove distributor head with cables intact. Then remove manual advance stop screw and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor every 750 miles. Every 1000 miles remove the distributor head and rotor and put a small amount of vaseline on the face of the breaker cam and oil the breaker arm pivot pins with light engine oil.

Timing:—**Synchronization of Contacts.** Contacts must be synchronized so that they open at the same instant firing both spark plugs in each cylinder simultaneously. Connect a six volt lamp in each primary circuit. Turn ignition on and crank engine over slowly. The lamps will go out as each set of contacts open. If both lamps go out at the same instant the contacts are synchronized. If they do not, loosen the four lock screws on the breaker plate and shift the plate causing one set of contacts to open earlier or later until synchronization is effected. Then tighten lock screws and check contact gap with breaker arm on lobe of cam. If outside limits of .015-.020 inch, reset at .017 inch and repeat synchronization.

Timing Distributor to Engine. Standard setting 15 degrees (on flywheel) before top dead center with manual spark control fully advanced. To set timing, fully advance manual spark control, see that distributor is rotated counter-clockwise as far as possible, take off cover over inspection hole in flywheel housing. With No. 1 piston on compression stroke turn engine over until flywheel mark 'AD.SPK.1 & 8' is directly opposite indicator in inspection hole in housing. Loosen lock screw in center of breaker cam, carefully locate cam so that contacts are beginning to open, tighten locking screw. Connect spark plugs as indicated on diagram.

NOTE:—The flywheel mark 'AD.SPK.1&8' is not provided on Model LA cars and ignition should be set with piston on top dead center with spark control advanced 6/10.

Firing Order:—The firing order is 1-5-3-6-2-4. Spark plugs are connected 1R-6L-5R-2L-3R-4L-6R-1L-2R-5L-4R-3L clockwise around the distributor head. Spark plugs are right (R) and left (L) in the cylinder head as viewed from the driver's seat and No. 1 cylinder is nearest the radiator.

Spark Plugs:—18 MM. Metric Champion No. 7. Set gaps at .022 inch.

VALVE TIMING:—Valves in cylinder head operated directly by overhead camshaft. Camshaft driven from transfer sprocket on front of engine block by silent timing chain. Transfer sprocket driven from crankshaft by silent timing chain. Automatic idler take-up sprockets are used on both chains.

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake and Exhaust	1 21/32"	3/8"	6 11/32"	45°	11/32"

Tappet Clearance	Spring Pressure
Intake .028" (see Note)	56 pounds (length 2 27/64")
Exhaust .028" (see Note)	102 pounds (length 2 5/64")

Intake Valves	Timing	Exhaust Valves
Open—1° before top dead center.		Open—49° before lower dead center.
Close—55° after lower dead center.		Close—7° after top dead center.

Note on Tappet Clearance or Lash. Valves equipped with conventional removable valve stem guide (inner guide) and piston guide (outer guide) screwed on end of valve stem. Valve cap (which bears against cam face) screwed on end of valve stem against valve piston. To set tappet clearance or lash, turn camshaft until nose of cam points up at 45° angle with heel of cam at one side of metering pin directly over valve cap. Insert bar in hole in valve piston (piston guide cut away on left side) to hold valve piston from turning and turn valve cap by bar inserted in hole. Adjust lash to .028 inch by screwing valve cap and piston up or down on valve stem.

To Set Valve Timing. Cam shaft sprocket should be taken off cam shaft and automatic adjusting sprocket must be off engine. Crank engine over until piston No. 1 reaches a position 7 degrees past top dead center when the flywheel mark 'EX.CL.1 & 6' should be in the exact center of the inspection hole in the upper flywheel housing. Then turn cam shaft until the heel of the first cam at the front of the engine is directly above No. 1 valve (exhaust valve in cylinder No. 1). Set lash or clearance between valve cap and cam at .028 inch (this is very important). Then turn cam shaft in direction of rotation (clockwise) until the valve has opened and just closed. This may be determined by inserting pin in hole in valve cap and oscillating valve. The added drag when the valve seats will be perceptible. Then mesh cam shaft sprocket in upper chain and rotate sprocket counter-clockwise to take up all the slack in the driving side of the chain. Line up holes in sprocket and cam shaft flange by slipping chain one tooth at a time on the transfer sprocket. Insert four cap screws mounting sprocket on cam shaft. Mesh automatic adjusting sprocket in chain and insert eccentric adjusting hub. Wind up spiral spring one and one half turns to provide proper chain tension and insert spring tongue in nearest slot. Assemble plain washer on sprocket shaft and insert cotter.

STARTER:—Model 726-C. Starter is connected to the engine through a clutch and manual pinion shift connected to the starting switch. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting pedal linkage and remove three flange mounting cap screws. Then pull starter forward and lift from place.

GENERATOR:—Model 391. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, take off commutator cover band and shift third brush using a screwdriver inserted in the notch in the third brush plate to shift the plate. Shift third brush counter-clockwise to increase or clockwise to decrease the charging rate. Third brush mounting plate held in position by friction. With standard car setting maximum charging rate is 12 amperes (hot) at 7.6 volts reached at 1600 R.P.M. or 32 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
22-24	8.2-8.62	1400	10-12	7.35-7.65	1600

Shunt field current is 1.8-2.3 amperes at 6 volts. Brush spring tension is 20-28 ounces.

Mounting:—Generator is flange mounted at right of engine on rear of accessory bracket. To remove generator, disconnect water pump drive coupling and generator lead and remove three flange mounting cap screws. Then pull generator to rear and lift from place.

RELAY:—Model 266-N. Relay is mounted on the generator. Relay contacts close at 575 R.P.M. or 8 M.P.H. when the generator voltage reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Contacts separate .015-.020 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 486-G. Lighting switch is mounted at lower end of steering column. Headlights are dimmed by resistance on lighting switch. Lighting switch positions:

1. Lever vertical—All lights off.
2. No. 1 right—Headlights dimmed through resistance, tail light on.
3. No. 2 right—Headlights on bright, tail light on.
4. No. 1 left—Cowl lights on, tail light on.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32	S.C.	1133
Parking Lights	6-8	3	S.C.	63
Dash and Tail Lights	6-8	3	S.C.	63
Stop Light	6-8	15	S.C.	87
Dome and Corner Lights	6-8	15	S.C.	87

CURRENT LIMIT RELAY:—Model 410-C. This device is a vibrating circuit breaker mounted on the dash and connected in the lighting circuits. It begins to vibrate when the current flow reaches 20-30 amperes and continues limiting the current to 2-15 amperes. Contacts separate .012-.030 inch. Air gap is .019-.025 inch with contacts closed.

CAR SERIAL NUMBER:—Stamped on plate on right front side of engine dash and on right top side of front frame cross member (forward engine support).

ENGINE NUMBER:—Stamped on plate on right side cylinder cover and on right crankcase wall back of distributor.

ENGINE:—Eight cylinder, 'I' or overhead valve type, 3⅜x4½" bore and stroke, 322 cubic inch displacement, rated at 46.4 H.P., develops 113 H.P. at 3300 R.P.M. Standard compression ratio 5.5-1. Optional low compression ratio 5.0-1.

BATTERY:—**Prest-O-Lite, Type A-619-ST,** 6 volt, 19 plate, 145 ampere hour capacity (5 ampere rate). Starting capacity 173 amperes for 20 minutes.
Grounded Terminal:—Negative (—) terminal grounded to frame.
Mounting:—On left hand side of frame under driver's seat.
Dimensions:—Width, 7". Length, 13". Height, 9 3/16".

IGNITION:—**Coil Model 531-C (2 used).** Coils are mounted at right of engine.
Ignition Current:—6 amperes at 6 volts (engine running), 10 amperes at 6 volts (engine stopped) total for both coils.
Ignition Switch:—**Oakes** 'Hershey' type co-incidental ignition switch and steering post lock.

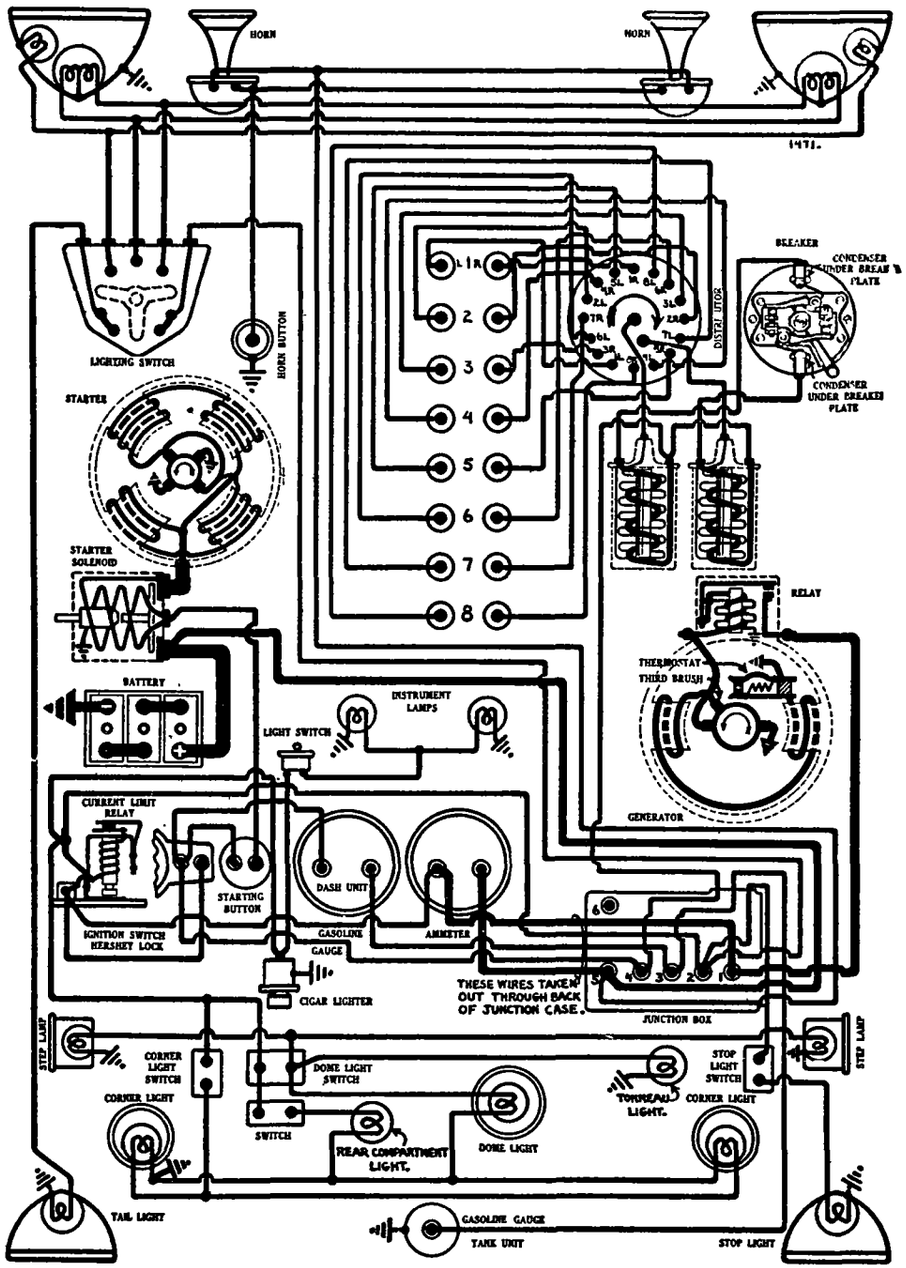
Distributor Model 4028. Two breaker arm, 8-lobe cam type with semi-automatic advance. Breaker contacts open simultaneously to fire both spark plugs in each cylinder. Contacts must be synchronized—(see Timing). Manual advance is controlled by left hand lever on steering wheel. Maximum manual advance is 38° (engine).
Breaker Gap:—Set contact gap at .017". Hold within limits of .015-.020".
Breaker Arm Spring Tension:—17-21 ounces measured at tip of breaker arm with spring scale at right angles to contact surface.

Automatic Advance

Degrees	Distributor R.P.M.	Degrees	Engine R.P.M.
Start	300	2	600
6	700	12	1400
11	1275	22	2550

Mounting:—Distributor mounted on accessory bracket at right front of engine. To remove, disconnect manual spark control, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.

Oiling:—**750 Miles.** Put 8-10 drops light engine oil in oiler on side of distributor cup.



1000 Miles. Take off distributor cap and rotor. Put one drop oil on breaker arm pivot pins, apply thin film vaseline to face of breaker cam.

Timing:—Standard setting 15° (on flywheel) before top dead center with manual spark control fully advanced. To set timing, first advance manual spark control (pull lever down), see that distributor is rotated counter-clockwise to end of advance arm slot, take off cover over inspection hole in top of flywheel housing. With No. 1 piston on compression turn engine over until piston is slightly before top dead center with flywheel mark AD.SPK. 1 & 8' directly opposite indicator on housing, loosen taper lock screw in center of breaker cam, carefully locate cam so that contacts are beginning to open (use test lamp), tighten locking screw, connect spark plugs as indicated on diagram.

Synchronization of Contacts. To synchronize contacts, connect test lamp in each primary circuit, loosen four lock screws on movable breaker sub-plate, shift plate until both sets of contacts open at the same instant. Synchronization should be checked whenever contacts are adjusted or ignition is set.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator. See diagram for order in which spark plug cables are connected around distributor head.

Spark Plugs:—18 MM. Metric. Champion No. 7. Set gaps at .022 inch.

VALVE TIMING:—Valves in cylinder head operated directly from overhead camshaft. Camshaft driven from transfer sprocket on front of engine by silent timing chain. Transfer sprocket driven from crankshaft in tandem with accessory sprocket by silent timing chain. Automatic idler sprockets on both chains.

Valve Specifications

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake and Exhaust	1 21/32"	3/8"	6 11/32"	45°	11/32"

Tappet Clearance		Spring Pressure	
Intake	.028" (see note)	Closed	56 pounds (2 27/64")
Exhaust	.028" (see note)	Open	102 pounds (2 5/64")

Intake Valves	Timing	Exhaust Valves
Open—1° before top dead center.		Open—49° before lower dead center.
Close—55° after lower dead center.		Close—7° after top dead center.

Note on Tappet Clearance or Lash:—Valves equipped with conventional removable valve stem guide (inner guide) and piston guide (outer guide) screwed on end of valve stem. Valve caps (which bears against cam face) are screwed on valve stem against valve piston. To set tappet clearance or lash, turn camshaft until nose of cam points up at 45° angle with heel of cam at one side of metering pin directly over valve cap. Insert bar in hole of valve piston (piston guide cut away on left side), hold valve piston from turning, turn valve cap with bar inserted in hole to loosen. Adjust lash to .028" by screwing valve cap and piston up or down on valve stem.

To Check Valve Timing. Set tappet clearance or lash of No. 1 exhaust valve at .028" (see above). With No. 8 piston on compression turn engine over until No. 1 exhaust valve begins to close (insert valve adjusting rod in hole in valve cap and oscillate valve until added drag indicates that valve has begun to seat). Flywheel mark 'EX.CL.1 & 8' should be directly opposite indicator on housing (inspection hole at top or side of flywheel housing).

To Set Valve Timing—with upper chain and idler sprocket off engine and camshaft sprocket off camshaft. Turn crankshaft until flywheel mark 'EX. CL.1 & 8' is directly opposite indicator on housing. Turn camshaft in direction of rotation until No. 1 exhaust valve has begun to close (see paragraph above). Mesh camshaft sprocket in chain, turn sprocket counter-clockwise to take up all slack in driving side of chain, slip chain on transfer sprocket one tooth at a time until cap screws can be inserted without disturbing position of camshaft (a closer adjustment can be obtained by rotating camshaft sprocket one quarter turn which changes the timing ¼ tooth). After mounting camshaft sprocket, mesh automatic sprocket, turn eccentric hub clockwise to take up all slack in chain, wind up spring 1½ turns to secure proper spring tension, insert end of spring in nearest slot in stud, assemble plain washer and cotter pin. Wire camshaft sprocket cap screws. Check setting and set tappet clearance or lash of all valves at .028 inch.

CARBURETION:—Zenith Updraft Dual Carburetor (see Carburetor Section for complete data).

Fuel System:—Kingston Vacuum tank mounted on dash.

Gasoline Gauge:—Stewart-Warner electric type.

STARTER:—Model 726-C ('31-32), 727-C ('33-34). Starter drive—manual pinion shift operated by pedal on toeboard (1931-32), or by solenoid starting switch Type 1501 (1933-34). See article in Electrical Equipment Section for complete data on this solenoid switch. Rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5500	5.0	65
16 "	Lock	3.0	600

Mounting:—Starter flange mounted left front face flywheel housing. To remove, disconnect cable, disconnect starting pedal linkage, take out 3 flange mounting screws, pull starter forward to clear pinion housing, lift out.

Oiling:—750 Miles. Put 8-10 drops light engine oil in commutator end oiler. Intermediate bearing and drive end bearing are graphite bronze oilless.

GENERATOR:—Model 391. Third brush regulation, thermostat control. Thermostat operates at 160°F. (contacts open, cuts in resistance) reducing output approximately 40%. Rotation is counter-clockwise at commutator end. Maximum charging rate is 12 amperes (hot) at 7.3 volts reached at 1600 R.P.M. or 32 M.P.H.

Charging Rate Adjustment. Take off commutator cover band, shift third brush by prying on brush mounting plate by means of a scrwdriver inserted in the slot in the plate. Shift third brush counter-clockwise to increase, or clockwise to decrease charging rate. Third brush mounting plate is held in position by friction.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
22-24	8.2-8.6	1400	10-12	7.3-7.6	1600

Brush Spring Tension:—20-28 ounces on each brush.

Field Current:—1.8-2.3 amperes at 6 volts across field terminals.

Mounting:—Generator flange mounted on rear face of accessory bracket at right of engine. To remove, disconnect water pump drive coupling, disconnect lead, take out 3 flange mounting screws, pull generator to rear to disengage drive coupling, lift out.

Oiling:—750 Miles. Put 8-10 drops light engine oil in oiler at each end.

RELAY:—Model 266-N. Relay mounted on generator. Contacts close at 600 R.P.M. of generator or 7 M.P.H. with generator voltage of 7-7.5 volts and open with discharge current of 0-2.5 amperes. Relay contact gap limits .015-.025 inch. Air gap limits .012-.017 inch (contacts closed).

LIGHTING:—Delco-Remy Switch, Model 486-G. Lighting switch mounted at lower end of steering column controlled by lower lever on steering wheel. Headlamps dimmed by resistance on switch (1931-32). On 1933-34 models, double filament bulbs used for 'depressed beam' dimming and are controlled by lighting switch.

Lamp Sizes

Dome and Corner Lights	6-8	15	S.C	87

NOTE—Headlamp bulbs for 1931-32 models 32 cp. SC., Mazda No. 1133.

CURRENT LIMIT RELAY:—Model 410-C, N, F. Vibrating circuit breaker mounted on back of instrument panel at extreme left. Circuit breaker begins to vibrate with current load of 35-40 amperes (410-N), 30-35 amperes (410-F) limiting load to 5-22 amperes with direct short-circuit.

Contact Gap:—.012-.030". Air Gap:—.015-.025" with contacts closed.

Spring Tension:—5 ounces minimum measured at brass button with spring scale at right angles to contact arm.

HORNS:—Klaxon Model K-26, Type 1509 (low note), **Type 1510** (high note) matched tone twin horns. Current draw 6.0-8.5 amperes at 6.0 volts (Type 1509), 5.0-6.5 amperes at 6.0 volts (Type 1510).

CAR SERIAL NUMBER:—Stamped on plate on right front side of engine dash and on right top side of frame front cross member (front engine support).

ENGINE NUMBER:—Stamped on plate on right side cylinder head cover and on right crankcase wall back of distributor.

ENGINE:—Eight cylinder, 'I' or overhead valve type with separate intake and exhaust camshafts mounted on cylinder head and two intake and exhaust valves per cylinder. Bore and stroke 3⅜x4½", 322 cubic inch displacement, rated at 46.4 H.P., develops 156 H.P. at 3900 R.P.M. Standard compression ratio 5.0-1. Optional high compression ratio 5.5-1.

BATTERY:—**Prest-O-Lite, Type A-619-ST,** 6 volt, 19 plate, 145 ampere hour capacity (5 ampere rate). Starting capacity 173 amperes for 20 minutes.
Grounded Terminal:—Negative (—) terminal grounded.
Mounting:—On left hand side of frame under driver's seat.
Dimensions:—Width, 7". Length, 13". Height, 9 3/16".

IGNITION:—**Coil Model 531-C.** Coil mounted on bracket at right front of engine beside generator. Ignition current 3 amperes at 6 volts (engine running) 5 amperes at 6 volts (engine stopped). Ignition switch is Oakes 'Hershey' type co-incidental ignition switch and steering post lock.

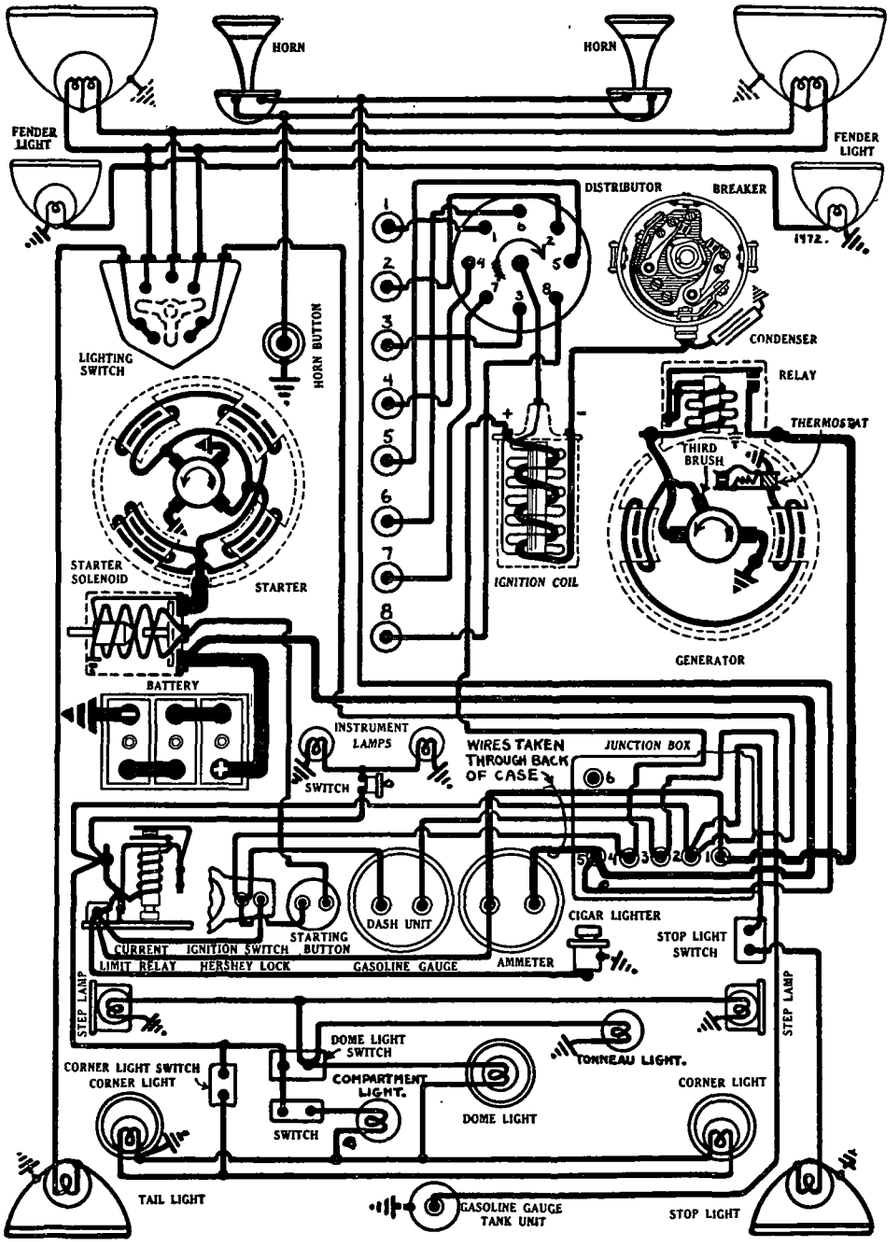
Distributor Model 660-W. Two breaker arm, 4 lobe cam type with semi-automatic advance. Breaker contacts open alternately at 45° intervals corresponding to 90-degree firing interval of engine. Contacts must be synchronized (see Timing).
Manual Advance:—40 degrees (engine) maximum.
Breaker Gap:—Set contact gap at .020". Hold within limits of .018-.024".
Breaker Arm Spring Tension:—17-21 ounces measured at tip of breaker arm
Cam Angles—Closed 33°, open 12° (distributor) when synchronized.

Automatic Advance

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	2		600
6		700	12		1400
18.5		2100	37		4200

Mounting:—Distributor mounted on accessory bracket at right front of engine. To remove, disconnect lead, disconnect manual spark control, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.

Timing:—Standard setting 20° (on flywheel) before top dead center with manual spark control fully advanced. To set timing, first advance manual spark control (pull lever down), see that distributor is rotated counter-clockwise to end of advance arm slot, take off cover plate over inspection hole in top of flywheel housing. With No. 1 piston on compression stroke, turn engine over until flywheel mark 'AD.SPK.1&8' (which is 20° before top dead center mark 'TOP C.1 & 8') is directly opposite indicator in inspection hole, loosen advance arm clampscrew, rotate distributor until first set of contacts mounted directly on breaker plate begin to open (use test lamp), tighten clamp screw, connect spark plugs as indicated on diagram.



Synchronization of Contacts. Use special Delco-Remy tool, Part No. 1838182 and follow complete directions in Equipment Section. No flywheel marks provided to check synchronization by timing distributor using second set of contacts.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.
Spark Plugs:—18 MM. Metric. Champion No. 7. Set gaps at .022 inch.

VALVE TIMING:—Exhaust valves (two per cylinder) in cylinder head at right of engine operated by overhead exhaust camshaft. Intake valves (two per cylinder) in cylinder head at left of engine operated by overhead intake camshaft. Both camshafts driven in tandem by silent timing chain from transfer sprocket on front of engine block. Transfer sprocket driven in tandem with accessory sprocket by silent timing chain from crankshaft. Both chains equipped with automatic take-up idler sprockets, no adjustment necessary in service.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake and Exhaust	1 9/32"	⅜"	5 21/32"	45°	11/32"

Tappet Clearance	Valve Springs
Intake .....028" or .046" see note	Open .....115 pounds (1 15/16")
Exhaust .....028" or .046" see note	Closed .....53 pounds (2 9/32")

Intake Valves	Timing	Exhaust Valves
Open—5° before top dead center.	Open—46° before lower dead center.	
Close—41° after lower dead center.	Close—10° after top dead center.	

Note on Tappet Clearance or Lash:—Tappet clearance on various engines set at either .028" or .046". Correct tappet clearance for each engine is stamped on name plate on engine and should be consulted when tappet clearance is being set. Valves are fitted with conventional removable valve stem guide (inner guide) and piston guide screwed on end of valve stem (outer guide). Valve cap (which bears on cam face) is screwed on valve stem against valve piston. To set tappet clearance or lash, turn camshaft until nose of cam is perpendicular (at right angles to face of valve cap), with metering pin turned off valve cap. Insert adjusting bar in hole in valve piston (piston guide cut away on inside), hold valve piston from turning, insert second bar in hole in valve cap and turn cap to loosen. Adjust lash to .028" or .046" by screwing valve cap and piston up or down on valve stem. All turning must be done on valve cap to avoid formation of burs on valve piston.

To Check Valve Timing Intake Camshaft:— Set tappet clearance No. 1 intake and exhaust valves at .028" or .046" (see name plate on engine), take off cover plate over inspection hole in top or side of flywheel housing. Turn engine over until No. 1 intake cam is about to touch valve cap (tappet clearance taken up—valve about to open), insert adjusting bar in valve cap hole so that bar is pointed across engine and loop rubber band over bar fastening other end of band to engine so that band tension is slightly less than amount necessary to rotate valve. Turn engine over slightly until band begins to rotate valve indicating that valve has left its seat. Flywheel mark 'IN.OP.1 & 8' (which is 5° before top dead center mark "TOP. C. 1 & 8') should be directly opposite indicator on housing. If setting is not exact, turn crankshaft over two revolutions and stop with flywheel mark at indicator. Then loosen camshaft sprocket mounting capscrews slightly, rotate camshaft until intake valve begins to open, tighten capscrews (capscrew holes are slotted). Check setting.

To Check Exhaust Camshaft:—After checking intake camshaft setting (above) insert adjusting rod in hole of No. 1 exhaust valve cap, turn engine over slowly until added drag on rod when valve is oscillated indicates that valve is beginning to seat. Flywheel mark 'EX.CL.1 & 8' (which is 10° after top dead center mark 'TOP.C. 1 & 8') should be directly opposite indicator on housing. If setting is not correct, turn crankshaft two revolutions and stop with flywheel mark at indicator. Then loosen camshaft sprocket mounting capscrews slightly, turn camshaft until valve closes, tighten mounting screws (capscrew holes are slotted). Check setting.

To Set Valve Timing:—With intake and exhaust camshaft sprockets and automatic idler take-up sprocket off engine. Turn crankshaft until flywheel mark '0' (which is 2½° after top dead center mark 'TOP.C.1 8') is directly opposite indicator on housing with distributor rotor pointed toward rear of car (if rotor points toward front of car turn engine over one complete revolution). Turn intake camshaft until No. 1 intake valve is about to open and turn exhaust camshaft until No. 1 exhaust valve is about to close. Mesh intake camshaft sprocket in chain, turn sprocket counterclockwise to take up all slack in driving side of chain (between sprocket and transfer sprocket), see if lines indicating center of slotted holes in sprocket line up with lines on camshaft flange indicating center of capscrew holes without disturbing position of camshaft. If they do not, slip sprocket on chain one tooth at a time to left until sprocket can be mounted on flange with marks in line without disturbing camshaft. This is necessary to provide for later adjustment. Insert capscrews mounting sprocket on flange. Mesh exhaust camshaft sprocket in chain, turn to left to take up slack in driving side of chain between camshaft sprockets, slip sprocket on chain one tooth at a time until sprocket can be mounted on camshaft flange with marks indicating center of slots in sprocket and center of holes in flange in line without disturbing position of camshaft. Mesh automatic take-up idler sprocket in chain, turn eccentric hub to left to take up all slack in chain, wind up eccentric spring one and one half turns, insert end of spring in nearest slot, assemble washer and cotter. Check valve timing as directed above for both camshafts and make any adjustment necessary by shifting sprockets on camshafts until exact settings are secured.

CARBURETION:—Stromberg Downdraft Carburetor, Model EE-3 (see Carburetor Section for complete data). Stromberg Automatic Choke is standard equipment.

Fuel Pump:—Stewart-Warner mechanical type fuel pump is mounted on valve cover at left rear of engine (see Carburetion Section).

Gasoline Gauge:—Stewart-Warner electric type.

STARTER:—**Model 726-C ('31-32), 727-C ('33-34).** Starter drive—manual pinion shift operated by pedal on toeboard (1931-32), or by solenoid starting switch Type 1501 (1933-34). See article in Electrical Equipment Section for complete data on this solenoid switch. Rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5500	5.0	65
15 "	Lock	3.0	600

Mounting:—Starter flange mounted left front face flywheel housing. To remove, disconnect cable, disconnect starting pedal linkage, take out 3 flange mounting screws, pull starter forward to clear pinion housing, lift out.

GENERATOR:—**Model 391.** Third brush regulation, thermostat control. Thermostat operates at 160° F. (contacts open, cuts in resistance) reducing output approximately 40%. Rotation is counter-clockwise at commutator end. Maximum charging rate is 12 amperes at 7.3 volts (hot) reached at 1600 R.P.M. or 32 M.P.H.

Charging Rate Adjustment. Take off commutator cover band, shift third brush by means of a screwdriver inserted in slot in brush mounting plate, counter-clockwise to increase, or clockwise to decrease charging rate. Brush mounting plate is held in position by friction.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
22-24	8.2-8.6	1400	10-12	7.3-7.6	1600

Brush Spring Tension:—20-28 ounces on each brush.

Field Current:—1.8-2.3 amperes at 6 volts across field terminals.

Mounting:—Generator flange mounted on rear face of accessory bracket at right of engine. To remove, disconnect water pump drive coupling, disconnect lead, take out 3 flange screws, pull generator to rear to disengage drive coupling, lift out.

RELAY:—**Model 266-N.** Relay mounted on generator. Contacts close at 600 R.P.M. of generator or 7 M.P.H. with generator voltage of 7-7.5 volts and open with discharge current of 0-2.5 amperes. Relay contact gap limits .015-.025 inch. Air gap limits .012-.017 inch (contacts closed).

LIGHTING:—**Delco-Remy Switch, Model 486-G.** Lighting switch mounted at the lower end of steering column controlled by lower lever on steering wheel. Headlamps dimmed by resistance on switch (1931-32). On 1933-34 models, double filament bulbs used for 'depressed beam' dimming and are controlled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No
Headlights	6-8	32-32	D.C.	1000
Parking Lights	6-8	3	S.C.	63
Dash and Tail Lights	6-8	3	S.C.	63
Stop Lights	6-8	15	S.C.	87
Dome, Corner Lights	6-8	15	S.C.	87

NOTE—Headlamp bulbs for 1931-32 models 32 cp. SC., Mazda No. 1133.

CURRENT LIMIT RELAY:—**Model 410-C, N, F.** Vibrating circuit breaker mounted on back of instrument panel at extreme left. Circuit breaker begins to vibrate with current load of 35-40 amperes (410-N), 30-35 amperes (410-F), limiting load to 5-22 amperes with direct short-circuit.

Contact Gap:—.012-.030". **Air Gap:**—.015-.025" with contacts closed.

Spring Tension:—5 ounces minimum measured at brass button with spring scale at right angles to contact arm.

HORNS:—Klaxon Model K-26, Type 1509 (low note), Type 1510 (high note), matched tone twin horns. Current draw 6.0-8.5 amperes at 6.0 volts (Type 1509), 5.0-6.5 amperes at 6.0 volts (Type 1510).

SERIAL NUMBER:—First number (K) 373,000, (KU) 21,500, (KS) 396,727. On plate on engine side of dash under hood.

COMPRESSION:—Ratio—Std. 5.75-1 hd. Optl. 6.25-1 hd. **Pressure**—(Std. head) 80 lbs. at 125 R.P.M.

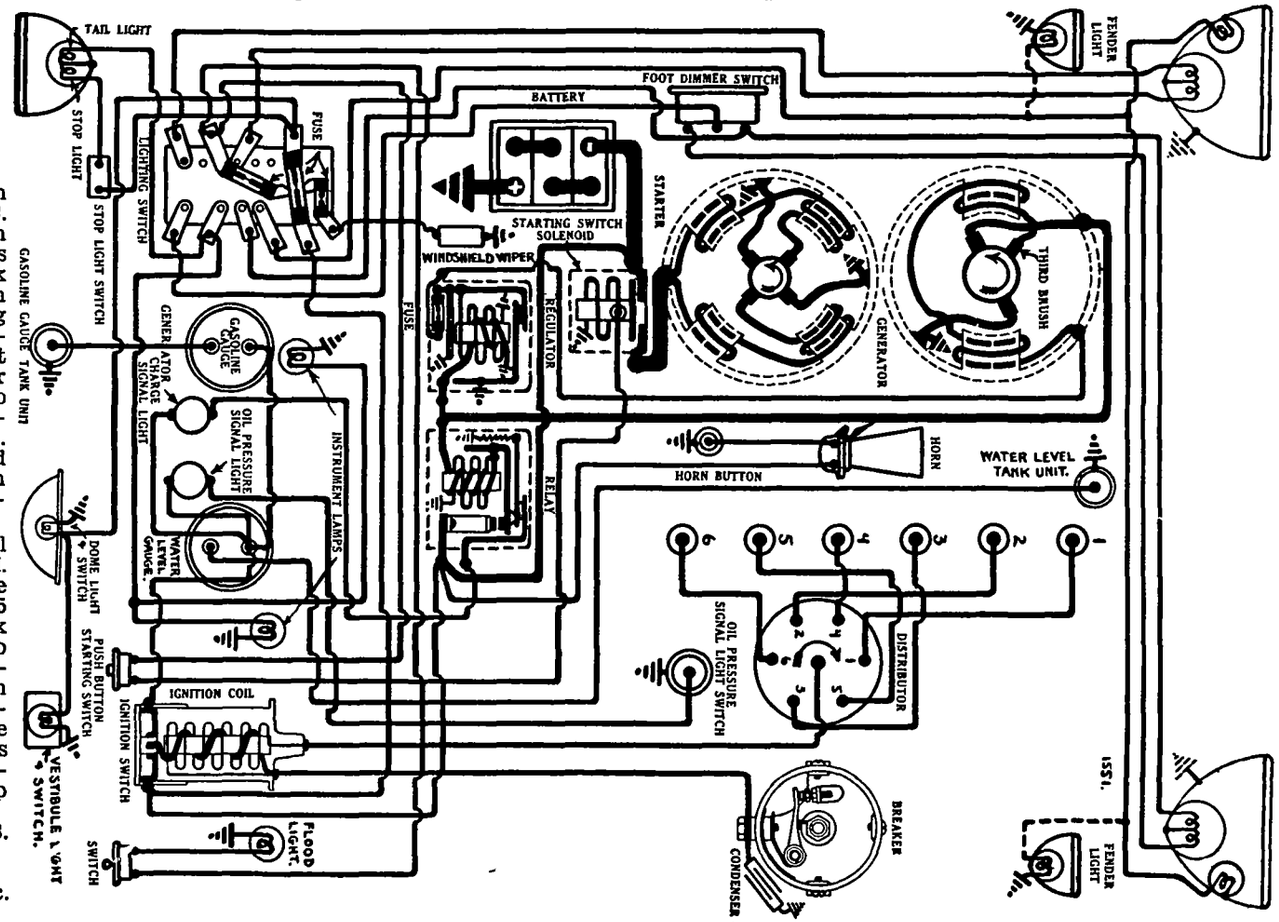
VACUUM READING:—Gauge should show steady reading of 18-19" with engine idling.

IGNITION:—Coil Model IG-4311. Lock coil type. Resistor mounted on distributor.
Ignition Current—2.5 amperes (idling), 4.5 amperes (stopped).
Distributor Model IGB-4301-A. Single breaker, 6 lobe cam, full automatic advance type.
Breaker Gap—Set gap at .020". Limits, .018-.020".
Breaker Arm Spring Tension—16-22 ounces.
Cam Angles—Closed 40°. Open 20° (distributor).

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	400	0	800
3	720	6	1440
6	1040	12	2080
9	1360	18	2720
12	1680	24	3360
15	2000	30	4000

IGNITION TIMING:— Flywheel Degs. Piston Position Initial Setting (all engines) at TDC. ..... .0000" TDC.
Timing (Initial Setting):—With #1 piston on compression, turn engine over until piston reaches top dead center, stop when flywheel mark 'UDC.1-6/' registers with pointer in inspection hole (left hand front face of flywheel housing above starter), loosen hold-down screw in advance arm, rotate distributor clockwise to limit of advance arm slot, then rotate distributor slowly counter-clockwise until contacts begin to open, tighten hold-down screw, check rotor position and spark plug connections (see diagram). This top dead center setting should be checked by road-testing car and spark advanced as much as operating conditions and fuel rating will allow (see below).
Timing (Final Setting):—With engine at normal operating temperature and running at 8 M.P.H. in high gear on level road, accelerate engine rapidly and note performance from 10 to 15 M.P.H. With correct setting a slight spark knock should be noted under these conditions. If no knock is heard, loosen hold-down screw in advance arm and rotate distributor one graduation counter-clockwise (advance). If knock is too severe, rotate distributor one graduation colckwise (retard). Repeat test until satisfactory setting is secured. Final setting must not be beyond maximum advance mark on flywheel (¾" before top dead center mark 'UDC.1-6/').
Motor Gauge—Weidenhoff Adapter #114, Rod #43.



Firing Order:—1-5-3-6-2-4 (see diagram).

Spark Plugs:—Champion, Type J-7. 14 MM. Metric.
Spark Plug Gaps—.022".

CARBURETION: — (Fuel System). See Carburetion Section for complete data on Carburetor, Automatic Choke (Climatic Control), Fuel Pump, and Gasoline and Oil Level Gauge.
Carburetor:—Carter, Model 281-S (K, KU), 295-S (KS), 1¼" plain tube, downdraft type.
Automatic Choke—Carter Climatic Control (281-only).
Fuel Pump:—A.C., Type R.
See 'Servicing AC Fuel Pumps' in Carburetion Equipment Section for recommended replacement pumps.
Gasoline Gauge:—Motometer, electric type.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0562" before top dead center when a point on the flywheel approximately 3.17 teeth before top dead center mark 'UDC.1-6' lines up with indicator. Reset tappet clearance at .006" with engine warm and running.
Motor Gauge—Weidenhoff Adapter #114, Rod #43.
Tappet Clearance:—.006" Int., .008" Exh., engine hot and running.
Valve Spring Pressure:—44 lbs. at 2" (valve closed). 102 lbs. at 1 21/32" (valve open).

LUBRICATION:—Duo-flow (splash) system with positive pump feed to oil troughs and timing gears by oscillating plunger type pump. Pump mounted on right hand side of crankcase.
Normal Oil Pressure—3 pounds.
Oil Pressure Relief Valve—Operates at 3 lbs. Located on right hand side of crankcase at rear (combined with oil pressure signal light switch). See Signal Lights article in Equipment Section.
Capacity and Oil—7 qts. (dry), 6 qts. (refill). Use SAE #30 (above 40°F.), #20-W (40° to 0°F.).

BATTERY:—National, Type ST-3-17X, 6 volt, 17 plate, 100 ampere hour capacity.
Starting Capacity—122 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—Left hand side under front floor boards.

STARTER:—Model MAB-4060. Armature No. MAB-2114. Starter drive—Inboard Bendix.
Rotation—Counter-Clockwise at commutator end.
Brush Spring Tension—44-56 ozs. (new brushes).
Cranking Engine—125-150 amperes at 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

NOTE:—Lock torque figures correct without switch.

Starting Switch:—Type SS-4001. Solenoid type switch mounted on starter field frame and controlled by pushbutton switch on instrument panel.

Mounting:—Flange mounted on left hand front face of flywheel housing. To remove, take out two flange mounting bolts.

GENERATOR:—Model GBK-4602. Armature No. GBK-2055. Ventilated, third brush control type with external voltage regulator. See Equipment Section for complete data on Voltage Regulator.

Charging Rate Adjustment:—Use test meters to check generator output. Short out voltage regulator by connecting short jumper wire from 'F' terminal on generator to ground. Take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate. Remove jumper wire.

Maximum Charging Rate—22 amperes (cold), 8.0 volts, 2400 R.P.M. or 28 M.P.H.

Performance Data
Cold—Regulator Inoperative—Hot

Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	800	0	6.4	840
4	6.7	980	4	6.8	1025
8	7.0	1110	8	7.15	1200
12	7.3	1300	12	7.5	1450
16	7.55	1500	16	7.85	1760
22	8.0	2200	18	8.0	2400

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—18-22 ounces.
Field Current—3.75-4.15 amperes at 6.0 volts.
Motoring—4.46-4.94 amperes at 6.0 volts.
Field Fuse—7½ ampere capacity in knurled cup under regulator case.

Mounting:—Pivot mounted at left front of engine. Driven by fan belt. To remove, take out two pivot bolts and one clamp bolt.
Belt Adjustment—Loosen pivot bolts and clamp bolt, swing generator out or away from engine until slight pull is felt on belt, tighten clamp bolt before slacking off on generator, tighten pivot bolts.

CUT-OUT RELAY:—Model CBA-4002. Mounted on dash. Relay has extra set of contacts above armature for charge tell-tale light control.
Cuts in—6.4 volts, 750 R.P.M. or 8 M.P.H.
Cuts out—.5-2.5 ampere discharge.

VOLTAGE REGULATOR:—Model TC-4102A. Two Charge Regulator mounted on engine side of dash. See article in Electrical Equipment Section for complete data.
Contacts Open—7.86-8.27 volts at 70° F.
Contacts Close—6.46-6.86 volts at 70° F.
Contact Gap—.005" minimum.
Core Gap—.030" plus or minus .001" with contacts closed.

LIGHTING:—Soreng-Manegold Switch, Model 5640-A, C-5640-A (without windshield wiper fuse). Soreng-Manegold Foot Control Switch. Foot control switch provides asymmetric 'meeting' beam (lower beam right hand headlight, upper beam left hand headlight). Headlight beams are crossed (left hand headlight lights right side of road). Operative only with lighting switch in 'Country Driving' position. Headlight bulbs are pre-focused type.

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlights	32-21	2320-C
Parking, Instrument, Flood	3	63
Dome, Vestibule	15	87
Stop and Tail	21-2	1158
Signal	3	64 (DC.)

SIGNAL LIGHTS:—Battery charge tell-tale and oil pressure tell-tale light mounted on instrument panel. Light bulbs are standard 3 cp. DC. bulbs.

Battery Charge Tell-tale. At left of instrument cluster. Tell-tale should light with ignition turned on and should go out when gentrator begins to charge battery (relay contacts closed). If tell-tale does not burn when ignition turned on, check bulb by grounding tell-tale terminal on relay to generator field frame. If tell-tale does not light, replace bulb. If lamp lights, check auxiliary contact spring, contacts and ground resistor. See that auxiliary contacts are closed with main contacts open. If tell-tale lights at speeds above idling (8 M.P.H.), generator or relay is defective.

Oil Pressure Tell-tale. At right of instrument cluster. Tell-tale should light with ignition turned on but should go out when engine is operated (light should flash at idling speeds). Tell-tale should not light or flash at speeds above idling. If tell-tale does not light when ignition is turned on, check bulb by grounding terminal on oil pressure check valve (right side of crankcase) to engine. If tell-tale does not light, replace bulb. See special article on Hudson Signal Lights in Equipment Section for complete data.

FUSES:—Lighting—Two 20 ampere capacity fuses on back of lighting switch.
Windshield Wiper—7½ ampere capacity fuse on lighting switch (not used on all cars).
Generator Field—7½ ampere capacity.

SERIAL NUMBERS:—First number — 51-101. On plate on engine side of dash. All cars have this prefix '51'.

COMPRESSION:—Ratio—6.0-1 std. (cast-iron) head, 7.0-1 optl. (composite aluminum-iron) head.
Pressure—111 lbs. at 215 R.P.M. (6.0-1 head), 127 lbs. (7.0-1 head) with all spark plugs removed and throttle wide open.

VACUUM READING:—Gauge should show steady reading of 18-19" with engine idling at 350 R.P.M. or 7 M.P.H.

AUTOMATIC SHIFT (ELECTRIC HAND):—Bendix electro-pneumatic type optional on this car. See article in Mechanical Equipment Sect. for complete description, wiring diagram, and trouble shooting.

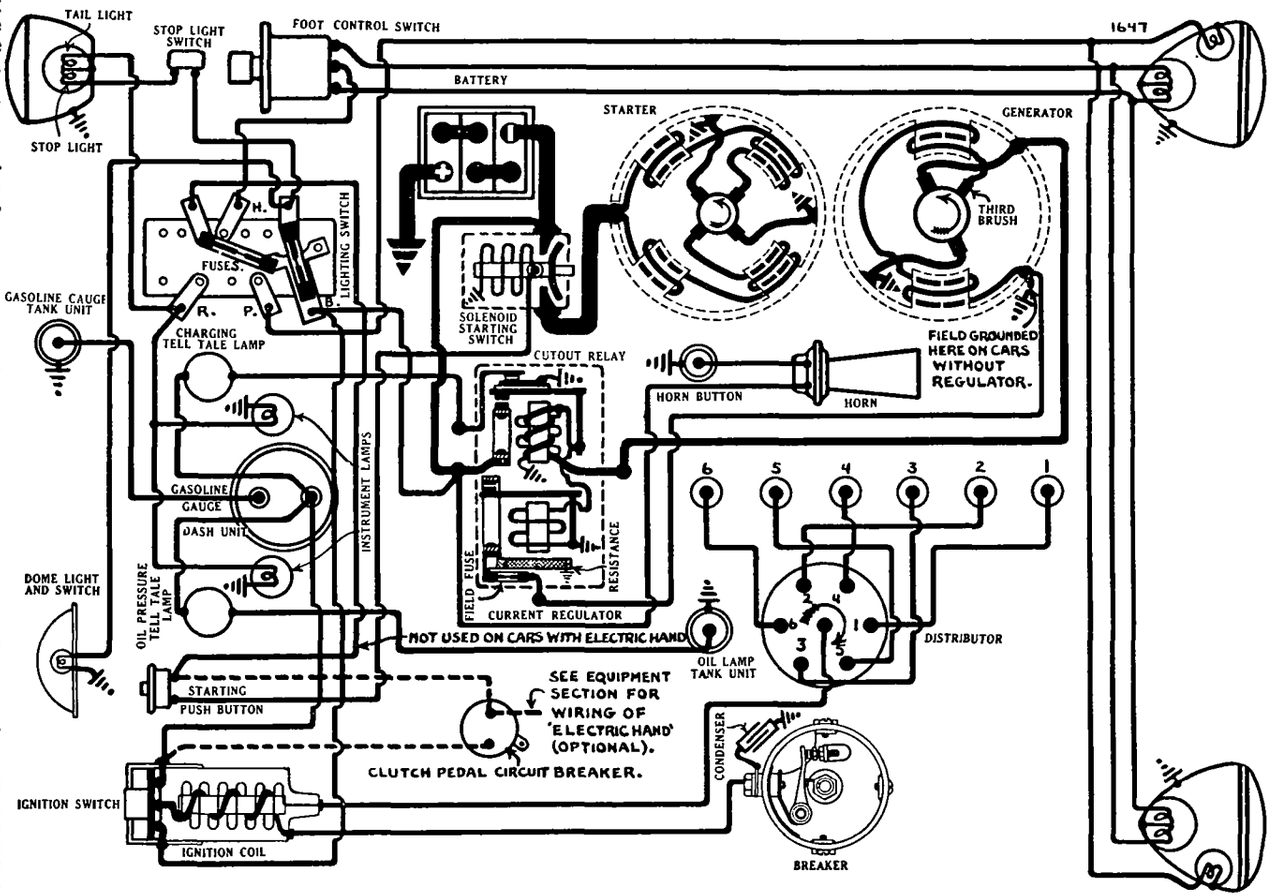
IGNITION:—Coil Model IG-4616. Resistance unit mounted on distributor connected in primary.
Ignition Current—2.5 amperes idling, 4.5 stopped.
Ignition Switch—Mitchellock Mod. 24-B, Type 6509.
Distributor Model IGB-4301-A (first 25076 cars), IGB-4301-B (after Eng. No. 128077). Single breaker, 6 lobe cam, full automatic advance type.
Breaker Gap—Set at .020". Limits .018-.020".
Breaker Arm Spring Tension—16-22 ounces.
Cam Angles—Closed 40°. Open 20° (distributor).

Automatic Advance—IGB-4301-A

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	400	0	800
3	720	6	1440
6	1040	12	2080
9	1360	18	2720
12	1680	24	3360
15	2000	30	4000

Automatic Advance—IGB-4301-B

Start	300	0	600
3	400	6	800
5	615	10	1230
10	1150	20	2300
14	1580	28	3160



Removal:—Mounted on right side of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:— Flywheel Degs. Piston Posi.
First 25076 cars 4½° or ½" BTDC. ..... 0101" BTDC.
Eng. No. 128077 up.....At TDC. ..... .0000" TDC.
Timing (Initial Setting)—With #1 piston on compression, turn engine over until piston reaches top dead center, stop when flywheel mark 'UDC. 1-6' lines up with pointer on edge of inspection hole in left front face of flywheel housing above starter (after 25076 cars or ½" before this point on first cars). Loosen hold-down screw in advance arm, turn distributor clockwise to limit of advance arm slot, then turn distributor slowly counter-clockwise until contacts just open, tighten hold-down screw, see that rotor is opposite #1 segment in distributor cap. Car should then be road-tested and spark advanced as much as operating conditions and fuel will allow.

Timing (Final Setting)—With engine at normal operating temperature, and running at 8 M.P.H. in high gear on level road, accelerate engine rapidly and note performance from 10-15 M.P.H. A slight spark knock should be noticed. If no knock is heard, loosen hold-down screw and advance distributor one graduation on scale (turn distributor counter-clockwise) If knock is too severe, retard distributor one graduation (clockwise). Repeat test until satisfactory setting is secured. Final setting must not be beyond maximum advance mark on flywheel (¾" before mark 'UDC.1-6').
Motor Gauge—Weidenhoff Adapter #114, Rod #43.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs—Champion Type J-7-S. 14 MM. Metric.
Spark Plug Gaps—Set at .022".

CARBURETION:—See Carburetion Section for data.
Carburetor: — Carter Model 311-S, 1¼" downdraft type.
Fuel Pump:—AC. Type R-1521540 diaphragm type. See 'Servicing AC Fuel Pumps' in Carburetion Equipment Section for recommended replacement pumps.
Gasoline Gauge:—King-Seeley Electric. K-S No. 5240 (dash unit), No. 5582 (tank unit).
See article in Carburetion Equipment Section.

VALVE TIMING:—**To Check Timing**—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0562" before top dead center when a point on the flywheel approximately 3.17 teeth before top dead center mark 'UDC.1-6' lines up with indicator. Reset tappet clearance at .006" with engine warm and running.
Motor Gauge—Weidenhoff Adapter #114, Rod #43.
Tappet Clearance:—.006" Int., .008" Exh., engine hot and running.
Valve Spring Pressure:—44 lbs. at 2" (valve closed). 102 lbs. at 1 21/32" (valve open).

LUBRICATION:—**Crankcase Capacity**—5 qts. (refill).
Normal Oil Pressure—3 pounds.

BATTERY:—**National, Type ST-3-17X.** 6 volt 17 plate, 96 A.H. capacity (20 hour rate).
Starting Capacity—120 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left hand side under front floor.

STARTER:—**Model MAB-4060, MAB-4074 after Engine No. 143134. Armature No. MAB-2114.**
Starter Drive—Inboard Bendix, Type A-1588.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—44-56 ozs. (new brushes).
Cranking Engine—150 R.P.M., 125 amperes, 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

Lock torque figures correct without switch.

Starting Switch:—Type SS-4001. Solenoid type switch mounted on starter field frame controlled by pushbutton switch. See Equipment Section.

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting bolts.

GENERATOR:—**Model GBK-4601-2. Armature No. GBK-2055.** Air-cooled. Third brush control type. Current Regulator (two-rate charging control) used on some models. See Equipment Section for complete data on Regulator.
Charging Rate Adjustment—Use test meters to check generator output. On cars with Current Regulator, short out regulator by connecting jumper wire from 'F' terminal on generator to ground on generator frame. Take off commutator cover band, shift third brush by hand counter-clockwise to increase charging rate, or clockwise to decrease charging rate. Third brush held in position by friction. Remove jumper wire.
Maximum Charging Rate—17 amperes (cold) or 13 amperes (hot) cars without regulator or 22 amperes (cold), 17 amperes (hot) cars with regulator, 8.0 volts, 2200 R.P.M., 28 M.P.H.
NOTE—On generators used without the regulator, the field terminal on the generator frame is grounded by a grounding cup assembled on the terminal. This ground cup must be removed when a regulator is installed.

Performance Data—No Regulator

Cold			Hot		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	800	0	6.4	840
4	6.8	1000	4	6.85	1050
8	7.2	1200	8	7.3	1260
12	7.6	1400	12	7.7	1560
16.5	8.0	2200	14.8	8.0	2250

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—18-22 ozs. (new brushes).
Field Current—4.08-4.52 amperes at 6.0 volts.
Field Fuse—5 ampere in knurled cup on side of regulator case (no fuse when regulator not used).
Motoring Current—4.18-4.62 amperes at 6.0 volts.

Removal:—Pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Loosen pivot bolts and clamp bolt, pull generator out from engine until slack on belt midway between crankshaft and generator pulleys is 1¼" (measure from straightedge across pulleys), tighten mounting bolts.

CUTOUT RELAY:—**Model CBA-4002.** Used on cars without regulator. Mounted on dash. See Equipment Section for complete data.
Cuts In—6.4 volts, 8 M.P.H.
Cuts Out—.5-2.5 amperes discharge current.
Contact Gap—.025-.035". With upper or ground contacts closed.
Air Gap—.010-.030" with contacts closed.

RELAY-REGULATOR:—**Model TC-4304-A.** Used on some cars. Mounted on dash. Consists of Cutout Relay and Current Regulator in a single case. See Equipment Section for data on these units.

Cutout Relay

Cuts In—6.5-7.25 volts.
All other data same as for CBA-4002 above.

Current Regulator

Contacts Open—8.0-8.50 volts at 70°F.
Contacts Close—1.2-1.4 volts below opening point.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—**Soreng-Manegold Switch Model F-5640-A. R.B.M. Foot Control Switch Model 1076, A.** Foot switch used to control Country Driving (high) and City (low) beams with lighting switch in second or driving position. Headlamp bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-C
Parking, Instrument	3	63
Stop and Tail	21-2	1158
Dome	15	87
Signal lights	3	64 (DC)

SIGNAL LIGHTS:—Battery Charge Tell-tale and Oil Pressure Tell-tale lights mounted in instrument cluster. See Equipment Section for complete data.

HORNS:—**Auto-Lite Type HA-4003, 4004 Std. Klaxon Model K-26-M Type 1716 (high note), 1717 (low note) Optional.** All horns are vibrator type. Optional horns are matched tone, twin horns.

FUSES:—**Lighting**—Two 20 ampere on back of switch.
Generator Field—5 ampere in knurled plug on regulator case—not used without regulator.

SERIAL NUMBER:—First number, 52-101. On plate on engine side of dash. All serial numbers have this prefix '52'.

COMPRESSION:—**Ratio**—6.0-1 Std. (cast-iron) head. 7.0-1 Optl. (composite aluminum-iron) head. **Pressure**—111 lbs. at 215 R.P.M. (std. head), 127 lbs. at 207 R.P.M. (optl. head) with all spark plugs removed and throttle wide open.

VACUUM READING:—Gauge should show steady reading of 18-19" with engine idling at 350 R.P.M. or 7 M.P.H.

AUTOMATIC SHIFT (ELECTRIC HAND):—Bendix electro-pneumatic type optional on this car. See article in Mechanical Equipment Sect. for complete description, wiring diagram, and trouble shooting.

IGNITION:—**Coil Model IG-4616.** Resistance unit mounted on distributor connected in primary circuit.
Ignition Current—2.5 amperes idling, 4.5 stopped.
Ignition Switch—Mitchellock Mod. 24-B, Type 6509.
Distributor Model IGB-4301-A (first 25076 cars), IGB-4301-B (Eng. No. 128077 up). Single breaker, 6 lobe cam, full automatic advance type.
Breaker Gap—Set at .020". Limits .018-.020".
Breaker Arm Spring Tension—16-22 ounces.
Cam Angles—Closed 40°. Open 20° (distributor).

Automatic Advance—IGB-4301-A

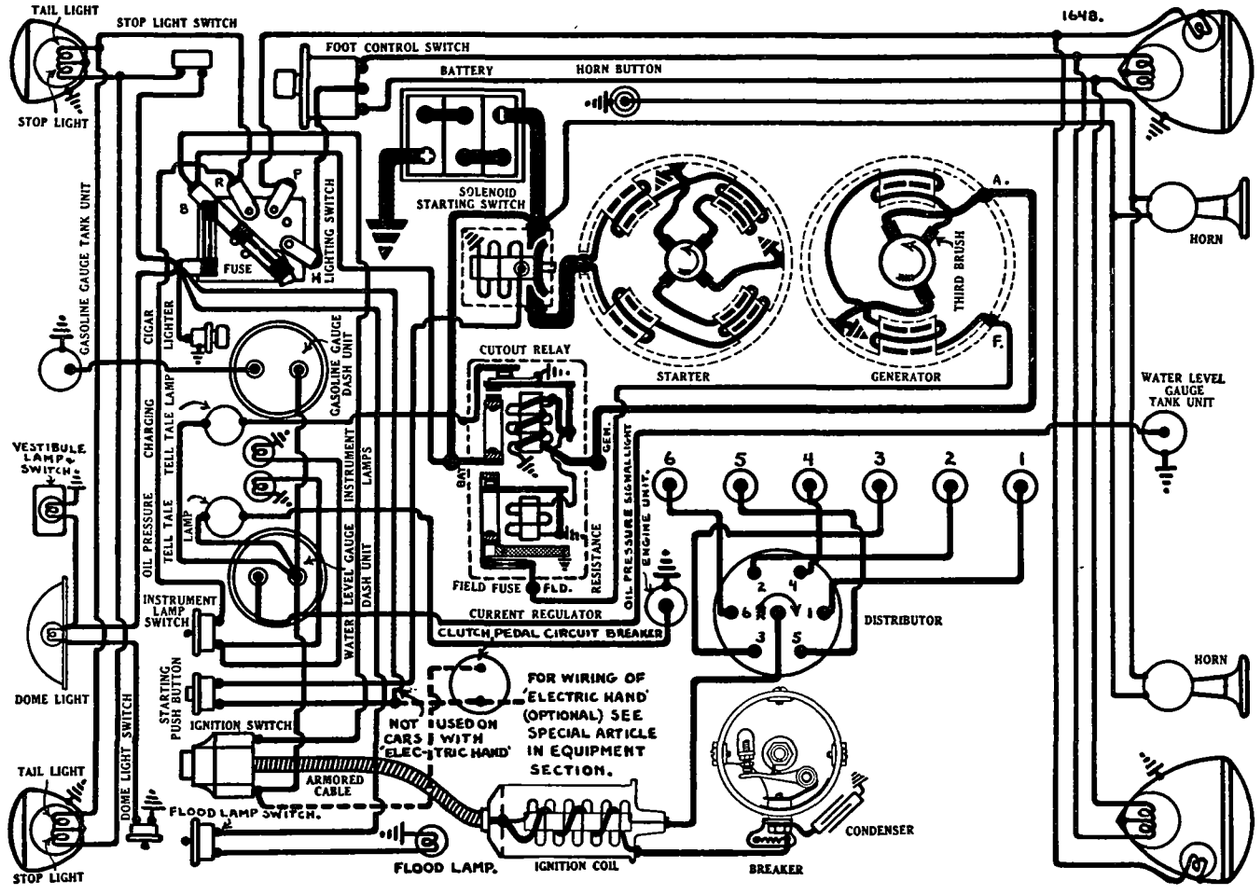
5	615	10	1230
10	1150	20	2300
14	1580	28	3160

Removal:—Mounted on right side of crankcase. To remove, take out hold-down screw in advance arm, lift out.

IGNITION TIMING:—

	Flywheel Degs.	Piston Pos.
First 25076 cars	4½° or ½" BTDC.	.0101" BTDC.
Eng. No. 128077 up	At TDC.	.0000" TDC.

Timing (Initial Setting)—With #1 piston on compression, turn engine over until piston reaches top dead center, stop when flywheel mark 'UDC. 1-6/' lines up with pointer on edge of inspection hole in left front face of flywheel housing above starter (after 25076 cars or ½" before this point on first cars). Loosen hold-down screw in advance arm, turn distributor clockwise to limit of advance arm slot then turn distributor slowly counter-clockwise until contacts just open, tighten hold-down screw, see that rotor is opposite #1 segment in distributor cap. Car should be road-tested and spark advanced as much as operating conditions and fuel will allow.



Timing (Final Setting)—With engine at normal operating temperature, and running at 8 M.P.H. in high gear on level road, accelerate engine rapidly and note performance from 10-15 M.P.H. A slight spark knock should be noticed. If no knock is heard, loosen hold-down screw and advance distributor one graduation on scale (turn distributor counter-clockwise). If knock is too severe, retard distributor one graduation (clockwise). Repeat test until satisfactory setting is secured. Fnal setting must not be beyond maximum advance mark on flywheel (¾" before mark 'UDC.1-6/).

Motor Gauge—Weidenhoff Adapter #114, Rod #43.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion Type J-7-S. 14 MM. Metric.
Spark Plug Gaps—Set at .022".

CARBURETION:—See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.

Carburetor:—Carter, Model 309-S, 1¼", downdraft type with drop-bar type Fast Idle.
Automatic Choke—Carter Climatic Control integral with carburetor.

Fuel Pump:—AC. Type R-1521540 diaphragm type. **See 'Servicing AC Fuel Pumps' in Carburetion Equipment Section for recommended replacement pumps.**

Gasoline Gauge:—King-Seeley Electric. K-S No. 5200 (dash unit), No. 5582 (tank unit).
See article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0562" before top dead center when a point on the flywheel approximately 3.17 teeth before top dead center mark 'UDC.1-6' lines up with the indicator. Reset tappet clearance at .006" with engine warm and running.
Motor Gauge—Weidenhoff Adapter #114, Rod #43.

Tappet Clearance:—.006" Int., .008" Exh., engine hot and running.

Valve Spring Pressure:—44 lbs. at 2" (valve closed). 102 lbs. at 1 21/32" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill).
Normal Oil Pressure—3 pounds.

BATTERY:—National, Type ST-3-17X. 6 volt, 17 plate, 96 A.H. capacity (20 hour rate).
Starting Capacity—120 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left hand side under front floor.

STARTER:—Model MAB-4060, MAB-4074 after Engine No. 143134. Armature No. MAB-2114.
Starter Drive—Inboard Bendix, Type A-1588.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—44-56 ozs. (new brushes).
Cranking Engine—150 R.P.M., 125 amperes, 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60

15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

Lock torque figures correct without switch.

Starting Switch:—Type SS-4001. Solenoid type switch mounted on starter field frame controlled by pushbutton switch on instrument panel. See Equipment Section.

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting bolts.

GENERATOR:—Model GBK-4602-1. Armature No. GBK-2055. Ventilated, third brush control type with external current regulation (two-step charging rate). See Equipment Section for complete data on Regulator.
Charging Rate Adjustment—Use test meters to check generator output. Short out current regulator by connecting jumper wire from 'F' terminal on generator to ground. Take off commutator cover band, shift third brush by hand, counter-clockwise to increase, or clockwise to decrease charging rate. Remove jumper wire.
Maximum Charging Rate—22 amperes (cold) or 18 amperes (hot), 8.0 volts, 2400 R.P.M., 28 M.P.H.

Performance Data

Cold—Regulator Inoperative—Hot					
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	800	0	6.4	840
4	6.7	980	4	6.8	1025
8	7.0	1110	8	7.15	1200
12	7.3	1300	12	7.5	1450
16	7.55	1500	16	7.85	1760
22	8.0	2200	18	8.0	2400

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—18-22 ozs. (new brushes).
Motoring—4.46-4.94 amperes at 6.0 volts.
Field Current—3.75-4.15 amperes at 6.0 volts.
Field Fuse—5 amperes in knurled cup on side of regulator case.

Removal:—Pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts, one clamp bolt.

Belt Adjustment—Loosen pivot bolts and clamp bolt, pull generator out from engine until slack on belt midway between crankshaft and generator pulleys is 1¼" (measure from straightedge across pulleys), tighten mounting bolts.

REGULATOR:—Model TC-4304-A. Consists of Cutout Relay and Current Regulator (two-rate relay) in a single case on the dash. See Equipment Section for complete article on these units. Cutout relay has extra set of ground contacts for generator charging tell-tale signal light control.

Cutout Relay

Cuts In—6.5-7.25 volts.
Cuts Out—.5-2.5 ampere discharge current.
Relay Contact Gap—.015-.045" (with upper or ground contacts closed—ground contacts must be open with main contacts closed).
Air Gap—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.0-8.50 volts at 70° F.
Contacts Close—1.2-1.4 volts below opening point.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—Soreng-Manegold Switch Model 5770-A. R.B.M. Foot Control Switch Model 1076, A. Foot switch used to control Country Driving (high) and City (low) beams with lighting switch in driving or second position. Headlight bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlights	32-21	2320-C
Parking, Instrument	3	63
Signal Lights	3	64(DC)
Stop & Tail	21-2	1158
Dome	15	87

SIGNAL LIGHTS:—Battery Charge Tell-tale and Oil Pressure Tell-tale lights mounted on instrument panel. See Equipment Section for complete data.

HORNS:—Auto-Lite HA-4003, 4004 (Std), Klaxon Model K-26-M, Type 1716 (high note), 1717 (low note) matched tone, twin horns (optl.).

FUSES:—Lighting—Two 20 ampere on switch.
Generator Field—5 ampere in regulator.

NOTE:—'Electric Hand' Bendix electro-pneumatic type gear shift optional on all models.
See article in Mechanical Equipment Section for complete data.

SERIAL NUMBER:—First number—(61) 61101 (U.S.), 61C101 (Canada); (62) 62101 (U.S.), 62C101 (Canada). Stamped on plate on dash under hood.

COMPRESSION:—Ratio 6.0-1 Std. cast-iron head, 7.0-1 Optl. high compression aluminum head. Check compression pressure by removing all spark plugs and cranking engine with throttle wide open.

Cylinder Head	Compression Pressure
Std. 6.0-1	111 lbs. at 215 R.P.M.
Optl. 7.0-1	127 lbs. at 207 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-20" of HG. with engine idling at 350 R.P.M.

IGNITION:—**Coil Model IG-4633.** Resistor unit mounted on distributor terminal is connected in series with coil primary.
Resistance Unit—Part No. SP-4008.
Coil Draw—2.5 amperes idling, 4.5 stopped.

Ignition Switch:—Mitchellock Model 24-B, Type 6696. Connected to coil by armored cable.
Ignition Lock—Briggs & Stratton No. 50184, Mitchell No. 6095.

Distributor Model IGB-4301B. Single breaker, 6 lobe cam, full automatic advance type.
Breaker Gap—Set at .020". Limits .018-.020".
Cam Angle or Dwell—38° closed, 22° open (distr.).
Breaker Arm Spring Tension—16-20 ounces.
Condenser—Part No. IGB-1025J. Capacity .20-.25 mfds.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	300	0	600
3	400	6	800
5	615	10	1230
10	1150	20	2300
14	1580	28	3160

Distributor Removal:—Mounted on right side of crank case. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—Initial setting for all engines as shown. See Final Setting Section for adjustment in accordance with octane rating of fuel used.

Flywheel Degrees	Piston Position
At TDC.	.000" TDC.

NOTE—High octane type fuel must be used in engines with high compresion 7.0-1 aluminum head.

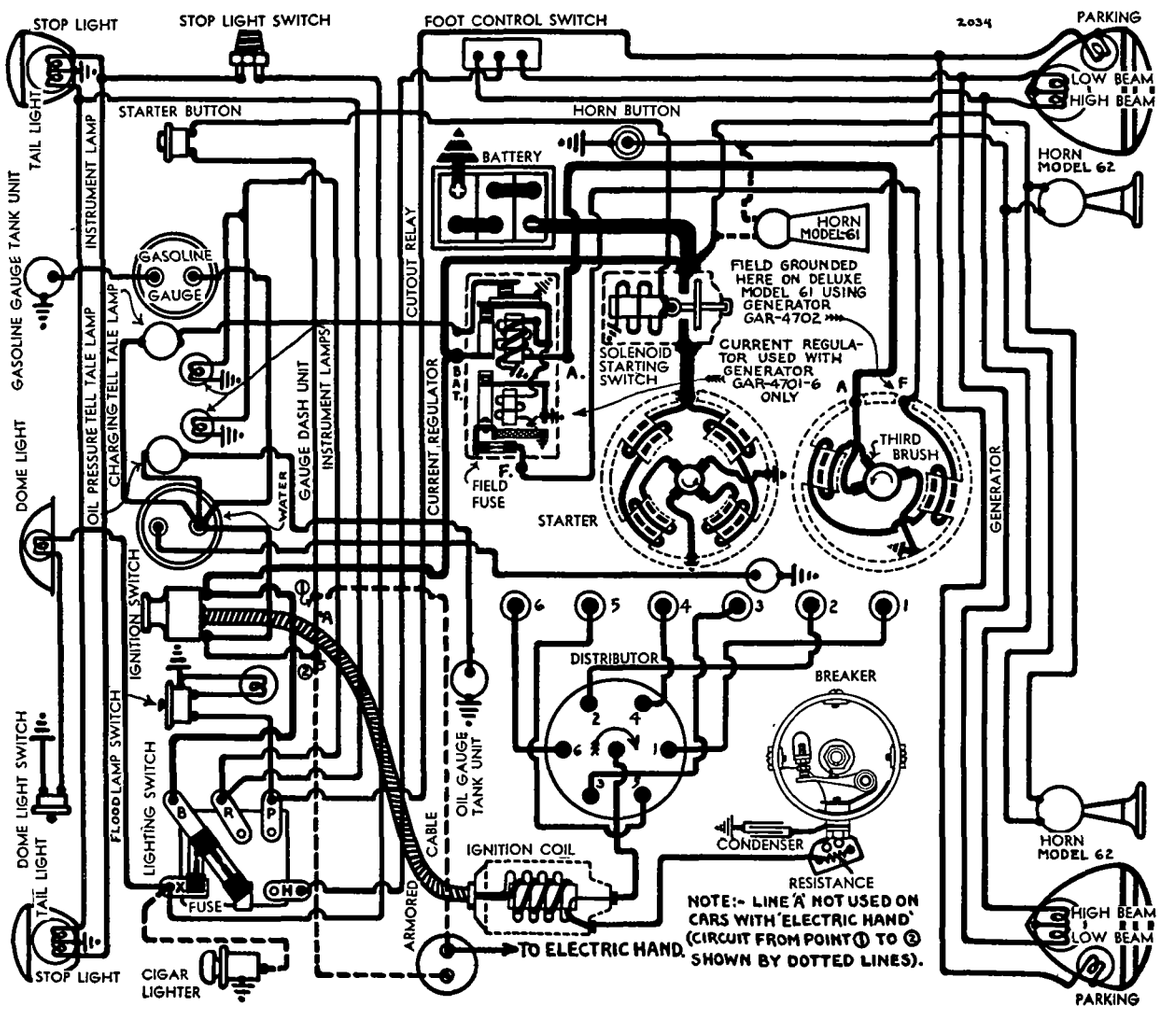
To Set Timing (Initial Setting)—With #1 piston on compression, turn engine over until flywheel mark 'UDC.1-6/' lines up with pointer in inspection hole in left front face of flywheel housing above starter. Loosen hold-down screw in advance arm, rotate distributor clockwise to limit of advance arm slot, then slowly rotate distributor counter-clockwise until contacts begin to open, tighten hold-down screw.

Final Setting—Check ignition setting by road testing car. With engine warm and running in high gear on level road, a slight spark knock should be evident when car is accelerated from 10-15 M.P.H. with wide open throttle. Adjust by loosening hold-down screw in advance arm and rotating distributor one graduation on scale counter-clockwise (if no knock evident) or clockwise (if knock too severe). Repeat test until slight knock is evident. Final setting must not be more than ¾" on flywheel before 'UDC.1-6/' mark.

Timing (Motor Gauge)—Weidenhoff #114 Adapter, #44 Rod.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion Type J-8 (Std. 6.25-1 engines), J-9 (Optl. 7.0-1 engines). 14 MM. Metric type.
Spark Plug Gaps—.025" (Std. engine), .022" (Optl. H. C. engine).



CARBURETION:—**Carburetor**—(61) Carter Mod. 331-S, (62) Carter Model 329-S. 1¼" downdraft types. See Carburetion Section for complete adjustment, overhaul and Jet Specifications.
NOTE—Do not adjust carburetor until engine is warmed up so that choke valve is wide open and engine idling at slow or hot idling speed.

Idle Adjustment—Adjust throttle stopscrew so that speed is 350 R.P.M. or 7 M.P.H. Turn idle adjusting screw in until engine begins to miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Final setting should be ¼-1 (331-S), ½-1 (329-S) turn open from seated position. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Pump lever (under dust cover at top of carburetor) has three holes for pump link engagement. Change for seasonal requirements as follows:
Center Hole—Normal summer temperatures.
Inner Hole (Min. stroke)—Extreme hot weather.
Upper Hole (Max. stroke)—Extreme cold weather.

Throttle Cracking (331-S only):—Opens throttle valve .036-.040" with choke fully closed. No adjustment.

Fast Idle (329-S only):—Integral with carburetor. No adjustment required. See article on Carter Fast Idle in Carburetion Section.

Automatic Choke (329-S only):—Carter Climatic Control. See article in Carburetion Section.

Air Cleaner:—AC. #1526650 Std., #1526651 on cars with Electric Hand. Heavy duty oil-bath type optl.

Fuel Pump:—AC. Type R #1521450. Diaphragm type. See article in Carburetion Section.
See 'Servicing AC Fuel Pumps' in Carburetion Equipment Section for recommended replacement pumps.

Gasoline Gauge:—King-Seeley Electric. K-S No. 6190 (dash unit), No. 5835 (tank unit).
See article in Carburetion Equipment Section.

VALVE TIMING:—Tappet Clearance—.006" Int., .008" Exh., with engine hot.

Valve Spring Pressure—44 lbs. at 2" (valve closed), 102 lbs. at 1 21/32" (valve open).

To Check Valve Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0562" before top dead center when point on flywheel approximately 3.94 teeth before dead center mark 'UDC.1-6/' lines up with pointer in inspection hole in left front face of housing. Reset tappet clearance at .006" with engine hot.

Motor Gauge—Weidenhoff #114 Adapter, #44 Rod.

LUBRICATION:—Crankcase Capacity—5 qts. refill.

Normal Oil Pressure—3 lbs. (no gauge).

Oil Pressure Signal Light—Used instead of pressure gauge. Controlled by oil pressure regulator valve. See complete article in Equipment Section.

BATTERY:—National, Type ST-317X. 6 volt, 17 plate, 96 ampere hour capacity (20 hour rate).

Starting Capacity—120 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.2 minutes.

Grounded Terminal—Positive (+) terminal.

Location—On left hand side under front floor.

STARTER:—Model MAB-4075. Armature MAB-2113.

Drive—Inboard Bendix (barrel), Type A-1673.

Cranking Engine—150 R.P.M., 120-125 amps. at 5 vs.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque		R.P.M.	Volts	Amperes
0	ft. lbs.	3700	5.5	60
.6	"	1910	5.5	100
3.4	"	1100	5.0	200
6.6	"	695	4.5	300
10.15	"	420	4.0	400
15.8	"	Lock	3.	582
22.5	"	Lock	4.	775

NOTE—Lock Torque figures correct without switch.

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out flange mounting bolts.

Starting Switch:—Solenoid Type SS-4001. Controlled by pushbutton switch (R.B.M. Model 1800) on dash. Operative with switch turned on. On cars with Electric Hand clutch must be disengaged to operate switch.

Solenoid Switch

Closes with terminal voltage of 4 volts or less and will remain closed until voltage drops to .75-2.0 volts. Current draw 3 amperes at 6 volts.

GENERATOR:—(61) Model GAR-4702, (62) GAR-4701-6 Armature No. GAR-2077. Ventilated, third brush control type. Current Regulator (two-rate charging control) on GAR-4701-6.

Charging Rate Adjustment—Use test meters to check generator output. On Mod. GAR-4701-6, short out regulator by connecting jumper wire from 'F' terminal on generator to ground. Take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate. Third brush held in position by friction. Remove jumper wire.

NOTE—Model GAR-4702 generator field terminal on generator frame is grounded by a grounding cup assembled on the terminal. If regulator is installed, this ground cup must be removed.

Performance Data—GAR-4701-6

Cold—Regulator Inoperative—Hot					
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	780	0	6.4	820
4	6.7	930	4	6.8	1000
8	6.95	1060	8	7.1	1180
12	7.25	1210	12	7.35	1400
16	7.6	1440	16	7.8	1790
22.8	8.0	2400	18.4	8.0	2700

Model GAR-4702

Cold — No Regulator — Hot					
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	860	0	6.4	830
4	6.8	1000	4	6.85	1040
8	7.2	1200	8	7.3	1300
12	7.6	1460	12	7.75	1550
16	8.0	2150	14.5	8.0	2200

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—18-22 ozs. (new brushes).

Field Current—3.51-4.89 amperes (GAR-4702), 3.51-3.89 amperes (GAR-4701-6) at 6.0 volts.

Motoring Current—4.84-5.36 amperes (GAR-4702), 5.32-5.88 amperes (GAR-4701-6) at 6.0 volts.

Field Fuse—5 ampere in knurled cup on side of regulator case (GAR-4701-6 only).

Removal:—Pivot mounted at left front of engine, with fan belt drive. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Swing generator away from engine until slack in belt midway between fan pulley and generator pulley is 1¼" (measure from straight edge across pulleys).

CUTOUT RELAY:—Model CBA-4003 (GAR-4702). Mounted on dash. Extra set of ground contacts provided for generator charging tell-tale signal light control. See article in Equipment Section for complete data.

Cuts In—6.75-7.5 volts.

Cuts Out—.5-2.5 amperes discharge current.

Contact Gap—.025-.035" (with upper or ground contacts closed—ground contacts must be open with main contacts closed).

Air Gap—.010-.030" with contacts closed.

RELAY-REGULATOR:—Mod. TC-4304A (GAR-4701-6). Mounted on engine side of dash. Consists of Cutout Relay and Current Regulator (two-rate charging control). See Equipment Section for complete data. Cutout Relay has extra set of ground contacts for generator charging tell-tale signal light control.

Cutout Relay

Cuts In—6.5-7.25 volts. All other data same as for Model CBA-4003 (see above).

Current Regulator

Contacts Open—8.0-8.50 volts at 70° F.

Contacts Close—1.2-1.4 volts below opening point.

Contact Gap—.005" minimum.

Air Gap—.045" with contacts closed.

LIGHTING:—Headlamps—Hall, Pre-focused type. Head lamps aimed straight ahead (upper beams with lenses in place). Upper and lower beams controlled by foot selector switch.

Switches

Lighting—R.B.M. Model 1650.

Foot Selector—R.B.M. Model 1082.

Instrument Lights—Soreng-Manegold Mod K2060A.

Stop Light—Motometer Model 58012-C. Hydraulic type mounted in brake line at left frame side rail in channel at rear.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Parking, Instrument	1	55
Signal Lights	1	51
Stop and Tail	21-3	1158
Dome	15	87

SIGNAL LIGHTS:—Battery Charge Tell-tale and Oil Pressure Tell-tale lights mounted on instrument panel. See Equipment Section for complete data.

FUSES:—Lighting—Two 20 ampere capacity on switch.
Generator Field—5 ampere in regulator (on GAR-4701-6 only).

HORNS:—E. A. Vibrator type. Twin horns on Model 62

NOTE:—Electric Hand (Bendix type Electro-pneumatic gear shift optional on all models.
See article in Mechanical Equipment Section for complete data.

SERIAL NUMBER:—First number 70-101 (Commercial Model 70), 71-101 (Deluxe Model 71). Stamped on plate on right front door hinge pillar above top hinge.

COMPRESSION:—Ratio—6.25-1 Std. cast-iron head. 7.0-1 Optl. 'Super Power Dome' aluminum alloy hd. NOTE—High octane fuel must be used with this hd.
Pressure—Check pressure by removing all spark plugs and cranking engine with throttle wide open.

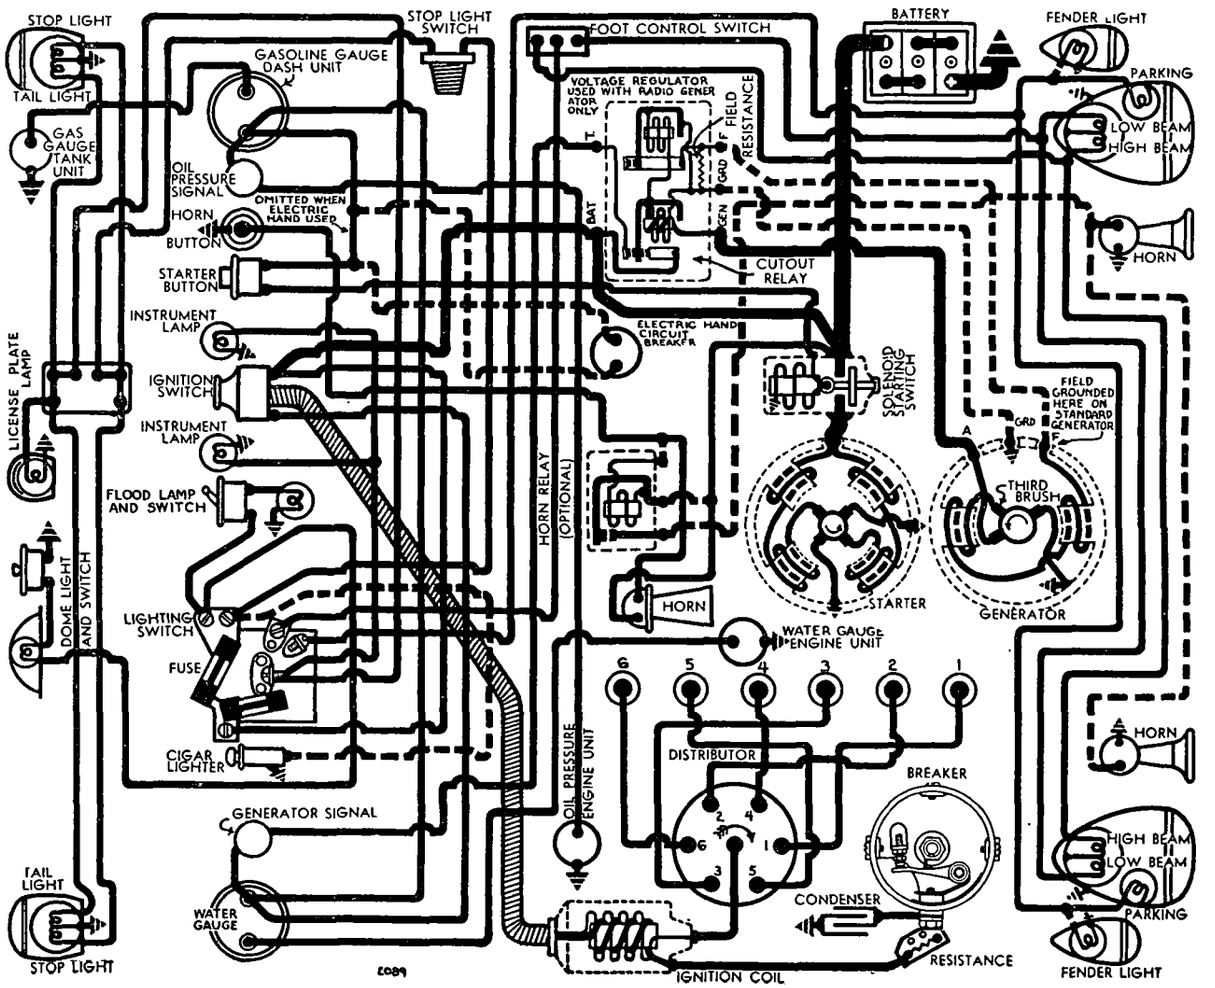
Cylinder Head	Compression Pressure
6.25-1	103 lbs., 170 R.P.M.
7.0-1	119 lbs., 170 R.P.M.

VACUUM READING:—18-20" steady reading with engine idling at 350 R.P.M. or 6 M.P.H.

IGNITION:—Coil Model IG-4644. Service winding (coil less switch and cable) IG-3224S. Resistor unit mounted on distributor terminal connected in primary circuit. NOTE—This resistor not used when Regulator (VRD-4003A, B) used. Resistor should be removed when regulator installed.
Ignition Current—2.5 amperes idling, 4.5 stopped.
Ignition Switch:—Michellock Model 24-B, Type 7063. Connected to coil by armored cable.
Ignition Lock—Briggs & Stratton, Mitchell No. 6095.
Distributor Model IGW-4012-A. Single breaker, 6 lobe cam, full automatic advance type.
Breaker Gap—Set at .020".
Cam Angle or Dwell—35° (closed), 25° (open).
Breaker Arm Spring Tension—16-20 ounces.
Condenser—No. IGB-1025J. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	300	0	600
3	400	6	800
5	520	10	1040
10	1150	20	2300
14	1575	28	3150



Distributor Removal:—Mounted on right side of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—Initial setting for all engines as shown. See Final Setting for adjustment dependent on Octane rating of fuel used.

Flywheel Degrees	Piston Position
At TDC.	.0000" TDC.

NOTE—High Octane fuel must be used in engines with 7.0-1 high compression aluminum head.
To Set Timing (Initial Setting)—With #1 piston on compression, crank engine over until flywheel mark 'UDC.1-6/' lines up with pointer in left front face of flywheel housing. Loosen hold-down screw in advance arm, rotate distributor clockwise to limit of slot, then slowly rotate distributor counter-clockwise until contacts begin to open, tighten hold-down screw.
Final Ignition Setting—Road test car and note performance when accelerating from 10-15 M.P.H. with wide open throttle on level road (engine must be warm), slight spark knock should be evident. Adjust by loosening hold-down screw and rotating distributor one graduation on scale counter-clockwise (if no knock), clockwise (if knock too severe). Repeat test. Final setting must not be advanced more than ¾" before 'UDC.1-6/' mark on flywheel.
Timing (Motor Gauge)—Weidenhoff Adapter #114, Rod #43.
Firing Order:—1-5-3-6-2-4. See diagram.
Spark Plugs:—Champion Type J-8 (Std. 6.25-1 hd.), H-10 (Optl. 7.0-1 hd.). 14 MM. Metric type.
Spark Plug Gaps—.025".

CARBURETION:—Carburetor—Carter Model W1 Type 348-S. Single barrel, downdraft type.
See Article in Carburetion Section for data.
Idle Adjustment—Engine must be warm so that choke valve wide open and throttle cracker inoperative. Set throttle lever stopscrew so that idling speed is 6 M.P.H. Turn idle adjusting screw in until engine begins to miss, then out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Final setting should be ¼-1 turn open from inner seated position. Readjust throttle stopscrew for correct idling speed.
Accelerating Pump Setting—Pump lever (under dust cover at top of carburetor) has three holes for pump link connection. Change for seasonal requirements as follows:
Center Hole—Normal summer temperatures.
Inner (Min. stroke)—Extreme hot weather.
Upper (Max. stroke)—Extreme cold weather.
Throttle Cracker:—Open throttle valve .036-.040" with choke valve fully closed. No adjustment.
Air Cleaner:—AC. #1528159 (Std.), #1528158 (cars with Electric Hand), oil-wetted type. Heavy duty oil-bath type optional.
Fuel Pump:—AC. Type AK #1523289. Diaphragm type std., Type AB #1523290 combination fuel-and-vacuum type optl.
NOTE—**See 'AC Fuel Pump Servicing' in Carburetion Equipment Section for special pump gasket data.**
Gasoline Gauge:—King-Seeley Electric Type. K-S No. 6190 (dash unit), 5835 (tank unit).

VALVE TIMING:—To Check—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0562" before top dead center when a point on the flywheel approximately 3.94 teeth before top dead center mark 'UDC.1-6/' lines up with indicator on left front face on flywheel housing. Reset tappet clearance at .006" hot.

Motor Gauge—Weidenhoff Adapter #114, Rod #43.

Tappet Clearance:—.006" Int., .008" Exh. engine hot.

Valve Spring Pressure:—44 lbs. at 2" (valve closed), 102 lbs. at 1 21/32" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill).

Normal Oil Pressure—3 lbs. (no gauge).

Oil Pressure Signal—Used instead of press. gauge. Controlled by oil pressure regulator valve.

See Article in Mechanical Equipment Section.

BATTERY:—National, Type ST-317X. 6 volt, 17 plate, 96 ampere hour capacity (20 hour rate).

Starting Capacity—120 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.2 minutes.

Grounded Terminal—Positive (+) terminal.

Location—In left front fender. Accessible from engine compartment by taking out 3 slotted screws in cover flange (2 top, 1 rear) and removing cover.

STARTER:—Model MAB-4075. Armature MAB-2113.

Drive—Inboard Barrel type Bendix No. A-1673.

Rotation—Counter-clokwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Cranking Engine—150 RPM., 120-125 amps., 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

NOTE—Lock torque figures correct without switch.

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch:—Type SS-4001. Magnetic solenoid type mounted on starter field frame. Controlled by pushbutton (R.B.M. Model 1815) on instrument panel. Operative only with ignition on (and clutch disengaged on cars with Electric Hand).

GENERATOR:—Mod GCJ-4804A-1. Armature GCJ-2006. Third brush control type. Ventilated by fan on drive pulley. Vibrating voltage regulator used on cars with radio only.

NOTE—On standard cars (without Voltage Regulator) field terminal on generator frame is grounded by ground cup assembled on terminal stud. This ground cap must be removed if regulator installed.

Maximum Charging Rate—16 amperes (cold), 12.4 amperes (hot) without regulator, 25 amperes (cold) 22 amperes (hot) with regulator.

Charging Rate Adjustment—Remove commutator cover band, shift third brush by hand, counter-clockwise to increase or clockwise to decrease charging rate. Third brush held in position by friction. Do not exceed maximum rate as given above. Actual charging rate, on cars with regulator, determined by regulator setting and dependent upon battery condition (see Regulator Section below).

Performance Data

Cold Without Regulator			Hot		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	835	0	6.4	920
4	6.6	1025	4	6.9	1100
8	7.2	1225	8	7.4	1325
12	7.6	1460	12.4	8.0	2400
16	8.0	2250			

Performance Data

Cold Cars with Regulator			Hot		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	760	0	6.4	850
4	6.65	920	4	6.7	1020
8	6.9	1080	8	7.0	1240
12	7.2	1240	12	7.3	1400
16	7.45	1400	16	7.6	1650
20	7.7	1580	20	7.9	2100
25	8.0	2500	22	8.0	2700

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—53 ozs. max. (new brushes).

Field Current—1.9-2.1 amperes at 6.0 volts.

Motoring Current—4.0-4.4 amperes at 6.0 volts.

Removal:—Generator pivot mounted at left front of engine. To remove, take out clamp bolt and pivot bolts.

Belt Adjustment:—Loosen pivot bolts and clamp bolt, swing generator out until total sideplay or deflection midway between generator and fan pulleys is ¾-1¼".

CUTOUT RELAY:—Model CBA-4003 (Std.). Mounted on the dash. Has extra set of ground contacts for Generator Charge Signal control. See Electrical Equipment Section for complete data.

Cuts In—6.75-7.5 volts.

Cuts Out—.5-2.5 ampere discharge current.

Contact Gap—.025-.035" with upper ground contacts closed (upper contacts must open when main contacts close).

Air Gap—.010-.030" with contacts closed.

REGULATOR:—Models VRD-4003A, B, Voltage Type. (Cars with Radio only). Consists of Cutout Relay and Vibrating Voltage Regulator in case on dash. Cutout Relay has extra set of contacts for Generator Charge Signal control.

See Article in Electrical Equipment Section.

NOTE—Regulator cover is sealed. Serviced on exchange basis if seals unbroken. Cover must be removed to make adjustments.

Cutout Relay

Cuts In—6.4-7.0 volts Cold.

Cuts Out—.5 ampere Min., 3.0 amperes Max. Cold.

Contact Gap—.015" minimum (with ground contacts closed—ground contacts must be open with main contacts closed).

Air Gap—.034" Min., .038" Max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting (VRD-4003-A)—7.5-7.8 volts at 70°F. (Before #8R-000001), 7.35-7.65 volts at 70°F (After #8R-000001).

Setting (VRD-4003-B)—7.8-8.1 volts at 70°F (Before #8R-000001), 7.35-7.65 volts at 70°F (After #8R-000001).

See Electrical Equipment Section for complete settings and changes on these Regulator models.

To Check—Connect ammeter in charging line at 'B' terminal on regulator (use short heavy leads), connect voltmeter between regulator 'B' and 'GD' terminals. Operate generator, charging fully charged battery, at speed equivalent to 30 M.P.H. car speed until voltage is steady. Voltmeter reading should be within limits of 7.4-7.9 volts (VRD-4003-A before #8R-000001), 7.8-8.1 volts (VRD-4003-B before #8R-000001), 7.1-7.8 volts (all models after #8R-000001). If outside these limits, regulator is defective.

To Adjust—Change regulator armature spring tension by bending lower spring hanger. See Electrical Equipment Section for complete instructions.

Contact Gap—.010" Min., .020" Max. with armature against stop pin.

Air Gap—.0595-.0625" with contacts just opening.

LIGHTING:—Headlamps. Hall, pre-focused type. Lenses interchangeable. Aim headlamps straight ahead with top of beam 39" above floor level at 25' (car unloaded, upper beam lighted). Upper and lower beams controlled by foot selector switch with lighting switch in driving (right hand) position.

Switches

Lighting—R.B.M.

Foot Selector—R.B.M. No. 1076.

Dome Light—R.B.M. No. 1220.

Stop Light—R.B.M. No. 965.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Headlamps (export)	50-21	2520
Park, Instrument	1½	55
Signals, Service	1	51
Fender (Optl.) License	3	63
Stop-Tail	21-3	1158
Dome	15	87

SIGNAL LIGHTS:—Oil Pressure Indicator and Generator Charge Indicator mounted on instrument board. Similar to design used previously except that bulb lights up word 'Not' on dials. See article in Electrical Equipment Section.

FUSES:—Lighting—Two 20 ampere type on back of lighting switch.

HORNS:—Delco-Remy Klaxon, Model K16 Type 2010. Vibrator type. Current draw 6.5-8.5 amperes at 6.0 volts. **Air Gap**—.025-.029".

NOTE—See Terraplane Model 72 for optional horns.

NOTE:—Electric Hand (Bendix type Electro-pneumatic gear shift optional on all models.
See article in Mechanical Equipment Section for complete data.

SERIAL NUMBER:—First number 72-101. Stamped on plate on right front door hinge pillar above top hinge.

COMPRESSION:—Ratio—6.25-1 Standard cast-iron hd. 7.0-1 Optl. 'Super Power Dome' aluminum alloy head.
NOTE—High octane fuel must be used with this hd.
Pressure—Check presure by removing all spark plugs and cranking engine with throttle wide open.

Cylinder Head	Compression Pressure
6.25-1	103 lbs., 170 R.P.M.
7.0-1	119 lbs., 170 R.P.M.

VACUUM READING:—18-20" steady reading with engine idling at 350 R.P.M. or 6 M.P.H.

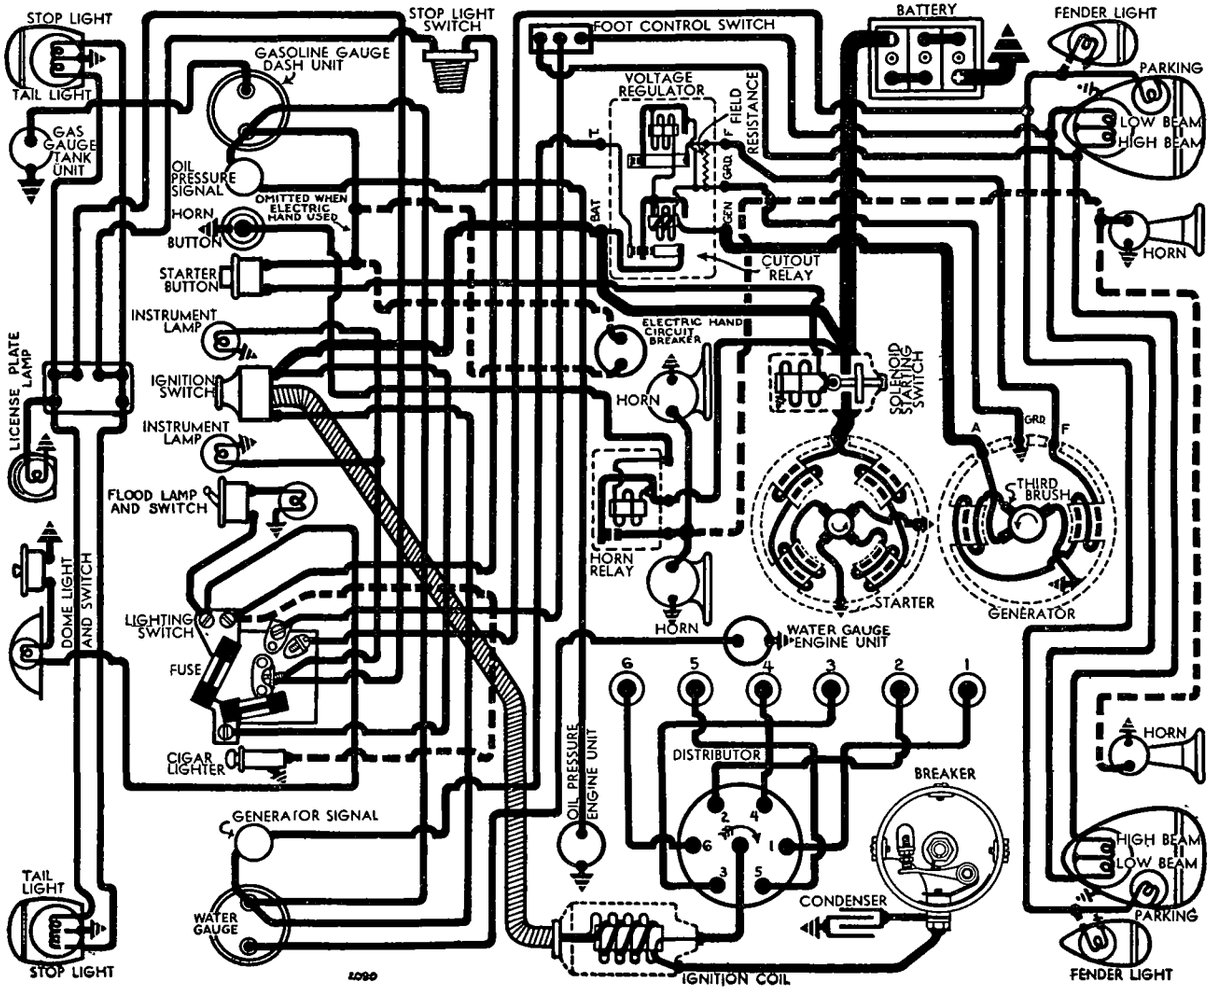
IGNITION:—Coil Model IG-4644. Service winding (coil less switch and cable) IG-3224-S.
Ignition Current—2.5 amperes idling, 4.5 stopped.
Ignition Switch:—Mitchellock Model 24-B, Type 7063. Connected to coil by armored cable.
Ignition Lock—Briggs & Stratton, Mitchell No. 6095. B. & S. #50184. **Key Series**—H601-H1100.
Distributor Model IGW-4013-A. Single breaker, 6 lobe cam, full automatic advance type.
Breaker Gap—Set at .020".
Cam Angle or Dwell—35° (closed), 25° (open).
Breaker Arm Spring Tension—16-20 ounces.
Condenser—No. IGB-1025-J. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	300	0	600
3	400	6	800
5	520	10	1040
10	1150	20	2300
14	1575	28	3150

Distributor Removal:—Mounted on right side of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—Initial setting for all engines as shown. See Final Setting for adjustment dependent on Octane rating of fuel used.



Flywheel Degrees	Piston Position
At TDC	.0000" TDC.

NOTE—High Octane fuel must be used in engines with 7.0-1 high compression aluminum head.
To Set Timing (Initial Setting)—With #1 piston on compression, crank engine over until flywheel mark 'UDC.1-6/' lines up with pointer in left front face of flywheel housing. Loosen hold-down screw in advance arm, rotate distributor clockwise to limit of slot, then slowly rotate distributor counter-clockwise until contacts begin to open, tighten hold-down screw.
Final Ignition Setting—Road test car and note performance when accelerating from 10-15 M.P.H. with wide open throttle on level road (engine must be warm). Slight spark knock should be evident. Adjust by loosening hold-down screw and rotating distributor one graduation on scale counter-clockwise (if no knock), clockwise (if knock too severe). Repeat test. Final setting must not be advanced beyond ¾" before 'UDC.1-6/' mark on flywheel.
Timing (Motor Gauge)—Weidenhoff Adapter #114, Rod #43.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion Type J-8 (Std. 6.25-1 head), H-10 (Optl. 7.0-1 head), 14 MM. Metric type.
Spark Plug Gaps—.025".

CARBURETION:—Carburetor—Carter, Mod. WDO Type 344-S. Duplex or dual downdraft type.
See Article in Carburetion Section.
Idle Adjustment—Engine must be warm so that fast idle and automatic choke control inoperative. Set throttle lever stopscrew so that idling speed is 6 M.P.H. Turn each idle adjusting screw, in succession, in until engine begins to miss, then slowly out until engine fires smoothly. Final setting should be ¼-¾ turn out from inner seated position and screws must be adjusted equally so that engine fires smoothly on all cylinders. Readjust throttle stopscrew if necessary.
Accelerating Pump Setting—Adjustable for minimum and maximum stroke. Requires partial dismantling of carburetor to change setting (see article in Carburetion Section for complete directions).
Fast Idle:—Integral with carburetor. See Carburetion Section for checking and adjusting directions.
Automatic Choke:—Carter Climatic Control mounted on carburetor. See article in Carburetion Equipment Section.
Air Cleaner:—AC. #1528161 (Std.), #1528160 (Cars with Electric Hand), oil-wetted type. Oil-bath type optional.
Fuel Pump:—AC. Type AK #1523289 diaphragm type std., Type AB #1523290 combination fuel-and-vacuum type optional. See article in Carburetion Equip. Section.
NOTE—**See 'AC Fuel Pump Servicing' in Carburetion Equipment Section for special pump gasket data.**
Gasoline Gauge:—King-Seeley Electric type. K-S No. 6190 (dash unit), 5835 (tank unit). See article in Carburetion Equipment Section.

VALVE TIMING:—To Check—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0562" before top dead center when a point on the flywheel approximately 3.94 teeth before top dead center mark 'UDC.1-6/' lines up with indicator on left front face of flywheel housing. Reset tappet clearance at .006" hot.

Motor Gauge—Weidenhoff Adapter #114, Rod #43.

Tappet Clearance:—.006" Int., .008" Exh., hot.

Valve Spring Pressure:—44 lbs. at 2" (valve closed), 102 lbs. at 1 21/32" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill).

Normal Oil Pressure—3 lbs. (no gauge).

Oil Pressure Signal—Used instead of pressure gauge. Controlled by oil pressure regulator valve. See article in Electrical Equipment Section.

BATTERY:—National, Type ST-317X. 6 volt, 17 plate, 96 ampere hour capacity (20 hour rate).

Starting Capacity—120 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.2 minutes.

Grounded Terminal—Positive (+) terminal.

Location—In left front fender. Accessible from engine compartment by taking out 3 slotted screws in cover flange (2 top, 1 rear) and removing cover.

STARTER:—Model MAB-4075. Armature MAB-2113.

Drive—Inboard Barrel Type Bendix No. A-1673.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Cranking Engine—150 R.P.M., 120-125 amps., 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.	582
22.5 "	Lock	4.	775

NOTE—Lock torque figures correct without switch.

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch:—Type SS-4001. Magnetic solenoid type mounted on starter. Controlled by pushbutton on instrument board (RBM Model 1815). Operative only with ignition on (and clutch disengaged on cars with Electric Hand).

Switch Specifications

Closes with terminal voltage of 4.0 volts or less. Remains closed until voltage drops to .75-2.0 volts. Current draw, 3 amperes at 6.0 volts.

GENERATOR:—Mod. GCJ-4803-A. Armature GCJ-2006. Third brush control type with external voltage regulation. Ventilated by fan on drive pulley.

Maximum Charging Rate—25 amperes (cold), 22 amperes (hot), 8.0 volts, 2500 R.P.M. Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Charging Rate Adjustment—Maximum output controlled by third brush. Do not adjust third brush for output greater than shown in table below (with field terminal grounded to render regulator inoperative). Actual charging rate controlled by regulator setting. See Regulator Section below.

Cold Performance Data			Hot Performance Data		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	760	0	6.4	850
4	6.65	920	4	6.7	1020
8	6.9	1080	8	7.0	1240
12	7.2	1240	12	7.3	1400
16	7.45	1400	16	7.6	1650
20	7.7	1580	20	7.9	2100
25	8.0	2500	22	8.0	2700

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—53 ozs. max. (new brushes).

Field Current—1.9-2.1 amperes at 6.0 volts.

Motoring Current—4.0-4.4 amperes at 6 volts.

Removal:—Generator pivot mounted at left front of engine with fan belt drive. To remove, take out clamp bolt and two pivot bolts.

Belt Adjustment:—Loosen clamp bolt and pivot bolts, swing generator out until slack in belt midway between generator and fan pulleys is ¾-1¼" (measured from straightedge across pulleys).

REGULATOR:—Models VRD-4003A, B. Voltage Type. Consists of Cutout Relay and Vibrating Voltage Regulator in case on dash. Cutout Relay has extra set of contacts for generator charge signal control.

See Article in Electrical Equipment Section.

NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken. Cover must be removed to make adjustments.

Cutout Relay

Cuts In—6.4-7.0 volts Cold.

Cuts Out—.5 ampere Min., 3.0 amperes Max. Cold.

Contact Gap—.015" minimum (with ground contacts closed—ground contacts must be open with main contacts closed).

Air Gap—.034" Min., .038" Max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting (VRD-4003-A)—7.5-7.8 volts at 70°F. (Before #8R-000001), 7.35-7.65 volts at 70°F (After #8R-000001).

Setting (VRD-4003-B)—7.8-8.1 volts at 70°F (Before #8R-000001), 7.35-7.65 volts at 70°F (After #8R-000001).

See Electrical Equipment Section for complete settings and changes on these Regulator models.

To Check—Connect ammeter in charging line at 'B' terminal on regulator (use short heavy leads), connect voltmeter between regulator 'B' and 'GD' terminals. Operate generator, charging fully charged battery, at speed equivalent to 30 M.P.H. car speed until voltage is steady. Voltmeter reading should be within limits of 7.4-7.9 volts (VRD-4003-A before #8R-000001), 7.8-8.1 volts (VRD-4003-B before #8R-000001), 7.1-7.8 volts (all models after #8R-000001). If outside these limits, regulator is defective.

To Adjust—Change regulator armature spring tension by bending lower spring hanger. See Electrical Equipment Section for complete instructions.

Contact Gap—.010" Min., .020" Max. with armature against stop pin.

Air Gap—.0595-.0625" with contacts just opening.

LIGHTING:—Headlamps—Hall, Pre-focused type. Lenses interchangeable. Aim headlamps straight ahead with top of beam 39" above floor level at 25' (car unloaded, upper beams lighted). Upper and lower beams controlled by foot selector switch with lighting switch in driving (right hand) position.

Switches

Lighting—R.B.M.

Foot Selector—R.B.M. No. 1076.

Dome Light—R.B.M. No. 1220

Stop Light—R.B.M. No. 965.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Headlamps (export)	50-21	2520
Park, Dash	1½	55
Dash Signal, Service	1	51
Fender (Optional)	3	63
Stop-Tail	21-3	1158
License Plate	3	63
Dome	15	87

SIGNAL LIGHTS:—Battery Charge Indicator and Oil Pressure Indicator mounted on instrument board. Similar to design used previously except that bulb lights up word 'Not' on dials. See article in Electrical Equipment Section for complete data.

FUSES:—Lighting—Two 20 ampere capacity on back of lighting switch.

HORNS:—Delco-Remy Model K-33-S Std., K-33-F Optl. Blended tone, twin horns operated by relay.

Horn	Current (6 volts)	Air Gap
K-33-S, 2051 (low note)	11-13 amps.	.042-.046"
K-33-S, 2052 (high note)	10-12 "	.032-.036"
K-33-F, 2117 (low note)	11-13 "	.040-.044"
K-33-F, 2118 (high note)	9-11 "	.032-.036"

Horn Relay Model 271-A:—Contacts close at 2.7-4.0 volts.

Contact Gap—.015-.030". **Air Gap**—.010-.025".

NOTE:—Electric Hand (Bendix type Electro-pneumatic gear shift) optional equipment.
See article in Mechanical Equipment Section.

SERIAL NUMBER:—First number 80101 (80), 88101 (88), 81101 (81). Stamped on plate on right front door hinge pillar post.

ENGINE NUMBER:—First number 80101 (80), 88101 (88), 81101 (81). On boss on left side of block near top front or on top of block between #1 and #2 exhaust manifold flanges.

COMPRESSION:—Ratio and pressure as follows:

Ratio	Compression Pressure
6.25-1 std. C. I. hd.....	.....103 lbs. @ 170 R.P.M.
7.0-1 Optl. Al hd.	119 lbs @ 170 R.P.M.

NOTE—7.0-1 aluminum head—Super Power Dome.

VACUUM READING:—Gauge should show steady reading of 18-21" with engine idling at 350 R.P.M. or 7 M P.H.

IGNITION:—Coil Model IG-4650. Service winding (coil less switch and cable) IG-3224JS.
Ignition Current—5-6 amperes stopped.
Ignition Switch:—Mitchellock Model 24-B, Type 7642.
Ignition Lock—Briggs & Stratton, Mitchell No. 6095.
Distributor Model IGW-4104A, IGW-4103A (Cars with radio). Single breaker, 6 lobe cam, full automatic advance type.
NOTE—Resistor unit used on IGW-4104A (mounted on distributor terminal connected in primary circuit). When voltage regulator is installed (for cars with radio), resistor should be removed or IGW-4103A type distributor installed.
Breaker Gap—Set at .020".
Cam Angle or Dwell—35° (closed), 25° (open).
Breaker Arm Spring Tension—16-20 ounces.
Rotation—Clockwise viewed from the top
Condenser—Part IGB-1025J. Capacity .20-.25 mfd.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	0	600
3	400	6	800
4	500	8	1000
9	1040	18	2080
14	1580	28	3160

Fuel Compensator—Provides manual adjustment at distributor for octane rating of fuel used. See Fuel Compensator Setting (following).
Distributor Removal:—Mounted on right side of crankcase. To remove, take out hold-down screw in advance arm.

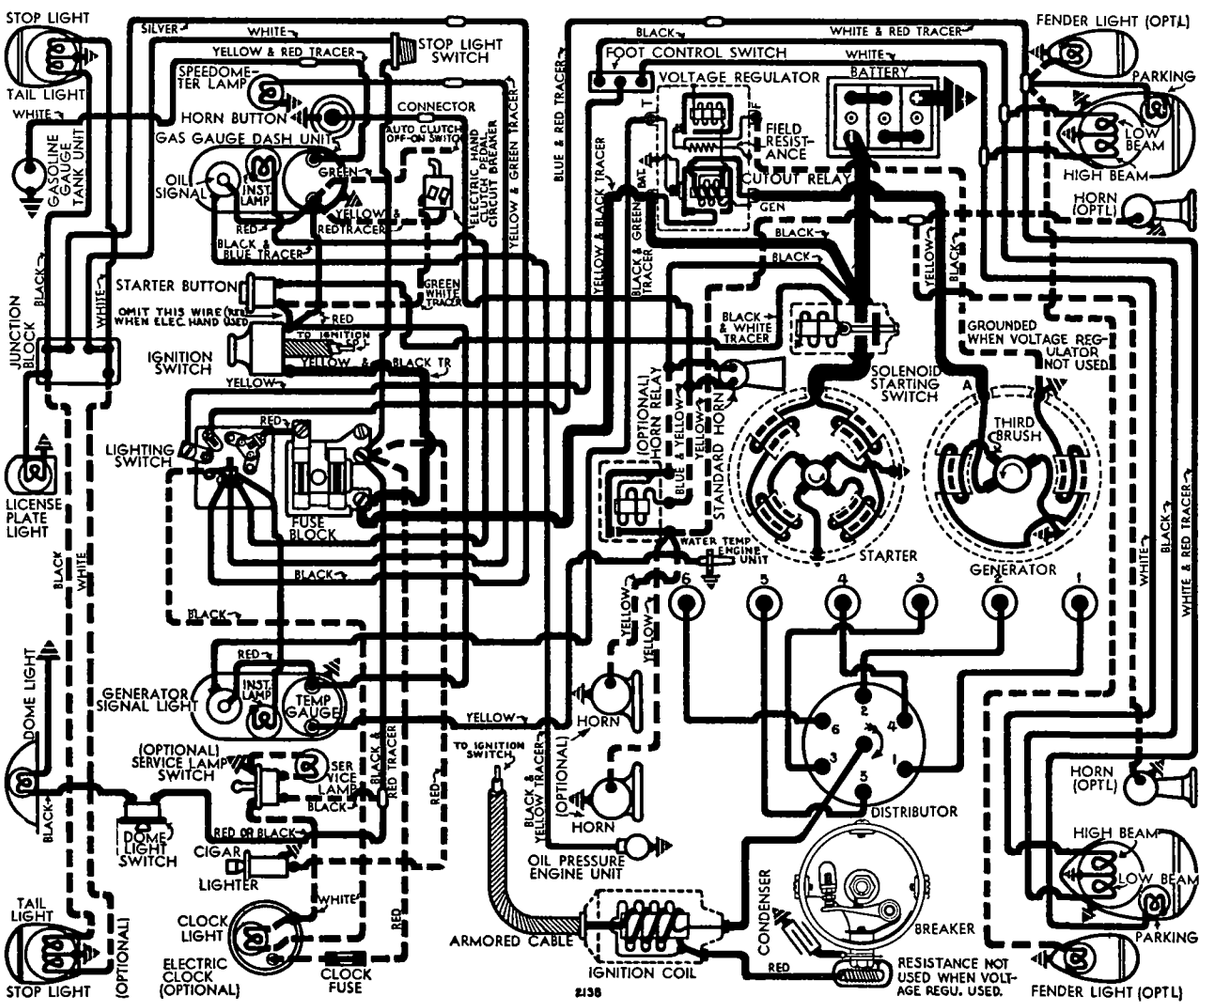
IGNITION TIMING:—Initial Setting as shown. See Fuel Compensator Setting following.

	Flywheel Degrees	Piston Position
All engines	0° TDC.	.000" TDC.

NOTE—High octane fuel must be used in engines with 7.0-1 'Super Power Dome' head.
To Set Timing—With #1 piston on compression, turn engine over until flywheel mark 'UDC.1-6/', lines up with pointer in left front face of flywheel housing. Loosen hold-down screw in advance arm, rotate distributor clockwise to limit of slot, then slowly rotate distributor counter-clockwise until contacts begin to open, tighten hold-down screw.
To Set Timing (Using Synchroscope)—Car manufacturer recommends this method. Clip lead to #6 spark plug, fill in timing mark with white chalk and direct light on flywheel through hole in housing.
See article in Electrical Equipment Section.
Motor Gauge—Weidenhoff Adapter #114, Rod #44.
Fuel Compensator Setting—Road test car and note performance when accelerating from 10-15 M.P.H. with wide open throttle on level road (engine must be warm). Slight spark knock should be evident. Adjust by loosening hold-down screw and rotating distributor one graduation on scale counter-clockwise (if no knock), clockwise (if knock too severe). Repeat test. Final setting must not be advanced beyond ¾" before 'UDC.1-6/' mark on flywheel.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion Type J-8A (std. 6.25-1 head), H-10 (optl. 7.0-1 head). 14 MM. Metric type.
Spark Plug Gap—Set at .032".



CARBURETION:—Carburetor—Carter Model W1, Type 397-S. 1¼" single barrel downdraft, vacumeter type.
See article in Carburetor Section for data.
Idle Adjustment—Engine must be warm so that choke valve is wide open and throttle cracker inoperative. Set throttle lever stopscrew to idle engine at 7 M P.H. Turn idle adjusting screw in until engine begins to miss, then out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Final setting should be ¼-1 turn open from inner seated position. Readjust throttle stopscrew for correct idling speed.
Accelerating Pump Setting—Pump lever (under dust cover at top of carburetor) has three holes for pump link engagement. Set as follows:
Lower Hole (medium stroke)—Normal setting.
Inner Hole (min. stroke)—Hot temp., hi-test fuel.
Outer Hole (max. stroke)—Cold temp., low-test fuel.

Throttle Cracker:—With choke valve closed, throttle opening should be .036-.040".

Air Cleaner—AC. #1528159 (std.), #1528158 (with Electric Hand) oil-wetted type. United (oil-bath type) optional.

Fuel Pump:—AC. Type AK #1523289 (LHD), #1523313 (RHD), diaphragm type, standard. Type AB #1523290 (LHD), #1523314 (RHD), combination fuel-and-vacuum pump optional.
See article in Carburetion Equipment Section.

Gasoline Gauge:—King-Seeley Electric type. K-S No. 6783 (dash unit), No. 5835 (tank unit).
See article in Carburetion Equipment Section.

MANIFOLD HEAT CONTROL:—Manual adjustment type located at center of exhaust manifold behind carburetor. Setting should be changed for seasonal requirements.

Setting—To adjust, loosen nuts on strut bar on face of valve cover, turn cover so that pointer is in line with 'W' mark on manifold (Winter temperatures), straight up (Normal Summer temperatures), toward front in line with 'S' mark (Extremely hot temperatures).

VALVE TIMING:—To Check—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10° 40' or .0562" before top dead center when a point on the flywheel approximately 3.94 teeth before top dead center mark 'UDC.1-6/' lines up with indicator on left front face of flywheel housing. Reset tappet clearance at .006" hot.

Motor Gauge—Weidenhoff Adapter #114. Rod #44.

Tappet Clearance:—.006" Int., .008" Exh., Hot.

Valve Spring Pressure—44 lbs. at 2" (valve closed), 102 lbs. at 1 21/32" (valve open).

LUBRICATION:—Crankcase Capacity—6 quarts (dry), 5 quarts (refill).

Normal Oil Pressure—3 lbs. (no gauge).

Oil Pressure Signal—Used instead of pressure gauge. Controlled by oil pressure regulator valve.

See article in Electrical Equipment Section.

BATTERY:—National, Type HT-17 (Original equipment), L-17-1F (Replacement). 6 volt, 17 plate, 100 ampere hour capacity (20 hour rate).

Starting Capacity—120 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.5 minutes.

Grounded Terminal—Positive (+) terminal. Grounded to left front fender support bracket. Engine grounded to frame by ground strap at bell housing.

Dimensions—Length 10 9/16". Width 7¼". Height 7 15/16".

Location—In left front fender under hood. Accessible from engine compartment by taking out 3 slotted screws in cover flange (2 top, 1 rear) and removing cover.

STARTER:—Model MAB-4075. Armature MAB-2113.

Drive—Inboard Barrel Type Bendix No. A-1673.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Cranking Engine—150 RPM., 120-125 amperes, 5 v.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.	582
22.5 "	Lock	4.	775

NOTE—Lock torque figures correct without switch.

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch:—Type SS-4001. Magnetic solenoid type mounted on starter. Controlled by pushbutton on instrument board (RBM Model 1815). Operative only with ignition on (and clutch disengaged on cars with Electric Hand).

Switch Specifications

Closes with terminal voltage of 4.0 volts or less. Remains closed until voltage drops to .75-2.0 volts. Current draw, 3 amperes at 6.0 volts.

GENERATOR:—Model GDF-4803A-1. Armature GDF-2006. Third brush control type. Ventilated by fan on drive pulley. Vibrating voltage regulator used on cars with radio only.

NOTE—Generator field terminal grounded by ground cup assembled on terminal stud (on cars without regulator). This cup must be removed when regulator installed.

Maximum Charging Rate—16-18 amperes (hot), 17-19 amperes (cold) without regulator. 26.5-29.5 amperes (hot), 29-32 amperes (cold) with regulator. Use test meter connected to battery terminal on regulator.

Charging Rate Adjustment—Remove commutator cover band, shift third brush by hand, counter-clockwise to increase, clockwise to decrease charging rate. Third brush held in position by friction. Do not exceed maximum rate given above. On cars with regulator, actual charging rate determined by regulator setting and dependent upon battery condition (see Regulator).

NOTE—Standard 3rd brush setting 3¾-4 (without regulator), 2⅛ (with regulator) commutator bars from insulated (nearest) main brush.

Performance Data—without Regulator

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	860	0	6.4	1020
4	6.75	1200	4	6.8	1260
8	7.1	1450	8	7.15	1500
12	7.45	1680	12	7.55	1740
16	7.8	2020	16	7.9	2240
18	8.0	2800	17	8.0	2800

Performance Data—with Regulator

0	6.4	920	0	6.4	1000
4	6.6	1030	4	6.6	1140
8	6.8	1140	8	6.85	1280
12	7.0	1300	12	7.1	1440
16	7.25	1460	16	7.3	1640
20	7.45	1650	20	7.55	1840
24	7.65	1880	24	7.75	2220
28	7.9	2220	28.3	8.0	3200
32	8.0	3100			

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—53 ozs. max. (new brushes).

Field Current—1.90-2.10 amperes at 6.0 volts.

Motoring Current—4.6-5.2 amperes (without regulator), 5.3-5.9 (with regulator) at 6 volts.

Removal:—Generator pivot mounted at left front of engine with fan belt drive. To remove, take out clamp and pivot bolts.

Belt Adjustment:—Loosen clamp and pivot bolts, swing generator out until slack in belt midway between generator and fan pulleys is ¾" (measured with straightedge across pulleys).

CUTOUT RELAY (CARS WITHOUT RADIO):—Model CBA-4003. Mounted on engine side of dash. Relay has extra set of contacts for Teleflash Generator Charging Indicator.

See article in Electrical Equipment Section.

Cuts In—6.75-7.5 volts. Approx. 10 M.P.H.

Cuts Out—.5-2.5 ampere discharge current.

Contact Gap—.025-.035" with upper ground contacts closed (upper contacts must open when main contacts close).

Air Gap—.010-.030" with contacts closed.

REGULATOR (CARS WITH RADIO):—Model VRD-4008A. Voltage Type. Consists of Cutout Relay and vibrating Voltage Regulator in case on dash. Cutout Relay has extra set of contacts for Teleflash Generator Charging Indicator.

NOTE—See distributor and generator notes for changes to be made when this unit installed in field.

See article in Electrical Equipment Section.

NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken.

Cutout Relay

Cuts In—6.4-7.0 volts Cold. Approx. 10 M.P.H.

Cuts Out—.5 ampere min., 3.0 amperes max. cold.

Contact Gap—.015" minimum (with ground contacts closed—ground contacts must be open with main contacts closed).

Air Gap—.034" min., .038" max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting—7.35-7.65 volts at 70°F. (after 15 minutes operation charging at 10 amperes).

To Check (without breaking seal)—Connect ammeter in charging line at 'BAT' terminal on regulator, connect voltmeter between 'BAT' terminal and ground. Operate generator at speed equivalent to 30 MPH., charging fully charged battery until voltage is constant. Voltmeter reading should be within 7.1-7.8 volts (high limit cold, low limit hot). If outside these limits regulator is defective.

To Adjust (with cover removed)—Change regulator armature spring tension slightly by bending lower spring hanger. Check setting as directed above. See Electrical Equipment Section for complete directions.

Contact Gap—.010-.020" (armature against stop).

Air Gap—.0595-.0625" with contacts just opening.

LIGHTING:—Headlamps—Hall, pre-focused type with interchangeable lenses. Upper and lower beams (lower beam deflected slightly to right) controlled by foot selector switch with lighting switch in driving (right hand) position.

Headlamp Adjustment—Aim headlamps straight ahead with top of beam 35¼" above floor level at 25' (car unloaded, upper beams lighted). Headlamps aimed by means of two screws on underside of headlamp body. Vertical movement obtained by turning both screws equally in or out, horizontal movement by turning one screw in until half desired movement obtained and completing movement by turning opposite screw out an equal amount.

Switches

Lighting—R.B.M. #1725.

Beam Selector—R.B.M. #1076.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Headlamps (export)	21-50	2520D

Dash Signals	1	51
Dome	15	87

SIGNAL LIGHTS:—Teleflash Generator Charging Indicator and Oil Pressure Indicator mounted on instrument panel.

See article in Electrical Equipment Section.

FUSES:—Lighting—Two 20 ampere capacity mounted on fuse block on lower flange of instrument panel on left side.

HORNS:—Single horn standard. Sparton twin horns with R.B.M. relay (optl.—dash mounted).

Klaxon Model K-33-F—Type 2117 (left—low note), 2118 (right—high note), twin horns, blended tone with Delco-Remy horn relay (optional—outside mounting).

NOTE—Data below for Delco-Remy equipment.

Horn Type	Current at 6 volts	Air Gap
2117 (low note)	11-13	.040-.044"
2118 (high note)	9-11	.032-.036'

Horn Relay:—Model 271-A (with Klaxon horns' Contacts close 2.7-4.0 volts.

Contact Gap—.020". **Air Gap**—.015".

NOTE—R.B.M. #780 relay also used.

NOTE:—Electric Hand (Bendix type Electro-pneumatic gear shift) optional equipment.
See article in Mechanical Equipment Section.

SERIAL NUMBER:—First number 82101. On plate on right front door hinge pillar post.

ENGINE NUMBER:—First number 82101. On boss on left side of block near top front or on top of block between #1 and #2 exhaust manifold flanges.

COMPRESSION:—Ratio and pressures as follows:

Ratio	Compression Pressure
6.25-1 std. CI. hd.	103 lbs. @ 170 R.P.M.
7.0-1 Optl. Al. hd.	119 lbs. @ 170 R.P.M.

NOTE—7.0-1 aluminum head—Super Power Dome.

VACUUM READING:—Gauge should show steady reading of 18-21" with engine idling at 350 R.P.M. or 6 M.P.H.

IGNITION:—**Coil Model IG-4650.** Service winding (coil less switch and cable) IG-3224JS. On dash.
Ignition Current—5-6 amperes (stopped).

Ignition Switch:—Mitchellock Model 24-B, Type 7642. Connected to coil by armored cable.
Ignition Lock—Briggs & Stratton, Mitchell No. 6095.

Distributor Model IGW-4103A. Single breaker, 6 lobe cam, full automatic advance type.
Breaker Gap—Set at .020".
Cam Angle or Dwell—35° (closed), 25° (open).
Breaker Arm Spring Tension—16-20 ounces.
Rotation—Clockwise viewed from the top.
Condenser—Part No. IGB-1025J. Capacity .20-.25 mfds.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
3	400	6	800
4	500	8	1000
9	1040	18	2080
14	1580	28	3160

Fuel Compensator—Provides manual adjustment at distributor for octane rating of fuel used. See Fuel Compensator Setting (following).

Distributor Removal:—Mounted on right side of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—Initial Setting as shown. See Fuel Compensator Setting following.

	Flywheel Degrees	Piston Position
All engines	0° TDC	.000" TDC.

NOTE—High octane fuel must be used in engines with 7.0-1 'Super Power Dome' head.

To Set Timing—With #1 piston on compression, turn engine over until flywheel mark 'UDC.1-6/', lines up with pointer in left front face of flywheel housing. Loosen hold-down screw in advance arm, rotate distributor clockwise to limit of slot, then slowly rotate distributor counter-clockwise until contacts begin to open, tighten hold-down screw.

To Set Timing (Using Synchroscope)—Car manufacturer recommends this method. Clip lead to #6 spark plug, fill in timing mark with white chalk and direct light on flywheel through hole in housing.
See article in Electrical Equipment Section.

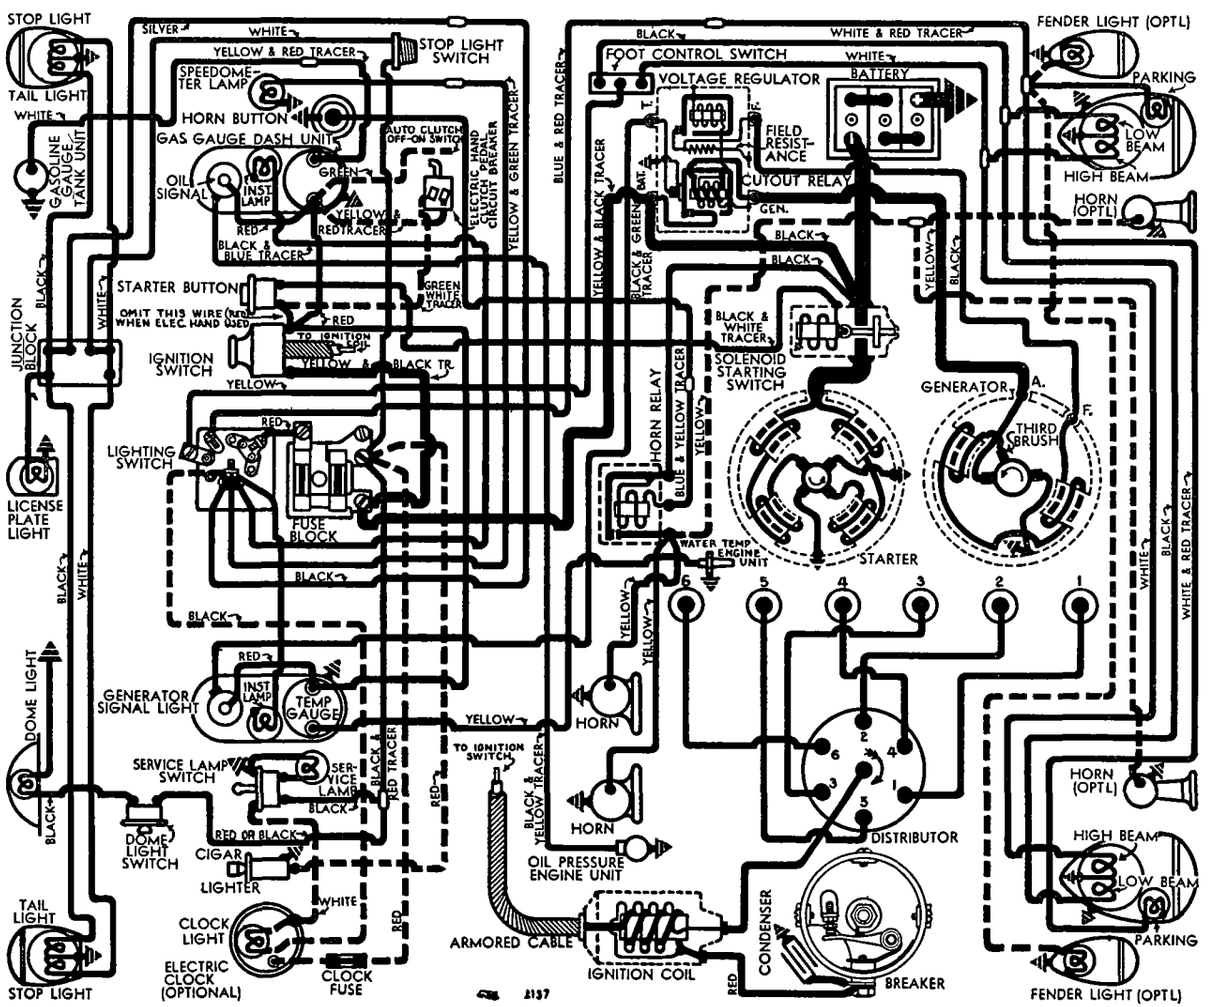
Motor Gauge—Weldenhoff Adapter #114, Rod #44.

Fuel Compensator Setting—Road test car and note performance when accelerating from 10-15 M.P.H. with wide open throttle on level road (engine must be warm). Slight spark knock should be evident. Adjust by loosening hold-down screw and rotating distributor one graduation on scale counter-clockwise (if no knock), clockwise (if knock too severe). Repeat test. Final setting must not be advanced beyond ¾" before 'UDC.1-6/' mark on flywheel.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion Type J-8A (std. 6.25-1 hd.), H-10 (optl. 7.0-1 hd.). 14 MM. Metric type.
Spark Plug Gap—Set to .032".

CARBURETION:—**Carburetor**—Carter Model 402-S. 1" dual downdraft type.
See article in Carburetor Section.



Idle Adjustment—Engine must be warm so that fast idle and automatic choke control inoperative. Set throttle lever stopscrew so that idling speed is 6 M.P.H. Turn each idle adjusting screw, in succession, in until engine begins to miss, then slowly out until engine fires smoothly. Final setting should be ¼-¾ turn out from inner seated position and screws must be adjusted equally so that engine fires smoothly on all cylinders. Readjust throttle stopscrew if necessary.

Accelerating Pump Setting—Adjustable for minimum and maximum stroke as follows:
Short stroke (inner hole)—Hot temperatures.
Long stroke (outer hole)—Cold temperatures.

Fast Idle:—Three step type cam used.
See article in Carburetion Equipment Section.

Air Cleaner:—AC. #1528161 (std.), #1528160 (with Electric Hand) oil-wetted type. United (oil-bath type) optional.

Fuel Pump:—AC. Type AK #1523289 (LHD), #1523313 (RHD), diaphragm type, standard. Type AB #1523290 (LHD), #1523314 (RHD), combination fuel-and-vacuum pump optional.
See article in Carburetion Equipment Section.

Gasoline Gauge:—King-Seeley Electric type. K-S No. 6756 (dash unit), No. 5835 (tank unit).

See article in Carburetion Equipment Section.

MANIFOLD HEAT CONTROL:—Thermostatic coil type (located within exhaust manifold housing behind carburetor). No adjustment required.

VALVE TIMING:—To Check—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0562" before top dead center when a point on the flywheel approximately 3.94 teeth before top dead center mark 'UDC.1-6/' lines up with indicator on left front face of flywheel housing. Reset tappet clearance at .006" hot.

Motor Gauge—Weidenhoff Adapter #114, Rod #44.

Tappet Clearance:—.006" Int., .008" Exh., Hot.

Valve Spring Pressure—44 lbs. at 2" (valve closed), 102 lbs. at 1 21/32" (valve open).

LUBRICATION:—Crankcase Capacity—6 quarts (dry), 5 quarts (refill).

Normal Oil Pressure—3 lbs. (no gauge).

Oil Pressure Signal—Used instead of pressure gauge. Controlled by oil pressure regulator valve.

See article in Electrical Equipment Section.

BATTERY:—National, Type HT-17 (Original equipment), L-17-1F (Replacement). 6 volt, 17 plate, 100 ampere hour capacity (20 hr. rate).

Starting Capacity—120 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.5 minutes.

Grounded Terminal—Positive (+) terminal. Grounded to left front fender support bracket. Engine grounded to frame by ground strap at bell housing.

Dimensions—Length 10 9/16". Width 7¼". Height 7 15/16".

Location—In left front fender under hood. Accessible from engine compartment by taking out 3 slotted screws in cover flange (2 top, 1 rear) and removing cover.

STARTER:—Model MAB-4075. Armature MAB-2113.

Drive—Inboard Barrel Type Bendix No. A-1673.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Cranking Engine—150 RPM., 120-125 amperes, 5 v.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.	582
22.5 "	Lock	4.	775

NOTE—Lock torque figures correct without switch.

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch:—Type SS-4001. Magnetic solenoid type mounted on starter. Controlled by pushbutton on instrument board (RBM Model 1815). Operative only with ignition on (and clutch disengaged on cars with Electric Hand).

Switch Specifications

Closes with terminal voltage of 4.0 volts or less. Remains closed until voltage drops to .75-2.0 volts. Current draw, 3 amperes at 6.0 volts.

GENERATOR:—Model GDF-4802A. Armature No. GDF-2006. Third brush control type with external voltage regulation. Ventilated by fan on drive pulley.

Maximum Charging Rate—32.0 amperes (cold), 29.5 amperes (hot), 8.0 volts, 3100 R.P.M., 30-35 M.P.H. Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Charging Rate Adjustment—Maximum output controlled by third brush. Do not adjust third brush for out put greater than shown in table below (with field terminal grounded to render regulator inoperative). See Regulator Section below.

NOTE—Standard third brush setting 2⅛ commutator bars from nearest main brush.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	920	0	6.4	1000
4	6.6	1030	4	6.6	1140
8	6.8	1140	8	6.85	1280
12	7.0	1300	12	7.1	1440
16	7.25	1460	16	7.3	1640
20	7.45	1650	20	7.55	1840
24	7.65	1880	24	7.75	2220
28	7.9	2220	28.2	8.0	3200
32	8.0	3100			

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—53 ozs. max. (new brushes).

Field Current—1.90-2.10 amperes at 6.0 volts.

Motoring Current—4.6-5.2 amperes at 6.0 volts.

Removal:—Generator pivot mounted at left front of engine with fan belt drive. To remove, take out clamp bolt and two pivot bolts.

Belt Adjustment:—Loosen clamp bolt and pivot bolts, swing generator out until slack in belt midway between generator and fan pulleys is ¾-1¼" (measured with straightedge across pulleys).

REGULATOR:—Model VRD-4008A. Voltage Type. Consists of Cutout Relay and Vibrating Voltage Regulator in case on dash. Cutout Relay has extra set of contacts for generator charge signal control.

See article in Electrical Equipment Section.

NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken. Cover must be removed to make adjustments.

Cutout Relay

Cuts In—6.4-7.0 volts Cold. Approx. 10 M.P.H.

Cuts Out—.5 ampere Min., 3.0 amperes Max. Cold.

Contact Gap—.015" minimum (with ground contacts closed—ground contacts must be open with main contacts closed).

Air Gap—.034" Min., .038" Max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting—7.35-7.65 volts at 70° F. (after 15 minutes operation charging at 10 amperes).

To Check (without breaking seal)—Connect ammeter in charging line at 'BAT' terminal on regulator, connect voltmeter between 'BAT' terminal and ground. Operate generator at speed equivalent to 30 M.P.H., charging fully charged battery until voltage is constant. Voltmeter reading should be within 7.1-7.8 volts (high limit cold, low limit hot). If outside these limits regulator is defective.

To Adjust (with cover removed)—Change regulator armature spring tension slightly by bending lower spring hanger. Check setting as directed above. See Electrical Equipment Section for complete directions.

Contact Gap—.010" Min., .020" Max. with armature against stop pin.

Air Gap—.0595-.0625" with contacts just opening.

LIGHTING:—Headlamps—Hall, pre-focused type with interchangeable lenses. Upper and lower beams (lower beam deflected slightly to right) controlled by foot selector switch with lighting switch in driving (right hand) position.

Headlamp Adjustment—Aim headlamps straight ahead with top of beam 35¼" above floor level at 25' (car unloaded, upper beams lighted). Headlamps aimed by means of two screws on underside of headlamp body. Vertical movement obtained by turning both screws equally in or out, horizontal movement by turning one screw in until half desired movement obtained and completing movement by turning opposite screw out an equal amount.

Switches

Lighting—R.B.M. #1725.

Beam Selector—R.B.M. #1076.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Headlamps (export)	21-50	2520D
Park, Instrument, Service	1½	55
License, Fender	3	63
Stop-Tail	21-3	1158
Dash Signals	1	51
Dome	15	87

SIGNAL LIGHTS:—Teleflash Generator Charging Indicator and Oil Pressure Indicator mounted on Instrument panel.

See article in Electrical Equipment Section.

FUSES:—Lighting—Two 20 ampere capacity mounted on fuse block on lower flange of instrument panel on left side.

HORNS:—Sparton—Twin horns with R.B.M. #780 horn relay (standard dash mounted horns).

Klaxon Model K-33-F—Type 2117 (left—low note) 2118 (right—high note), twin horns, blended tone with Delco-Remy horn relay (optional—outside mounting).

NOTE—Data below for Delco-Remy equipment.

Horn Type	Current at 6 volts	Air Gap
2117 (low note)	11-13	.040-.044"
2118 (high note)	9-11	.032-.036"

Horn Relay:—Model 271-A (with Klaxon horns). Contacts close 2.7-4.0 volts.

Contact Gap—.020". **Air Gap**—.015".

CAR SERIAL NUMBER:—Stamped on plate on left hand frame side rail in front of left front spring rear shackle and on plate under driver's seat cushion. First number 1001 (6-90), 14,201 (6-90A).

ENGINE NUMBER:—Stamped on left hand upper front of engine block.

ENGINE:—Six cylinder, 'L' head type, 3¼x3⅞" bore and stroke, 193 cubic inch displacement, rated at 25.35 H.P., develops 65 H.P. at 3400 R.P.M. Standard compression ratio—5.26-1.

BATTERY:—U.S.L., Type XY-13X-7A, 6 volt, 13 plate, 87.5 ampere hour capacity (5 ampere rate). Starting capacity 102 amperes for 20 minutes.

Grounded Terminal:—Negative (—) terminal grounded to frame.

Mounting:—On left hand frame side rail under front floor boards.

Dimensions:—Width, 7¼". Length, 9". Height, 8⅝".

IGNITION:—Coil Model IG-4305 (Std.), IG-4602 (Clsd. Cars), IG-4502 (Sport Rdstr.), IG-4501 (Std. Rdstr.). IG-4035, 4501, 4502 are coil lock types mounted on back of instrument board (switch in base). IG-4602 mounted on dash and connected to special Mitchellock by armored cable (see Electrical Equipment Section for Mitchellock data).

Ignition Current:—1½ amperes at 6 volts (engine running), 3.4-5 amperes at 6 volts (engine stopped).

Distributor Model IGB-4032. Single breaker arm, 6 lobe cam, semi-automatic advance type. Manual advance controlled by button on dash. Distributor is retarded by pulling out button for hand cranking or heavy pulling. Pushing button in toward dash advances distributor 20° (engine).

Breaker Gap:—Set contact at .018". Hold within limits of .018-.020".

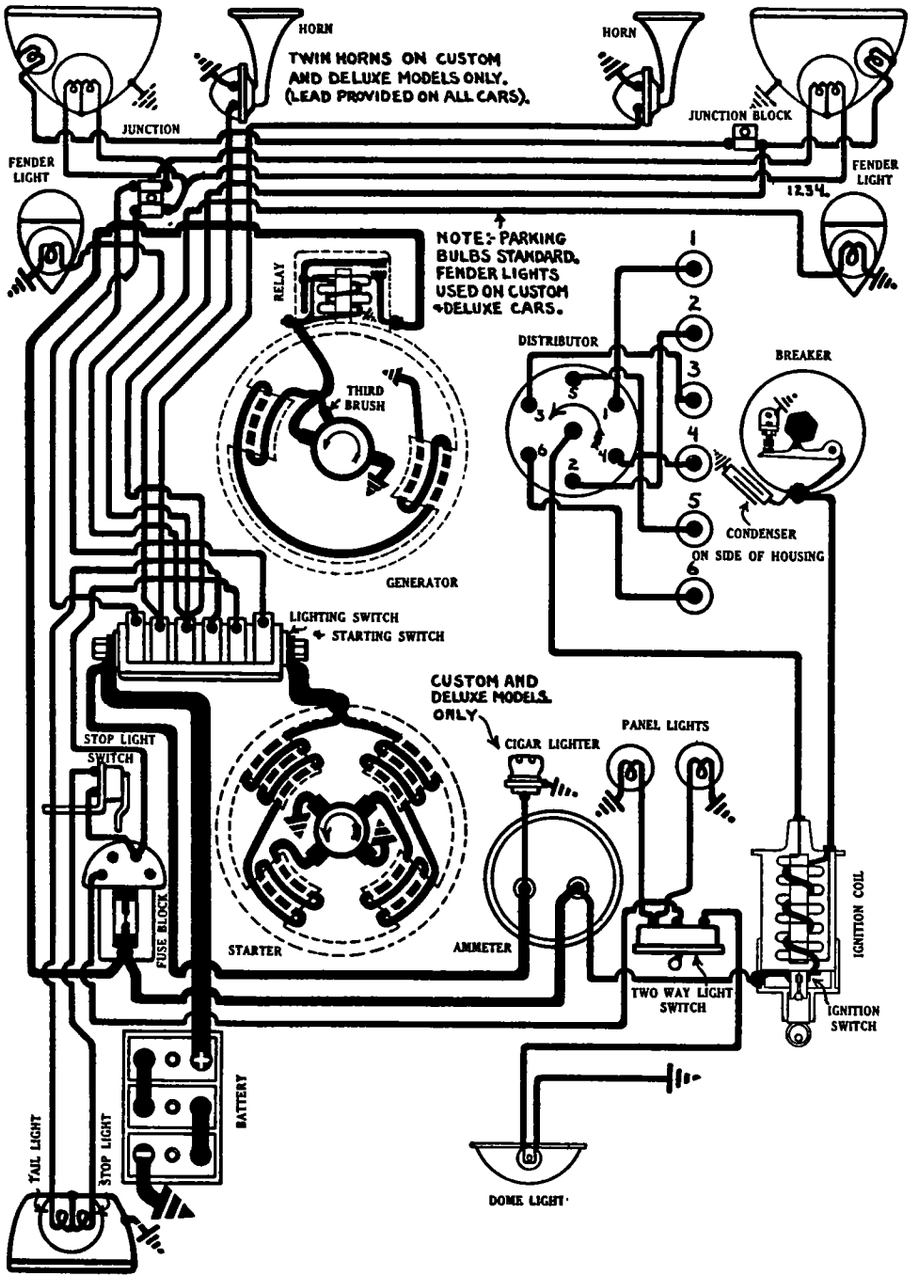
Breaker Arm Spring Tension:—16-22 ounces (measured at tip of breaker arm with spring scale centered on arm and at right angles to breaker arm.

Cam Angles—Closed 34°. Open 26° (distributor degrees).

Automatic Advance

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	0		600
3		640	6		1280
6		1010	12		2040
9		1350	18		2700
11		1600	22		3200

Mounting:—Distributor mounted at left center of engine and driven by an inclined shaft from the camshaft. To remove, disconnect primary lead, disconnect manual spark control, take off distributor cap, take out hold-down screw in advance arm, lift out.



Oiling:—250 Miles. Put 6 drops SAE. #20 engine oil in oiler on side of shaft. Take off distributor cap and rotor, put 6 drops oil in wick oiler in center of shaft.

5000 Miles. Apply thin film vaseline to face of breaker cam.

IGNITION TIMING:—Standard Setting—top dead center with manual control advanced.

To Set Ignition Timing:—Take off cover plate over inspection hole in left hand front face of flywheel housing, advance manual spark control (push button in toward dash), see that distributor is rotated clockwise to end of advance arm slot. With No. 1 piston on compression turn engine over until piston reaches top dead center with flywheel mark '1-6 CYL./IGN.TC' directly opposite indicator on housing, loosen advance arm clam bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite No. 1 terminal in distribuor cap (see diatgram), connect spark plugs as indicated.

Note on Cars with Startix:—The Electrolock ignition switch used on all cars with Startix automatic starting switch has two 'On' positions. The first 'On' position (approximately ⅛ turn from the vertical 'Off' position) turns on ignition and gasoline gauge circuit but does not connect Startix. This switch position should be used in checking ignition to avoid automatic

cranking. The second 'On' position (approximately ¼ turn of switch key) is the normal operating position of the switch with Startix operative.

Firing Order:—1-5-3-6-2-4. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Metric. Champion Type C-7. Set spark plug gaps at .027".

VALVE TIMING:—Camshaft Setting:—Camshaft at right of engine is driven from crankshaft by two-sprocket non-adjustable chain drive. Sprockets are marked. Mesh chain with sprockets turned so that punch marks are adjacent and in line with straightedge across shaft centers. With correct setting, mark on rim of camshaft sprocket should be in line with mark on edge of front engine support with piston No. 1 on top dead center and flywheel mark 'IGN.TC./CYL.1-6' at indicator.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .008", No. 1 exhaust valve at .009" (cold). With No. 6 piston on compression turn engine over until flywheel mark 'IO/' is opposite pointed screw on edge of inspection hole in left front face of flywheel housing. No. 1 intake valve should begin to open at this point. Turn engine over 5° to point where flywheel mark 'EC./' registers with pointer. No. 1 exhaust valve should close at this point. Reset tappet clearance at .004" (intake), .006" (exhaust) with engine hot.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Seat Angle	Lift
Intake	1⅝"	.372"	45°	5/16"
Exhaust	1 15/32"	.371"	45°	5/16"

Tappet Clearance (Operating Timing)		Valve Springs	
Intake	.004" (hot) .008" (cold)	Closed	46 pounds—2¼"
Exhaust	.006" (hot) .009" (cold)	Open	85½ pounds—1 15/16"

Timing

Intake Valve	Exhaust Valves
Open—7° before top dead center.	Open—49° before lower dead center.
Close—39° after lower dead center.	Close—2° before top dead center.

CARBURETION:—Tillotson Updraft Carburetor, Model J1B. See Carburetor Section for complete data. Intake manifold heat control automatic.

Fuel Pump:—A.C. Mechanical Fuel Pump mounted on right side of crankcase (see Carburetion Section for complete data). Remove glass sediment bowl when necessary, empty water and sediment, clean filter screen (located above bowl) before reassembling.

Gasoline Gauge:—K-S Telegauge hydrostatic type gauge (see Carburetion Section).

STARTER:—Model MZ-4030 (Custom and Sport Models), (MZ-4024 Standard Models). Starter drive—inboard Bendix with Startix automatic starting switch on Custom models and Pines 'Finger Tip Control' switch on Standard models. See Equipment Section for complete data on Startix and Pines switches. Rotation counter-clockwise at commutator end. Brush spring tension 44-56 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4902	5.5	47 (with Bendix)
.65 "	2500	5.5	100
2.55 "	1325	5.0	200
4.95 "	750	4.5	300
7.65 "	220	4.0	400
10.1 "	Lock	3.5	470
12.25 "	Lock	4.0	545

Mounting:—Flange mounted on left hand front face of flywheel housing. To remove, disconnect cable, take out 3 flange mounting screws, pull starter forward to clear Bendix, lift out.

Oiling:—500 Miles. Put 6 drops SAE. No. 20 engine oil in oiler at each end.

GENERATOR:—Model GAL-4331. Third brush regulation. Rotation counter-clockwise at commutator end. Maximum charging rate (standard setting) is 17.2 amperes (cold) at 8.0 volts reached at 1900 R.P.M.

Charging Rate Adjustment:—Take off commutator cover band, shift third brush by prying on brush mounting stud counter-clockwise to increase, or clockwise to decrease charging rate. Brush held in position by friction.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.3	600	0	6.4	700
4	6.7	740	4	6.9	900
8	7.1	900	8	7.4	1150
12	7.4	1120	10	7.7	1340
17	8.0	1900	12.4	8.0	2150
12	7.4	3200	9.5	7.7	3200

Brush Spring Tension:—8-13 ounces on each brush.

Field Current:—4.08-4.52 amperes at 6 volts across field terminals.

Motoring:—4.27-4.73 amperes at 6.0 volts.

Mounting:—Pivot mounting on bracket at left front of engine with fan belt drive. To remove, disconnect lead, loosen adjustment clamp bolt, swing generator toward engine and slip off drive belt, take out bolt forming bracket hinge, lift generator out.

Belt Adjustment:—Loosen adjustment clamp bolt and mounting bolt, pull generator away from engine until fan can just be turned with belt held stationary, tighten adjustment bolt and mounting bolt before slacking off on generator.

Oiling:—250 Miles. Put 6 drops SAE. No. 20 engine oil in oiler at each end. **1000 Miles.** Remove grease cup under bearing retainer on commutator end, clean out old grease, fill cup with vaseline, dip wick in oil and replace.

RELAY:—Model CB-4014, 4021 (With Startix terminal). Mounted on generator field frame. Relay contacts close at 675 R.P.M. with generator voltage of 7-7.5 volts and charging current of approximately 2 amperes and open with discharge current of .5-2.5 amperes.

Contact Gap:—.025-.035 inch. **Air Gap:**—.010-.030 inch (contacts closed).

LIGHTING:—Pines Switch, Model A-805 (Standard Models), 6700 (Custom and Sport Models). Lighting switch 'Finger Tip Control' type mounted at lower end of steering column and controlled by knob on steering wheel. Type A-805 on Standard models includes starting switch. Type 6700 on Custom models is used with Startix and does not include starting switch. See Equipment Section for complete data. Lighting system 'depressed beam' dimming with standard double filament headlight bulbs.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Parking Lights	6-8	3	S.C.	63
Instrument Lights	6-8	3	S.C.	63
Stop and Tail Lights	6-8	21-2	D.C.	1158

Custom and Sport models have parking lights mounted on fenders. Standard models have parking bulbs in headlights. Stop and tail light has special double filament bulb and tail light lead must be connected to 2 cp. filament.

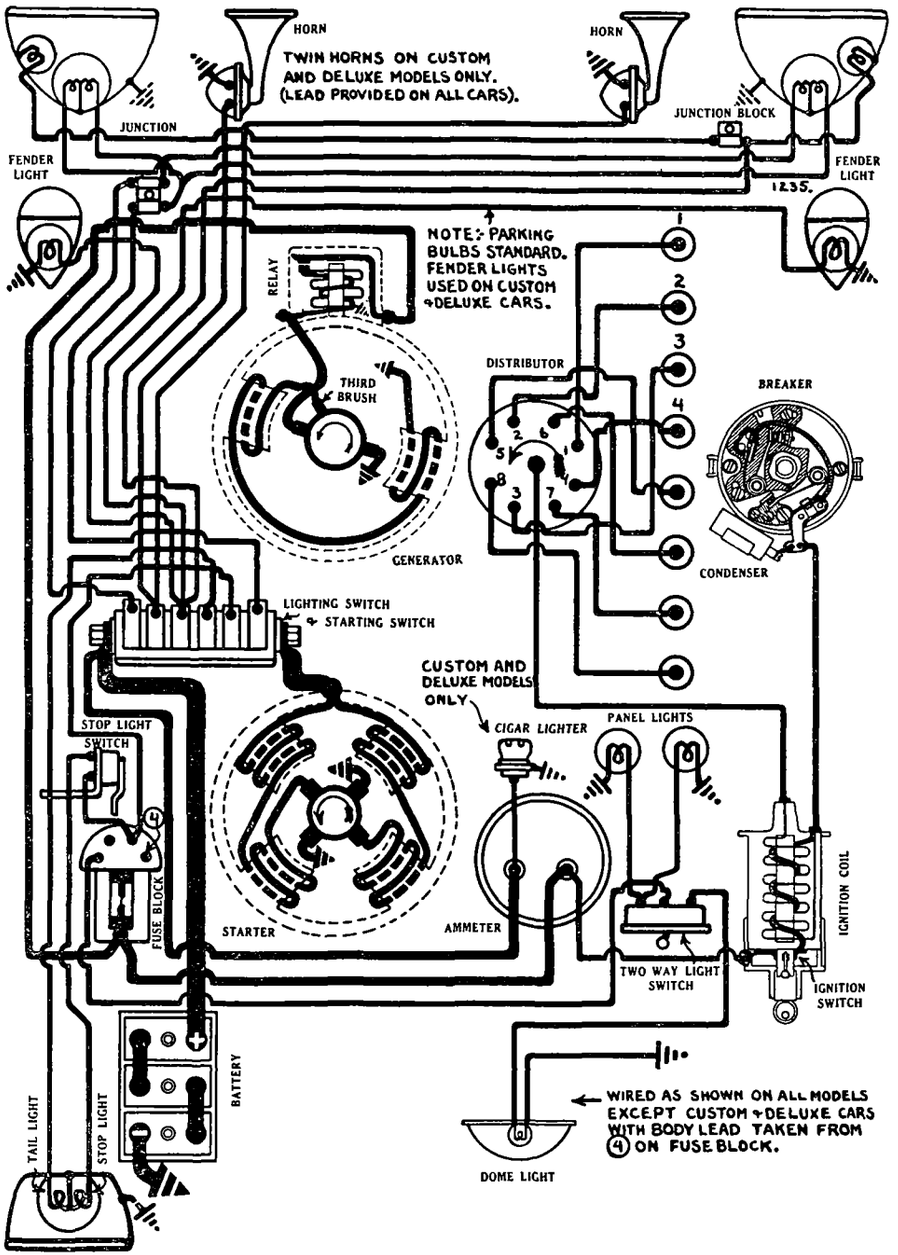
FUSES:—One 20-ampere capacity fuse mounted on left front of dash.

CAR SERIAL NUMBER:—Stamped on plate on right hand frame side rail above right front spring rear shackle and also under driver's seat. First number 1001 (8-88), 2,401 (8-88A).

ENGINE NUMBER:—Stamped on left side cylinder block opposite No. 1 cylinder.

BATTERY:—U.S.L., Type 3-HVX-7X-6A, 6 volt, 15 plate, 142 ampere hour capacity (5 ampere rate). Starting capacity 148.5 amperes for 20 minutes.
Grounded Terminal:—Negative (—) terminal grounded to frame.
Mounting:—Mounted on left hand frame side rail under front floor boards.
Dimensions:—Width, 7 7/16". Length, 11¾". Height, 9¾".

IGNITION:—Coil Model IG-4305, 4501 (8-88), IG-4602 (8-88A). IG-4305 and IG-4501 are coil lock types mounted on back of instrument board with switch in base of coil. IG-4602 mounted on dash and connected to special Mitchellock by armored cable. See Electrical Equipment Section for Mitchellock data.
Ignition Current:—1-3 amperes at 6 volts (engine running), 3-4.5 amperes at 6 volts with engine stopped.
Ignition Switch—Type 16-S Mitchellock integral with coil. Switch has two 'On' positions. First on position (⅛ turn from 'Off' or vertical) does not connect Startix and should be used for timing. Second 'On' position (approximately ¼ turn to right) is regular running position with Startix operative.



Distributor Model IGH-4013. Two-breaker arm, 4-lobe cam, semi-automatic advance type. Distributor is retarded by pulling out spark control button for hand cranking and operation at low speeds or heavy pulling. Pushing in button advances distributor 20° (engine). Breaker contacts open alternately at 45° intervals corresponding to 90° firing interval of engine. Contacts must be synchronized (see Ignition Timing).
Breaker Gap:—Set contact gap at .018". Hold within limits of .018-.020".
Breaker Arm Spring Tension:—16-22 ounces (measured at tip of breaker arm with spring scale centered and at right angles to arm).
Cam Angles—Closed 32°. Open 13° (distributor) when synchronized.

Automatic Advance					
Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		200	0		400
3		600	6		1200
6		1015	12		2030
9		1430	18		2860
11		1700	22		3400

Mounting:—Mounted at left center of crankcase and driven by inclined shaft from crankshaft. To remove, disconnect primary lead, disconnect manual spark control, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.

Oiling:—250 Miles. Put 6 drops SAE. No. 20 engine oil in oiler on side of shaft. Take off distributor cap and rotor, oil wick oiler in center of shaft. Put one drop oil on breaker arm pivot pins.
5000 Miles. Apply thin film vaseline to face of breaker cam.

IGNITION TIMING:—Standard Setting—6° (flywheel) or .0136" (piston travel) before top dead center with manual spark control advanced.
To Set Ignition Timing. Take off cover plate on inspection hole in right front face of flywheel housing, advance manual spark control (push button in toward dash) with No. 1 piston on compression, turn engine over by hand until flywheel mark 'IGN./' (which is 6° before top dead center mark '1&8.TC./I.O.') registers with pointed end of inspection cover plate screw. Loosen advance arm clamp bolt, rotate distributor until first set of breaker contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt. If ignition is turned on to check opening of contacts on Custom models equipped with Startix, use first 'On' position of switch (key turned approximately ⅛ turn to right) to avoid automatic cranking. See that rotor is directly opposite No. 1 terminal in distributor cap (see diagram) and connect spark plugs as indicated. Then synchronize contacts.
Synchronization of Contacts. No flywheel marks provided to synchronize

contacts on engine. It will be necessary to use a rotary spark gap or special Auto-Lite synchronizing tool. See Equipment Section for complete data on synchronization. If timing gause is used, shift gauge to No. 6 cylinder and repeat timing. Do not loosen clamp bolt but loosen lock screws on movable sub-plate (carrying second set of contacts), shift plate until contacts begin to open, tighten lock screws.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Metric. Champion Type #8. Set gaps at .027 inch.

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine and driven from crankshaft by two-sprocket non-adjustable chain drive. Sprockets are marked. Mesh chain so that marks are adjacent and in line with straight-edge across shaft centers. With correct setting, mark on rim of camshaft sprocket should be in line with mark on edge of front engine support with piston No. 1 on top dead center and flywheel mark '1&8.T.C./I.O.' registering with pointer in inspection hole.

To Check Valve Timing. Set tappet clearance No. 1 intake and exhaust valves at .010" cold. With No. 8 piston on compression turn engine over until piston reaches top dead center with flywheel mark '1&8.T.C./I.O' at indicator. No. 1 intake valve should open at this point. Turn engine over 4° until flywheel mark 'E.C/' registers with pointer. No. 1 exhaust valve should close. Reset tappet clearance at .006" (intake), .008" (exhaust) with engine warm.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Seat Angle	Lift
Intake	1 17/32"	.372"	45°	21/64"
Exhaust	1 15/32"	.371"	45°	21/64"

Tappet Clearance	Operating	Timing	Valve Springs

Exhaust	.008" (hot)	.010" (cold)	

Intake Valves	Timing	Exhaust Valves
Open—At top dead center	Open—34° before lower dead center.	
Close—38° after lower dead center.	Close—4° after top dead center.	

CARBURETION:—Tillotson Updraft Carburetor, Model W5D. See Carburetor Section for complete data. Intake manifold heat control automatic.

Fuel Pump:—A.C. Mechanical Fuel Pump mounted on right side of crankcase (see Carburetion Section). Remove glass sediment bowl when necessary empty water and sediment, clean filter screen (located directly above bowl) before reassembling.

Gasoline Gauge:—K-S Telegauge hydrostatic type (see Carburetion Section).

STARTER:—**Model MAB-4035, 4048.** Drive—Inboard Bendix with Startix automatic starting switch on Custom models and Pines 'Finger Tip Control' switch on Standard models. See Equipment Section for complete data on Startix and Pines 'Finger Tip Control' switches. Rotation counter-clockwise at commutator end. Brush spring tension 44-56 ounces.

Starter Data

Parking Lights	6-8	3	S.C.	63
Instrument Lights	6-8	3	S.C.	63
Stop and Tail Lights	6-8	21-2	D.C.	1158

Custom and Sport models have parking lights mounted on fenders. Standard models have parking bulbs in headlights. Stop and tail light has special double filament bulb and tail light lead must be connected to 2 cp. filament.

FUSES:—One 20-ampere capacity fuse mounted on left front of dash.

SERIAL NUMBER:—First number 1001 ('33), 13820 ('34), 27001 ('35), 42000 ('36). On left hand frame member near rear shackle of left front spring and on body sill at left front door opening.

COMPRESSION:—

Ratio	Pressure
1933-34-35 ... 5.13-1	83 lbs. at 120 R.P.M.
1936 ... 5.7-1	87 lbs. at 216 R.P.M.

NOTE—Cylinder heads are cast-iron.

VACUUM READING:—Gauge should show steady reading of 18½" with engine idling at 7 M.P.H.

IGNITION:—**Coil Model IG-4406 ('33-35), IG-4090 ('36).** Mounted on right side of engine. Service coil IG-4044 ('33-35), IG-4070 ('36).

Ignition Current—Idling—3 1 amperes ('33-35), 2.5 amperes ('36), at 6.0 volts. Stopped—4.98 amperes ('33-35), 4 amperes ('36).

Ignition Switch:—Mitchellock 17-A, Type 5159. Coil connection not armored.

Ignition Lock—Independent Lock Co. No. 4044-H, Mitchell No. 4759.

Distributor Model IGB-4078 ('33-35), IGS-4007 ('36). Single breaker, 4 lobe cam, full automatic advance type. Auxiliary vacuum spark control used on IGS model.

Breaker Gap—Set at .018". Limits, .018-.020"

Breaker Arm Spring Tension—16-20 ounces.

Cam Angles—(IGB)—46° (closed), 44° (open).
(IGS)—47° (closed), 43° (open).

Condenser—Part No. IGB-1025 (IGB), IG-2671 (IGS).
Capacity .20-.25 microfarads.

Automatic Advance—IGB-4078

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
2	510	4	1020
4	750	8	1500
6	970	12	1940
8	1190	16	2380
10	1415	20	2830
12½	1700	25	3400

Automatic Advance—IGS-4007

Start	300	0	600
4.4	420	8.8	840
7	770	14	1540
10	1165	20	2330
14	1700	28	3400

Vacuum Spark Control (IGS-4007)—Integral with distributor. Mounted on distributor housing and linked directly to breaker plate. Provides additional advance for all speeds above idling except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance—IGS-4007

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	3½"
2°	4°	5¾"
5°	10°	9¼"
8°	16°	12¾"
10°	20°	15"

IGNITION TIMING:—

Flywheel Degs.	Piston Position
'33-35 engines ... 4° BTDC.	.0066" BTDC.
'36 engines ... 5° ATDC.	.0103" ATDC.

Timing—Take off cover plate over inspection hole (top surface left hand side flywheel housing). Turn engine over with #1 piston on compression, stop when flywheel mark IGN lines up with pointed end of inspection plate screw, loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug connections (see diagram).

Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Firing Order:—1-3-4-2 (see diagram).

Spark Plugs:—Champion, Type C-7. 18 MM. Metric type.

Spark Plug Gaps—.025".

CARBURETION:—**Carburetor.** Tillotson Model D-1A ('33-34), D-1D ('35), D-1E ('36). 1⅛" downdraft type with manual choke control.

See article in Carburetion Section for complete data.

Adjust as follows:

NOTE—High Speed Adjustment applies to Model D-1E (1936) only.

High Speed Adjustment—With engine warm set throttle for 25-30 M.P.H. speed. Turn idle adjusting screw in until it is closed. Then turn High Speed Adjusting Screw (screw with cross bar) in until engine misses, turn screw out until engine begins to roll, finally turn screw in (approximately ¾ turn) until engine fires smoothly. Then set Idle Adjustment as outlined below.

Idle Speed Adjustment—Open idle screw 1-1¼ turns and close throttle. Set throttle stopscrew for idling speed of 7 M.P.H., turn idle adjusting screw out or left until engine misses, then turn screw in until engine fires smoothly. Reset throttle stop screw if necessary for correct idling speed.

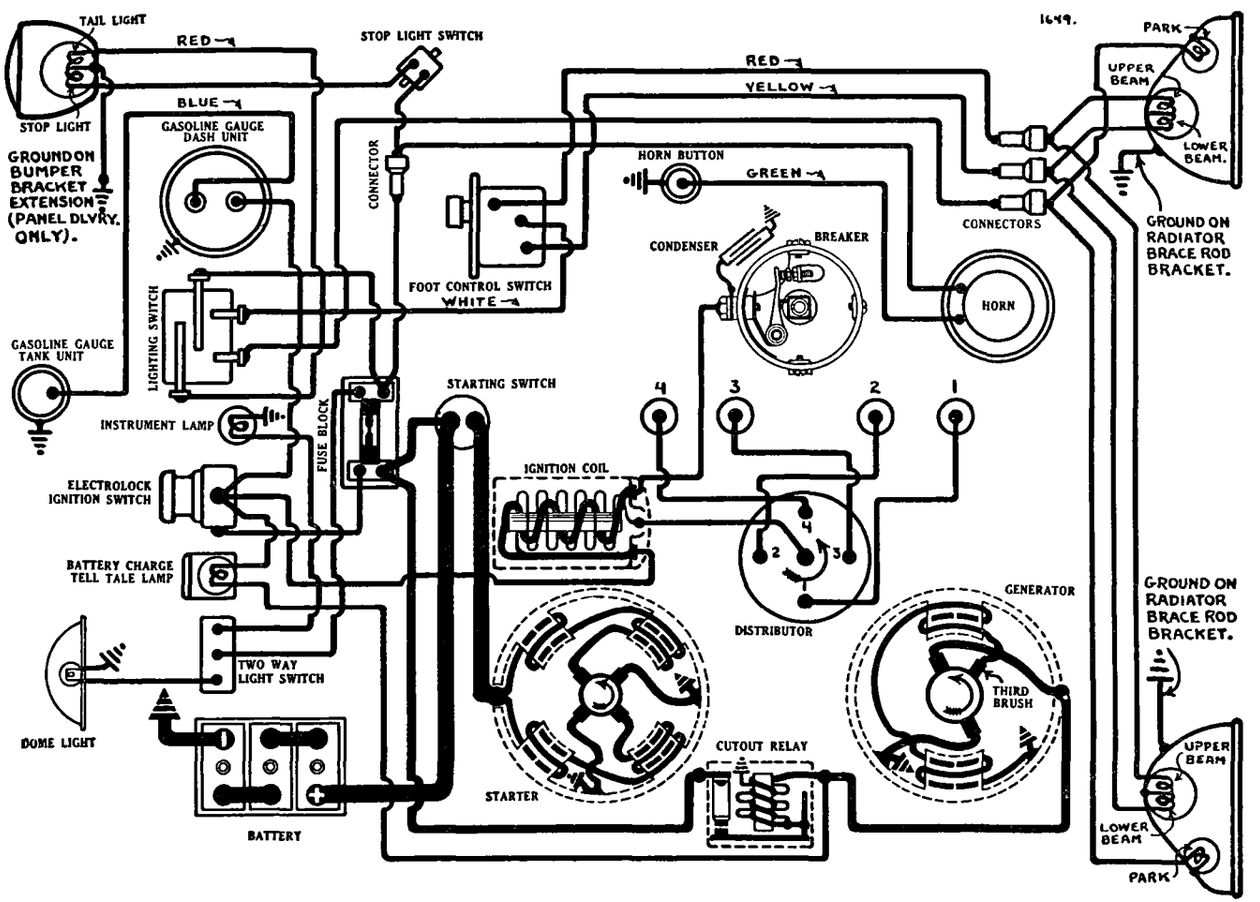
Air Cleaner:—AC #1525088 ('33-34), Monroe ('35-36) oil-wetted types.

Fuel Pump:—A.C. Type P-1521390.

NOTE—P-1521010 used on early 1933 models.

See article in Carburetion Equipment Section.

Gasoline Gauge:—National, Electric type.



See article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake and exhaust valves at .010". Intake valve opens with piston on top dead center when flywheel mark 'T.C.I.O.1-4' lines up with pointed end of inspection hole cover screw (top of flywheel housing on left hand side). Exhaust valve closes with piston 5° or .0103" down on intake stroke when flywheel mark 'E.C.' lines up with indicator. Reset tappet clearance at .004" Int., .006" Exh., with engine hot.

Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Tappet Clearance:—.004" Int., .006" Exh., with engine hot.

Valve Spring Pressure:—46½ lbs. at 2¼" (valve closed). 85½ lbs. at 1 15/16" (valve open).

LUBRICATION:—Crankcase Capacity—4 quarts.
Normal Oil Pressure—30 lbs. at 30 MPH. (warm oil).

BATTERY ('33-34):—U.S.L., Type CW-11. 6 volt, 11 plate, 84AH. capacity (5 amp. rate).
Starting Capacity—96 amperes for 20 minutes.
Grounded Terminal—Negative (—) terminal.
Location—On 'X' member under right front seat.

BATTERY ('35-36):—U.S.L., A-13-A. 6 volt, 13 plate, 78 A.H. capacity (20 hour rate).
Starting Capacity—90 amperes for 20 minutes.
Grounded Terminal & Location—As above.

STARTER:—Model MZ-4033. Armature No. MZ-2089.
Starter Drive—Special outboard Bendix RC10HD.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—120 R.P.M., 200 amperes, 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.5	70
.65 " "	2500	5.5	100
2.55 " "	1325	5.0	200
4.95 " "	750	4.5	300
7.65 " "	220	4.0	400
7.8 " "	Lock	3.0	420
11.8 " "	Lock	4.0	560

Starting Switch:—Model SW-4001. Foot plunger type mounted on toeboard.
Mounting:—Flange mounted on right hand front face of flywheel housing. To remove, take out two flange cap screws and one cap screw in bracket on commutator end.

GENERATOR:—Model GAM-4504. Armature No. GAM-2055. Third brush control type.
Charging Rate Adjustment—Take off commutator cover band, shift third brush by hand by prying on brush mounting stud, counter-clockwise to increase, or clockwise to decrease charging rate. Third brush is held in position by friction.
Maximum Charging Rate—17 amperes (cold), 8.0 volts, 1950 R.P.M.

Performance Data

Cold			Hot		
Amps.	Volts	R.P.M.	Amps	Volts	R.P.M.
0	6.4	700	0	6.4	720
4	6.8	880	4	6.9	920
8	7.2	1075	8	7.35	1160
12	7.6	1280	12	7.8	1460
16.5	8.0	1950	13.8	8.0	2000

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—18-22 ozs. (new brushes).
Field Current—3.89-4.31 amperes at 6.0 volts.
Motoring Current—4.08-5.32 amperes at 6.0 volts.

Mounting:—Pivot mounted at right front of engine. Fan belt drive. To remove, take out two pivot bolts, one clamp bolt.

Belt Adjustment—Loosen two pivot bolts and adjustment clamp bolt, pull generator away from engine until fan can just be turned with belt held stationary, tighten clamp bolt and pivot bolts.

GENERATOR CHARGE INDICATOR (1935 ONLY):—Consists of signal light on instrument board connected between generator side of Cutout Relay and ignition coil terminal of Ignition Switch. Lamp should light when ignition is turned on and will go out when generator begins to charge battery (cutout relay contacts close). If lamp does not light with ignition on and engine not running, replace bulb. Signal light bulb is standard 6-8 volt, 3 cp. S.C., Mazda 63.

RELAY:—Model CB-4008. Mounted on top of right hand frame side rail near generator.
See article in Electrical Equipment Section.
Cuts in—7.0-7.5 volts, 700-800 R.P.M. of generator.
Cuts out—.5-2.5 amperes discharge.
Relay Contact Gap—.025-.035".
Air Gap—.010-.030" (contacts closed).

LIGHTING:—Headlamps—Corcoran-Brown. Fixed focus type. Headlamps aimed straight ahead (upper beam with lenses in place). Upper and lower beams controlled by foot selector switch.

Switches

Lighting—Culver-Stearns.
Foot Selector—Clum Model 9579.

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlights	21-21	1110
Stop and Tail Light	21-2	1158
All others	3	63

FUSES:—20 ampere capacity lighting fuse mounted on engine side of dash ('33-35), back side of dash under cowl ('36).

HORNS:—Schwartze vibrator type disc horn.

SERIAL NUMBER:—First number 37-1001. Stamped on plate located on right side of cowl under the engine hood and on plate above crank opening on front frame cross-member.

ENGINE NUMBER:—Stamped on right front upper corner of block. First number—37-1001 (37).

COMPRESSION:—Ratio—5.7-1 Std. cast-iron head. No optl. ratios. **Pressure**—87 lbs. at 216 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18½" with engine idling at 7 M.P.H.

IGNITION:—Coil Model IG-4090. Mounted on right side of engine block. Service coil IG-4070.

Ignition Current—2.5 amps. idling, 4 stopped (cold).

Ignition Switch:—Douglas. Coil connection nct armored.

Distributor Model IGS-4007, A. Single breaker, 4 lobe cam, full automatic advance type with auxiliary vacuum spark control.
See Electrical Equipment Section for special Distributor Servicing data.
Breaker Gap—Set at .020".
Cam Angle or Dwell—47.0° (closed), 43.0° (open).
Breaker Arm Spring Tension—16-20 ounces.
Rotation—Counter-clockwise viewed from top.
Condenser—Part No. IG-2671G. Capacity .20-.25 mfds.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	0.	600
4.4	420	8.8	840
7	770	14.	1540
10	1165	20.	2330
14	1700	28	3400

Vacuum Spark Control—Integral with distributor. Mounted on distributor housing and linked directly to breaker plate. Provides additional advance for all speeds above idling except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	3½"
2°	4°	5¾"
5°	10°	9¼"
8°	16°	12¾"
10°	20°	15"

Distributor Removal:—Mounted on right side of engine. To remove, disconnect vacuum line, take out hold-down screw in plate.

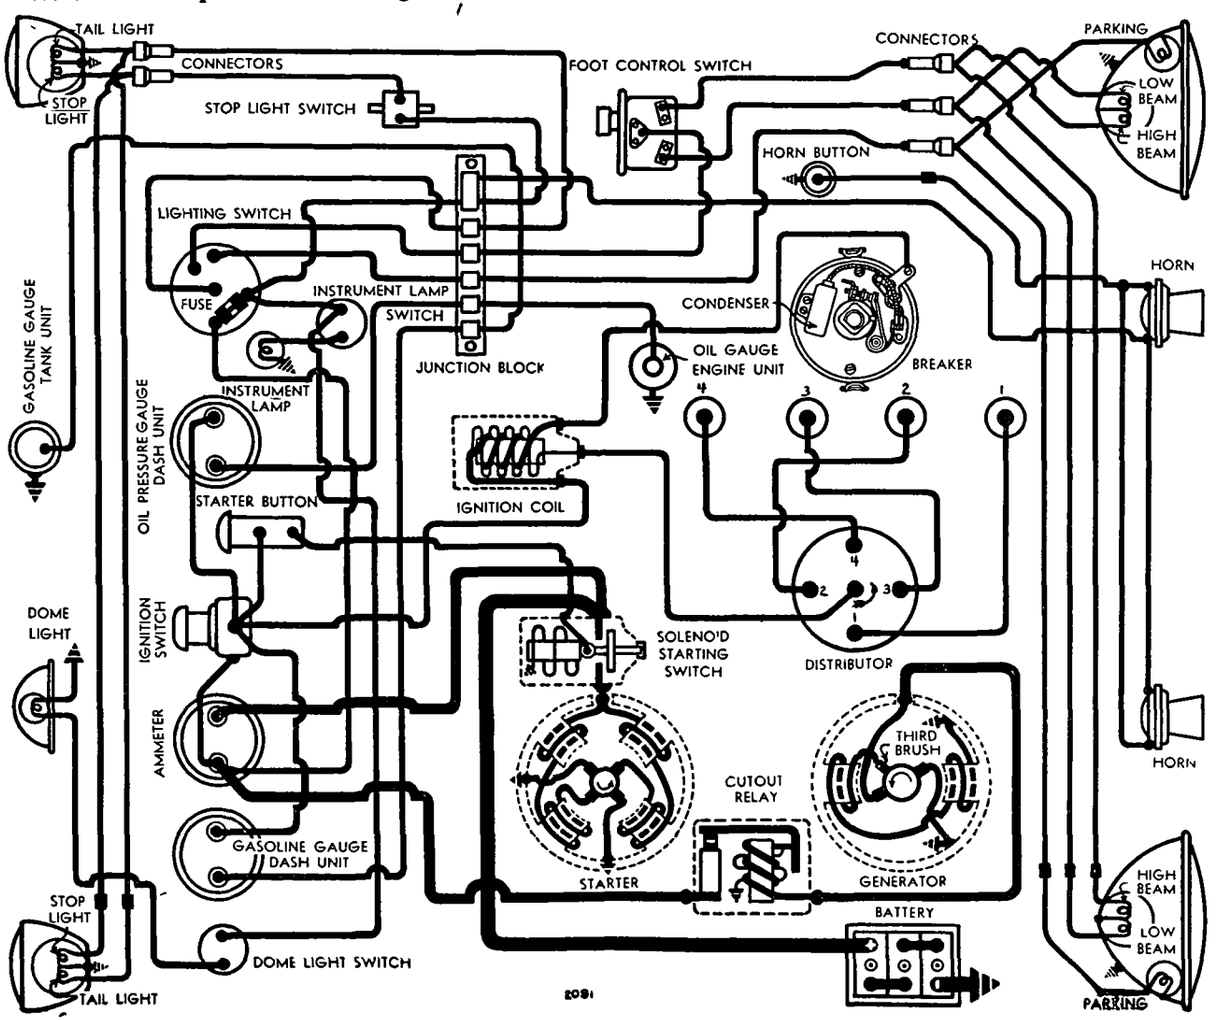
IGNITION TIMING:—Flywheel Degrees Piston Position
All engines .....5° ATDC..... .0103" ATDC

To Check Timing—Take off inspection hole cover plate (top surface left hand side of flywheel housing). Turn engine over with #1 piston on compression, stop with piston 5° or .0103" after top dead center when flywheel mark 'IGN' lines up with pointed end of inspection plate screw, loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug connections (see diagram).
NOTE—This check must be made with all back lash eliminated in distributor drive and vacuum spark control should be in a fully released position.
Motor Gauge—Weidenhoff Adapter #104, Rod #2.
Firing Order:—1-3-4-2. See diagram.

Spark Plugs:—Champion Type C-7. 18 MM. Metric.
Spark Plug Gap—Set at .025". Limits .024-.025".

CARBURETION:—Carburetor—Tillotson Model U-1A 1⅛" downdraft type with manual choke control.
See Article in Carburetion Section.

Adjust as follows:



High Speed Adjustment—Set idle adjusting screw ¾ turn open from inner seated position. With engine warm set throttle for 25 M.P.H. Turn High Speed Adjusting Screw (screw with cross bar) in until engine misses, then turn screw out until engine begins to roll, finally screw in (approximately ⅜ turn) until engine fires smoothly. Then set Idle Adjustment as outlined below.

Idle Speed Adjustment—Close throttle, set throttle stopscrew to idle slightly faster than normal, turn idle adjusting screw out or left, until engine misses, then turn screw in until engine fires smoothly. Reset throttle stopscrew to idle engine at 7 M.P.H.

Air Cleaner:—AC. #1528326 oil-wetted type standard. #1528608 heavy duty (oil-bath type) optl.
Fuel Pump:—AC. Type AF #1523306. Diaphragm type.
See Article in Carburetion Equipment Section.

Gasoline Gauge:—King-Seeley Electric. Part No. 6270 (dash unit), 6280 (tank unit). See separate article in Carburetion Equipment Section for complete data.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open when piston reaches top dead center and flywheel mark 'T.C.I.O.1-4' lines up with pointed end of inspection hole cover plate screw (top of flywheel housing left hand side). Reset tappet clearance at .004" with engine hot.
Motor Gauge—Weidenhoff Adapter #104, Rod #2.
Tappet Clearance:—.004" Int., .006" Exh., hot.
Valve Spring Pressure:—46½ lbs. at 2¼" (valve closed), 85½ lbs. at 1 15/16" valve open).

LUBRICATION:—Crankcase Capacity—4 qts. (refill).
Normal Oil Pressure—30 lbs. at 30 M.P.H.

BATTERY:—U.S.L., Type A-13A. 6 volt, 13 plate, 78 ampere hour capacity (20 hour rate).

Starting Capacity—96 amperes for 20 minutes.

Zero Capacity—300 amperes for 1.9 minutes.

Grounded Terminal—Negative (—) terminal. Grounded to right end of frame front cross-member.
Dimensions—Length 8⅞". Width 7". Height 8⅝".

Location—In recess in right front fender skirt under hood.

STARTER:—Model MZ-4049. Armature No. MZ-2089.
Drive—Special outboard Bendix No. RC10HD.
Cranking Engine—120 R.P.M., 200 amps., at 5 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.5	70
.65 "	2500	5.5	100
2.55 "	1325	5.0	200
4.95 "	750	4.5	300
7.65 "	220	4.0	400
7.8 "	Lock	3.	420
11.8 "	Lock	4.	560

Removal:—Flange mounted on right hand front face of flywheel housing. To remove, take out two flange capscrews and one capscrew in bracket on commutator end.

Starting Switch:—Solenoid Type SS-4001. Controlled by push-button switch on instrument panel.
See Article in Electrical Equipment Section.

Switch Specifications

Closes with terminal voltage of 4 volts or less and will remain closed until voltage drops to .75-2.0 volts. Current draw 3 amperes at 6 volts.

GENERATOR:—Model GAM-4504. Armature No. GAM-2055. Third brush control type.

Charging Rate Adjustment—Take off commutator cover band, shift third brush by hand by prying on brush mounting stud, counter-clockwise to increase, or clockwise to decrease charging rate. Third brush is held in position by friction.

Maximum Charging Rate—17 amperes (cold), 12.5 amperes (hot), 8.0 volts, at 22 MPH. Use test ammeter connected in charging line at Cutout Relay to check generator output.

Performance Data

Cold Amperes	Cold Volts	Cold R.P.M.	Hot Ampere	Hot Volts	Hot R.P.M.
0	6.4	720	0	6.4	720
4	6.8	880	4	6.9	900
8	7.2	1050	8	7.4	1160
12	7.6	1280	12	7.95	1700
16.4	8.0	1950	12.5	8.0	2000

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—18-22 ozs. (new brushes).
Field Current—3.89-4.31 amperes at 6.0 volts.
Motoring Current—4.08-4.52 amperes at 6.0 volts.

Removal:—Pivot mounted at right front of engine. To remove, take out two pivot bolts, one clamp bolt.

Belt Adjustment:—Loosen two pivot bolts and adjustment clamp bolt, swing generator away from engine until fan can just be turned with belt held stationary, tighten clamp bolt and pivot bolts.

CUTOUT RELAY:—Model CB-4025. Mounted on top of right hand frame side rail near generator.
Cuts In—6.75-7.5 volts, 995 RPM, 12 MPH.
Cuts Out—.5-2.5 amperes discharge current.
Contact Gap—.025-.035".
Air Gap—.010-.030" with contacts closed.

LIGHTING:—Headlamps—Corcoran Brown. Fixed focus type. Headlamps aimed straight ahead (upper beam with lenses in place). Upper and lower beams controlled by foot selector switch.

Switches

Lighting—Douglas Model 5400-B.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2320
Stop-Tail	21-3	1158
All others	3	63

FUSES:—Lighting—Mounted on lighting switch. 20 ampere capacity.

HORNS:—Schwarze vibrator type disc horn.

SERIAL NUMBER:—First number 65,001 (1938), 91,751 (1939—see Note following). Stamped on front center of front frame cross-member and on right side of cowl under engine hood.
NOTE—Cars manufactured after beginning of fiscal year (Sept. 1, 1938), Serial No. 89001 and up, are 1939 cars.

ENGINE NUMBER:—First number 91751 (1939). Stamped on boss on right front upper corner of block.

COMPRESSION:—Ratio—5.7-1. **Pressure**—87 lbs. at cranking speed of 216 R.P.M.

VACUUM READING:—Steady 18½" idling at 7 M.P.H.

IGNITION:—Coil Model IG-4090, 4090A (48 Truck). On right hand side of engine. Service Coil #IG-4070.
Ignition Current—2.5 amperes idling, 4 stopped.
Ignition Switch:—Douglas. Coil connection is not armored.
Distributor Model IGS-4007A, IGW-4129A (some 48 cars). Single breaker, 4 lobe cam, full automatic advance type with auxiliary vacuum spark control. NOTE—Vacuum unit integral type (IGS-4007A), separate VC-4007 or VC-4010 (IGW-4129A).
Breaker Plate Identification (IGS-4007A)—Maximum vacuum advance limited by slot and marked by number #10 stamped on plate.
Breaker Gap—.020".
Cam Angle (IGS-4007A)—47° closed 43° open.
Cam Angle (IGW-4129A)—41° closed, 49° open.
Breaker Arm Spring Tension—16-20 ozs.
Rotation—Counter-clockwise viewed from top.
Condenser—No. IG-2671G (IGS-4007A), No. IGB-1025 (IGW-4129A). Capacity .20-.25 microfarads.

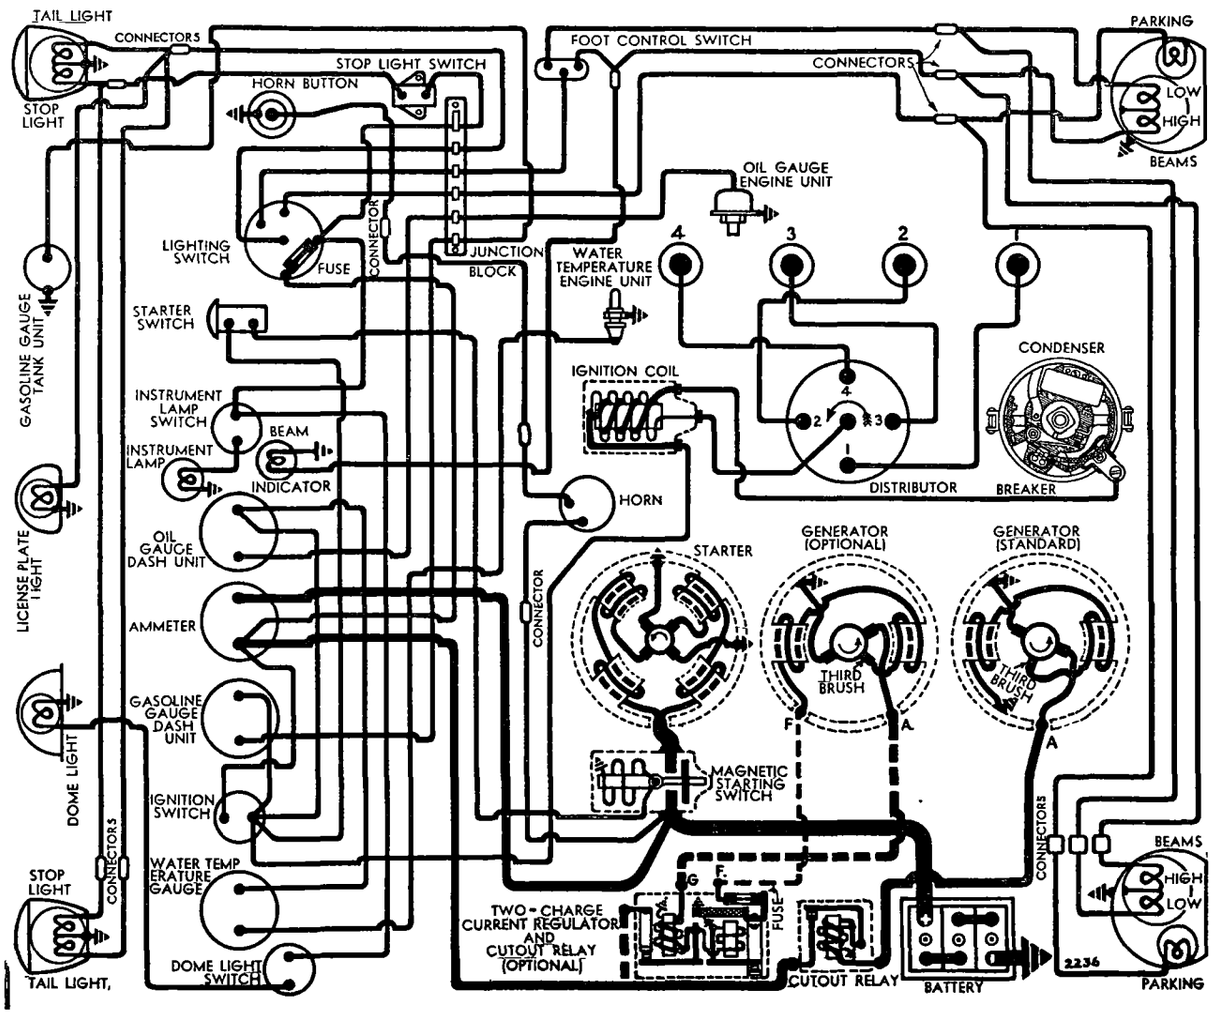
Automatic Advance—IGS-4007A

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
4.4	420	8.8	840
7	770	14	1540
10	1165	20	2330
14	1700	28	3400

Automatic Advance—IGW-4129A

Start	300	0	600
4	400	8	800
7	790	14	1580
11	1310	22	2620
14	1700	28	3400

Vacuum Spark Control (IGS-4007A)—Mounted on distributor cup and linked to breaker plate. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring within unit.



Vacuum Advance—IGS-4007A

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	3½"
2°	4°	5¾"
5°	10°	9¼"
8°	16°	12¾"
10°	20°	15"

Vacuum Spark Control (IGW-4129A). Type VC-4007 or VC-4010. Mounted on bracket under distributor cup and linked to advance arm. Operates in same manner as IGS-4007A type.
Distributor Removal:—Mounted on right side of engine. To remove, disconnect vacuum line and take out hold-down screw in advance arm. To remove IGW-4129A without disturbing vacuum unit, loosen advance arm clamp bolt.

IGNITION TIMING: Flywheel Degrees Piston Position
All Engines .....5° ATDC.....0103" ATDC.
To Set Timing—Remove inspection hole cover plate in left top face of flywheel housing. With #1 piston on compression, turn engine over until piston reaches firing position when flywheel mark 'IGN' lines up with pointed end of inspection plate screw. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor opposite #1 segment in distributor cap, check spark plug connections (see diagram).
Motor Gauge—Weidenhoff Adapter #104. Rod #2.
Firing Order:—1-3-4-2. See diagram.
Spark Plugs:—Champion Type C7. 18 MM. Metric.
Spark Plug Gaps—.025".

CARBURETION:—Carburetor—Tillotson Model U-1A. 1⅛" single barrel, downdraft type.
See article in Carburetor Section for data.
Preliminary Adjustment (If carburetor out of adjustment so that engine cannot be warmed up)—Turn main adjustment (high speed) needle valve clockwise or in until it is seated, then back off exactly 3 turns. Turn idle adjustment screw in or clockwise until seated, then back off ¾ turn. Start engine and run until warm. Then adjust as follows:
High Speed Adjustment—Set throttle so that engine runs at 25 MPH., turn main adjustment needle valve in or clockwise slowly until engine begins to slow down, then turn needle valve out until maximum speed is secured, finally turn needle valve in ⅜ turn. This final setting should be approximately 2⅜ turns open from inner seated position. Then set idle adjustment.
Idle Adjustment—Close throttle, set throttle stopscrew to idle engine slightly faster than normal, turn idle adjusting screw counter-clockwise or out until engine begins to miss, then turn screw in slowly until engine fires smoothly. Open throttle momentarily to clear manifold, close throttle, recheck idle adjustment. Final setting should be approximately 1 turn open from inner seated position. Then set throttle lever stopscrew for correct 7 M.P.H. idling speed.

Air Cleaner: AC #1528326 oil-wetted type Std., #1528608 ('38), #1529167 ('39) oil bath type optl.
Fuel Pump:—AC Type AF #1523306. Diaphragm type. *See article in Carburetion Equipment Section.*
Gasoline Gauge:—King-Seeley Electric. K-S No. 6270 (dash unit), No. 6280 (tank unit). *See article in Carburetion Equipment Section.*

MANIFOLD HEAT CONTROL:—Manual type with three settings (depressions for valve lever setscrew engagement) as follows: 'Heatoff'—Summer operation (left hand), 'Midway'—Mild Winter operation (middle position), 'Heaton'—Extreme Winter operation (right hand). To adjust, loosen locknut, back off setscrew, move heat valve lever toward right (in direction of arrow) for more heat, opposite direction for less heat. Make certain that setscrew engages depression in manifold and tighten locknut.

VALVE TIMING:—To Check—Set tappet clearance #1 intake valve at .010". This valve should open with piston on top dead center when flywheel mark 'I.O. T.C.1-4' lines up with pointed end of inspection plate screw in inspection hole on left top face of flywheel housing (permissible variation ¼" either way from mark). Reset tappet clearance at .004" with engine warm.
Tappet Clearance:—.004" Int., .006" Exh. Warm.
Valve Spring Pressure:—46½ lbs. at 2¼" (valve closed), 85½ lbs. at 1 15/16" (valve open). Free length 2 11/16".

LUBRICATION:—Crankcase Capacity—4 qts.
Normal Oil Pressure—30 lbs. at 30 M.P.H.
Oil Pressure Gauge:—King-Seeley Electric. K-S No. 6275 (dash unit), No. 6425 (engine unit). *See article in Mechanical Equipment Section for data.*

COOLING SYSTEM:—Capacity—11 qts.
Thermostat—None. NOTE—Accessory thermostat available.
Temperature Gauge:—King-Seeley Electric type. **Dash Unit**—K-S No. 6628 ('38 Std., Economy & Comm'l.), No. 6632 ('38 Deluxe, '39 Comm'l). NOTE—'39 passenger cars use dash signal light. **Engine Unit**—K-S No. 5700 (All except '39 passenger cars), No. 7205 ('39 passenger cars). *See article in Mechanical Equipment Section for data.*

BATTERY:—USL Type A-13. 6 volt, 13 plate, 78 ampere hour capacity (20 hour rate).
Starting Capacity—96 amperes for 20 minutes.
Zero Capacity—300 amperes for 1.9 minutes.
Grounded Terminal—Negative (—) grounded to right side of front cross-member. **Engine Ground**—Strap connector at left front engine mounting.
Dimensions—Length 8⅞". Width 7". Height 8⅝".
Location—Right hand side under engine hood.

STARTER:—Model MZ-4049. Armature No. MZ-2089.
Drive—Special Bendix No. RC10HD.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—216 RPM., 135-150 amperes, 5.35 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.5	70
.65 "	2500	5.5	100
2.55 "	1325	5.0	200
4.95 "	750	4.5	300
7.65 "	220	4.0	400
7.8 "	Lock	3.0	420
11.8 "	Lock	4.0	560

Removal:—Starter flange mounted on right front face of flywheel housing. To remove, take out two flange capscrews and one capscrew in bracket at commutator end, remove starter and switch as an assembly.

Starting Switch:—Model SS-4001. Magnetic type. Mounted on starter and controlled by pushbutton switch on instrument panel. *See article in Electrical Equipment Section.*

GENERATOR (STD.):—Models GAM-4504-A, B. Armature No. GAM-2055. Third brush control type.
Charging Rate Adjustment—Remove commutator cover band, shift third brush by hand, counter-clockwise to increase charging rate, clockwise to decrease charging rate. Brush held in position by friction.
Maximum Charging Rate—16 amperes (cold), 12.5 amperes (hot), 8.0 volts, 1950 R.P.M.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.

8	7.2	1050	8	7.4	1160
12	7.6	1280	12	7.95	1700
16.4	8.0	1950	12.5	8.0	2000

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—18-22 ozs. (new brushes).
Field Current—3.89-4.31 amperes at 6.0 volts.
Motoring Current—4.08-4.52 amperes at 6.0 volts.

Removal:—Pivot mounted at right front of engine. To remove, take out two pivot bolts, one clamp bolt.

Belt Adjustment:—Loosen pivot and clamp bolts, swing generator out from engine until fan can just be turned with belt held stationary, tighten bolts.

GENERATOR (STD. 48 TRUCK, OPTL. 38):—Model GCS-4809A5. Arm. GCS-2049F. 3rd brush type in conjunction with non-vibrating type Two-Charge (Current) Regulator. Ventilated by fan on drive pulley.
Charging Rate Adjustment—Use test meters to check output, connect jumper between fuse cup on regulator and ground to eliminate regulator action. Shift third brush by hand counter-clockwise to increase, or clockwise to decrease output. Brush held in position by friction. **Do not exceed maximum rated output** (secured with third brush set 1⅔ commutator bars minimum, or this distance less 1 mica strip maximum, from nearest or insulated main brush). Remove jumper after completing adjustment.
Maximum Charging Rate—20 amperes (cold), 16.5 amperes (hot), 8.0 volts, 2000 R.P.M. with regulator inoperative.

Performance Data

Cold—Regulator Inoperative			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	500	0	6.4	550
4	6.75	620	4	6.8	700
8	7.1	750	8	7.2	915
12	7.4	925	12	7.6	1200
16	7.7	1200	16.5	8.0	2150
20	8.0	2000			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. maximum.
Field Current—3.56-3.94 amperes at 6.0 volts.
Field Fuse—5 ampere (in knurled cup on regulator)
Motoring Current—4.99-5.51 amperes at 6.0 volts. NOTE—Main brushes should be set 2-2½ commutator bars ahead of neutral point.
Removal & Belt Adjustment:—Same as Std. Generator.

CUTOUT RELAY (GAM-4504A, B GEN.):—Model CB-4025. Mounted separately. *See article in Electrical Equipment Section.*
Cuts In—6.75-7.5 volts.
Cuts Out—.5-2.5 ampere discharge current.
Contact Gap—.025-.035".
Air Gap—.010-.030" with contacts closed.

TWO-CHARGE REGULATOR (GCS-4809A-5 GEN.):—Model TC-4317A. Mounted separately. Consists of Cutout Relay and Two-Charge (Current) Regulator in single case. *See article in Electrical Equipment Section.*

Cutout Relay

Cuts In—6.5-7.25 volts.
Cuts Out—.5-2.5 ampere discharge current.
Contact Gap—.015-.045".
Air Gap—.010-.030" with contacts closed.

Regulator

Contact Opening Voltage—8.25-8.75 volts at 70°F. NOTE—Unit compensated for temperature (voltage different at other temperatures—see Electrical Equipment Section for complete performance table).
Contact Closing Voltage—1.2-1.4 volts below opening voltage at same temperature.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—Headlamps—Corcoran-Brown Stabilite with pre-focused bulbs. Upper and lower beams controlled by Beam Selector Switch on toeboard.
Headlamp Adjustment—With car fully loaded, 25' from screen, and with upper beams lighted, aim each headlamp so that hot spot centered on vertical lamp center-line and upper edge at horizontal lamp centerline. To adjust, loosen clampscrew (below lamp at center) three full turns, rotate entire lamp in the socket.
Beam Indicator—At center of instrument panel. Lighted whenever upper beams in use.

Switches

Lighting—Douglas. **Beam Selector**—Douglas.
Instrument—Douglas.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320
Parking	1.5	55
Instrument, Beam Indicator	1	51
Stop & Tail	21-3	1158
Dome, License Plate ('39)	3	63

FUSES:—Lighting—20 ampere. On Lighting Switch.
Generator Field Fuse (GCS-4809A-5 Generator only)—5 ampere. In knurled cup on side of regulator.

HORNS:—Schwarze. Vibrator, disc type. One horn Std., Twin horns Optl.
Horn Current—10 amperes (each).

SERIAL NUMBER:—First number 39-1001. Stamped on plate on right side of cowl under engine hood and on center of front frame cross-member.

ENGINE NUMBER:—First number 39-1001. Stamped on right front corner of engine block.

COMPRESSION:—Ratio—6.35-1 (Std.), 6.81-1 (High Alt.) cast-iron heads; 7.0-1 (Optl. HC) aluminum head.

Pressure—105 lbs. at 185 RPM. (Std. head).

VACUUM READING:—Steady 21-23" at 7 MPH. idling speed.

IGNITION:—**Coil Model IG-4090-A.** On the right side of engine block. Service Coil No. IG-4070.

Ignition Current—2.5 amperes idling, 4 stopped.

Ignition Switch:—Douglas. Coil connection not armored.

Distributor Model IGS-4007B, IGW-4129. Single breaker, 4 lobe cam, full automatic advance type with auxiliary vacum spark control. NOTE—Vacuum unit integral type (IGS-4007B), separate VC-4007 unit (IGW-4129).

Breaker Plate Identification (IGS-4007B)—Maximum vacuum advance limited by slot and marked by number (#7) stamped on plate.

Breaker Gap—.020".

Cam Angle (IGS-4007B)—47° closed, 43° open.

Cam Angle (IGW-4129)—41° closed, 49° open.

Breaker Arm Spring Tension—16-20 ounces.

Rotation—Counter-clockwise viewed from top.

Condenser—No. IG-2671K (IGS-4007B), No. IGB-1025 (IGW-4129). Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
2	550	4	1100
4	800	8	1600
6	1050	12	2100
8	1200	16	2400
9.5	1500	19	3000

Vacuum Spark Control (IGS-4007B)—Mounted on distributor cup and linked directly to breaker plate. Provides additional advance at all speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring within unit.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5"
2.5	5	9"
5	10	12.2"
7	14	15"

Vacuum Spark Control (IGW-4129)—Type VC-4007 or VC-4010. On bracket under distributor cup and linked to advance arm. Operates in same manner as IGS-4007B type above. Maximum vacuum advance 7° Dist., 14° Eng. (VC-4007).

Distributor Removal:—Mounted on right side of engine. To remove, disconnect vacuum line and take out hold-down screw in advance arm. To remove IGW-4129 without disturbing vacuum unit, loosen advance arm clamp bolt.

IGNITION TIMING:— Flywheel Degrees Pist. Position
All Engines .....0° At TDC.....0000" TDC

Timing—Remove inspection hole cover on top left hand side of flywheel housing. With #1 piston on compression, turn engine over until piston reaches top dead center, stop when flywheel mark 'TC-IGN' lines up with pointed end of indicator screw. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt and see that rotor is in line with #1 segment in distributor cap, check spark plug connections (see diagram). NOTE—Eliminate backlash in drive gears by pressing rotor clockwise when checking timing.

Firing Order:—1-3-4-2. See diagram.

Spark Plugs:—Champion Type J8. 14 MM. Metric.

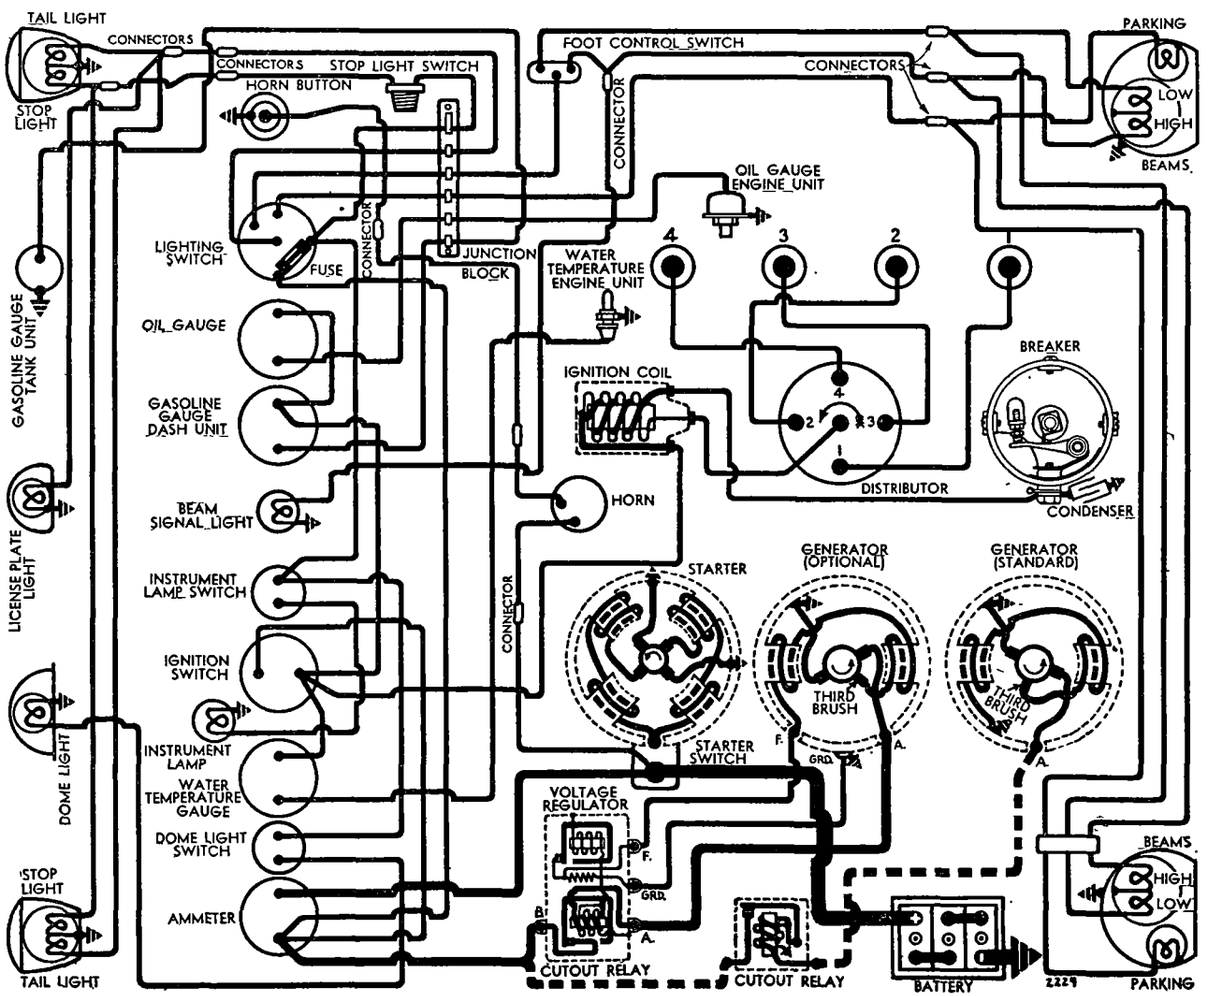
Spark Plug Gaps—.025".

CARBURETION:—Carburetor—Tillotson Model U-1B, 1⅛" downdraft type with manual choke control.

NOTE—No high speed adjustment provided on this model.

See article in Carburetor Section for data.

Idle Adjustment—If preliminary adjustment required (to warm up engine), turn idle adjusting screw in until just seated, then turn screw out ¾ turn. Warm up engine. With engine warm, adjust throttle lever stopscrew for slightly faster-than-normal idling speed, then turn idle adjusting screw out until engine begins to miss, finally turn screw in slowly until engine fires evenly. Set throttle lever stopscrew for 7 M.P.H. idling speed.



Air Cleaner:—AC #1528326 oil-wetted type Std., #1529167 heavy-duty oil-bath type Optl.

Fuel Pump:—AC Model AF #1523306. Diaphragm type.
See article in Carburetion Equipment Section.

Gasoline Gauge:—King-Seeley Electric. K-S No. 7044 (dash unit), No. 6280 (tank unit).
See article in Carburetion Equipment Section.

MANIFOLD HEAT CONTROL:—Automatic thermostatic type. No adjustment required.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .020". This valve should open with the piston 9° or .039" before top dead

center when flywheel mark 'I.O.' lines up with pointed end of indicator screw in inspection hole in top left surface of flywheel housing. Reset tappet clearance at .014" (engine cold).

Tappet Clearance:—.014" all valves, engine cold.

Valve Spring Pressure:—59.5 lbs. at 2.165" (valve closed), 100 lbs. at 1.814" (valve open). Free length 2.684".

LUBRICATION:—Crankcase Capacity—4 qts.

Normal Oil Pressure—30 lbs. at 30 M.P.H.

Oil Pressure Gauge:—King-Seeley Electric. K-S No. 7047 (dash unit), No. 6425 (engine unit).
See article in Mechanical Equipment Section.

COOLING SYSTEM:—Capacity—11¾ qts.

Thermostat—Harrison. In outlet elbow on cylinder head. Starts to open 140-147°F. Fully open 170°F.

Temperature Gauge:—King-Seeley Electric. K-S No. 7041 (dash unit), No. 7000 (engine unit).
See article in Mechanical Equipment Section for data.

BATTERY:—USL Type A-13. 6 volt, 13 plate, 78 Ampere Hour capacity (20 hour rate).

Starting Capacity—96 amperes for 20 minutes.

Zero Capacity—300 amperes for 1.9 minutes.

Grounded Terminal—Negative (—) terminal grounded to right end of front frame cross-member.

Engine Ground—Strap connector at front mounting.

Dimensions—Length 8⅞". Width 7". Height 8⅝".

Location—In engine compartment on right side.

STARTER:—Model MZ-4064. Armature No. MZ-2089.

Drive—Special Outboard Bendix No. RC10HD.

Cranking Engine—185 RPM. 150-175 amperes, 5 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.5	70
.65 "	2500	5.5	100
2.55 "	1325	5.0	200
4.95 "	750	4.5	300
7.65 "	220	4.0	400
7.8 "	Lock	3.0	420
11.8 "	Lock	4.0	560

Removal:—Flange mounted on right front face of flywheel housing. To remove, take out 2 flange mounting capscrews and capscrew in bracket on commutator end.

Starting Switch:—No. SW-3737S. On starter. Cable-operated by pull button on instrument panel. Pull required to close switch should be 2.3 lbs. minimum (measured at extreme end and at right angles to lever).

GENERATOR (STD.):—Model GBM-4612-A. Armature No. GBM-2065. Third brush control type. Ventilated by fan on drive pulley.

Maximum Charging Rate—18 amperes (cold), 8 volts, 2150 R.P.M. (generator).

Charging Rate Adjustment—Remove commutator cover band, shift third brush by hand, counter-clockwise to increase, or clockwise to decrease output. Brush held in position by friction.

Performance Data

Cold Amperes	Volts	R.P.M.	Hot Amperes	Volts	R.P.M.
0	6.4	760	0	6.4	800
4	6.8	920	4	6.9	960
8	7.25	1050	8	7.35	1150
12	7.65	1240	12	7.8	1360
16	8.1	1450	16	8.3	1750
20	8.5	2150	18	8.5	2450

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—50-60 ozs. (new brushes).

Field Current—3.80-4.20 amperes at 6.0 volts.

Motoring Current—5.7-6.3 amperes at 6.0 volts.

GENERATOR (DELUXE):—Model GCJ-4811-A. Armature No. GCJ-2006F. Third brush control in conjunction with external vibrating type voltage regulator. Ventilated by fan on driven pulley.

Maximum Charging Rate—25 amperes (cold), 22 amperes (hot), 8.0 volts, 2500 R.P.M. Actual charging rate controlled by regulator and dependent on battery condition. See Regulator data below.

Charging Rate Adjustment—See Regulator data below. Maximum output controlled by third brush and adjustable by removing commutator cover band and shifting third brush counter-clockwise to increase, clockwise to decrease output (brush held in position by friction). When checking output, ground 'F' terminal (to eliminate regulator action). Do not set generator for greater amount than maximum given above.

Performance Data

Cold Amperes	Volts	R.P.M.	Hot Amperes	Volts	R.P.M.
0	6.4	760	0	6.4	850
4	6.65	920	4	6.7	1020
8	6.9	1080	8	7.0	1240
12	7.2	1240	12	7.3	1400
16	7.45	1400	16	7.6	1650
20	7.7	1580	20	7.9	2100
25	8.0	2500	22	8.0	2700

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—53 ozs. max. (new brushes).

Field Current—1.9-2.1 amperes at 6.0 volts.

Motoring Current—4.0-4.4 amperes at 6.0 volts.

Removal:—Conventional pivot mounting at right front of engine. To remove, take out pivot and clamp bolts.

Belt Adjustment:—Loosen pivot and clamp bolts, swing generator out until fan can just be rotated with belt stationary.

CUTOUT RELAY (STD. GENERATOR):—Model CB-4025. Mounted separately on dash.
See article in Electrical Equipment Section.

Cuts In—6.75-7.5 volts.

Cuts Out—.5-2.5 amperes discharge current.

Contact Gap—.010-.030".

Air Gap—.025-.035" with contacts closed.

REGULATOR (DELUXE GENERATOR):—Model VRD-4004A. Consists of Cutout Relay and vibrating type Voltage Regulator in case mounted on the dash.
NOTE—Regulator cover sealed. Serviced on exchange basis if seals not broken.
See article in Electrical Equipment Section.

Cutout Relay

Cuts In—6.4-7.0 volts cold.

Cuts Out—.5 ampere min., 3.0 amperes max. cold.

Contact Gap—.015" minimum.

Air Gap—.034-.038" (hinge end of core—contacts open).

Voltage Regulator

Setting—7.3-7.6 volts at 70°F.

To Check (Without Breaking Seals)—Connect ammeter in charging line at regulator 'BAT' terminal, voltmeter between 'BAT' terminal and ground. Operate generator at speed of 30 M.P.H. charging fully charged battery until voltage is constant. Voltmeter reading should be within limits of 7.3-7.6 volts (cold—70°F.), 7.1-7.4 volts (hot—140°F.). See article in Electrical Equipment Section for voltages at other temperatures.

To Adjust (With cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. Check setting as directed above. See Electrical Equipment Section for complete instructions.

Contact Gap—.010-.020" (armature against stop pin).

Air Gap—.0595-.0625" with contacts just opening.

LIGHTING:—Headlamps—Corcoran - Brown Stabilite, Pre-focused type. Upper and lower beams controlled by beam selector switch on toeboard.

Headlamp Adjustment—Adjust by loosening clamp-screw at lower end of mounting band (on back of lense body below lamp, under fender) 3 full turns and turning lamp in socket by grasping adjusting pin at rear. Aim upper beam of each lamp straight ahead so that hot spot centered on vertical line directly ahead of lamp center with upper edge on horizontal line at lamp-center height at 25 feet.

Beam Indicator—In upper rim of speedometer dial. Lighted whenever upper or high beams in use.

Switches

Lighting—Douglas. **Beam Control**—Douglas.
Instrument—Douglas.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320
Parking	1.5	55
Instrument, Beam Indicator	1	51
Stop and Tail	21-3	1158
Dome, License Plate	3	63

FUSES:—Lighting—20 amperes. On lighting switch.

HORN:—Schwarze. Vibrator type.

Horn Current—10 amperes.

CAR SERIAL NUMBER:—On plate on right frame member above front spring *rear hanger and under driver's seat cushion. First number 1001 (66-D), 7601* (66-E).

ENGINE NUMBER:—On plate on left side of crankcase.

BATTERY:—U.S.L., Type HW-17A (Models 66-D and 66-E). 6 volt, 17 plate, 166 ampere hour capacity (5 ampere rate). Starting capacity 170 amperes for 20 minutes.

Grounded Terminal:—Negative (—) terminal grounded to frame.

Mounting:—On left hand side of frame under front floor boards.

Dimensions:—Width, 7⅛". Length, 13 7/16". Height, 9⅛".

IGNITION:—**Coil Model IG-4202, 4303 (66-D) IG-4602 or North East No. 22636** (66-E). Lock coil type mounted on back of instrument board with switch in base (except North East coil mounted on side of engine block, and IG-4602 used with special Mitchellock Model 16-S).

Ignition Current:—2 amperes at 6 volts (engine running), 4 amperes at 6 volts (engine stopped).

Ignition Switch—Electrolock Type 5-B (N. E. distributor—see Equip. Section for complete data). Switch is assembled as unit with distributor and must be taken off the car whenever distributor is removed. No provision is made to turn ignition on with Startix being inoperative and it will be necessary to disconnect lead on 'IGN' terminal of Startix case to avoid automatic cranking when ignition is turned on to check timing.

Distributor North-East Type 10877 or Auto-Lite Model IGC-4052. Single breaker, 6 lobe cam, semi-automatic advance type.

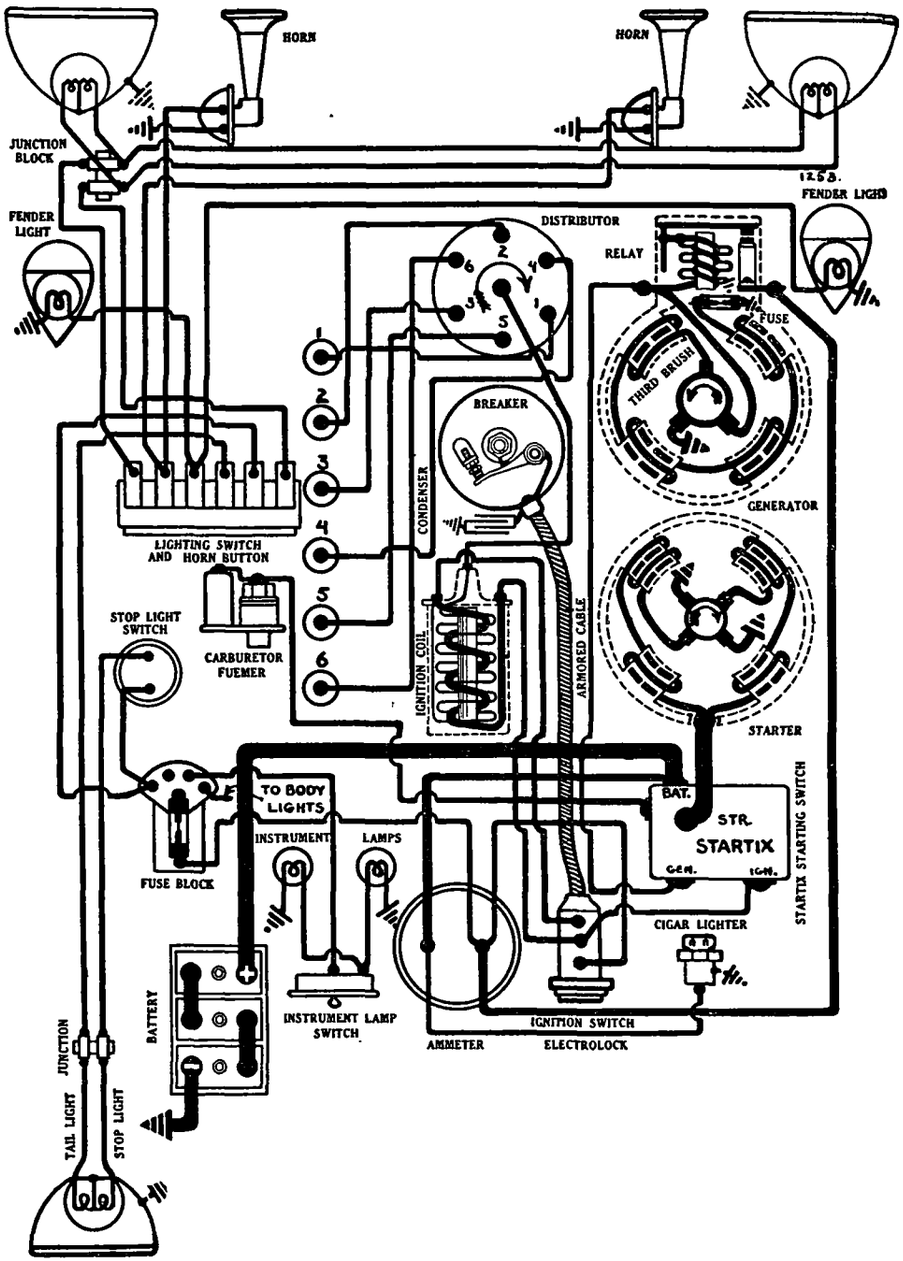
Manual Advance:—20 degrees (engine) maximum.

Breaker Gap:—Set contact gap at .020 inch.

Breaker Arm Spring Tension:—16-20 ounces.

Cam Angles—(IGC-4052). Closed 41°. Open 19° (distributor degrees).

Automatic Advance—Type 10877



Degrees	Distributor R.P.M.	Degrees	Engine R.P.M.
Start	200	2	400
12	1000	24	2000

Automatic Advance—Model IGC-4052

Start	200	0	400
3	610	6	1220
6	1050	12	2100
9	1480	18	2960
10.5	1700	21	3400

Mounting:—Distributor is mounted on top of oil pump housing at right of engine. To remove distributor, take out hold-down screw in advance arm and lift distributor from place.

Timing:—Breaker contacts begin to open when the piston entering power stroke reaches a position .112 inch (actual piston travel) or 16 degrees (on the flywheel) before top dead center with the manual spark control fully advanced. To set timing, crank engine over until piston No. 1 enters compression stroke. This can be determined by taking out No. 1 spark plug and turning the engine over until the air compressed in the cylinder is felt escaping through the spark plug port. Fully advance the manual spark control (push the spark button all the way in toward the dash) and see that the distributor is turned counter-clockwise as far as possible. Turn engine over until the ignition mark on the flywheel, 'IGN', which is 16 degrees before the top dead center mark 'T.C.' is directly opposite the

indicator in the inspection hole in the flywheel housing. Take up all backlash in distributor gears by turning distributor shaft counter-clockwise. Then loosen advance arm clamp screw and rotate distributor until contacts begin to open. Tighten the clamp screw and connect spark plugs as shown on the diagram.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—⅞-18 S.A.E. Champion Type C-4. Gaps are .020 inch.

VALVE TIMING:—The Willys-Knight engine is of the sleeve valve type. To time sleeve valves with eccentric shaft sprocket removed, remove pipe plug in exhaust manifold directly opposite No. 1 exhaust port and scrape carbon from edges of sleeve ports so that closing of ports can be checked. Remove inspection hole cover in flywheel housing and turn engine over until piston No. 1 reaches top dead center with the flywheel mark 'T.C.' directly opposite the indicator. Remove the spark plug in cylinder No. 1 and place a test lamp in the spark plug port so that the light can be seen through the exhaust port. Then turn eccentric shaft in direction of rotation until the upper edge of the port in the outer sleeve just passes the lower edge of the port in the cylinder block when the light will be cut off. Assemble eccentric shaft sprocket and timing chain, being careful not to disturb relative positions of eccentric shaft and crankshaft.

Intake Ports	Timing—1931	Exhaust Ports
Open—5° after top dead center.		Open—50° before lower dead center.
Close—46° after lower dead center.		Close—At top dead center.

Timing—1932

Open—10° before top dead center.	Open—45° before lower dead center.
Close—36° after lower dead center.	Close—At top dead center.

STARTER:—Model MAB-4018, MAB-4036 R.H.D. Starter drives engine through a Bendix drive. The direction of rotation is clockwise, viewed from the commutator end. Brush spring tension is 44-56 ounces. The starting switch is mounted at the lower end of the steering column and is operated by pulling up on the knob on the steering wheel.

Starter Data

Torque	R.P.M.	Volts	Amperes
.6 lb. ft.	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
24 "	Lock	4.0	725

Mounting:—Starter is sleeve mounted at the right of the transmission on the rear face of the flywheel housing. To remove starter, disconnect cable and take out two dowel screws in flywheel housing directly above starter sleeve. Then pull starter to the rear to clear drive and lift from place.

GENERATOR:—Model GAG-4130, 4134. Direction of rotation is counter-clockwise at commutator end. Third brush regulation. With standard car setting, maximum charging rate is 17 amperes at 8 volts (cold) reached at 1500 R.P.M.

Charging Rate Adjustment. Take off commutator cover band, shift third brush by prying on brush mounting stud, counter-clockwise to increase, or clockwise to decrease charging rate. Third brush mounting plate is held in position by friction.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	550	0	6.4	640
4	6.7	660	4	6.9	800
8	7.0	760	8	7.3	980
12	7.4	900	10	7.6	1110
16	7.8	1120	12	7.8	1280
19	8.0	1500	14.2	8.0	1680
13	7.4	2400	11.5	7.7	2400

Brush Spring Tension:—22-27 ounces on each brush.

Field Current:—4.08-4.52 amperes at 6.0 volts across field terminals.

Field Fuse:—7½ ampere capacity fuse mounted on brush ring.

Motoring:—4.18-4.62 amperes at 6.0 volts.

Mounting:—Generator is cradle mounted at the right of the engine and is driven through a flexible coupling from the chain case. To remove generator, disconnect lead and drive coupling. Then loosen mounting strap and slide generator from place.

RELAY:—Model CB-4014, 4021. Mounted on the generator field frame. Relay contacts close at 575 R.P.M. when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of .5-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Finger Tip Control Switch, Model A-805. Switch is mounted at the lower end of the steering column and is controlled by a button on the steering wheel. The starting switch, lighting switch and horn button are all incorporated in the single unit. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch. See Equipment Section for complete article on Finger Tip Control.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Fender lights	6-8	3	S.C.	63
Dash lights	6-8	3	S.C.	63
Stop and tail light	6-8	21-2	D.C.	1158
Dome and corner lights	6-8	3	S.C.	63

FUSES:—Generator field fuse is 7.5 ampere capacity. Lighting fuse mounted on fuse block on lower left front side of dash is 20 ampere capacity.

NATIONAL SERVICE MANUAL

1940 SUPPLEMENTS

FIELD & PRODUCTION CHANGES
NEW TYPE UNITS—SPECIAL SERVICE NOTES

BANTAM

1940 MODELS

New Carburetor—New Zenith model—does not have High Speed Adjustment. See Bantam 'T&E' page and Zenith 61A5 Carburetor in 'C' Section.

New Crankshaft Bearings—New 3 bearing crankshaft with new type center main bearing. See Bantam 'M' page.

New Shock Absorbers—Monroe Hydraulic type now used on Passenger Car models. See Monroe Shock Absorbers in 'ME' Section.

New Clutch Facing—After Eng. No. 65-500, front facing not riveted on flywheel (floats between flywheel and driven member).

Oil Pump Screen Location—After Eng. No. 65-500, screen mounted on pump inside oil pan (was on side of crankcase on previous models).

1939 & PREVIOUS MODELS

Excessive Oil Gauge Pointer Fluctuation—Correct by removing oil gauge line, blowing out oil and restricting lower end of line to pin hole size. Install later type high-pressure oil gauge.

Oil Leakage at rear end of Crankshaft—Has been corrected by use of new solid washer, No. 8700, under head of flywheel bolt.

Front Shock Absorber Squeaks—Correct by cleaning or replacing discs and oiling center bolt. See Bantam 'M' page for directions.

COPYRIGHT 1940, NATIONAL AUTOMOTIVE SERVICE

BUICK

1940 MODELS

Hard Shifting Complaints (50, 70)—Lubricate shift control idler lever on side of transmission case (see Buick Transmission Control in 'ME' Section). This lever not used on other models.

New Axle Torque Tube & Carrier (40, 50, 60, 70)—New two-piece bolted type. Torque tube should not be disconnected from carrier (except for gasket installation to correct oil leaks) or original alignment will be disturbed (parts not furnished separately).

New Pistons—New type with deeper top compression ring groove and new ring with heavier wall section to prevent ring and land failure. See Pistons & Replacement Piston Ring data in Buick Shop Notes ('M' Section).

Transmission—New type Synchronizer Cones and Second Speed Gears. Must be matched on each transmission model and must not be confused with previous types. See Buick Transmission in 'ME' Section.

New Ignition Lock (not Steering Column Lock)—Has two different 'off' positions (locked in one position only). See Ignition Switch on Buick 'T&E' page.

Carter & Stromberg Carburetors—Both makes used on each model (2 different Carter models on 40, 50). See Buick 'T&E' page and Carter 'WDO' and Stromberg 'AAV' carburetors in 'C' Section.

Starter Controls (2 Types)—Different type vacuum switch (on carburetor) on each carburetor make. See Buick 'T&E' page and complete data in 'EE' Section.

Horn Relay Sticking—See Note under Horn Relay on Buick 'T&E' page for special tested service relays to correct sticking complaints.

New Direction Signal—1940 Type has Direction Signal built in steering wheel hub. Switch must be turned 'off' whenever steering wheel removed or replaced. See Direction Signals in 'EE' Section.

1939 & PREVIOUS MODELS

1939 40 & 60 Engine & Axle Alignment Caution—See special caution note under Rear Axle Removal on 1939 'M' page to maintain alignment of Axle and Engine on these cars with frame-mounted universal joint ball. See also Engine & Rear Axle Alignment instructions on Buick Shop Note page in 1939 Supplement 'M' Section.

CADILLAC—LA SALLE

1940 MODELS

Clutches (2 Makes used)—Borg & Beck 11A6 type used on first Cadillac V8 & La Salle cars, Long 11CF and 10CF on later cars. See Borg & Beck and Long 'CF' Clutches in 'ME' Section.

CONTINUED ON NEXT PAGE

FIELD & PRODUCTION CHANGES, NEW TYPE UNITS, SPECIAL SERVICE NOTES

CONTINUED FROM PRECEDING PAGE

Replacement Clutch Caution—Service clutches furnished with locking pin blocking each release lever. Pins must be removed when clutches installed in car or they will drop down in clutch housing and may cause damage.

Clutch Balancing—Clutches must be balanced when installed in car for smooth operation. See Balancing data in Cadillac Shop Notes in 'M' Section.

Rear Axle Pinion Bearing Caution—Do not loosen rear universal joint companion flange nut (controls pinion bearing 'pre-load').

Direction Signal Bulb Change—Two different bulbs used in rear signal. Flasher will not operate if wrong type installed. See Cadillac & La Salle 'T&E' page Bulb Specifications.

New Steering Gear (72)—New Recirculating Ball Type. See Saginaw Recirculating Ball type Steering Gear in 'ME' Section for special servicing caution to avoid damage to nut and ball return channels.

1939 & PREVIOUS MODELS

Replacement Clutch Caution—See caution note for '40 Models (above) for locking pin or block removal.

Steering Gear Chuckle or Noise on V8 & V16 Cars with offset steering shaft & Universals—See Special Service Note on Universal Joints in 'Saginaw Steering Gears' in 'ME' Section for recommended correction.

1939 Rear Axle Pinion Bearing Caution—Rear universal joint companion flange nut must not be loosened (controls pinion bearing 'pre-load').

CHEVROLET

1940 MODELS

Gearshift Flutter Complaints—See Chevrolet Transmission Control in 'ME' Section for recommended procedure to correct this complaint.

Carburetor 'Popping-back' & Rich or Lean Complaints—See Carter W1 (Chevrolet) Carburetor in 'C' Section for recommended correction.

Engine Running Backward when turned off—See Carter W1 (Chevrolet) Carburetor in 'C' Section for recommended correction.

1940 Carburetors—1940 cars use same models as 1939 but specifications and jets changed. See Carter W1 Carburetor and Carter Jet Specifications in 'C' Section for new data.

New Adjustable Throttle-cracker—See Chevrolet 'T&E' page for adjustment directions.

New Oil Distributor Caution—See 'Oil Distributor' in Chevrolet Shop Notes in 'M' Section for Important gasket installation data.

New Crankshaft Rear Oil Seal—See Oil Seal data in Chevrolet Shop Notes in 'M' Section for servicing instructions.

New Valve Timing (New Crankshaft Gear)—See 'Timing Gear' and 'Valve Timing' sections on Chevrolet 'M' page. *CAUTION*—Old type gear must not be used on '40 cars.

Tight Rear Spring Shackle Correction—See Chevrolet Shop Notes in 'M' Section for recommended correction.

Brake Adjustment Change—Not necessary to remove front wheels for brake adjustment on '40 models (slots now provided in front wheels).

New Truck Axles—All Truck Axles now Hypoid type (Semi-floating & Full-floating types). See Chevrolet Axles in 'ME' Section.

Transmission Control Changes—On Passenger cars, new type shifter mechanism and vacuum power cylinder linkage used. See Chevrolet Transmission Control in 'ME' Section for new adjustment data.

1939 & PREVIOUS MODELS

Engine Running Backward when turned off—See Carter W1 Carburetor in 1939 Supplement 'C' Section for recommended correction.

1939 Carburetor Stalling, Loading, Pinging, or Poor Mileage Complaints—See Carter W1 Carburetor in 1939 Supplement 'C' Section for recommended corrections.

Main Bearing Dimensions (1937-38)—See 1939 Supplement Chevrolet 'M' page for Crankshaft Journal data. Correct 1937 & 1938 Supplement pages to read same as 1939 data.

Transmission Front Bearing Retainer (New Type to correct Oil Leaks caused by cracked retainer)—Can be installed on '38-39 Cars and '38-39-40 Trucks for heavy duty service. See Chevrolet 1940 Transmission in 'ME' Section for data.

Manifold Heat Control Valve Rattle Correction—See Note under Manifold Heat Control on Chevrolet 'T&E' page for installation of special anti-rattle spring.

CHRYSLER—DE SOTO—DODGE PLYMOUTH

1940 MODELS

Carburetor Changes (Chrysler 6 & De Soto)—Two carburetor models used on each with different jet calibrations. See Carter (B&B) Carburetor & Jet Specifications in 'C' Section for data. IMPORTANT CHRYSLER NOTE—First Type Carburetor can be brought up to later type performance by installing new jets. See Carter (B&B) Carburetor in 'C' Section for directions.

- **Throttle Guard on Fluid Drive Cars**—See Chrysler 'T&E' page or Chrysler Throttle Guard in 'CE' Section for adjustment directions.

New Toe-in Adjustment—Now adjusted by turning both rods on all models. See Chrysler Independent Suspension in 'ME' Section for instructions.

New Windshield Wiper & Circuit Breaker—New two-speed type wiper with circuit breaker on switch instead of fuses. See Auto-Lite Electric Windshield Wiper in 'ME' Section.

New Rear Axle (C27)—Has barrel type differential case. See Chrysler C27 Axle in 'ME' Section for special important differential cover lockpin data.

Overdrive Transmission (Chrysler, De Soto)—Adapter plate fastened to overdrive case by concealed screws. See Warner Overdrive in 'ME' Section for Adapter Removal Note (Servicing Section).

CROSLEY

1939-40 MODEL

Important Service Note—Engine must be removed from chassis for service work. See Crosley Shop Notes in 'M' Section for instructions.

Rear Axle Service Caution—See Axle & Transmission Removal instructions on Crosley 'M' page for caution when removing axle or shaft and torque tube from car.

FORD—MERCURY

1940 MODELS

Cylinder Sleeves & Special Piston Servicing Data—New dry cylinder sleeves used on all models (part production). See Ford Shop Notes in 'M' Section for engine markings and special piston servicing data when sleeves used.

1940 '60' Crankshaft—New type with larger main and connecting rod journals. See new bearing data in Ford Shop Notes in 'M' Section.

1940 '60' Clutch—New larger semi-centrifugal clutch on Passenger Cars. See Ford '60' 'M' page and Long 'CF' Clutch in 'ME' Section.

New Timing Gear—New aluminum alloy bolted-on type Camshaft Gear used (part production). See Ford Shop Notes in 'M' Section for servicing data.

New Transmission Control—New gearshift lever mounted on steering column used on all models. See Ford Transmission Control in 'ME' Section for adjustments.

New Rear Axles (Trucks)—All Trucks now Hotchkiss drive. See Ford Truck Rear Axle in 'ME' Section and also Ford 'M' pages for new propeller shaft and universal joint data.

1939 & PREVIOUS MODELS

Starter Support Brace Installation (1938 cars & earlier) to correct Engine Pound—See Ford Shop Note page in 'M' Section (1938 Supplement or manual) for instructions.

1939 Shock Absorber Change—New spring-loaded automatic type packing gland used on late 1939 cars. No packing gland adjustment (to prevent leaks) required on these cars.

HUDSON

1940 MODELS

New Distributor & Drive 6—New type distributor & vacuum spark control. Rotation reversed from 1939. New type distributor mounting at rear of engine. See Distributor section of Hudson 6 'T&E' page.

Carburetor Changes (41, 43)—Two different Carter carburetors used. See Hudson 8 'T&E' page and Carter 'WDO' Carburetor in 'C' Section.

Regulator Changes—Auto-Lite 'VRD' used on first cars, 'VRR' with different specifications on later cars. See Hudson 'T&E' pages and Auto-Lite Regulators in 'EE' Section.

Special Carburetor Mounting—8 gaskets used. See Carter 'WA1' and 'WDO' Carburetors in 'C' Section for gasket and heat deflector installation data.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

New Rear Camshaft Bearing (6)—Bearing has cut-out for distributor drive gear clearance. See special installation instructions on Hudson Shop Note page in 'M' Section.

Vibration Dampener Removal—Can be removed from under car without removing radiator. See instructions on Hudson Shop Note page in 'M' Section.

New Overdrive with 'kick-down' Control—See Warner Overdrive & Warner Overdrive Control in 'ME' Section for servicing & adjustment data.

New Front Suspension—New Independent Suspension used on all models. See Hudson Independent Suspension in 'ME' Section.

1939 & PREVIOUS MODELS

1939 Water Pump Change—New Impeller and seal spring washer used on late cars, can be installed on earlier cars. See Hudson Water Pump in 1940 Supplement 'ME' Section.

1939 Shock Absorber Change—New Monroe '3 tube' type used on late cars. See Monroe Shock Absorbers in 1940 Supplement 'ME' Section for data.

LINCOLN-ZEPHYR

1940 MODELS

1940 Engine Changes—Larger engine with increased bore and higher compression ratio. See Engine Specifications on Lincoln-Zephyr 'M' page and new Piston & Ring data on Lincoln-Zephyr Shop Note page in 'M' Section.

New Timing Gear—New aluminum alloy bolted-on type Camshaft Gear. Can be replaced without removing camshaft. See Lincoln-Zephyr Shop Note page in 'M' Section for instructions.

New Larger Carburetor—Carburetor size increased and new larger jets used. See Chandler-Groves Carburetor and Jet Specifications in 'C' Section.

1939 & PREVIOUS MODELS

Connecting Rod Bearing Correction—Bearing shells on all Lincoln-Zephyr engines are clamped in rod (not floating) and have small tangs which engage notches in rod and cap. Make this notation on Lincoln-Zephyr 1936-37-38 'M' pages. Bearing dimensions are correct as shown.

1939 Firing Order—On 1939 Lincoln-Zephyr 'T&E' page, firing order should be 1-4-9 etc. Change second figure from '3' to '4'.

1939 Shock Absorber Change—New spring-loaded automatic type packing gland used on late 1939 cars. No packing gland adjustment (to correct leaks) required on these cars.

NASH & NASH-LAFAYETTE

1940 MODELS

Warming up Complaints—On Nash 6 & 8, see Carter 'WA1' and 'WDO' Carburetor in 'C' Section for directions on checking hot air tube. On Nash-Lafayette, see Climatic Control change following.

Climatic Control Change (Nash-Lafayette)—New type Climatic Control (automatic choke) with different setting and other changes made to correct warming up complaints. See Carburetor section on Nash-Lafayette 'T&E' page and Carter 'WDO' Carburetor in 'C' Section for data.

Torquematic Spark Control (Nash 6 & 8)—See Ignition Timing on Nash 'T&E' pages for adjustments.

Crankshaft Chain Sprocket Installation—Sprocket should be heated. See Nash Shop Note page in 'M' Section for instructions.

1940 Clutch Changes—Clutch type changed in production and new 'Borglite' driven member used with later types (requires different lever setting). See Nash 'M' pages and Borg & Beck Clutch in 'ME' Section.

New Independent Suspension—Used on all 1940 models. See Nash Independent Suspension in 'ME' Section.

New Brake Adjustment (Nash 6 & Nash Lafayette)—Do not have Eccentric adjustment and must be adjusted differently than previous models. See Bendix Hydraulic Brakes (No Eccentric) in 'ME' Section for instructions.

New 'kick-down' type Overdrive—Electrical control not same as used on other car models. See Warner Overdrive & Warner Overdrive Control in 'ME' Section for servicing and adjustment.

Transmission Shifter Fork & Overshift Stop Adjustments—Must be adjusted when cover installed. See Nash Transmission in 'ME' Section.

Hypoid Rear Axles—All models now have Hypoid Axles. See Nash Rear Axle in 'ME' Section for complete overhaul and adjustment data.

1939 & PREVIOUS MODELS

Piston Removal on 8 Cylinder Cars—Pistons should be removed from below. Make this correction on Nash 8 'M' pages.

OLDSMOBILE

1940 MODELS

Ignition Timing Change (8)—Flywheel mark now indicates #1 firing point (not #6 as on previous cars). See Oldsmobile 8 'T&E' page.

New Carburetors on Hydra-matic Drive Cars—Different carburetors used on each model when cars equipped with Hydra-matic Drive. See Oldsmobile 'T&E' pages and Carter 'WA1' and 'WDO' Carburetors in 'C' Section for special settings on these models.

Carburetor Float Level Change (8)—Float level changed to 3/8" (supersedes all former settings on Std. & Hydra-matic Car Carburetor models). See Oldsmobile 'T&E' page & Carter 'WDO' Carburetor in 'C' Section for complete data.

Connecting Rod Bolt Change—New type bolt (no cotter pin) used on later cars. Must be tightened to different tension. See Oldsmobile Shop Note page in 'M' Section for data.

Special Main Bearing Bolts (6)—Special bolts used on #3 main bearing cap on all Sixes. See Crankshaft Note on Oldsmobile 6 'M' page.

New Self-locking Tappet Screws—Used on all 1940 cars. See Tappet Clearance Note on Oldsmobile 'T&E' and 'M' pages.

New Brake Adjustment (8)—Brakes do not have eccentric adjustment. See Bendix Hydraulic Brakes (No Eccentric) in 'ME' Section for new adjustment directions.

Hydra-matic Drive—New type Fluid Coupling and automatic transmission optional on all 1940 cars. No clutch used with this drive. See Oldsmobile Hydra-matic Transmission in 'ME' Section.

Propeller Shaft Slip-joint Caution—See note under Rear Axle Removal on Oldsmobile 'M' pages (slip-joint formed in transmission ahead of front universal and entire shaft assembly free to pull out unless care taken to prevent this).

1939 & PREVIOUS MODELS

1939 Water Pump Change—Neoprene bearing seal used on pumps on late cars. See Oldsmobile Water Pump in 1940 Supplement 'ME' Section for data.

1939 Propeller Shaft & Slip-joint Caution—When disconnecting shaft, use care not to allow shaft to pull out of transmission (slip-joint formed in transmission ahead of front universal and entire shaft free to pull out).

New 1937-38 Valve Guides—New shorter 1939-40 type Valve Guide can be installed on 1937-38 cars to correct valve sticking. See Oldsmobile 1939 or 1940 'M' pages for Valve Guide data.

New 1939 Clutch Throw-out Bearing—New improved 1940 type bearing may be installed on 1939 cars.

New 1939 Transmission Oil Seal—New 1940 type may be used. This seal has locating shoulder to insure correct installation.

Distributor Ground Leads—New 1940 ground lead can be installed on previous 6 cylinder distributors. Special longer type (as used on first 1250 1940 8 cylinder cars) can be installed on previous 8 cylinder distributors.

PACKARD

1940 MODELS

Distributor Change (6 & 8)—Two different distributors used on each model (production change). Condenser also changed on 6 (new type has different capacity). See Packard 6 & 8 'T&E' pages.

New Carburetor (6)—1940 Six equipped with new type Stromberg Carburetor. See Stromberg 'BXOV' Carburetor in 'C' Section.

New Electric Windshield Wiper (6 & 8)—See Stewart-Warner Electric Windshield Wiper in 'ME' Section.

Regulator Change (6 & 8)—Auto-Lite 'VRB' type used on first cars, new 'VRP' type on later cars. See Packard 6 & 8 'T&E' pages and Auto-Lite Regulators in 'EE' Section.

CONTINUED ON NEXT PAGE

FIELD & PRODUCTION CHANGES, NEW TYPE UNITS, SPECIAL SERVICE NOTES

CONTINUED FROM PRECEDING PAGE

Clutch Change (All Models)—Both Borg & Beck (10A7 & 11A6) and Long (CF) Clutches used on 1940 cars. See Packard 'M' pages and Borg & Beck and Long 'CF' & 'CFS' Clutches in 'ME' Section.

Self-locking Tappet Screws (6 & 8)—See Packard 6 & 8 'T&E' or 'M' pages for data.

New Super 8 Engine—Entirely new design. See Packard Super 8 'M' page.

New Electrically Controlled Overdrive—Not like previous type or overdrive on any other car. Control entirely electrical (solenoid action reversed from 1939 type). See Warner (Packard) Overdrive, and Overdrive Control, in 'ME' Section.

New Brake Adjustment—Brakes on 6, 8, Super 8 (1803, 6 only) do not have eccentric adjustment and adjusted differently than previous models. See Bendix Hydraulic Brakes (No Eccentric) in 'ME' Section for adjustment instructions.

New Shock Absorbers (6 & 8)—Delco or Monroe Direct Acting type used. See Delco and Monroe Shock Absorbers in 'ME' Section.

Rear Axle Pinion Bearing Caution—Pinion bearings must be adjusted whenever rear universal joint companion flange nut loosened or removed. See Packard Rear Axle in 1940 Supplement 'ME' Section for directions and specified 'pre-load'.

1939 & PREVIOUS MODELS

1938 Valve Guide Change to prevent sticking (6 & 8)—See 1939 Packard Shop Notes in 'M' Section for recommended change on first cars with longer guides.

1938 Camshaft & Lifter Change (6 & 8)—See 1939 Packard Shop Notes in 'M' Section for change in camshaft and lifter type used with each shaft.

1939 Econo-drive Rear Bearing Caution—Bearings must be adjusted if universal joint companion flange nut loosened (controls bearing 'pre-load') on cars with first type bearing. See Packard Transmission and Warner Overdrive in 1939 Supplement for Bearing Adjustment and installation of recommended later type bearing (with automatic spring-washer bearing adjuster). NOTE—On cars with later type bearing, rear nut must be kept tight—on first cars tighten nut only enough to secure correct bearing pre-load.

Rear Axle Pinion Bearing Caution (6, 8, 1939 Super 8)—Bearing must be adjusted whenever rear universal joint companion flange nut loosened or removed. See Packard Rear Axle in 'ME' Section for directions.

PONTIAC

1940 MODELS

Carburetor Changes (6 & 8)—See Carter 'WA1' Carburetor in 'C' Section for changes on new 'SP' type and recommended correction for 'hesitating' when starting in 2nd gear on first types.

Carburetor Changes (Torpedo 8)—Metering Rod and Climatic Control changed on later 'SM' type. See Carter 'WDO' Carburetor in 'C' Section for different settings on each type and recommended correction for poor warming up on first type.

New Light Switch & Stop Light Fuse—See Lighting Switch Note on Pontiac 'T&E' pages. New switch used on later cars and Stop Light fuse added.

Grounded Generator Field Coils—See Generator Note on Pontiac 6 'T&E' page.

Generator Open-circuits (Torpedo 8)—See correction note under Regulator on Pontiac 8 'T&E' page.

Timing Gear Cover Noise Correction—See Pontiac Shop Notes in 'M' Section for recommended change.

Engine Rear Support Insulator Loosening from Frame (First Cars)—See Pontiac Shop Notes in 'M' Section for installation of special Re-inforcement Plate (as used on later cars).

Clutch Slippage Correction (8)—See Inland Clutch in 'ME' Section for new heavier clutch assembly recommended to correct slipping when starting in second gear on first cars (used on later cars).

Rear Axle Oil Leakage—See Pontiac Shop Note page in 'M' Section for recommended correction.

Gearshift Stiffness Correction—See Pontiac Transmission Control in 'ME' Section for recommended correction.

Clutch Poor Release, Noise, Roughness Correction—See Anti-rattle Spring data for Inland Clutch in 'ME' Section for recommended correction.

Propeller Shaft Slip-joint Caution—See note under Rear Axle Removal on Pontiac 'M' pages (slip-joint formed in transmission and entire shaft assembly free to pull out unless care taken to prevent this).

1939 & PREVIOUS MODELS

1939 Water Pump Change—Neoprene bearing seal used on later cars. See Pontiac Water Pump in 1940 Supplement 'ME' Section.

1939 Easier Shifting Correction—See Pontiac Transmission in 1940 Supplement 'ME' Section for installation of 1940 type shifter shaft.

Clutch Poor Release, Noise, Roughness—See Anti-rattle spring data for Inland Clutch in 1940 Supplement 'ME' Section for correction.

1939 Propeller Shaft & Slip-joint Caution—When disconnecting shaft, use care not to allow shaft to pull out of transmission (slip-joint located in transmission ahead of front universal).

STUDEBAKER

1940 MODELS

Carter & Stromberg Carburetors (Comm. & Pres.)—Both makes used on each model. See Carter 'WA1' & 'WDO' and Stromberg 'BXO' & 'AAO' Carburetors in 'C' Section.

Manifold Heater Valve Noise Correction (Champion early cars)—See Note under Manifold Heat Control on Champion 'T&E' page for recommended correction on first cars.

New Drive Shaft Slip Joint (Champion)—Located on rear of transmission (solid shaft). See Note under Transmission on Champion 'M' page for data.

New Gearshift (Commander & President)—Now use new type similar to Champion. See Studebaker Transmission Control in 'ME' Section for directions on reworking 1939 adjusting gauge for 1940 models.

Champion Carburetor Float Level Caution—See important note under Float Level for Carter 'WO' Carburetors in 'C' Section.

1939 & PREVIOUS MODELS

1939 Champion Carburetor Change—Special spring loaded float valve used on late cars. See Carter 'WO' Carburetor in 1940 Supplement 'C' Section for special caution when checking float level.

1939 Champion Clutch Facing Change—New grooved facings used after Engine No. 17804.

1939 Champion Insulated Steering Arm—Used on late cars. See Ross Cam-and-Twin Lever Steering Gear in 1940 Supplement 'ME' Section for servicing data.

1939 Commander Compression Ring Change—New sealed power type compression ring used after Engine No. H-81539.

1939 Commander Suspension & Camber Adjustment—New type and different adjustment after Serial No. 4112701. See Studebaker Independent Suspension in 1940 Supplement 'ME' Section for directions.

1935 Dictator Valve Timing & Tappet Clearance Change—After Eng. No. D-47576, tappet clearance changed to .016" Cold (All Valves) and Valve Timing changed to same Opening & Closing points as 1935 Commander & President. Make this change on 'T&E' & 'M' pages in early editions where not shown.

1935 Commander & President Tappet Clearance Change—On engines so marked on plate on valve cover plate, tappet clearance should be set at .016" Cold for all valves (instead of .004" Int., .006" Exh. Hot). Make this change on Studebaker 1935 'T&E' & 'M' pages in early editions where not shown.

WILLYS

1940 MODELS

New Carburetor (Pass. Cars) & Float Level Caution—See Carter 'WO' Carburetor in 'C' Section and important note under Float Level when checking float level.

New Clutch (Passenger Cars)—See Atwood Clutch in 'ME' Section.

Engine Change on Panel Delivery Model—Two different engines used (changed at Eng. No. 35129). See Willys 'M' pages for both types.

New Gearshift & Rattle Correction (Pass. Cars)—See Willys Transmission Control in 'ME' Section and note special Trouble Shooting data and Control Shaft Dampener Adjustment to correct rattles.

New Shock Absorbers—Both Monroe and Gabriel Direct Acting types used. See Monroe and Gabriel Shock Absorbers in 'ME' Section.

1939 & PREVIOUS MODELS

1939 Shock Absorber Change—New Monroe '3 tube' type used on late cars. See Monroe Shock Absorbers in 1940 Supplement 'ME' Section for data.

1940 TUNE UP & ELECTRICAL CAR MODEL INDEX

Car	Model	Year	Electrical System	Page No.
BANTAM	65 Super 4	1940	Auto-Lite	T&E-1730

NOTE:—All Specifications and Service Data for car models listed below are same as for corresponding 1939 model except as noted.

GRAHAM MODEL 108, SUPERCHARGER MODEL 107, HOLLYWOOD SUPERCHARGER 109

MODEL 109 NOTE:—This is a new model. All specifications and equipment on this model same as for 107 Supercharger (except Carburetor—see below).

SERIAL NUMBER:—First 1940 Number—505001 (107), 605001 (108), 700001 (109).

ENGINE NUMBER:—First 1940 Number—515001 (107), 615001 (108), 710001 (109).

COMPRESSION:—Ratio—6.65-1 Std., 7.0-1 & 7.25-1 Optl. (on all models).
Pressure—125 lbs. (108), 130 lbs. (107 & 109) at cranking speed (std. hd.).

SPARK PLUGS:—Champion Type J-10. 14 MM. Metric type. **Gap**—Set at .025".

CARBURETION:—Carburetor. Carter Type WA-1, Model 472-S (108), 473-S (107); Type WDO, Model 488-S (109), single barrel (107,8), dual (109) downdraft types with Carter Climatic Control.
See Carter WA-1 and WDO carburetor articles in Carburetor Section for data.
Idl Adjustment—Adjust only with engine warmed up so Automatic Choke and Fast Idle inoperative. Turn idle adjusting screw (2 used on 488-S—adjust in succession) in for leaner mixture, out for richer mixture, adjust so engine fires smoothly. Adjust throttle lever stopscrew for 7-8 MPH idle speed.
Float Level (WA-1)—⅜" from top of machined projection on bowl cover to top of soldered seam at free end of float (invert to check).
Float Level (WDO)—3/16" from top of float to gasket seat on cover with needle valve seated (remove bowl cover assembly—invert cover to check).
Automatic Choke:—Carter Climatic Control.
See article in Carburetion Equipment Section for complete data.
Choke Setting—Center coil housing (108), 1 Notch Rich (107, 109).

VALVE TIMING:—New valve timing. *See Graham Model 107, 108, 109 (1940) 'M' page.*

BATTERY:—Model 109—Willard Type SWB-100, 17 Plate (Std.); Type HWB-110, 19 Plate (Radio).
Capacity (20 Hour Rate)—100 (SWB-100), 110 (HWB-110) ampere hours.
Dimensions (Std. & Radio)—Length 10½". Width 7⅛". Height 8 7/16".
Models 107, 108—Same batteries used as on corresponding 1939 model.

GENERATOR:—Delco-Remy Model 1100007 (same as for 1939 Model 97). This generator used on all 1940 models (no Lamp Load Type generator used in 1940).

REGULATOR:—Delco-Remy Model 1118204 'Single Core' type. Cutout Relay and vibrating Voltage Regulator in a single case on engine side of dash.
NOTE—This regulator does not have 'IGN' terminal.
See 'Single Core' Regulator article in Electrical Equipment Section.

Cutout Relay

Cuts In—6.2-6.7 volts hot. **Cuts Out**—0-4.0 amperes discharge.
Contact Gap—.020" (same for both sets). **Air Gap**—.020" (points just closed).

Voltage Regulator

Setting—7.4-7.8 volts (70° F.), 7.2-7.4 volts (hot—operating temp.). This Voltage Regulator is over-compensated for temperature.
Checking & Adjustment—*See Delco-Remy Single Core Regulator article in Electrical Equipment Section for complete instructions.*
Air Gap—.070" between center of core and armature (contacts just closed).

LIGHTING SWITCH:—Delco-Remy Model 478-H (for all models).
For all other data see Graham Model 96, 97 (1939) 'T&E' page.

HUPMOBILE SKYLARK MODEL R (1940)

DISTRIBUTOR:—Auto-Lite IGC-4277 (Early '39), IGW-4141 (Late '39 & '40). All data same for both distributors except Cam Angle as follows:
Cam Angle—IGC: 40° closed, 20° open. IGW: 35° closed, 25° open (dist. °).

REGULATOR:—Auto-Lite VRR-4005A (Late '40). All data same as for VRD-4009A except as follows:

Cutout Relay

Cuts Out—6.0 amperes maximum discharge current.

Voltage Regulator

Contact Gap—.012" minimum (with armature against stop pin).
Air Gap—.048-.052" with contacts just opening.
For all other data see Hupmobile Skylark Model R (1939) 'T&E' page.

LINCOLN V12 MODEL (1940)

For all data see Lincoln V12 Model (1938) 'T&E' page.

Cam Angles for Delco-Remy distributors are correct with breaker gap set midway between limits and breaker arm fibre bumper worn in (1000 miles).

Cam Angles for Auto-Lite distributors correct with gap specified by car manufacturer except in instances where special gap specified under 'Cam Angle.'

HOOD LATCH NOTE:—Hood latch handles located in driver's compartment on extreme right and left sides and must be released before hood can be raised.

SERIAL NUMBER:—First number 65-343. Stamped on plate on left side of cowl under engine hood. On Export Cars, Serial Number also stamped on left frame side rail below engine oil level gauge.

ENGINE NUMBER:—First number 65-501. Stamped on left side of crankcase above Starter Bendix.

COMPRESSION:—**Ratio**—7.4-1 Std. cast-iron head.
Pressure—135 lbs. at cranking speed (200 RPM).

VACUUM READING:—18-20" steady reading at idling speed of 7 MPH.

IGNITION:—**Auto-Lite Coil Model IG-4065.** Service coil IG-4070. Mounted on dash.

Ignition Current—2.5 amperes idling, 4.5 stopped.

Ignition Switch:—Douglas #2980 Ignition Lock Assembly. Coil connection not armored.
Ignition Lock—Douglas.

Distributor Auto-Lite IGW-4105C. Single breaker, 4 lobe cam, full automatic advance type.

Breaker Gap—.018" (.022" for new set of points).

Cam Angle or Dwell—41° closed, 49° open (distributor degrees with .020" gap).)

Breaker Arm Spring Tension—17-20 ounces.

Rotation—Clockwise viewed from the top.
Condenser—No. IGB-1025. Capacity .20-.25 mfd.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	400	0	800
2	800	4	1600
5	1400	10	2800
8	2000	16	4000
10	2400	20	4800

Removal:—Distributor mounted on bracket at front of engine. To remove, loosen clampscrew in mounting bracket, lift distributor out.

IGNITION TIMING:— **Flywheel Degrees** **Piston Pos.**
All Engines..... 4° BTDC.....0048" BTDC

To Set Timing—With #1 piston on compression, turn engine over until piston is 4° or .0048" BTDC, stop when point 3/8" before '/' flywheel mark lines up with indicator under pit cover on flywheel housing. Loosen distributor clampscrew, rotate distributor until contacts begin to open, tighten clampscrew.

Firing Order:—1-3-4-2.

Spark Plugs:—Champion Type H-10. 14 MM. Metric.
Spark Plug Gaps—Set at .025".

CARBURETION:—**Carburetor**—Zenith Model 61A5. 13/16" single barrel updraft type.
See article in Carburetor Section for complete data.

NOTE—This carburetor has Idle (low speed) adjustment only. No high speed adjustment used.

Idle Adjustment—With engine warm and idling, set idle adjusting screw so that engine fires smoothly. Idle screw should be set approximately 1½ turns out from inner seated position and setting should be varied only slightly. Set throttle stopscrew for idle speed of 7 MPH.

Float Level—Bottom of float at free end should be 1 5/32" from gasket seat of throttle body with needle valve closed (invert throttle body to check).

Air Cleaner:—AC #A1529203. Oil-wetted type Std.

Gasoline Gauge:—Stewart (Stewart-Warner) Electric. Dash Unit—No. 99166 (Instrument Cluster), Tank Unit—No. 97550.
See article in Carburetion Equipment Section.

VALVE TIMING:—**To Check**—Check tappet clearance #1 intake valve (.011" warm). This valve should open with piston 19° or .115" before top dead center when point on flywheel 1 5/32" before '/' mark lines up with indicator under pit cover on flywheel housing.

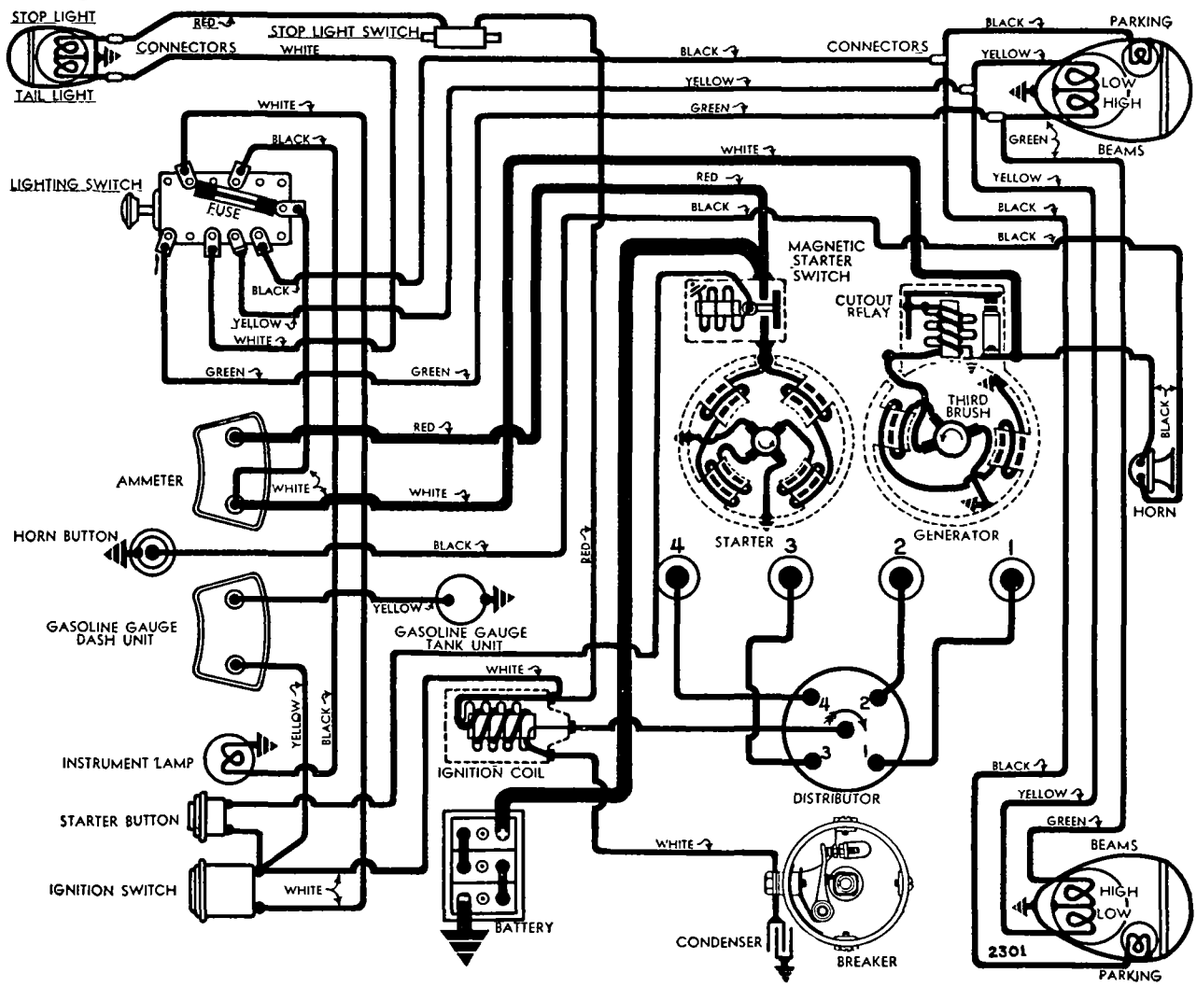
Tappet Clearance:—.011" Int., .012" Exh. Warm.

Valve Spring Pressure:—28 lbs. at 1¼" (valve closed), 44 lbs. at 1" (valve open). Spring free length 1.6875".

LUBRICATION:—**Crankcase Capacity**—6 pints (3 qts.).

Normal Oil Pressure—30 lbs. at 50 MPH.

COOLING SYSTEM:—Thermo-syphon type water circulation (no pump used).



Capacity—6 quarts.

BATTERY:—**Auto-Lite Type PN-11F.** 6 volt, 11 plate, 67 ampere hour capacity (20 hr. rate).

Grounded Terminal—Negative (—) terminal grounded to dash. No separate engine ground used.

Dimensions—6 15/16" long. 7" wide. 8⅝" high.

Location—Battery mounted on right side of cowl under engine hood.

STARTER:—Auto-Lite MAK-4001. Armature MAK-2006.

Drive—Special Inboard Bendix Type RCE11-10.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—38-61 ozs. (new brushes).

Performance Data

Torque		R.P.M.	Volts	Amperes
0	ft. lbs.	5000	5.5	70
.3	"	3240	5.5	100
1.35	"	1880	5.0	200
3.1	"	1000	4.5	300
4.8	"	220	4.0	400
4.5	"	Lock	3.0	380
7.0	"	Lock	4.0	520

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws, remove starter and switch as an assembly.

Starting Switch:—Magnetic type mounted on dash and controlled by pushbutton on left side of instrument panel.

GENERATOR:—Auto-Lite GAS-4139A. Armature GAS-2076. Third brush control type. Not ventilated.

Maximum Output—10 amperes (cold), 8 amperes (hot), 8.0 volts, 2600 RPM, 40 MPH. with standard car setting.

Charging Rate Adjustment—Remove commutator cover band, shift third brush by hand counter-clockwise to increase, clockwise to decrease charging rate. Third brush held in position by friction.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	880	0	6.4	975
2	6.6	985	2	6.8	1135
4	6.9	1100	4	7.0	1310
6	7.2	1230	6	7.35	1540
8	7.3	1420	8	7.7	1860
10	7.6	1650	10.2	8.0	2900
12	7.8	2000			
14	8.0	2800			

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—15-20 ozs. (new brushes).

Field Current—3.80-4.20 amperes at 6.0 volts.

Motoring Current—4.64-4.94 amperes at 6.0 volts.

Removal:—Generator cradle mounted at left front of engine with fan belt drive. To remove, loosen drive belt, take out clamp bolt in mounting clamp band, lift generator out.

Belt Adjustment:—Loosen fan shaft clamp nut, raise fan until belt can be pulled out of vertical line (midway between pulleys) not more than 1" with single finger pull, tighten clamp nut.

CUTOUT RELAY:—Auto-Lite CB-4014. Mounted on generator.

See article in Electrical Equipment Section.

Cuts In—6.5-7.25 volts, 5 MPH.

Cuts Out—.5-2.5 ampere discharge current (after charging at 15 amperes).

Contact Gap—.015-.045".

Air Gap—.010-.030" with contacts closed.

LIGHTING:—Headlamps—Corcoran-Brown. Pre-focused type. Upper and lower beams controlled by lighting switch.

Headlamp Adjustment—Aim headlamp upper beam straight ahead at lamp center height.

Switches

Lighting—H.A. Douglas No. 5794.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320
Parking	1.5	55
Instrument	3	63
Stop & Tail	21-3	1158

FUSES:—Lighting—20 ampere. Mounted on lighting switch.

HORN:—Schwartze No. 93. Vibrator type.

Horn Current—7 amperes.

SERIAL NUMBER:—First number (all series) 13596807 (Flint), 23601856 (Calif.), 33611856 (Linden). On right frame side rail at dash under hood.

ENGINE NUMBER:—First number (40,50) 3786214, (60, 70,80,90) 3812000 with prefix 4- (40), 5- (50), 6- (60), 7- (70), 8- (80), 9- (90). Stamped on boss on right side of crankcase to rear of fuel pump.

COMPRESSION:—

Model	Compression Ratio	Pressure 1000 RPM.	Cranking Spd.
40-40, 50	6.1-1	126 lbs.	112 lbs.
40-60, 70, 80, 90	6.25-1	130 lbs.	114 lbs.

VACUUM READING:—Steady 18-20" idling at 7-8 MPH.

IGNITION:—Coil Model 1115024, 1115026 (with radio). Mounted on engine side of dash. NOTE—Radio type coil has condenser installed under end cover.

Ignition Current—2½ amperes idling, 4½ stopped.

Ignition Switch:—Delco-Remy Model 1116276 (40, 50, 60, 70), 1116277 (40, 50, 60, 70—RHD), 1116280 (80, 90), 1116281 (80, 90—RHD). Coil connection armored. NOTE—Ignition switch has 3 positions as follows: 1) 60° to right—Ign. OFF also LOCKED with key removed. 2) Vertical—Ign. ON with or without key in place. 3) 40° to left—Ign. OFF also UNLOCKED with or without key in place.

Ignition Lock—Briggs & Stratton No. 85253. Key Series—8000 to 9499. Groove—No. 15.

Distributor Delco-Remy 1110801 (40,50), 1110805 (60,70, 80, 90). Full automatic advance type with auxiliary vacuum spark control.

Breaker Gap—.015". Limits .0125-.0175".

Cam Angle or Dwell—31° (closed), 14° (open).

Breaker Arm Spring Tension—19-23 ounces.

Rotation—Counter-clockwise viewed from above.

Condenser—Part No. 1869704. Capacity .18-.25 mfd.

Automatic Advance—1110801

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	250	3.5	500
7	400	14	800
13	1500	26	3000

Automatic Advance—1110805

Start	250	2	500
8	600	16	1200
13	1500	26	3000

Vacuum Spark Control 681-H—Integral type (on distributor, linked to breaker plate). Provides additional advance at speeds above 18 M.P.H. except when engine accelerated or operated with wide open throttle when spark retarded by return spring in unit. Plunger travel ⅛" maximum.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG).
Start	0	5-7"
5-6½	10-12	10-13"

Distributor Removal:—Mounted on right side of crankcase. To remove, disconnect vacuum line, take out two hold-down screws in advance arm, lift out. NOTE—Oil pump driven by tongue on lower end of distributor shaft. When installing distributor, mesh drive gear so that rotor at #1 segment in cap and normal timing secured with mounting screws approximately centered in slots.

IGNITION TIMING:—Initial setting (regular fuel 40, 50, Ethyl fuel 60, 70, 80, 90) given below. See 'Final Ignition Setting' (following) for correction dependent on operating conditions and fuel used.

	Flywheel Degrees	Piston Position
40-40, 50	4° BTDC	.0063" BTDC.
40-60, 70, 80, 90	6° BTDC	.0149" BTDC.

Timing (With Synchroscope)—Connect synchroscope in #1 spark plug lead, direct light on flywheel through inspection hole in right front face of flywheel housing above starter. Idle engine at 400 RPM. maximum. Loosen two distributor hold-down screws, rotate distributor until 'ADV' mark lines up with indicator on flywheel housing, tighten screws (screws should be approximately centered in slots). See Final Ignition Setting below.

Timing (Without Synchroscope)—With #1 piston on compression, turn engine over until 'ADV' mark on flywheel lines up with reference mark on housing (inspection hole in right front face of housing above starter). Adjust distributor as above.

Final Ignition Setting—Should be adjusted for fuel used so that light 'ping' secured when engine accelerated with wide open throttle between 10 & 20 MPH. To adjust, loosen two distributor hold-down screws, move distributor in small steps counter-clockwise (if ping too severe), clockwise (if no ping).

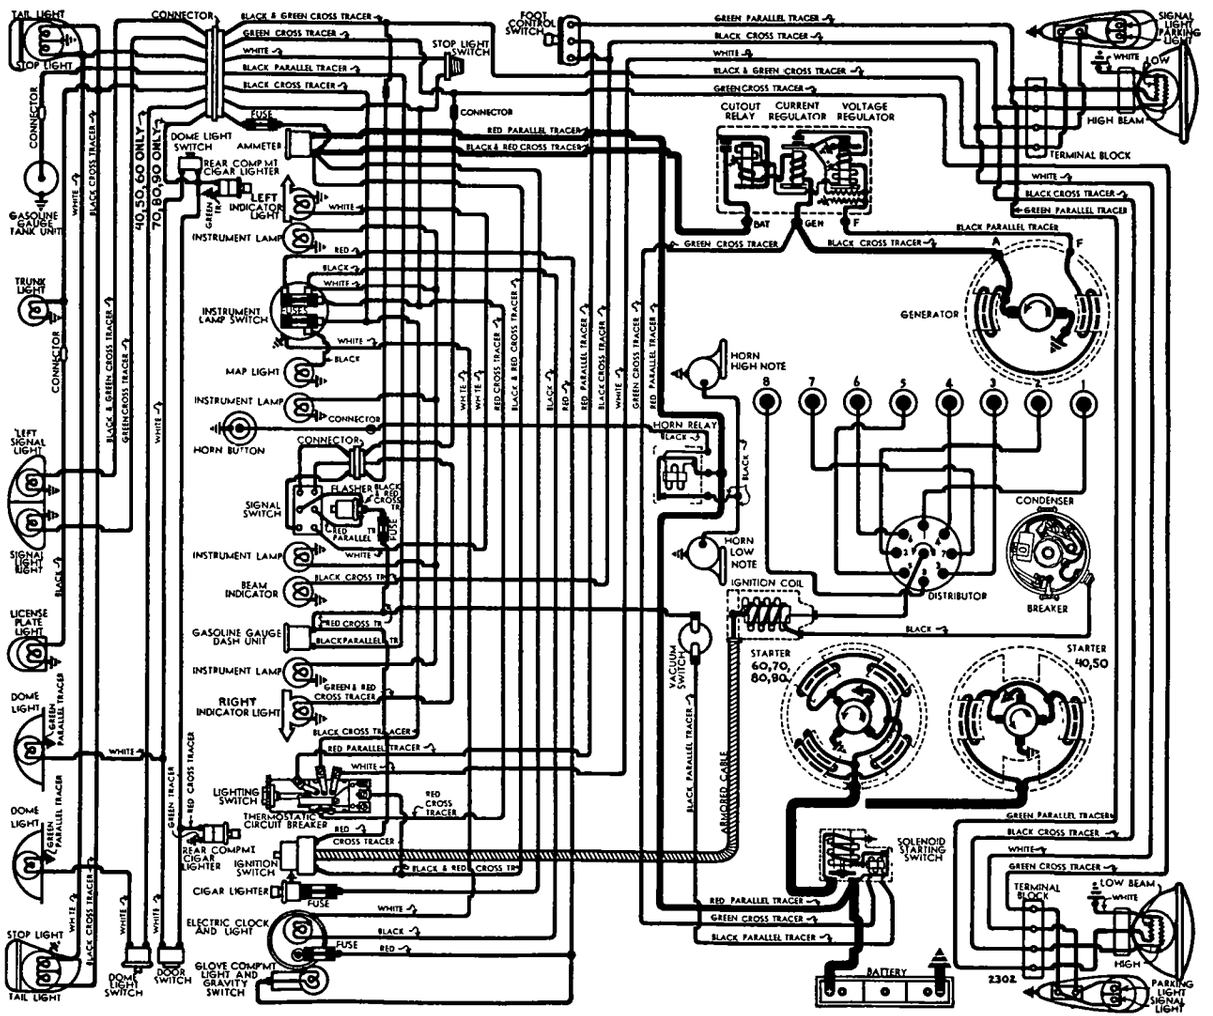
Firing Order:—1-6-2-5-8-3-7-4.

Spark Plugs:—AC No. 46. 14 MM. Metric type.

Spark Plug Gaps—.025".

CARBURETION:—Carburetor—Stromberg or Carter, 1" (40, 50), 1¼" (others) dual downdraft types.

	Carter	Stromberg
40, 50	440-S or 474-S	AAV-16
60, 70, 80, 90	448-S	AAV-26



See articles on each type in Carburetor Section.

Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 7-8 MPH. idling speed. Adjust idle adjusting screw for each barrel (in succession) until engine fires smoothly (approximately 1¼ turns—Stromberg, ½-1¼ turns —Carter, from inner seated position. Readjust idle speed.

NOTE—If vacuum gauge used for idling adjustment, turn screws evenly in 'rich' direction until gauge reading is 1" less than obtainable maximum.

Float Level (Carter)—3/16" from top of float to cover (gasket removed with needle valve seated.

Float Level (Stromberg)—Fuel level 19/32" below top edge of bowl with engine idling.

Accelerating Pump Setting—Three holes are provided in pump arm (Carter—remove dust cover), throttle lever (Stromberg) for pump rod connection. Recommended settings are as follows:
#1 (Inner—Min.) Hot weather, high-test gasoline.
#2 (Center)—Std. normal all-year setting.
#3 (Outer—Max.) Cold weather, low-test gasoline.

Fast Idle:—Integral type built-in each carburetor.
See articles in Carburetion Equipment Section.
Setting (Carter)—Adjust fast idle screw for .018" (440-S, 474-S), .012" (448-S) throttle opening with choke valve fully closed.
Setting (Stromberg)—Non-adjustable type.

Automatic Choke:—Carter Climatic Control (Carter), AAV-16, AAV-26 type (Stromberg).
See articles in Carburetion Equipment Section.
Setting (Carter)—1 Notch Lean (440-S, 474-S), 3 Notches Rich (448-S).
Setting (Stromberg)—Inverted 'V' mark on cover should line up with reference mark on housing.

Air Cleaner:—AC #1529294 (40, 50), #1529307 (60, 70, 80, 90) oil-wetted type Std. Heavy duty oil-bath type optional.

Fuel Pump:—AC Type AJ #1537100 (40, 50), #1523992 (60, 70, 80, 90). Combination fuel-and-vacuum pump.
See articles in Carburetion Equipment Section.

Gasoline Gauge:—AC Electric type. Dash unit—#1515367 (all). Tank unit—#1516167 (40, 50, 60, 70), #1516176 (80, 90).
See article in Carburetion Equipment Section.

MANIFOLD HEAT CONTROL:—Thermostatic coil type.
Setting—Coil wind-up ¼ turn at 70° F. With coil engaged on heat valve shaft, wind up outer end ¼ turn and engage prong on anchor stud.

VALVE TIMING:—#2 or #7 exhaust valve should be .145" open (40, 50), .155" (60, 70, 80, 90) with #1 & 8 pistons at TDC. Flywheel mark 'TDC/1-8' at indicator hole above starter.
Tappet Clearance—.015" all valves—engine hot.
Valve Spring Pressure—Total (inner and outer springs) 42-52 lbs. (closed), 112-124 lbs. (open).

LUBRICATION:—Crankcase Capacity 40, 50 8 qts. (dry), 6 qts. (refill). **60,70,80,90** 10 qts. (dry), 8 qts. (refill).
Normal Oil Pressure—45 lbs. at 35 M.P.H.

COOLING:—Capacity 13¼ qts. (40,50), 17 (60,70,80,90).
Thermostat—Harrison. In cylinder head outlet. Starts to open at 148-155° F. Fully open 173° F.

BATTERY:—Delco Model 17E-1. 6 volt, 17 plate, 115 ampere hour capacity (20 hour rate).
Starting Capacity—137 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.3 minutes. Five second voltage—4.4 volts.
Grounded Terminal—Negative (—) grounded to bolt on engine block.
Dimensions—Width 4". Length 19 5/16". Height 9".
Location—Under engine hood on right side.
Taxicab Battery—Delco Model 19E-1. 6 volt, 19 plate, 130 ampere hour capacity (20 hour rate).
Grounded Terminal & Location—Same as 17E-1.

STARTER:—Delco-Remy 1107005 (40,50), 1107018 (40,50 RHD), 1107908 (60 to 90), 1107909 (60 to 90 RHD).
Armature 1867897 (1107005), 820158 (1107908, 9), 810601 (1107018).
Drive—Overrunning clutch (solenoid pinion shift).
Brush Spring Tension—24-28 ounces.
Rotation—Counter-clockwise at commutator end.
Cranking Engine—(40, 50) 135 RPM., 150 amp., 4.5 volts. (60, 70, 80, 90) 115 RPM., 175 amperes, 5 volts.

Performance Data—1107005, 1107018

Torque	R.P.M.	Volts	Amperes
0 ft. lbs	5000	5.0	65
12 "	Lock	3.37	525

Performance Data—1107908, 1107909

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5500.	5.0	65
16 "	Lock	3.0	600

Removal:—Flange mounted on right front face of flywheel housing. To remove, take out capscrews.

Starting Switch:—Solenoid Switch No. 1542 (1107005, 1107908), 1545 (1107018, 1107909). Vacuum Switch D-R. No. 1990127 (Stromberg Carb.), Carter Car Starter No. 192-10U (Carter Carb.). Mounted on carburetor. *See articles in Electrical Equipment Section.*

Solenoid Switch Specifications

Closes against 70 lb. pull with ½" air gap drawing 65-71 amperes at 5 volts. Holds switch closed drawing 12-14 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—1.9 volts Max. **Contact Gap**—.035".
Contacts Open—1.0-1.2 volts. **Air Gap**—.012".

GENERATOR:—

Car Model	Delco-Remy Model	Pulley Diameter	Groove Width
40, 50	1102662	3 13/16"	13/16"
40 (3.9 Axle)	1102663	3 17/32"	13/16"
60, 70, 80	1102668	3 17/32"	15/16"
90	1102669	3 13/16"	15/16"

NOTE—Interchangeable when correct pulley installed. Two brush (shunt) type with current-voltage control.
Armature No.—1879002 (all models).
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator.
Maximum Charging Rate—32-34 amperes, 8.0 volts, 2000 RPM. (cold), 2400 RPM (hot), or approx. 20 MPH. and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

	Amperes	Volts	R.P.M.
Cold	30*	8.0	1800

*—Not maximum output—See Current Regulator.
Brush Spring Tension—25 ounces each.
Field Current—1.76-1.88 amperes at 6.0 volts.
Rotation—Counter-clockwise at commutator end.

Removal—Pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.

Belt Adjustment:—Loosen pivot and clamp bolts, pull generator up and out until belt deflection midway between fan and generator is ½".

REGULATOR:—Model 1118201. 'Single Core' type. Vibrating Voltage & Current regulator on dash.
CAUTION—Check generator for grounded fields before changing regulator settings.
See article in Electrical Equipment Section for data.

Cutout Relay

Cuts In—6.2-6.7 volts, hot, 880 RPM, 8-10 MPH.
Cuts Out—0-4.0 amperes discharge current.
Contact Gap—.020" (same for both sets).
Air Gap—.020" (with points just closed).

Voltage Regulator

Setting—7.4-7.8 volts (70° F.), 7.2-7.4 volts (hot). Regulator over-compensated for temperature.
To Check—Connect ammeter in charging line at 'BAT' regulator terminal, voltmeter between 'BAT' terminal and ground. Operate generator at 2800 RPM., adjust charging rate to 8-10 amperes (use variable rheostat or 'AVR' set). With regulator hot (150° F.), retard generator speed until cut-out relay points open, then increase generator speed to 2800 RPM. and check hot voltage setting (above).
To Adjust—Change regulator armature spring tension slightly by bending lower spring hanger for **light (left) spring (or one spring if both alike) only.** If further adjustment required, see Single Core Regulator article in Electrical Equipment Section for Heavy (or other spring) adjustment.
Air Gap—.070" between center of core and armature with contacts just closed.

Current Regulator

Setting—32-34 amperes (hot).
To Check—Remove cover, connect short jumper from voltage regulator frame to upper contact support bracket (shorting out Voltage Regulator). Connect ammeter in charging line at 'BAT" regulator terminal. Turn on lights and accessories, operate generator and increase speed until output remains stationary (run until hot). Check setting with regulator at operating temperature.
To Adjust—Change regulator armature spring tension slightly by bending lower spring hanger for **one spring.** If further adjustment required see Single Core Regulator article in Electrical Equipment Section for adjustment of other spring.
Air Gap—.075" (check same as Voltage Regulator).

LIGHTING:—Headlamps—Guide 'Sealed Beam' type.
See article in Electrical Equipment Section for data.
Headlamp Adjustment—Aim upper beam straight ahead with center of hot spot 3" below lamp center height.
Beam Indicator—In speedometer dial. Lighted when upper beams in use.
Direction Signal—*See Electrical Equipment Section.*

Switches

Lighting—Delco-Remy 1995008.
Beam Selector—Delco-Remy 1997002.
Direction Signal—Delco-Remy 1995501 (All—LHD), 1995502 (40, 50, 60, 70—RHD).

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Front Dir. Sig. & Park.	21-3	1154
Instrument, Map, Clock	1.5	55
Radio, Trunk	1.5	55
Beam Indicator, Glove Compt.	1	51
Direction Signal Indicators	1	51
Stop & Tail	21-3	1154
License Plate	3	63
Rear Direction Signal	32	1133
Dome (except 46C & 66C)	6	81
Dome (46C & 66C only)	1.5	55

THERMOSTATIC RELAY:—Delco-Remy. On lighting switch. Contacts remain closed with 30 amperes, open in 3 minutes with 42 amps. @ 70°. Not adj.

FUSES:—Dome Light & Rear Cigar Lighters (70,80,90) —30 ampere in feed wire at charge indicator.
Direction Signal—14 ampere in connector back of instrument panel.
Instrument Lamp Switch—Two 10 amperes. #1 protects Instrument Lights & Clock. #2, Map Light & License.
Clock—2 ampere under red button on back of clock.

HORNS:—Delco-Remy Model K-33-H. No. 1999501, 519 (low note, right horn), 1999502, 520 (high note, left horn). Vibrator type, blended tone, operated by horn relay. No. 1999501 & 502 on early cars.

Type	Current (at 6 volts)	Air Gap
1999501 (Low)	16-18 amperes.	.044-.049"
1999502 (High)	15-17 amperes.	.034-.039"
1999519 (Low)	19-21 amperes.	.044-.049"
1999520 (High)	18-20 amperes.	.034-.039"

Horn Relay:—Delco-Remy Model 1116775.
Contact Gap—.020". **Air Gap**—.015" (closed).
Contacts Close—2.75-4.0 volts.
NOTE—Use relays marked by bar over last 3 figures of part number to correct relay sticking.

ENGINE HOOD & SIDE PANELS:—Alligator type. To raise hood, tilt radiator ornament back to release catch and safety latch. Side panels removed by taking out 2 screws on upper edge and 3 screws along lower edge of panel.

SERIAL & ENGINE NUMBER:—First number (60S) 6320001, (62) 8320001, (72) 7320001, (75) 3320001. On crankcase at rear of left cylinder block and on left frame side member opposite steering gear.

COMPRESSION:—**Ratio** 6.25-1 (60S, 62), 6.7-1 (72, 75).

Pressure:—	At 1000 RPM.	At Cranking Speed
6.25-1	155 lbs.	Approx. 105-110 lbs.
6.70-1	170 lbs.	Approx. 110-115 lbs.

VACUUM READING:—Steady 20-21" idling 7-8 MPH.

IGNITION:—**Coil Model 1115128.** Mounted on dash.

Ignition Current—2.2 amperes idling, 4.4 stopped.

Ignition Switch:—Delco-Remy Model 1116282 (62, 72), 1116275 (60S, 75). Armored cable coil connection.

Ignition Lock—Briggs & Stratton No. 45792. Key Series—8000 to 9499. Groove—No. 15.

Distributor Model 1110806. Single breaker, 8 lobe cam, full automatic advance with vacuum spark control and manual adjustment.

Breaker Gap—.0125-.0175".

Cam Angle or Dwell—31° closed, 14° open (distr.).

Breaker Arm Spring Tension—19-23 ounces.

Rotation—Clockwise viewed from above.

Condenser—Part No. 1869704. Capacity .18-.25 mfd.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	500	1	1000
12	2000	24	4000

Vacuum Spark Control 1116020. Integral type (on distributor, linked to breaker plate). Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring within unit. Plunger travel 13/64" maximum.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5.5-7.5"
9°	18°	15-18"

Manual Adjustment—Permits 10° advance or retard from center position. See Ignition Timing for adjustment.

Removal:—Distributor mounted between cylinder banks at rear of engine. To remove, disconnect vacuum line, take out two hold-down screws in advance arm, lift out. NOTE—When installing distributor, turn crankshaft to firing position for #1 cylinder, mesh distributor drive gear with slot in upper end of drive shaft offset toward left-hand or rear side of engine (narrow portion of coupling toward rear).

IGNITION TIMING:—Setting for 72 octane fuel (60S, 62), premium 'Ethyl' fuel (72, 75). See Manual Adjustment (following) for correction dependent on operating conditions and fuel regularly used.

Flywheel Degrees	Piston Position
5° BTDC	.0114" BTDC

Timing (With Synchroscope)—This method recommended by manufacturer. Clip synchroscope lead to #1 spark plug, direct light on crankshaft pulley, idle engine. Loosen hold-down screw in advance arm, rotate distributor until 'IG/A' mark on pulley (5° before dead center Mark 'C.1/6) appears in line with pointer on chain case cover, tighten hold-down screw. Adjust for fuel (see Manual Adjustment).

Timing (Without Synchroscope)—Turn engine over to firing position for #1 piston (front piston, left bank) with crankshaft pulley mark 'IG/A' (5° before dead center mark 'C.1/6') lined up with pointer on chain case cover. Loosen hold-down screw in advance arm, center pointer on scale, tighten screw. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, check Manual Adjustment.

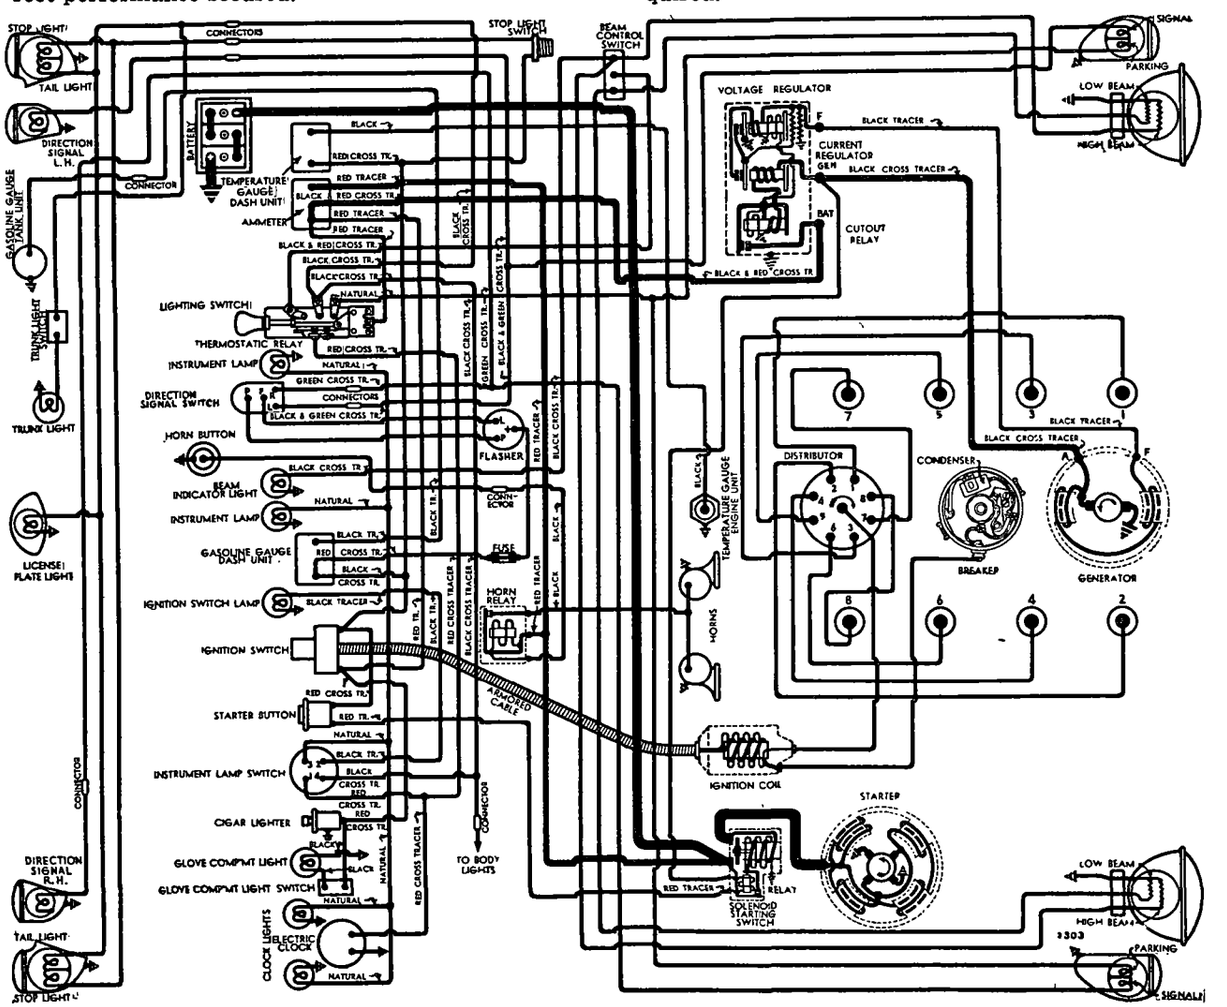
Manual Adjustment—Should be set for slight ping when accelerating engine with wide open throttle at speeds below 15 M.P.H. To adjust, loosen hold-down screw in advance arm, rotate distributor clockwise (if ping too severe), counter-clockwise (if no ping noted) one graduation at a time until correct performance secured.

NOTE—Check engine for faulty spark plugs, excessive carbon deposits, localized hot spots, lean carburetor setting before changing adjustment to correct pinging.

Firing Order:—1-8-7-3-6-5-4-2.

Spark Plugs:—AC No. 104. 10 MM. Metric type.

NOTE—These plugs are new small type. Do not tighten excessively (7-10 ft. lbs. tension).



Spark Plug Gaps—.025-.030".

CARBURETION:—**Carburetor**—Stromberg Model AAV-26. 1¼" dual downdraft type.

See article in Carburetor Section for data.

Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 7-8 MPH idling speed. Adjust idle adjusting screw for each barrel until engine fires smoothly (turn screws in for leaner mixture.) Readjust idle speed.

Accelerating Pump Setting—Throttle lever has two holes for pump link engagement. Connect as follows: Inner Hole (Min. Stroke)—Normal setting. Outer Hole (Max. Stroke)—When richer charge required.

Float Level—Fuel level 5/8" below top edge of bowl.
Fast Idle:—Integral (built-in carburetor). Non-adjustable. *See article in Carburetion Equipment Section.*
Fast Idle Setting—Not adjustable.
Automatic Choke:—Integral type built-in carburetor. *See article in Carburetion Equipment Section.*
Choke Setting—Center '0' mark on scale opposite mark on housing.
Air Cleaner:—AC #1529298 (60S,62,72), #1528980 (75) heavy duty oil-bath type.
Fuel Pump:—AC Type AX #1537088 Diaphragm type combination fuel-and-vacuum pump. *See article in Carburetion Equipment Section.*
Gasoline Gauge:—AC Electric type. #1515368 (dash unit), #1516155 (tank unit—60S,62), #1516190 (tank unit—72), #1516156 (tank unit—75). *See article in Carburetion Equipment Section.*

VALVE TIMING:—Intake valve (#1 cylinder, front—left bank) opens with piston at TDC. with mark 'C.1/6' behind crankshaft pulley aligned with pointer on chain case cover (right side).
Tappet Clearance—None (hydraulic take-up used). *See article in Mechanical Equipment Section for data.*
Valve Spring Pressure—66 lbs. at 1 59/64" (valve closed). 145 lbs. at 1 37/64" (valve open).

LUBRICATION:—**Crankcase Capacity**—7 quarts.
Normal Oil Pressure—25 lbs. at 30 MPH., 15 lbs. idling.

COOLING SYSTEM:—**Capacity**—24½ quarts.
Thermostat:—In radiator top tank (operates shutters). Starts to open 153-158°F., fully open 175°. High Reading Thermostat for use with heater (starts to open 168-175°F., fully open 190°).
Temperature Gauge:—AC Electric. #1510773 (dash unit), #1510774 (engine unit). *See article in Mechanical Equipment Section for data.*

BATTERY:—**Delco 17K-2.** 17 plate, 115 AH. capacity.
Starting Capacity—135 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.3 minutes. Five second voltage—4.38 volts.
Grounded Terminal—Positive (+) terminal.
Engine Ground—Strap connector at right front engine support.
Dimensions—Length 10⅜". Width 7". Height 8⅝".
Location—Under left front floor (62, 72), under right side of engine hood outside frame (60S, 75).
Commercial Battery—Delco Model 19Q-1. 6 volt, 19 plate, 122 A H. Capacity (20 hour rate).
Starting Capacity—140 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.8 minutes. Five second voltage 4.5 volts.
Dimensions—Same as 17K-2 except Height 8 9/16".
Grounded Terminal, Location—See 17K-2 above.

STARTER:—**Model 1107912 (A11 LHD—72, 75 RHD) 1107911 (60S, 62 RHD). Armature No. 820158 (all models).**
Drive—Overrunning clutch (solenoid pinion shift).
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces.

Performance Data

Torque	R P.M.	Volts	Amperes
0 ft. lbs.	5500	5.0	60
16 "	Lock	3.0	600

Removal:—Flange mounted on right front face of flywheel housing. To remove, take out flange mounting screws, pull starter forward and remove from below.
Starting Switch:—Solenoid Switch Type 1542 (all). Mounted on starter, controlled through relay (in switch) by Control Switch Type 1996005 on instrument panel. *See article in Electrical Equipment Section for data.*

Solenoid Switch Specifications

Closes against 70 lb. pull with ½" air gap drawing 65-71 amperes at 5 volts. Holds switch closed with current draw of 12-14 amperes (hold-in coil only).

Solenoid Relay Specifications

Contacts Close—1.9 volts max. **Open**—1.0-1.2 volts.
Contact Gap—.035". **Air Gap**—.012".

GENERATOR:—**Delco-Remy 1102661. Armature 1878211.** Two brush with current-voltage control.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator. *See Regulator data following.*
Maximum Charging Rate—32 amperes min. (hot), 8 0 volts, 2450 RPM, 27 MPH (60S,62), 24.5 MPH (72, 75) and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

	Amperes	Volts	R.P.M.
Cold	30*	8.0	1800

*—Not maximum output—See Current Regulator.
Rotation—Counter-clockwise at commutator end
Brush Spring Tension—25 ounces each.
Field Current—1.76-1.88 amperes at 6.0 volts.
Removal:—Flange mounted between cylinder banks at front of engine, belt driven in tandem with water pump (separate belt for fan). To remove, take out flange mounting bolts.
IMPORTANT AIR SCOOP NOTE—When installing air scoop on generator, make certain that raised portion provides clearance at terminals and that scoop does not cover drive end oil cup.
Belt Adjustment:—Loosen generator mounting bolts, lift generator up until only slight slack evident in belt (belt engages bottom of pulley groove not sides), tighten bolts. Generator pivots on left hand bolt, right bolt hole slotted. NOTE—Fan belt adjustment provided at fan bracket.

REGULATOR:—**Model 1118202. 'Single Core' type.** Vibrating Voltage & Current regulator on dash.
CAUTION—Check generator for grounded fields before changing regulator settings. *See article in Electrical Equipment Section for data.*

Cutout Relay

Cuts In—6.2-6 7 volts (hot).
Cuts Out—0-4.0 amperes discharge current.
Contact Gap— *020" (same for both sets).*
Air Gap—.020" (with points just closed).

Voltage Regulator

Setting—7.4-7.8 volts (70° F.), 7.2-7.4 volts (hot). Regulator over-compensated for temperature.
To Check—Connect ammeter in charging line at 'BAT' regulator terminal, voltmeter between 'BAT' terminal and ground. Operate generator at 2450 RPM, adjust charging rate to 8-10 amperes (use variable rheostat or 'AVR' set). With regulator at hot operating temperature, retard generator speed until cut-out relay points open, then increase generator speed to 2450 RPM and check hot voltage setting (above).
To Adjust—Change regulator armature spring tension slightly by bending lower spring hanger for **light (left) spring (or one spring if both alike) only.** If further adjustment required, see Single Core Regulator article in Electrical Equipment Section for Heavy (or other spring) adjustment.
Air Gap—.070" between center of core and armature with contacts just closed.

Current Regulator

Setting—32-34 amperes (hot).
To Check—Remove cover, connect short jumper from voltage regulator frame to upper contact support bracket (shorting out Voltage Regulator). Connect ammeter in charging line at 'BAT' regulator terminal. Turn on lights and accessories, operate generator and increase speed until output remains stationary (run until hot). Check setting with regulator at operating temperature.
To Adjust—Change regulator armature spring tension slightly by bending lower spring hanger for **one spring.** If further adjustment required see Single Core Regulator article in Electrical Equipment Section for adjustment of other spring.
Air Gap—.075" (check same as Voltage Regulator).

LIGHTING:—**Headlamps**—Guide 'Sealed Beam' type. *See article in Electrical Equipment Section for data.*
Headlamp Adjustment—Aim upper beam straight ahead with center of hot spot 3" below lamp center height.
Beam Indicator—On speedometer face. Lighted whenever Country (upper) beam in use.
Direction Signal—*See Electrical Equipment Section.*

Switches

Lighting—Delco-Remy 1995010.
Beam Selector—D-R 1997002, 471-U (60, 75 RHD).

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Front Indic. & Park	21-3	1154
Instr., Clock, Radio	1.5	55
Glove & Trunk Comp't	1.5	55
Beam Indicator, Ign. Lock	1	51
Stop & Tail	21-3	1154
*Rear Indicator (Early)	21-3	1154
*Rear Indicator (Later)	32	1133
License Plate	3	63
Dome & Quarter	15	87

*—When replacing Rear Indicator Bulb use same type bulb as formerly used (1154 double contact—1133 single contact) in order for circuit to function properly.

THERMOSTATIC RELAY:—**Delco-Remy.** On lighting switch. Contacts remain closed with 30 amperes, open in 3 minutes with 42 amps. @ 70°. Not adj.

FUSES:—**Direction Signal**—9 ampere. In Flasher lead under instrument panel.
Fog Lights—20 ampere. On switch.
Radio & Under Seat Heater—14 amperes each.

HORNS:—**Delco-Remy Model K-33-H.** No. 1999501, 519 (low note), 1999502, 520 (high note). Vibrator type, blended tone, operated by horn relay. Horn set 1999501 & 502 used on early cars.

Type	Current (at 6 volts)	Air Gap
1999501 (Low)	16-18 amperes	.044-.049"
1999502 (High)	15-17 amperes	.034-.039"
1999519 (Low)	19-21 amperes	.044-.049"
1999520 (High)	18-20 amperes	.034-.039"

Horn Relay:—Delco-Remy Model 1116775.
Contact Gap—.020". **Air Gap**—.015" (closed).
Contacts Close—2.75-4.0 volts.

ENGINE HOOD & SIDE PANELS:—Alligator type. To raise hood, tilt radiator ornament, raise hood slightly and release safety catch (under edge of hood). Side panels secured by screw at each upper corner and clips along lower edge.

SERIAL & ENGINE NUMBER:—First number 5320001. On upper rear corner of left hand cylinder block below head and on frame opposite steering gear.

COMPRESSION:—**Ratio**—6.75-1 (requires Ethyl fuel). 6.08-1 optional.

Pressure—180 lbs. at 1000 RPM for standard head or approximately 110-115 lbs. at cranking speed.

VACUUM READING:—Steady 20-21" idling at 7-8 MPH.

IGNITION:—**Coil Model 553-E.** Two coil unit mounted on bracket at radiator top. Coil Cover No. 1854013.

Current—2.2 amperes idling, 4.4 stopped (each).

Ignition Switch:—Delco-Remy No. 1116283 (switch and cable). Connected to coil unit by armored cable.

Ignition Lock—Briggs & Stratton No. 45792. Key Series—8000 to 9499. Groove—No. 15.

Distributor Nos. 1110601 (L.H.), 1110602 (R.H.). Two distributors used (left hand distributor times ignition for entire engine, right hand distributor distributes high tension current to spark plugs of right hand cylinder bank only and has no breaker mechanism. Same design as used on 39-90.

Type—Double breaker, 8 lobe cam, full automatic advance with manual adjustment at distributor.

Firing Interval—Movable contacts open 22½° (distr.) after fixed set. Must be synchronized (see Timing).

Breaker Gap—.0125-.0175".

Cam Angle or Dwell—31° closed, 14° open (distr.). Each set operates independently.

Breaker Arm Spring Tension—19-23 ounces.

Rotation—Clockwise viewed from top (L.H. No. 1110601), counter-clockwise (R.H. No. 1110602).

Condenser—No. 1869707 (2 used, both mounted in L.H. No. 1110601 distributor). Capacity .18-.25 mfd.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	800	1½	1600
10	2000	20	4000

Manual Adjustment—Permits 10° advance or retard from center position. See Ignition Timing for adjustment.

Removal:—Distributor for each bank mounted at right and left hand side at front of engine. To remove, take out hold-down screw in advance arm, lift up to disengage coupling (does not disturb drive gear).

Distributor Installation Note—Drive slot not offset and distributors must be installed as follows: With crankshaft turned to #1 firing position (IG/A mark on dampener at front of engine lined up with pointer), install both distributors with rotors pointing forward and to left (L. H.—33° to left from straight ahead position, R. H.—60° to left).

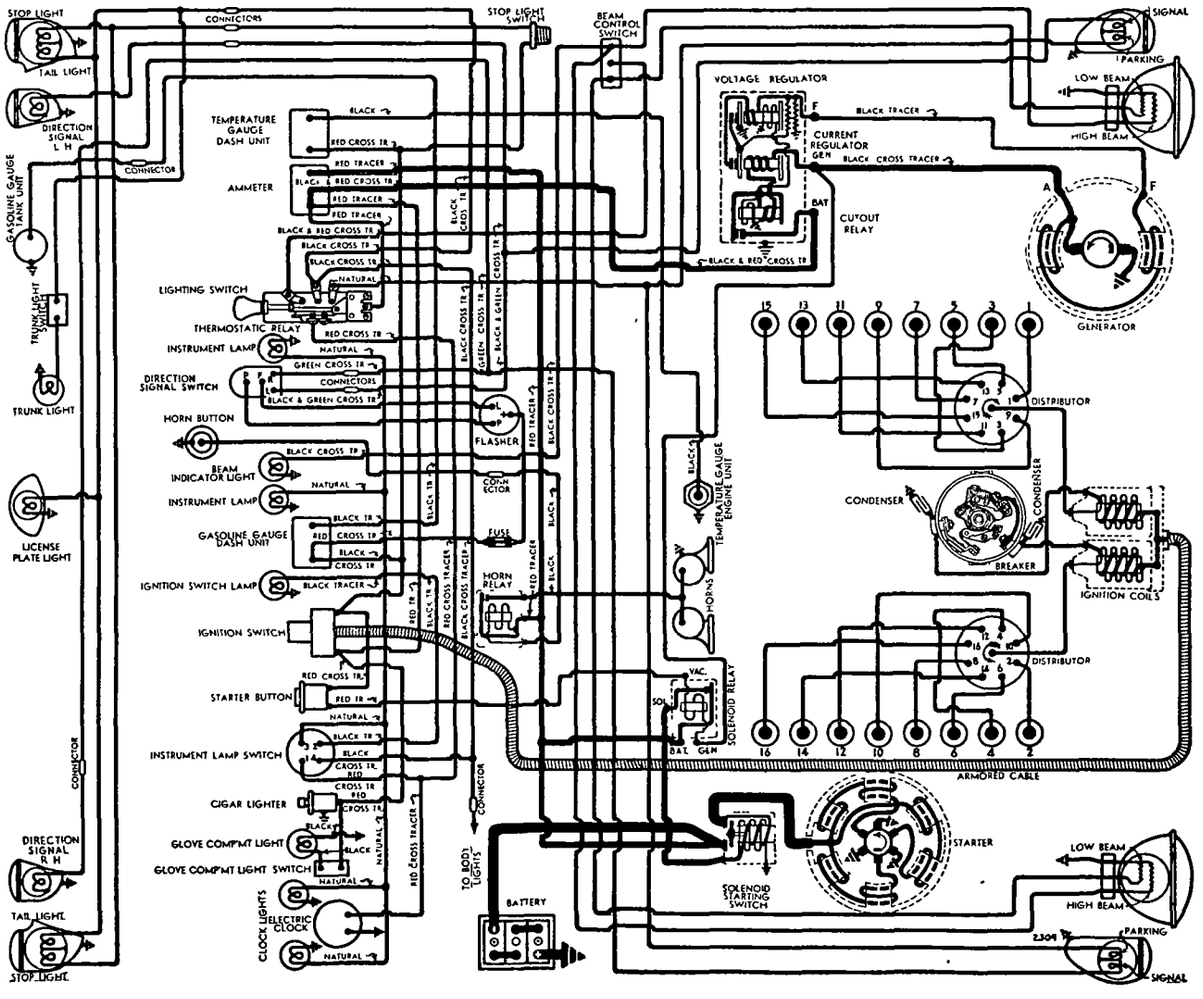
Distributor Drive Shaft Installation—Distributor cannot be timed unless shafts correctly installed as follows: With crankshaft and timing gear marks lined up, install special Distributor Shaft Setting Gauge #J-1212 in distributor support dowel holes, note pointer positions. Remove gauge, install distributor drive shafts, check with gauge (slots must line up with pointer).

IGNITION TIMING:—Standard setting (Ethyl fuel): See Manual adjustment for correction dependent on fuel regularly used.

Flywheel Degrees	Piston Position
6° BTDC.	.0112" BTDC.

Timing (Stationary Contacts)—Loosen thumbscrew on pointer arm, center pointer on scale, tighten thumbscrew. With #1 piston on compression (front cylinder, left bank), turn engine over until mark 'IG/A' on vibration dampener (which is 6° before TDC mark 'C/1-15') lines up with pointer on chain case cover. Loosen advance arm clampscrew on left hand distributor, rotate distributor until stationary contacts (mounted directly on breaker plate) begin to open, tighten clampscrew. Then synchronize.

Synchronization (Timing Movable Contacts)—Manufacturer recommends distributor removal and synchronization on test fixture (set movable contacts to open 22½° (distr.) after fixed set. To synchronize on engine, turn engine over 45° or ⅛ revolution to firing position for #4 cylinder with 'IG/A' mark on dampener lined up with pointer. Remove distributor cap and rotor, loosen two lockscrews on movable sub-plate (on which movable contacts mounted), turn eccentric adjusting screw until contacts begin to open ,tighten lockscrews. Check Manual Adjustment setting.



Manual Adjustment—Should be set for slight ping when accelerating engine with wide open throttle at speeds below 15 M.P.H. To adjust, loosen pointer thumbscrew, rotate distributor clockwise (if ping too severe), counter-clockwise (if no ping noted) one graduation on scale at a time until satisfactory performance secured. NOTE—Before changing manual adjustment, accelerate engine up to at least 60 MPH (critical point is 50 MPH.). If engine pings, check for fuel being used, faulty spark plugs, carbon deposits, lean carburetor setting which will cause pre-ignition.

Firing Order:—1-4-9-12-3-16-11-8-15-14-7-6-13-2-5-10. See diagram for cylinder numbering and spark plug connections.

Spark Plugs:—AC No. 104. 10 MM. Metric. NOTE—These plugs are new small type. Do not tighten excessively (7-10 ft. lbs. tension).

Spark Plug Gaps—.032". Limits .030-.035".

CARBURETION:—**Carburetors**—Carter WDO Type 407-S (Left hand), 408-S (Right hand). 1⅛" dual,

downdraft type. One carburetor used for each cylinder bank with interconnected throttle controls.
See article in Carburetor Section for data.
NOTE—Carburetors must be synchronized or equalized at both idle and part throttle position.
Idle Adjustment—With engine warmed up so that Automatic Chokes and Fast Idles inoperative, adjust each carburetor as follows: Set throttle lever stopscrew for 7-8 MPH. idling speed. Turn each idle adjusting screw (one for each barrel, two per carburetor) in until engine begins to lag or miss, then turn screw out slowly until engine fires smoothly. Readjust throttle stopscrew for correct idling speed of 300 R.P.M. After adjusting both carburetors, equalize as follows:
Equalizing Carburetors—Use mercury column 'U' tube connected to ⅛" pipe plug openings in long leg of each intake manifold (do not connect gauge to vacuum balancing tube between carburetors). Disconnect throttle rods, idle engine, note mercury levels in tube. Adjust throttle stopscrew at each carburetor so that engine idles at 7-8 MPH. and mercury level is equal in each tube. Adjust right throttle rod length (trunnion with fine threads on rod near carburetor) so that rod can be connected without disturbing throttles or unbalancing mercury levels. Open throttle to 1000 RPM. engine speed (use foot throttle, not hand throttle), make any necessary re-adjustment to secure equal mercury column levels. If adjustment made recheck idle setting (idle speed equalization more important).
Accelerating Pump Setting—Not adjustable.
Float Level—13/64" from top of float to cover (gasket removed) with needle seated.

Fast Idle—Integral type. Built-in each carburetor.
See article in Carburetion Equipment Section.
Fast Idle Setting—Adjust fast idle screw for .026" throttle opening with choke valve fully closed.

Automatic Choke:—Integral. Built-in each carburetor. *See article in Carburetion Equipment Section.*
Choke Setting—Set center index mark to coincide with mark on carburetor flange.

Air Cleaner:—AC #1528718 heavy duty oil-bath type (one cleaner used for each carburetor). NOTE—Crankcase ventilator air cleaner is AC #1528732.

Fuel Pump:—AC Type AU (2 used). #1523695 (R.H.), #1523696 (L.H.). Diaphragm type. One pump used for each carburetor. NOTE—Fuel lines inter-connected, one pump only may operate at idling speed.
See article in Carburetion Equipment Section.
Vacuum Pump—AC Type K #1523906 (separate unit) mounted between cylinder banks at rear.

Gasoline Gauge:—AC Electric type. #1515368 (dash unit), #1515461 (tank unit).
See article in Carburetion Equipment Section.

VALVE TIMING:—Intake valve (#1 cylinder, front—left bank) opens with piston 6° BTDC. Mark 'IG/A' behind crankshaft pulley aligned with pointer on chain case cover.
Tappet Clearance—None (hydraulic take-up used).
See article in Mechanical Equipment Section for data.
Valve Spring Pressure—50 lbs. at 1 25/32" (valve closed). 100 lbs. at 1 15/32" (valve open).

LUBRICATION:—**Crankcase Capacity**—11 quarts.
Normal Oil Pressure—25 lbs.@30 MPH, 15 lbs. idling.

COOLING SYSTEM:—**Capacity**—30 quarts.

Thermostat:—Harrison. In radiator top tank. Operates shutters. Starts to open 153-158°F. Fully open 175°F. (Std.); Starts to open 168-173°. Fully open 190°F (High Reading type for use with heaters).

Temperature Gauge:—AC Electric #1510773 (dash unit), #1510774 (engine unit).
See article in Mechanical Equipment Section for data.

BATTERY:—**Delco 19Q-1.** 19 plate, 122 AH. capacity.
Starting Capacity—140 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.8 minutes. Five second voltage—4.5 volts.
Dimensions—10⅜" long, 7" wide, 8 9/16" high.
Grounded Terminal—Positive (+) terminal.
Engine Ground—Strap connector at right front engine support.
Location—Under hood on right side outside frame.

STARTER:—**Delco-Remy 783. Armature No. 1868165.**
Drive—Overrunning clutch (solenoid pinion shift).
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—36-40 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lb.	3000	5.0	70
19	Lock	3.0	500

Removal:—Flange mounted on right front face of flywheel housing. To remove, take off cover in right side pan, take out flange mounting screws, remove starter and switch assembly from below.

Starting Switch:—Solenoid No. 1555 (on starter). Solenoid Relay No. 268-M (mounted separately on dash). Solenoid switch controlled through relay by pushbutton No. 1996005 on instrument panel.
See article in Electrical Equipment Section for data.

Solenoid Switch Specifications

Closes against 70 lb. pull with ½" air gap drawing 65-71 amperes at 5 volts. Holds switch closed with current draw of 12-14 amperes (hold-in coil only).

Solenoid Relay Specifications

Contacts Close—3.2 volts max. **Open**—1.6-2.0 volts.
Contact Gap—.035". **Air Gap** .010" (contacts closed).

GENERATOR:—**Delco-Remy 1102666. Armature 1878429.**
Two brush type with current-voltage control.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator.
Maximum Charging Rate—32 amperes min. (hot), 8 0 volts, 2450 RPM, 25 MPH and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

	Amperes	Volts	R.P.M.
Cold	30*	8.0	1800

*—Not maximum output—see Current Regulator.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—25 ounces each.
Field Current—1.76-1.88 amperes at 6.0 volts.

Removal:—Mounted on slide on fan bracket at front of engine between cylinder banks. To remove, take out mounting bolt in slot on slide mounting.

Belt Adjustment:—Loosen mounting bolt on slide mounting under generator, lift generator up to remove slack from belt, tighten mounting bolt.

REGULATOR:—**Model 1118202. 'Single Core' type.** Vibrating Voltage & Current regulator on dash.
CAUTION—Check generator for grounded fields before changing regulator settings.
See article in Electrical Equipment Section for data.

Cutout Relay

Cuts In—6.2-6.7 volts (hot).
Cuts Out—0-4.0 amperes discharge current.
Contact Gap—.020" (same for both sets).
Air Gap—.020" (with points just closed).

Voltage Regulator

Setting—7.4-7.8 volts (70° F.), 7.2-7.4 volts (hot). Regulator over-compensated for temperature.
To Check—Connect ammeter in charging line at 'BAT' regulator terminal, voltmeter between 'BAT' terminal and ground. Operate generator at 2450 RPM., adjust charging rate to 8-10 amperes (use variable rheostat or 'AVR' set). With regulator at hot operating temperature, retard generator speed until cutout relay points open, then increase generator speed to 2450 RPM and check hot voltage setting (above).
To Adjust—Change regulator armature spring tension by bending lower spring hanger for **light (left) spring (or one spring if both alike) only.** If further adjustment required, see Single Core Regulator article in Electrical Equipment Section for heavy (or other) spring adjustment.
Air Gap—.070" between center of core and armature with contacts just closed.

Current Regulator

Setting—32-34 amperes (hot).
To Check—Remove cover, connect short jumper from voltage regulator frame to upper contact support bracket (shorting out Voltage Regulator). Connect ammeter in charging line at 'BAT' regulator terminal. Turn on lights and accessories, operate generator and increase speed until output remains stationary (run until hot). Check setting with regulator at operating temperature.
To Adjust—Change regulator armature spring tension slightly by bending lower spring hanger for **one spring.** If further adjustment required see Single Core Regulator article in Electrical Equipment Section for adjustment of other spring.
Air Gap—.075" (check same as Voltage Regulator).

LIGHTING:—**Headlamps**—Guide 'Sealed Beam' type.
See article in Electrical Equipment Section for data.
Headlamp Adjustment—Aim upper beam straight ahead with center of hot spot 3" below lamp center
Beam Indicator—On speedometer face. Lighted whenever Country (upper) beam in use.
Direction Signal—*See Electrical Equipment Section.*

Switches

Lighting—Delco-Remy 1995010.
Beam Selector—Delco-Remy 1997002.

FUSES:—**Direction Signal**—9 ampere. In Flasher lead under instrument panel.
Fog Lights—20 ampere. On switch.
Radio & Under Seat Heater—14 amperes each.

HORNS:—**Klaxon.** D-R. Model K-33D Type 1967 (low note—left hand), 1968 (high note—right hand). Vibrator type, blended tone, twin horns operated by relay. NOTE—Horns mounted vertically behind radiator grille with horn relay on left front fender dust shield. Remove grille for horn service.

Horn Type	Current (at 6 volts)	Air Gap
1967 Low Note	12-14 amperes	.045-.050"
1968 High Note	11-13 amperes	.036-.040"

Horn Relay:—D-R. Model 1116775.
Contact Gap—.020". **Air Gap**—.015" (closed).
Contacts Close—2.75-4.0 volts.

ENGINE HOOD NOTE:—Alligator type with control knob under left side of instrument panel. Pull control knob out (hood will lift silghtly), reach under front edge of hood and press up on safety catch **Side Panels**—To remove, take out attaching screws (fastened to radiator grille at forward end).

FLEET MODEL NOTE:—Special Economy Engine available on all models. Identify by Tune Up Specification Plate on push rod cover listing special settings for this model. Special carburetor (434-S) has stop-pin limiting throttle opening to half-throttle.

SERIAL NUMBER:—First number 1001 with model prefix as follows: KA(Special Deluxe), KH(Master Deluxe), KB(Master), KC(½ Ton), KD(¾ Ton), KE (¾ Ton Special), WA, WB (1½ Ton), WC (School Bus), WD, WE, WF (1½ Ton Cab-over-Engine). On plate on right front floor (pass. cars), on right side of cowl under hood (Trucks except Cab-over-Engine), on plate on rear side of dash (Cab-over-Engine Trucks).

ENGINE NUMBER:—First No. 2697268 (Flint), B-105462 (Buffalo) with special prefix for each model as follows: Pass. Cars—None (Flint), B (Buffalo); Half Ton—K (Flint), KB (Buffalo); ¾ & ¾ Ton Special—AT (Flint), ATB (Buffalo); 1½ Ton—T (Flint), TB (Buffalo); 1½ Ton Cab-over-engine—H (Flint only), Dubl Duti Panel—E (Flint only). Stamped on right side of block to rear of distributor.

COMPRESSION:—**Ratio**—6.25-1 Std. cast-iron head. **Pressure**—112 lbs. at 65 RPM cranking speed. Minimum pressure 90 lbs. (cylinders even with 5-10 lbs.).

VACUUM READING:—Steady 18-21" with engine idling.

IGNITION:—**Coil Model 536-D.** On right side of engine above distributor. Switch connection armored.

Ignition Current—2.5 amperes idling, 4.8 stopped.

Ignition Switch:—Delco-Remy No. 1116272 (Pass. Cars), 1116287 (Pass. Cars—Canada), 1116278 (Trucks), 1116263 (Trucks with flat cowl), 1116279 (Cab-over-engine). 1116291, 1116292 (Trucks, Can.).

Ignition Lock—Briggs & Stratton No. 45792.

Key Series—8000 to 9499. **Groove**—No. 15.

Distributor Delco-Remy 1110052 with Vacuum Spark Control 1116011. Full automatic advance with auxiliary vacuum spark control & Octane Selector.

Breaker Gap—.018". Limits .018-.024".

Cam Angle or Dwell—35° closed, 25° open (distr.).

Breaker Arm Spring Tension—17-21 ounces.

Rotation—Clockwise viewed from above.

Condenser—Part No. 1869704. Capacity .18-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	400	4	800
5½	600	11	1200
18½	1550	37	3100

Vacuum Spark Control No. 1116011—Mounted on Octane Selector, linked to advance arm. Provides additional advance except when engine accelerated (spark retarded by return spring in unit) or at high speed with wide open throttle (vacuum port cut off by throttle valve shaft). Plunger travel 7/32".

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	6" Min.
8	16	12-15"

Octane Selector—Adjustment at distributor provides 10° advance or retard from center 'O' position. See Ignition Timing for adjustment instructions.

Removal:—On right side of crankcase. To remove, loosen advance arm clamp bolt (does not disturb Octane Selector).

IGNITION TIMING:—Initial setting as follows (see Octane Selector for final setting dependent on fuel used):

	Flywheel Degrees	Piston Position
All Engines	5° BTDC	.0091" BTDC.

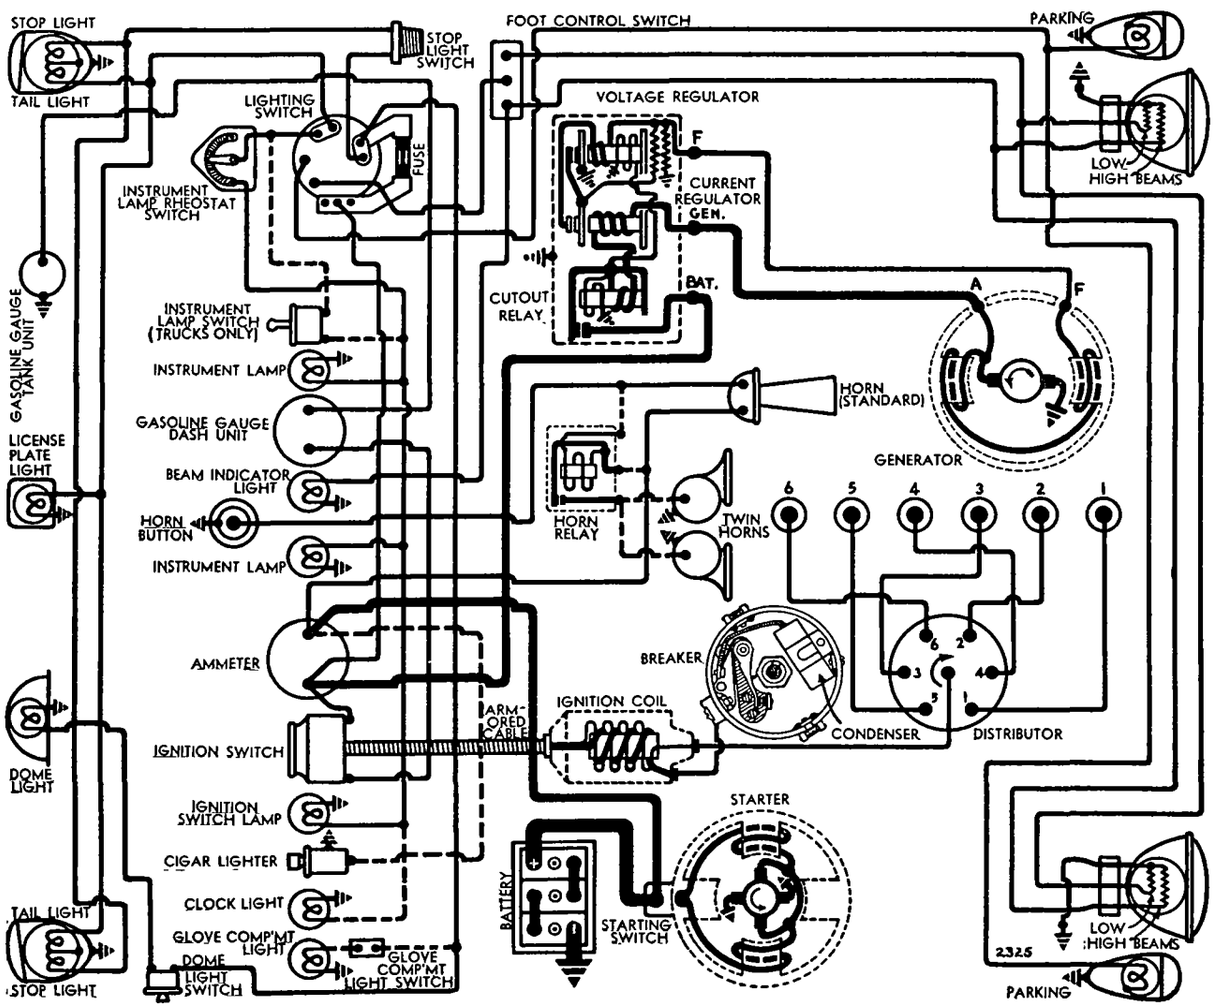
Timing (Neon Light)—This method recommended. Attach Neon Timing Light to #1 spark plug, direct light on flywheel through inspection hole in right front face of housing. Set Octane Selector pointer at 'O' on scale. Idle engine, loosen advance arm clamp bolt, rotate distributor until steel ball timing mark on flywheel appears in line with pointer. Tighten clamp bolt and check Octane Selector.

Timing (Without Neon Light)—With #1 piston on compression, turn engine over until piston is 5° or .0091" BTDC. when steel ball mark on flywheel lines up with pointer in inspection hole in right front face of housing. Adjust distributor as above.

Octane Selector Setting—Road test car and set Octane Selector for slight ping when accelerating engine with wide open throttle to secure maximum performance and economy with fuel regularly used. To adjust, loosen hold-down screw, move distributor and scale counter-clockwise to advance spark, clockwise to retard spark, tighten hold-down screw.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—AC No. 44. 14 MM. Metric type.



Spark Plug Gaps—.040".

CARBURETION:—**Carburetor**—Carter Model W1, No. 420-S (Std.), 434-S (Econ. Engines). 1¼" single barrel downdraft type. 420-S carburetor painted Black and marked '365' on flange, 434-S painted Brown and marked '373'. NOTE—These carburetors same models as used on 1939 but have new specifications. ***See article in Carburetor Section for complete data and directions to correct 'pop-back' in carburetor.***

Cab-over-Engine & Dubl Duti Panel—Carter BB1, Model 447-S, 1¼" single barrel, updraft type. ***See article in Carburetor Section for data.***

Idle Adjustment—With engine warm and choke valve wide open, set throttle stopscrew so engine idles at 450-500 RPM. (except Cab-over-Engine), 300-375 RPM. (Cab-over-Engine Truck). Turn idle adjusting screw in (leaner mixture), out (richer mixture) until engine fires smoothly. Final setting should be 1-2 turns (420-S, 434-S), ½-1¼ turns (447-S) out from inner seated position. Readjust throttle stopscrew for correct idling speed.

NOTE—Special metering rods (420-S, 434-S), me-

tering jets (447-S) available for special service. See Carter and Carter (B&B) Jet Specification Tables in Carburetor Section for complete data.

Accelerating Pump Setting—Pump lever under dust cover on bowl has 3 holes for pump link connection (420-S, 434-S), throttle lever has 2 holes for pump link (447-S). Connect link as follows (Med. stroke position not provided on 447-S).

Lower (Med. stroke)—Normal temp. Std. fuel.

Inner (Min. stroke)—Hot weather or high-test fuel.

Upper (Max. stroke)—Extremely cold weather.

Float Level (420-S, 434-S)—½" from top of float at free end to gasket seat on cover with valve closed

Float Level (447-S)—Top of float 1/32-1/16" below top edge of bowl (gasket removed) with valve closed.

Throttle Cracker:—New adjustable type. Opens throttle 1/3 when starter pedal depressed.

Adjustment—Set carburetor idle speed at 450-500 RPM. Loosen locknut, turn adjusting screw on accelerator rod bellcrank (left side of engine) until clearance between end of screw and throttle control bellcrank is .030" (use feeler gauge), tighten locknut. Loosen locknut and adjust bolt in accelerator rod for 1/16" clearance between head of bolt and lug on starter cross-shaft.

Air Cleaner:—AC #1528524 (Pass. Cars without Governor), #1529264 (Pass. Cars with Governor), #1525978 (Trucks) oil-wetted type Std. Heavy duty oil-bath type Air Cleaner Optl. on all models except Pass. Cars with Governor.

Fuel Pump:—AC Type AF. #1523089 Diaphragm type Std. Type AM #1523271 fuel & Vacuum type Optl. ***See article in Carburetion Equipment Section.***

Gasoline Gauge:—AC Electric. Dash Unit No. 1515369 (first—medium brown dial), 1516221 (later—light brown dial). Tank Unit No. 1516182 (Pass. Cars except—#1516183 Coupe & Sedan Delivery only). ***See article in Carburetion Equipment Section.***

MANIFOLD HEAT CONTROL:—Thermostatic type. Check coil wind-up when tuning engine. Spring should be wound up just enough to slip end over manifold pin (approximately ½ turn). NOTE—Excessive tension may cause sticking of valve, detonation and poor performance.

Anti-rattle Spring—To correct rattles, install No. 602799 anti-rattle spring (do not increase thermostatic coil tension). With valve rotated to heat off position, insert spring in slot in valve shaft, hold shaft counterbalance weight 3/16" above Heat On position, bend spring until it just touches stop pin

VALVE TIMING:—To Check—With #1 intake valve tappet clearance set at .006", valve should open with piston 3° or .0032" BTDC. when point on flywheel approximately 1.158 teeth before 'U/C' mark in line with indicator in inspection hole in right front face of flywheel housing.

Tappet Clearance:—.006-.008" Int., .013-.015" Exh. Hot (engine 'Normalized'). Use lower figure for ordinary service, higher figure for severe truck service. ***See Chevrolet Shop Notes in 'M' section for engine normalizing instructions.***

Fleet Econ. Engines—.010" Int., .016" Exh. Hot.

Valve Spring Pressure:—49-56 lbs. at 1 13/16" (valve closed), 131-133 lbs. at 1½" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill). **Normal Oil Pressure**—15 lbs. (all models) at 40 MPH. (KA, KH, KC, KE), 43 MPH. (KB), 36 MPH. (KD), 30 MPH. (WC Bus), 32 MPH. (Other Trucks).

COOLING SYSTEM:—Capacity—14 qts. (except Cab-over-Engine), 16½ qts. (Cab-over-Engine Trucks). **Thermostat**—Harrison. In cylinder head outlet. Starts to open at 142°F. (Std.), 150°F (for Alcohol Anti-freeze), 160° (Perm. anti-freeze & Econ. Eng.).

BATTERY (STD):—Delco Model 15X1. 6 volt, 15 plate, 94 ampere hour capacity (20 hour rate).

Starting Capacity—115 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.3 minutes.

Dimensions—Lgth. 8 15/16". Width 7". Hgt. 8 11/16".

Grounded Terminal—Negative (—) grounded to clutch housing below starter pedal pull-back spring (Pass. Cars), to rear of transmission (Trucks).

Location—In engine compartment on right side (Pass. Cars), under right front floor (Trucks), under right cab seat (Cab-over-Engine Trucks).

Special Battery—Delco Model 19Q1. 6 volt, 19 plate, 122 ampere hour capacity (20 hour rate).

Grounded Terminal & Location—See above.

STARTER:—Delco-Remy Model 1107009, Armature 1867897 (Std); 1107023, Arm. 810601 (RHD Cars).

Drive—Manual pinion shift (1107009), Solenoid pinion shift (1107023) with overrunning clutch.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-28 ounces each.

Cranking Engine—65 RPM., 150 amperes, 5.5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 " "	Lock	3.37	525

Removal:—Flange mounted on right front face of flywheel housing. To remove, disconnect cable take out capscrews, remove starter and switch.

Starting Switch (1107009):—No. 820052. Mounted on starter and operated by starting pedal.

(1107023)—Solenoid No. 1546 mounted on starter controlled by Pushbutton Switch D-R 1996006. ***See article in Electrical Equipment Section for data.***

GENERATOR:—Delco-Remy Model 1102667, Armature 1879002 (Std); Model 1106403 (City Police & U. S. Govt.). Two brush (shunt) type with vibrating type voltage and current regulation.

Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator, maximum output by Current Regulator.

Maximum Charging Rate—38-40 amperes, 7 55-7.85 volts, 1900 RPM. Cold; 34-36 amperes, 7.45-7.55 volts, 2300 RPM. Hot. Reached at 25 MPH (KA, KH, KC), 27 MPH. (KB, KE), 23 MPH. (KD), 22 MPH. (WA, B, D, E, F), 19 MPH. (WC Bus). Actual charging rate controlled by Regulator and dependent on battery

Performance Data Cold.

	Amperes	Volts	R.P.M.
1102667	30*	8.0	1700
1106403	35*	8.0	1040

*—Not maximum output—See Current Regulator.

Brush Spring Tension—25 ounces each.

Rotation—Counter-clockwise at commutator end.

Field Current—1.76-1.88 amperes (1102667), 1.77-2.0 amperes (1106403) at 6.0 volts.

Removal:—Generator pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.

Belt Adjustment:—Swing generator away from engine until belt sideplay at point midway between generator & fan pulleys is 1½" (light pressure).

REGULATOR:—Model 1118201 (1102667 Gen.), 1118229 or 1118232 (1106403 Gen.) 'Single Core' Type. Vibrating Voltage and Current Regulators in case on dash. NOTE—1118229 Regulator used with Negative battery ground, 1118232 with Positive ground. ***See article in Electrical Equipment Section for data.***

CAUTION—Check generator for grounded fields before changing regulator settings.

Cutout Relay

Cuts In—6.2-6.7 volts (hot), 800 RPM., 8.7 MPH. (KA, KH), 9.5 MPH. (KB), 8 5 MPH. (KC). 8 MPH. (KD, KE), 7.5 MPH. (WA, B, D, E, F), 7 MPH. (WC).

Cuts Out—0-4.0 amperes discharge current.

Contact Gap—.020" (same for both sets).

Air Gap—.020" (with points just closed).

Voltage Regulator

Setting (1118201)—7.4-7.8 volts (70°), 7.2-7.4 volts (Hot). **(1118229 & 1118232)**—7.0-7.4 volts (70° F.), 7.0-7.2 volts (Hot).

To Check—Connect ammeter in charging line at regulator 'BAT' terminal, voltmeter between 'BAT' terminal and ground. Operate generator at 2800 RPM., adjust charging rate to 8-10 amperes (use variable rheostat or 'AVR' set). With regulator hot (150° F.), slow generator speed until cutout relay points open, then increase speed to 2800 RPM. and check hot voltage setting (above).

To Adjust—Change regulator armature spring tension slightly by bending lower spring hanger for **light (left) spring (or one spring if both alike) only.** If further adjustment required, see Single Core Regulator article in Electrical Equipment Section for Heavy (or other) spring adjustment.

Air Gap—.070" between center of core and armature with contacts just closed.

Current Regulator

Setting—32-34 amperes (1118201), 34-36 amperes (1118229 & 1118232).

To Check—Remove cover, connect short jumper from voltage regulator frame to upper contact support bracket (to short out Voltage Regulator). Connect ammeter in charging line at regulator 'BAT' terminal. Turn on lights and accessories, operate generator and increase speed until output remains stationary (run until hot). Check setting with regulator at operating temperature.

To Adjust—Change regulator armature spring tension slightly by bending lower spring hanger for **one spring** only. If further adjustment required, see Single Core Regulator article in Electrical Equipment Section for adjustment of other spring.

Air Gap—.075" (check same as Voltage Regulator).

LIGHTING:—Headlamps—Guide 'Sealed Beam' type. ***See article in Electrical Equipment Section for data.***

Headlamp Adjustment—Aim upper beam straight ahead with center of hot spot 3" below lamp center

Beam Indicator—On face of speedometer dial. Lighted when upper beams in use.

Switches.

Lighting—Delco-Remy No. 1994014 (Pass. Cars—Instr. lamp rheostat in handle), 1994015 (Trucks).

Instrument—Delco-Remy 1404 (Trucks only).

Beam Selector—Delco-Remy 1997003.

Glove Compt. Light—D-R. 1997721 (Spec. Del.).

Stop Light—Delco-Remy 476-U (hydraulic type).

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Parking, License Plate	3	63
Instr., Glove Compt., Ign. (1½ Ton)	1½	55
Beam Ind. (all), Ign. (exc. 1½ Ton)	1	51
Stop & Tail (exc. 1½ Ton)	21-3	1154
Stop, Tail (1½ Ton)	3	63
Dome	6	81

NOTE—Dome lamp 15 cp. on Carryall only.

FUSES:—Lighting—30 ampere. On switch.

Clock—2 ampere. On clock.

HORNS:—Pass. Cars—Delco-Remy No. 1999509 (Low Note), 1999510 (High Note), 1999519 (Low Note—Canada), 1999520 (High Note—Canada). Twin horns

Trucks—No. 1999801 Vibrator type single horn.

	Current (at 6 volts)	Air Gap
1999509, 1999519	19-21 amperes	.044-.049"
1999510, 1999520	18-20 amperes	.034-.039"
1999801	7-9 amperes	.027-.033"

Horn Relay:—Delco-Remy 1116775. Used with twin horns on Pass. Car models.

Contacts Close—2.75-4.0 volts.

Contact Gap—.020". **Air Gap**—.015" (closed).

SERIAL NUMBER:—On right front door hinge post. First number: Detroit—7,625,001 (Royal), 6,955,201 (Windsor). Canada—9,714,601 (Royal).

ENGINE NUMBER:—First number C25-1001. Stamped on left side of block between #1 and #2 cylinders.

COMPRESSION:—Ratio and pressure as follows:

Ratio	Pressure at 1000 RPM	At 100 RPM
6.5-1 cast-iron hd.	140-150 lbs.	Approx. 115 lbs.
*7.0-1 aluminum hd.	150-160 lbs.	Approx. 120 lbs.

*—This head standard equip. on 7 passenger sedan.

VACUUM READING:—Steady 18-21" idling at 6 MPH.

IGNITION:—Coil Model IG-4661. Service winding (less switch and cable) IG-3224JS. Mounted on dash.
Ignition Current—2.25 amperes idling, 5.5 stopped.
Ignition Switch:—Mitchellock Model 24-R, No. 8197.
Ignition Lock—Yale & Towne or Briggs & Stratton. B&S No. 80651. Key Series 1BP to 1000BP. Groove #24.
Distributor Model IGS-4108A-1. Single breaker, 6 lobe cam, full automatic advance type auxiliary vacuum spark control and manual (octane selector) adjustment.
Breaker Plate Identification—Maximum vacuum advance limited by slot and marked with number (#11) stamped on plate.
Breaker Gap—Set at .020". Limits .018-.022".
Cam Angle or Dwell—38° closed, 22° open (distr.).
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Clockwise viewed from the top.
Condenser—No. IG-3927A. Capacity .25-.28 mfd.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	350	0	700
3	400	6	800
6	850	12	1700
9	1300	18	2600
12	1750	24	3500

Vacuum Spark Control—Integral type (on distributor, linked directly to breaker plate). Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle (spark retarded by return spring in unit).

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5"
2°	4°	7¼"
5°	10°	10½"
8°	16°	13¾"
11°	22°	17"

Manual Adjustment—At distributor. Provides 10° advance or retard from center '0' position. See Ignition Timing for adjustment.
Distributor Removal:—Mounted on left side of crankcase. To remove, disconnect vacuum line, take out hold-down screw in lock plate.

IGNITION TIMING:—Initial setting (correct for fuel of 70 octane rating at low altitudes for both cast-iron and aluminum heads) shown below. See Manual adjustment (following) for correction (not to exceed 4° either way) dependent on fuel regularly used and operating conditions.

	Flywheel Degrees	Piston Position
6.5-1 cast-iron hd.	0° at TDC	.0000" at TDC
7.0-1 aluminum hd.	2° ATDC	.002" ATDC

NOTE—Impulse neutralizer marked 'DC' at TDC point with 15 (1°) graduations on either side.
Timing (Using Timing Light)—Connect timing light between distributor and battery terminal on the generator regulator. With #6 piston on compression, turn engine over until piston reaches firing position (see Initial Setting above), stop when correct mark on impulse neutralizer lines up with pointer on chain case cover. Loosen lock-plate hold-down screw, center pointer on scale, tighten screw. Loosen lock-plate clamp bolt, rotate distributor until timing light just goes out, tighten clamp bolt. Check Manual Adjustment as directed below.

Timing (Using Synchroscope)—Tool C-374. Clip lead to #1 spark plug, direct light on impulse neutralizer (fill in correct mark on impulse neutralizer with chalk or paint), idle engine and adjust distributor as directed above.

Manual Adjustment—Initial ignition setting (listed above) should be varied not more than 4° (Cast-iron head from 4° or .007" BTDC to 4° or .007" ATDC. Aluminum head from 2° or .002" BTDC to 6° or .016" ATDC) so that slight ping noticeable between 10 and 30 MPH when accelerating with wide open throttle for best performance. To adjust, loosen lock-plate hold-down screw, rotate distributor counter-clockwise to advance spark (if no ping noted), clockwise to retard spark (if ping too severe) not more than 4°. Scale graduated in engine degrees.
Firing Order:—1-5-3-6-2-4. See diagram.
Spark Plugs:—Auto-Lite Type A-7B (cast-iron head), Type AL-7A (aluminum head). 14 MM Metric type.
Spark Plug Gaps—Set at .025".

CARBURETION:—Carburetor—Carter (Ball & Ball) Model E6S1 (early cars), E6S2 (later cars). 1½" single barrel, downdraft type.
See article in Carburetor Section for complete data.
E6S1 Note—Can be changed to E6S2 specifications by changing parts (carburetors marked E6S1* on bowl cover factory equipped to E6S2 specifications).
See article in Carburetor Section for part changes.
Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 6 MPH idle speed. Adjust idle adjusting screw until engine fires smoothly (½-1½ turns open—turn screw in for leaner mixture). Readjust idle speed. NOTE—Car manufacturer recommends use of vacuum gauge. Set idle screw for highest reading on gauge.

Accelerating Pump Setting—Pump lever has three holes for pump link engagement. Set as follows: Inner Hole (min. stroke)—Extreme hot temperatures or altitudes above 3000 feet.
Center Hole (med. stroke)—Normal setting.
Outer Hole (max. stroke)—Winter temperatures.
NOTE—If lean metering jets (High Alt. calibration) used at lower altitudes for increased economy, reduced speed and power will result (not recommended by manufacturer). See Carter (B&B) Jet Table in Carburetor Section for complete jet data.
Float Level—5/64" from top of float (not soldered seam) to top edge of float bowl.

Fast Idle:—Not adjustable (built-in type).

Automatic Choke:—Sisson Type AC-758B.
See article in Carburetion Equipment Section.

Air Cleaner:—AC #1529041 oil-wetted type standard.

Fuel Pump:—AC Type AT #1523912 diaphragm type. Type AS #1523913 combination fuel-and-vacuum pump used on cars with swinging windshield.
See articles in Carburetion Equipment Section.

Gasoline Gauge:—Auto-Lite electric. No. NG-9356D (dash unit), No. NG-9329T (tank unit).
See article in Carburetion Equipment Section.

MANIFOLD HEAT CONTROL:—Thermostatic coil type. See that shaft and valve rotate freely. When installing coil, wind free end approximately 1 turn counter-clockwise and hook end over stop stud.

VALVE TIMING:—To Check—With .014" (cold) tappet clearance #6 intake valve should open with #6 piston 12° or .063" BTDC with 12th graduation before DC mark on impulse neutralizer aligned with pointer. Reset tappet clearance at .008" hot.

Tappet Clearance:—.008" Int., .010" Exh. (hot & idling). .002" add'tl exh. clearance desirable for sustained high speeds. NOTE—Tappet screws self-locking (no locknuts). Remove right front wheel, lower housing panel and fuel pump shield for access to valves.

Valve Spring Pressure:—40-45 lbs. at 1¾" (valve closed). 107-115 lbs. at 1⅜" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill).
Normal Oil Pressure—30-45 lbs. at 30 MPH, 15 idling.

COOLING SYSTEM:—Capacity—18 quarts.
Thermostat—Bishop & Babcock or Fulton. In outlet on head. Starts to open 157-162°. Fully open 183°
Temperature Gauge—Motometer (Auto-Lite) Vapor tension type. A-L Part No. H-9355.
See article in Mechanical Equipment Section for data.

TRANSMISSION OVERDRIVE CONTROL:—Electric type with accelerator pedal 'kick-down' switch. Optional on Windsor only (not available on Royal).
See article in Mechanical Equipment Section for data.
Overdrive Solenoid—Auto-Lite SSB-4001.
Throttle Switch Setting—3/32" gap between switch plunger & contact screw (throttle just wide open).
Control Relay—Auto-Lite HR-4201. Use only 20 ampere fuse on relay (on left side of engine dash).
Overdrive Indicator Light—In upper right corner of speedometer dial. Lights when 'kick-down' direct drive operating.

BATTERY:—Willard Type SW-2-119. 6 volt, 15 plate, 119 ampere hour capacity (20 hour rate).
Starting Capacity—140 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.3 minutes. Five second voltage—4.3 volts.
Grounded Terminal—Positive (+) grounded to the transmission case.
Dimensions—Lgth 10 5/16". Width 7". Hght 9 5/16".
Location—Left side under front seat.

STARTER:—Model MAX-4020A. Armature MAW-2030.
Drive—Solenoid operated pinion shift type. Drive through overrunning clutch.
Cranking Engine—Approx. 160 amperes, 5 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque			R.P.M.	Volts	Amperes
0	ft.	lbs.	5300	5.5	65
.65	"	"	3300	5.5	100
2.75	"	"	1630	5.0	200
5.5	"	"	970	4.5	300
8.7	"	"	600	4.0	400
12.0	"	"	300	3.5	500
16.5	"	"	Lock	3.0	640
25.0	"	"	Lock	4.0	880

Removal:—Flange mounted on left front face of flywheel housing. Disconnect wire connections (tape battery lead) and oil filter lines. Remove two fastening bolts and withdraw unit.

Starting Switch:—Solenoid Switch Type SS-4206. Controlled through relay by pushbutton on instrument panel. Operative with ignition 'on'.
See article in Electrical Equipment Section for data.

GENERATOR:—Models GDZ-4801A (Std.), GEB-4801A (Police). Armature No. GDZ-2006F (GDZ-4801A) GEB-2006F (GEB-4801A). Two brush type with current-voltage control. Air cooled.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator.
Maximum Charging Rate—35 amperes (Std.), 32 amperes (Police), 8.0 volts, 2200 gen. RPM (Std.), 1400 (Police), approx. 24 MPH (Std.) and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data—GDZ-4801A

Cold			Hot

*—Current regulator setting.

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.60-1.78 amperes at 6 volts (GDZ).
Motoring Current—4.16-4.60 amperes at 6 v. (GDZ).

Removal:—Pivot mounted at left side of engine at front. To remove, take out pivot and clamp bolts.

Belt Adjustment:—Loosen clamp and pivot bolts, swing generator out until scale (attached to field frame) reads 40-50 lbs., tighten bolts.

REGULATOR:—Model VRP-4001A (Std.), B (Police). Current-Voltage type. In single case on dash.
See article in Electrical Equipment Section for data.
NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken.

Cutout Relay

Cuts In—6.4-6.6 volts at approximately 1000 generator RPM (Std.), approx. 600 gen. RPM (Police).
Cuts Out—4.8-5.6 volts (approx. 7-8 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.034" min., .038" max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting—7.3-7.6 volts at 70° F.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal, voltmeter between 'B' terminal and ground. Operate generator at speed equivalent to 30 MPH charging battery until voltage is steady. Voltage reading should be 7.3-7.6 volts (room temperature), 7.1-7.4 volts (hot operating conditions).
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap—.012" Min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator

Setting—Std: 34-36 amperes (marked '35' on cover), Police: 31-33 amperes (marked '32' on cover).
To Check (without breaking seals)—Connect test meters as for Voltage check (above). Operate generator at speed equivalent to 30 MPH charging battery, turn on car lights and accessories so that generator charges at peak rate and Current Regulator operates. Charging current should not exceed 34-36 amperes (Std.), 31-33 amperes (Police). If more than slight excess noted, regulator is defective.
Adjustment & Contact Gap—Same as for Voltage Regulator (above).
Air Gap—.034-.038" with contacts just opening.

LIGHTING:—Headlamps—Corcoran-Brown 'Sealed Beam' type. *See article in Electrical Equipment Section.*
Headlamp Adjustment—Aim upper beam for each lamp straight ahead with center of hot spot 3" below lamp center height.
Beam Indicator—Red light in upper left corner of speedometer dial. Lighted with upper beams on.

Switches

Lighting—Chrysler No. 854794, 857380 Optl.
Beam Selector—Chrysler No. 859974.
Instrument—Chrysler No. 853371.
Stop Light—Chrysler No. 677112 hydraulic type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Parking, Instrument	1½	55
Beam Indicator, Ign. Sw.	1	51
Stop and Tail	21-3	1158
Rear License	3	63
Dome or Reading	15	87
Overdrive Indicator	1	51

LIGHTING CIRCUIT BREAKER:—Vibrating, thermostatic type. Mounted on lighting switch.

FUSES:—**Clock**—2 ampere. In connector behind clock.
Transmission Overdrive Control—20 amp. On relay.
Horns & Windshield Wiper—No fuse used.
Radio—14 amp. In feed wire behind instr. panel.

HORNS:—Single—Delco-Remy No. 1999911 standard.
Dual—Auto-Lite HO-5001 horn set. HL-4001 (low pitch), HL-4002 (high pitch) operated by horn relay.
Current Draw—Approx. 7 amps. single, 35-40 dual.

Horn Relay:—Auto-Lite Model HRC-4001 (no fuse).
Contacts Close—1.5-3.0 volts. **Open**—.5 volt.
Contact Gap—.026". **Air Gap**—.016-.020" (closed).

WINDSHIELD WIPER:—Auto-Lite Model EBW-4001. Electric type with circuit-breaker on back of switch.
See article in Mechanical Equipment Section for data.
Circuit Breaker—Vibrating, thermostatic type. Starts to operate with current of 12 amperes.

SERIAL NUMBER:—6750101 Up (Traveler), 6673501 (Saratoga), 6613401 (New Yorker), 7806551 (Crown Imperial). On right front door hinge pillar post.

ENGINE NUMBER:—C26-1001 Up (C26), C27-1001 (C27). Left side of block between #2 and #3 cylinders.

COMPRESSION:—**Ratio**—6.8-1 CI (Std. C26), 6.8-1 AL (Std. C27). 7.45-1 aluminum (Optl. C26 & C27).

Ratio	Pressure at 1000 RPM	At 100 RPM
6.8-1 CI or AL hd.	150-160 lbs.	Approx. 118 lbs.
7.45-1 aluminum hd.	160-170 lbs.	Approx. 124 lbs.

VACUUM READING:—Steady 18-21" idling at 6 MPH.

IGNITION:—**Coil Model CE-4640.** Service coil (less switch and cable CE-3224JS). Mounted on dash.

Ignition Current—2.25 amperes idling, 5.5 stopped.

Ignition Switch:—Mitchellock Model 24-R. Type 8197.

Ignition Lock—Yale & Towne or Briggs & Stratton. B&S No. 80651. Key Series 1BP to 1000BP. Groove #24.

Distributor Model IGT-4101A-2 (C26), IGT-4101B-2 (C27). Single breaker, 8 lobe cam, full automatic advance type with auxiliary vacuum spark control and manual (octane selector) adjustment.

Breaker Plate Identification—Maximum vacuum advance limited by slot and marked by number (#8—IGT-4101A-2, #6—IGT-4101B-2) on plate

Breaker Gap—Set at .018".

Cam Angle—27° closed, 18° open (.017" gap).

Breaker Arm Spring Tension—17-20 ounces.

Rotation—Clockwise viewed from above.

Condenser—No. IG-3927A. Capacity .25-.28 mfd.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	350	0	700
3	400	6	800
6	850	12	1700
9	1300	18	2600
12	1750	24	3500

Vacuum Spark Control—Integral type (on distributor, linked directly to breaker plate). Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle (spark retarded by return spring in unit).

Vacuum Advance—IGT-4101A-2

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5"
2°	4°	8"
4°	8°	11"
6°	12°	14"
8°	16°	17"

Vacuum Advance—IGT-4101B-2

Start	0°	5"
1°	2°	7"
3°	6°	11"
5°	10°	15"
6°	12°	17"

Manual Adjustment—Provides 10° advance or retard from center '0' position on scale (at distributor). See Ignition Timing for adjustment.

Distributor Removal:—Mounted on left side of crankcase. To remove, disconnect vacuum line, take out hold-down screw in lock plate.

IGNITION TIMING:—Initial setting (correct for fuel of 70 octane rating at low altitudes for 6.8-1, Ethyl fuel 7.45-1 head) shown below. See Manual Adjustment (following) for recommended corrections (not to exceed 4° either way) dependent on fuel regularly used and operating conditions.

	Flywheel Degrees	Piston Position
C26—6 8-1 CI hd.	0° at TDC.	.0000" TDC.
C27—6.8-1 AL hd.	3° BTDC.	.0038" BTDC.
**All—7.45-1 AL hd.	0° at TDC.	.0000" TDC.

**—Ethyl gasoline setting.

NOTE—Impulse neutralizer marked DC at TDC with 15 (1°) graduations on either side.

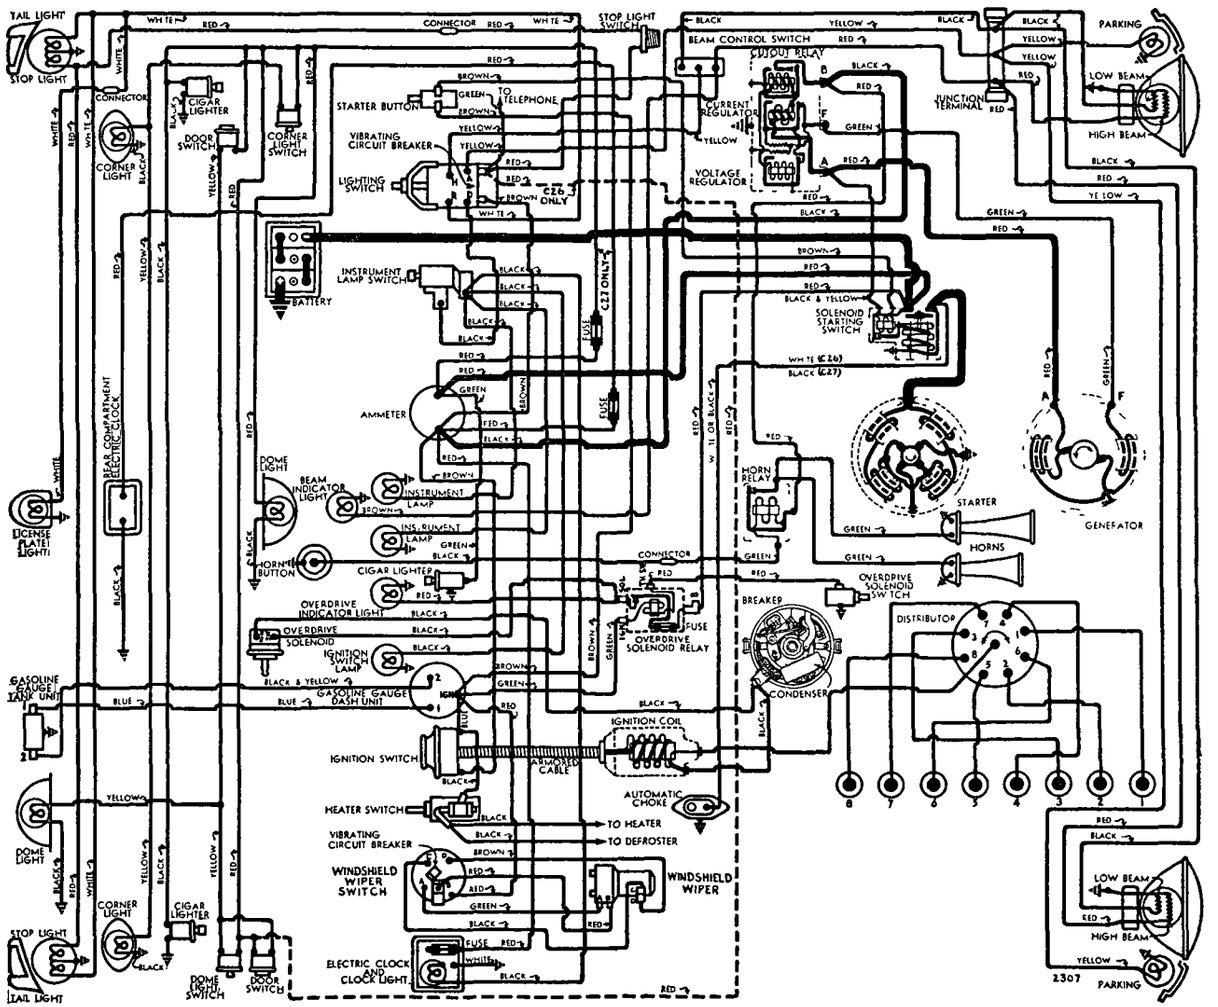
Timing (Using Timing Light)—Connect timing light between distributor and battery terminal on generator regulator. With #8 piston on compression, turn engine over until piston reaches firing position (see Initial Setting above), stop when correct mark on impulse neutralizer lines up with pointer on chain cover. Loosen lock-plate hold-down screw, center pointer on scale, tighten screw. Loosen lock plate clamp bolt, rotate distributor until timing light just goes out, tighten clamp bolt. Check Manual Adjustment setting (following).

Timing (Using Synchroscope)—Tool C-374. Clip lead to #1 spark plug, direct light on impulse neutralizer (correct mark filled in with paint or chalk), idle engine and adjust distributor as directed above).

Manual Adjustment—Initial ignition setting listed above should be varied not more than 4° (.007") retard or advance so that slight ping noticeable between 10 and 30 MPH when accelerating with wide open throttle for best performance. To adjust, loosen lock plate hold-down screw, rotate distributor counter-clockwise (if no ping noted), clockwise to retard (if ping too severe) not more than 4°. Scale graduated in engine degrees.

Firing Order:—1-6-2-5-8-3-7-4. See diagram.

Spark Plugs:—Auto-Lite Type A-7B (cast-iron hd.). AL-7A (aluminum heads). 14 MM Metric.



Spark Plug Gaps—Set at .025".

CARBURETION:—**Carburetor**—Stromberg Model AAV-2. No. A-18792. Aircraft, duplex, 1¼" downdraft type.

See article in Carburetor Section for complete data.

Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 6 MPH idle speed. Adjust idle adjusting screw for each barrel equally until engine fires smoothly (turn screws in for leaner mixture). Readjust idle speed. NOTE—Car manufacturer recommends use of vacuum gauge. Set idle adjusting screw for highest reading on gauge.

Accelerating Pump Setting—Throttle lever has two holes for pump link engagement. Set as follows:
Inner Hole (short stroke)—Extreme hot weather.
Outer Hole (long stroke)—Winter temperatures.

Float Level—Fuel level 5/8" below top edge of bowl.
Fast Idle Setting—Adjust choke connector link length so that choke valve opening is 1/8" with fast idle screw (throttle stopscrew) against first step of fast idle cam.

Automatic Choke:—Sisson Type AC-600.
See article in Carburetion Equipment Section.

Throttle Guard (Cars with Fluid Drive):—Vacuum operated throttle kicker to prevent engine stalling when accelerator pedal released quickly.
See article in Carburetion Equipment Section.

Air Cleaner:—AC #1528334 oil-wetted type standard.

Fuel Pump:—AC Type AW #1523869 diaphragm type.
See article in Carburetion Equipment Section.

Gasoline Gauge:—Auto-Lite electric. No. NG-9356D (dash unit), No. NG-9330T (tank unit).
See article in Carburetion Equipment Section.

MANIFOLD HEAT CONTROL:—Thermostatic coil type. See that shaft and valve rotate freely. When installing coil, wind up free end 1 turn counter-clockwise and hook end over stop stud.

VALVE TIMING:—To Check—With .011" (cold) tappet clearance #8 intake valve should open with #8 piston 6° or .0170" BTDC with 8th graduation before DC mark on impulse neutralizer aligned with pointer on chain cover. Reset tappet cl. at .008" (hot).

Tappet Clearance:—.008" Int., .010" Exh. (hot & idling). .002" add'tl exh. clearance desireable for high speeds. NOTE—Tappet screws self-locking (no locknuts). Remove right front wheel, lower housing panel and fuel pump shield for access to valves.

Valve Spring Pressure:—52-58 lbs. at 2 1/32" (valve closed). 129-137 lbs. at 1 21/32" (valve open).

LUBRICATION:—Crankcase Capacity—6 qts. (refill).
Normal Oil Pressure—30-45 lbs. @ 30 MPH, 15 idling.

COOLING SYSTEM:—**Capacity**—24 quarts.
Thermostat—Bishop & Babcock or Fulton. In outlet on head. Starts to open 157-162°. Fully open 183°
Temperature Gauge—Motometer (Auto-Lite) Vapor tension type. A-L Part No. H-9355.
See article in Mechanical Equipment Section for data.

TRANSMISSION OVERDRIVE CONTROL:—Electric type with accelerator pedal 'kick-down' switch. Standard on C27, Optl. on C26 (except Traveler).
See article in Mechanical Equipment Section for data.
Overdrive Solenoid—Auto-Lite SSB-4001.
Throttle Switch Setting—3/32" gap between switch plunger & contact screw (throttle just wide open).
Control Relay—Auto-Lite HR-4201. Use only 20 ampere fuse on relay (on left side of engine dash).
Overdrive Indicator Light—In upper right corner speedometer dial. Lights when 'kick-down' direct drive operating.

BATTERY:—Willard Type MW-2-135. 6 volt, 17 plate, 135 ampere hour capacity (20 hour rate).
Starting Capacity—171 amperes for 20 minutes.
Zero Capacity—300 amperes for 5.9 minutes. Five second voltage—4.5 volts.
Grounded Terminal—Positive (+) grounded to the transmission case.
Dimensions—Lgth. 10 5/16". Wid. 6 13/16". Hgt. 9".
Location—On left side under front seat.

STARTER:—Auto-Lite MAX-4037 (C26), MAX-4020A (C27, C26 Fluid Drive). Armature MAW-2030 (all).
Drive—Overrunning clutch (solenoid pinion shift).
Cranking Engine—Approx. 160-170 amps. 5 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5300	5.5	65
.65 " "	3300	5.5	100
2.75 " "	1630	5.0	200
5.5 " "	970	4.5	300
8.7 " "	600	4.0	400
12.0 " "	300	3.5	500
16.5 " "	Lock	3.	640
25.0 " "	Lock	4.	880

Removal:—Flange mounted on left front face of flywheel housing. Disconnect wire connections (tape battery lead) and oil filter lines. Remove two fastening bolts and withdraw unit.
Starting Switch:—Solenoid Pinion Shift type SS-4206. Controlled through relay by pushbutton on instrument panel. *See article in Electrical Equip. Section.*

GENERATOR:—Models GDZ-4801A (Std.), GEB-4801A (Police). Armature No. GDZ-2006F (GDZ-4801A) GEB-2006F (GEB-4801A). Two brush type with current-voltage control. Air cooled.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator.
See Regulator data following.
Maximum Charging Rate—35 amperes (Std.), 32 amperes (Police), 8.0 volts, 2200 gen. RPM (Std.), 1400 (Police), approx. 24 MPH (Std.) and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data—GDZ-4801A

Cold			Hot

*32	8.0	1150	32	8.0	1400

*—Current regulator setting.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.60-1.78 amperes at 6 volts (GDZ).
Motoring Current—4.16-4.60 amperes at 6 v. (GDZ).
Removal:—Pivot mounted at left side of engine at front. To remove, take out pivot and clamp bolts.
Belt Adjustment:—Loosen clamp and pivot bolts, swing generator out until scale (attached to field frame) reads 40-50 lbs., tighten bolts.

REGULATOR:—Model VRP-4001A (Std.), B (Police). Current-Voltage type. In single case on dash.
See article in Electrical Equipment Section for data.
NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken.

Cutout Relay
Cuts In—6.4-6.6 volts at approximately 1000 generator RPM (Std.), approx. 600 gen. RPM (Police).
Cuts Out—4.8-5.6 volts (approx. 7-8 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.034" min., .038" max. with contacts open. Measure at hinge end of core.

Voltage Regulator
Setting—7.3-7.6 volts at 70° F.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal, voltmeter between 'B' terminal and ground. Operate generator at speed equivalent to 30 MPH charging battery until voltage is steady. Voltage reading should be 7.3-7.6 volts (room temperature), 7.1-7.4 volts (hot operating conditions).
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap—.012" Min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator
Setting—Std: 34-36 amperes (marked '35' on cover), Police: 31-33 amperes (marked '32' on cover).
To Check (without breaking seals)—Connect test meters as for Voltage check (above). Operate generator at speed equivalent to 30 MPH charging battery, turn on car lights and accessories so that generator charges at peak rate and Current Regulator operates. Charging current should not exceed 34-36 amperes (Std.), 31-33 amperes (Police). If more than slight excess noted, regulator is defective.
Adjustment & Contact Gap—Same as for Voltage Regulator (above).
Air Gap—.034-.038" with contacts just opening.

LIGHTING:—Headlamps—Corcoran-Brown 'Sealed Beam' type. *See article in Electrical Equipment Section.*
Headlamp Adjustment—Aim upper beam for each lamp straight ahead with center of hot spot 3" below lamp center height.
Beam Indicator—Red light in upper left corner of speedometer dial. Lighted when upper beam on.

Switches
Lighting—Chrysler No. 854794, 857380 Optl.
Beam Selector—Chrysler No. 859974.
Instrument—Chrysler No. 853371.
Stop Light—Chrysler No. 677112 hydraulic type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Parking Instrument	1½	55
Beam Indicator, Ign. Sw.	1	51
Overdrive Indicator	1	51
Stop and Tail	21-3	1158
Rear License	3	63
Dome or Reading	15	87

LIGHTING CIRCUIT BREAKER:—Vibrating, thermostatic type. Mounted on lighting switch.

FUSES:—Clock—2 ampere. In connector behind clock.
Rear Clock (C27 only)—2 ampere. In connector near back of ammeter.
Body Wiring (C27 only)—30 ampere. In connector back of ammeter.
Transmission Overdrive Control—20 amp. On relay.
Radio—14 amp. In feed wire behind instr. panel.
Horns & Windshield Wiper—No fuse used.

HORNS:—Auto-Lite HC-5107, HO-5001 Horn Set. HL-4001 (low pitch), HL-4002 (high pitch), dual horns.
Current Draw—Approx. 35-40 amperes.
Horn Relay:—Auto-Lite Model HRC-4001 (no fuse).
Contacts Close—1.5-3.0 volts. **Open**—.5 volt.
Contact Gap—.026". **Air Gap**—.016-.020" (closed).

WINDSHIELD WIPER:—Auto-Lite Model EBW-4001. Electric type with circuit-breaker on back of switch.
See article in Mechanical Equipment Section for data.
Circuit Breaker—Vibrating, thermostatic type. Starts to operate with current of 12 amperes.

ENGINE NOTE:—Engine is two cylinder, horizontally opposed type with connecting rods on individual crankpins so that both pistons move in and out together. Cylinders fire alternately at 360° intervals (one complete revolution between firing points).

SERIAL NUMBER:—First number 390-10000. Stamped on front face of cowl below battery shelf (in engine compartment).

ENGINE NUMBER:—First number C-10000. Stamped on top center of engine block at rear of carburetor.

COMPRESSION:—**Ratio**—5.5-1. **Pressure**—90 lbs. at cranking speed.

VACUUM READING:—No means of connecting gauge.

IGNITION:—**Coil Model IG-4065.** Mounted on battery shelf between battery and gasoline tank. Service Coil IG-4070.

Ignition Current—2 amperes idling, 5 stopped.

Ignition Switch:—Douglas No. 2980.

Distributor Model IGW-4142-A. Single breaker, two lobe cam, full automatic advance type.

Breaker Gap—.020".

Rotation—Clockwise viewed from the top.

Cam Angle or Dwell—46° closed, 134° open.

Breaker Arm Spring Tension—17-20 ozs.

Condenser—No. IGB-1025. Capacity .20-.25 mfds.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	0	600
3	480	6	960
6	650	12	1300
10	1475	20	2950
14	2300	28	2600

Removal:—Distributor mounted on top of engine on left side. To remove, take out hold-down screw in advance arm, lift distributor out.

IGNITION TIMING:—Standard setting below correct for fuel of 70 Octane Rating. See Final Adjustment (following) for correction dependent on fuel used.

	Flywheel Degrees	Piston Position
All Engines	0° At TDC	.000" TDC

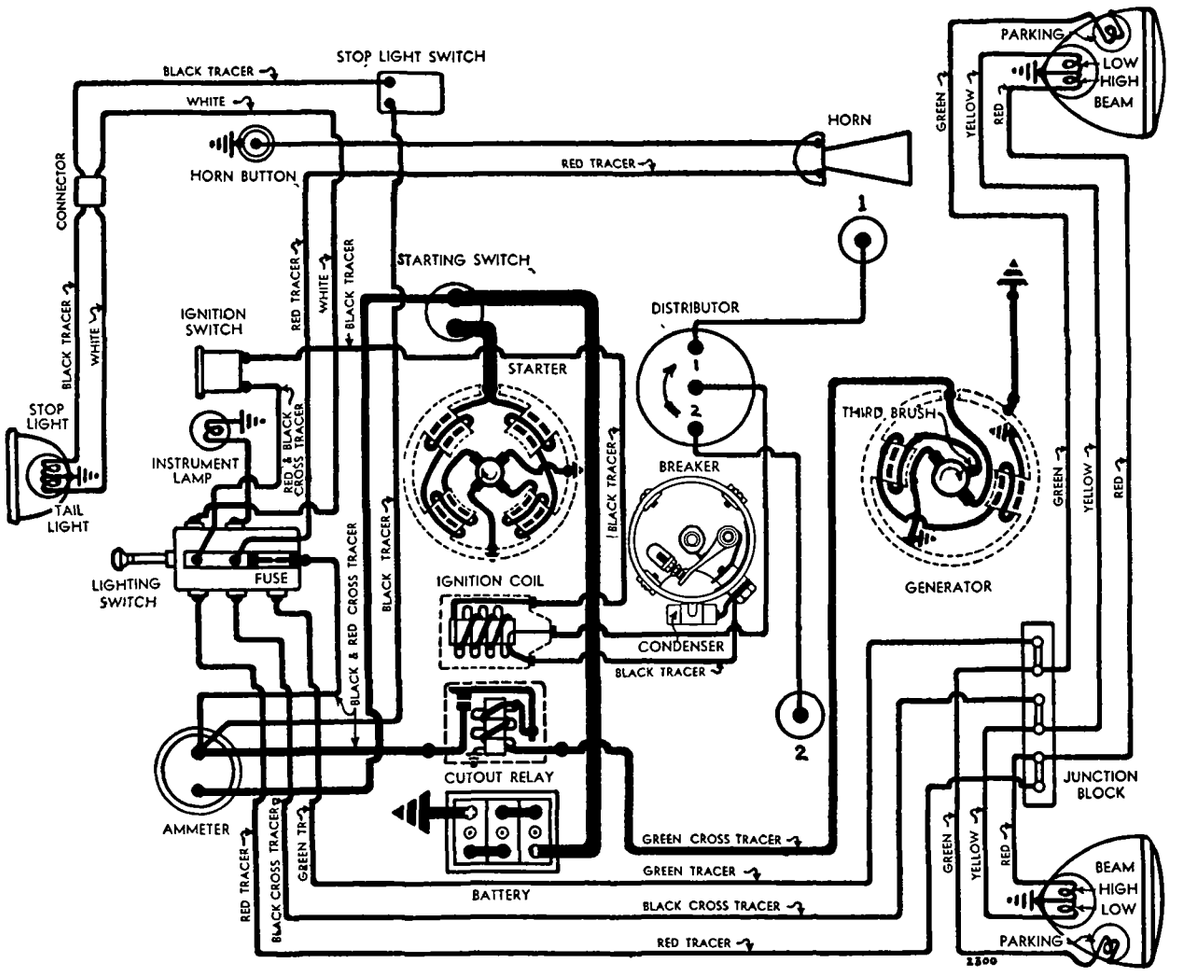
To Set Timing—Turn engine over until piston reaches top dead center when half-round notch in rim of flywheel lines up with small rib cast on top center of crankcase. Loosen advance arm clamp screw, rotate distributor until contacts just begin to open, tighten clamp screw. See that distributor cap terminal which is in line with rotor is connected to spark plug in cylinder entering power stroke (flywheel mark will be at indicator at firing point for each cylinder on alternate revolutions of the crankshaft).

Final Adjustment—If Ethyl fuel, or fuel of better than 70 Octane Rating used, loosen advance arm clampscrew and rotate distributor so as to advance timing until slight 'ping' secured when engine pulling under load.

Firing Order:—1-2 (cylinders fire alternately at intervals of 360° or one complete revolution of the crankshaft).

Spark Plugs:—Auto-Lite Type A5. 14MM. Metric.

Spark Plug Gaps—.025".



CARBURETION:—**Carburetor**—Tillotson Model DY-1A. 1", plain tube, single barrel downdraft type with low and high speed adjustments.

See article in Carburetor Section for data.

ADJUSTMENT NOTE—If carburetor out of adjustment so that engine can not be warmed up, make preliminary adjustment as given below, then run engine until warm before making adjustments.

Preliminary Adjustment—Turn main (high speed) adjusting screw in or clockwise lightly until it is seated, then back adjusting screw out exactly two full turns. Turn idle (low speed) adjusting screw in or clockwise lightly until seated, then back adjusting screw out exactly one full turn. Start engine and run until thoroughly warm, then adjust as follows:

High Speed (Main) Adjustment—Open throttle so that engine runs at speed of 30-35 M.P.H. Turn main adjusting screw in or clockwise slowly (¼ turn at a time) until engine slows down due to lack of fuel, then turn adjusting screw out very slowly (⅛ turn at a time) until maximum speed is secured. Correct setting is approximately 1½-1¾ turns of the screw from the inner seated position.

Low Speed (Idle) Adjustment—Close throttle, set throttle lever stopscrew so that engine idles faster than normal. Turn idle adjusting screw in or clockwise slowly until engine begins to miss, then turn screw out until engine fires smoothly. Open throttle momentarily to clear manifold, recheck idle adjustment. Correct setting is approximately ¾-1¼ turns of the screw from the inner seated position. Adjust throttle lever stopscrew for high gear idling speed of 7 M.P.H.

Air Cleaner:—Oil-wetted type.

Fuel Pump:—None used (gravity feed).

MANIFOLD HEAT CONTROL:—No adjustment.

VALVE TIMING:—**To Check Timing**—Intake valve should open when point on flywheel 5.5 teeth before TDC mark (half-round notch in flywheel rim) lines up with small rib cast on top center of crankcase. Exhaust closing point is 5.5 teeth past TDC mark.

Tappet Clearance:—.006-.0065" Intake, .007-.0075" Exhaust (Cold). No adjustment.

Valve Spring Pressure:—20 lbs. at 1½" (closed), 41 lbs. at 1 15/64" (open). Free length 1 27/32".

LUBRICATION:—**Crankcase Capacity**—2 qts.
Normal Oil Pressure—30-45 lbs. (warm oil).

COOLING SYSTEM:—Air-cooled by suction fan built in flywheel. Fan capacity 700 cu. ft. per minute at 3600 R.P.M.

BATTERY:—**Auto-Lite Model AB-13L.** 6 volt, 13 plate, 80 ampere hour capacity (20 hour rate).
Starting Capacity—96 amperes for 20 minutes.
Zero Capacity—300 amperes for 2.0 minutes.
Grounded Terminal—Positive (+) terminal grounded to right hand side of cowl. **Engine Ground**—Strap between engine and frame cross-member at front engine mounting on right hand side.
Location—On shelf on front of cowl in engine compartment on right hand side.
Dimensions—Length 9". Width 7". Height 8⅝".

STARTER:—**Model MZ-4077. Armature No. MZ-2085.**
Drive—Compression Type Bendix No. RCBX11-10.
Rotation—Clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque		R.P.M.	Volts	Amperes
0	ft. lbs.	4300	5.5	70
.65	"	2500	5.5	100
2.55	"	1325	5.0	200
4.95	"	750	4.5	300
7.65	"	220	4.0	400
7.80	"	Lock	3.0	420
11.80	"	Lock	4.0	560

Removal:—Starter cradle mounted on top of flywheel housing. To remove, take out starting motor top plate (in driver's compartment), disconnect cable, take out two bolts in starter clamp band, lift starter out.

Starting Switch:—Model SW-4001. Manual 'type mounted on toeboard.

GENERATOR:—**Model GBM-4619-5. Armature GBM-2066.** Third brush control type. No ventilation.
Charging Rate Adjustment—Remove commutator cover band, shift third brush by hand clockwise to increase, or counter-clockwise to decrease, charging rate. Brush held in position by friction.
Maximum Charging Rate—12 amperes, 8.0 volts.

Performance Data

Cold			Hot		
Amperes	Volts.	R.P.M'	Amperes	Volts	R.P.M.
0	6.4	850	0	6.4	900
2	6.6	960	2	6.65	1040
4	6.75	1030	4	6.9	1180
6	7.05	1160	6	7.2	1330
8	7.25	1265	8	7.4	1500
10	7.45	1380	10	7.7	1720
12	7.7	1510	12	7.9	2080
14	7.9	1740	12.45	8.0	2400
15	8.0	2300			

Rotation—Clockwise at commutator end.
Brush Spring Tension—50-60 ozs.
Field Current—3.8-4.2 amperes at 6.0 volts.
Motoring Current—5.3-5.9 amperes at 6.0 volts.

Removal:—Generator flange mounted on timing gear cover and driven directly from front end of crankshaft. To remove, disconnect lead, take out two flange mounting capscrews, remove generator from below.

CUTOUT RELAY:—**Model CB-4025.** Mounted on shelf on front of cowl between battery and gasoline tank. *See article in Electrical Equipment Section for data.*
Cuts In—6.5-7.25 volts.
Cuts Out—.5-2.5 ampere discharge current (after charging at 15 amperes).
Contact Gap—.015-.045".
Air Gap—.010-.030" with contacts closed.

LIGHTING:—**Headlamps**—Moto-lamp type with upper and lower beams controlled by lighting switch.
Headlamp Adjustment—Aim each headlamp so that hot spot centered on vertical line directly ahead of each lamp center and upper edge of hot spot on horizontal line at lamp center height.

Switches

Lighting—Douglas No. 5731.

Bulb Specfications

Position	Candlepower	Mazda No.
Headlights	32-21	2320C
Parking, Instrument	1.5	55
Stop & Tail	21-3	1158

FUSES:—**Lighting**—10 ampere. On switch.

HORN:—**Sparton.** Disc type vibrator horn.
Current—5 amperes.

SERIAL NUMBER:—On right front door hinge post, First number: Detroit—5,688,001 (Custom), 6,064,301 (Deluxe), 5,096,701 (Taxi). Canada—9,393,281.

ENGINE NUMBER:—First number S7-1001. Stamped on left side of block between #1 and #2 cylinders.

COMPRESSION:—Ratio and pressure as follows:

Ratio	Pressure at 1000 RPM	At 100 RPM
6.5-1 cast-iron hd.	145-155 lbs.	Approx. 115 lbs.
*7.0-1 aluminum hd.	150-160 lbs.	Approx. 120 lbs.

NOTE—7.0-1 Head Std. on 7 Pass. Sedans.

IGNITION:—**Coil Model IG-4661.** Service winding (less switch and cable) IG-3224JS. Mounted on dash.
Ignition Current—2.25 amperes idling, 5.5 stopped.

Ignition Switch:—Mitchellock Model 24-R, No. 8197.
Ignition Lock—Yale & Towne or Briggs & Stratton. B&S No. 80651. Key Series 1BP to 1000BP. Groove #24.

Distributor Model IGS-4108-1. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control and manual (octane selector) adjustment.
Breaker Plate Identification—Maximum vacuum advance limited by slot and marked with number (#7) stamped on plate.
Breaker Gap—Set at .020". Limits .018-.022".
Cam Angle or Dwell—38° closed, 22° open (distr.).
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Clockwise viewed from the top.
Condenser—No. IG-3927A. Capacity .25-.28 mfd.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	350	0	700
3	400	6	800
6	850	12	1700
9	1300	18	2600
12	1750	24	3500

Vacuum Spark Control—Integral type (on distributor, linked directly to breaker plate). Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle (spark retarded by return spring in unit).

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5"
1°	2°	6½"
3°	6°	9¼"
5°	10°	12⅛"
7°	14°	15"

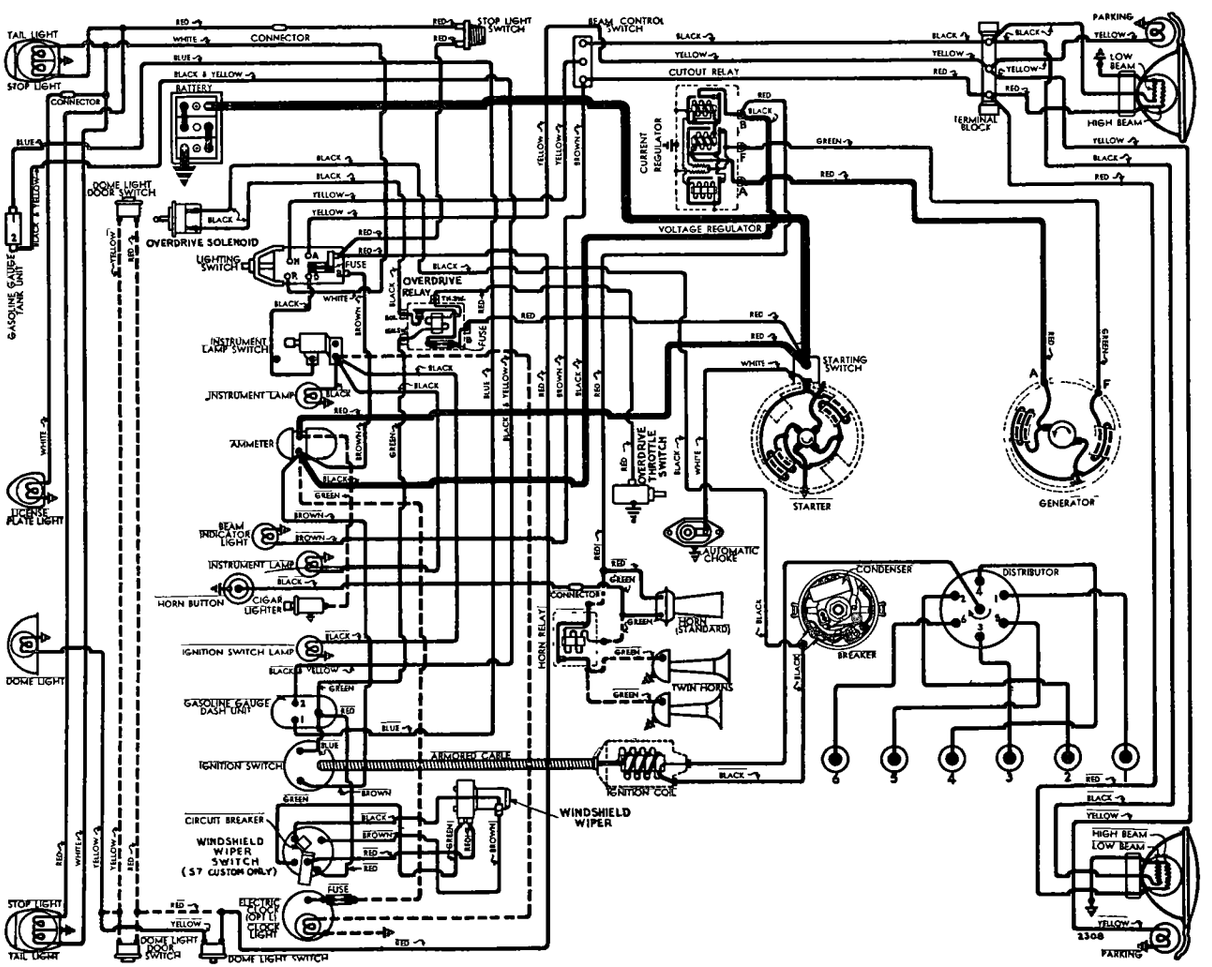
Manual Adjustment—At distributor. Provides 10° advance or retard from center '0' position. See Ignition Timing for adjustment.

Distributor Removal:—Mounted on left side of crankcase To remove, disconnect vacuum line, take out hold-down screw in lock plate.

IGNITION TIMING:—Initial setting (correct for fuel of 70 octane rating at low altitudes for both cast-iron and aluminum heads) shown below. See Manual adjustment (following) for correction (not to exceed 4° either way) dependent on fuel regularly used and operating conditions.

	Flywheel Degrees	Piston Position
6.5-1 cast-iron hd.	2° BTDC.	.002" BTDC.
7.0-1 aluminum hd.	2° ATDC.	.002" ATDC.

NOTE—Impulse neutralizer marked 'DC' at TDC point with 15 (1°) graduations on either side.
Timing (Using Timing Light)—Connect timing light between distributor and battery terminal on the generator regulator. With #6 piston on compression, turn engine over until piston reaches firing position (see Initial Setting above), stop when correct mark on impulse neutralizer lines up with pointer on chain case cover. Loosen lock-plate hold-down screw, center pointer on scale, tighten screw. Loosen lock-plate clamp bolt, rotate distributor until timing light just goes out, tighten clamp bolt. Check Manual Adjustment as directed below.



Timing (Using Synchroscope)—Tool C-374. Clip lead to #1 spark plug, direct light on impulse neutralizer (fill in correct mark on impulse neutralizer with chalk or paint), idle engine and adjust distributor as directed above.

Manual Adjustment—Standard ignition setting should be varied not more than 4° (cast-iron head —6° or .015" BTDC to 2° or .002" ATDC. Aluminum head—2° or .002" BTDC to 6° or .015" ATDC) so that slight ping noticeable between 10 and 30 M.P.H. when accelerating with wide open throttle for best performance. To adjust, loosen hold-down screw, rotate distributor counter-clockwise to advance spark (if no ping noted), clockwise to retard spark (if ping too severe) not more than 4°. Scale graduated in engine degrees.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Auto-Lite Type A-7B (cast-iron head), Type AL-7A (aluminum head). 14 MM Metric type.
Spark Plug Gaps—Set at .025".

CARBURETION:—**Carburetor**—Carter (Ball & Ball) Model E6N2 (early cars), E6N3 (later cars). 1½" single barrel, downdraft type.
See article in Carburetor Section for complete data.
NOTE—Carburetor jets changed (new metering jet used on E6N3). ***See Carter (B&B) carburetor article and Jet Table in Carburetor Section for complete data.***
Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 6 MPH idle speed. Adjust idle adjusting screw until engine fires smoothly (½-1¼ turns open—turn screw in for leaner mixture). Readjust idle speed. NOTE—Car manufacturer recommends use of vacuum gauge. Idle screw should be set to give highest reading on gauge.

Accelerating Pump Setting—Pump lever has three holes for pump link engagement. Set as follows: Inner Hole (min. stroke)—Extreme hot temperatures or altitudes above 3000 feet.
Center Hole (med. stroke)—Normal setting.
Outer Hole (max stroke)—Winter temperatures.
NOTE—If lean metering jets (High Alt calibration) used at lower altitudes for increased economy, reduced speed and power will result (not recommended by manufacturer). See Carter (B&B) Jet Table in Carburetor Section for complete jet data
Float Level—5/64" from top of float (not soldered seam) to top edge of float bowl.

Fast Idle:—Not adjustable (built-in type).

Automatic Choke:—Sisson Type AC-758B.
See article in Carburetion Equipment Section.

Air Cleaner:—AC #1529041 oil-wetted type standard.

Fuel Pump:—AC Type AT #1523912 diaphragm type Type AS #1523913 combination fuel-and-vacuum pump used on cars with swinging windshield.
See articles in Carburetion Equipment Section.

Gasoline Gauge:—Auto-Lite electric. No. NG-9349-D (dash unit), No NG-9329T (tank unit).
See article in Carburetion Equipment Section.

MANIFOLD HEAT CONTROL:—Thermostatic coil type See that shaft and valve rotate freely. When installing coil, wind up free end ½ turn counterclockwise and hook end over stop stud
CAUTION—Do not wind coil up more than ½ turn

VALVE TIMING:—To Check—With .014" (cold) tappet clearance #6 intake valve should open with #6 piston 12° or 063" BTDC with 12th graduation before DC mark on impulse neutralizer aligned with pointer on chain case cover. Reset tappet clearance at .008" (hot).

Tappet Clearance:— 008" Int, 010" Exh (hot & idling). 002" add'tl exh clearance desirable for sustained high speeds NOTE—Tappet screws self-locking (no locknuts). Remove right front wheel, lower housing panel and fuel pump shield for access to valves.

Valve Spring Pressure:—40-45 lbs at 1¾" (valve closed). 107-115 lbs. at 1⅜" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts (refill).
Normal Oil Pressure—30-45 lbs at 30 MPH, 15 idling

COOLING SYSTEM:—Capacity—17 quarts.
Thermostat—Bishop & Babcock or Fulton In outlet on head Starts to open 157-162° Fully open 183°
Temperature Gauge—Motometer (Auto-Lite) Vapor tension type. A-L Part No H-9348.
See article in Mechanical Equipment Section for data.

TRANSMISSION OVERDRIVE CONTROL:—Electric type with accelerator pedal 'kick-down' switch Optl.
See article in Mechanical Equipment Section for data.
Overdrive Solenoid—Auto-Lite SSB-4001
Throttle Switch Setting—3/32" gap between switch plunger & contact screw (throttle just wide open).
Control Relay—Auto-Lite HR-4201 Use only 20 ampere fuse on relay (on left side of engine dash).

BATTERY:—Willard Type SW-2-105. 6 volt, 15 plate, 105 ampere hour capacity (20 hour rate)
Starting Capacity—133 amperes for 20 minutes
Zero Capacity—300 amperes for 3 9 minutes. Five second voltage—4 3 volts
Grounded Terminal—Positive (+) grounded to transmission.
Dimensions—Length 10¼". Width 7". Height 9".
Location—On left side under front seat.

STARTER:—Model MAW-4016. Armature MAW-2030.
Drive—Overrunning clutch, manual pinion shift.
Rotation—Counter-clockwise at commutator end.
Cranking Engine—150-175 amperes, 5.1 volts.
Brush Spring Tension—42-53 ozs (new brushes).

Performance Data

Torque	R P M.	Volts	Amperes
0 ft. lbs.	4900	5 5	65
60 " "	3300	5 5	100
2 75 " "	1480	5 0	200
5 45 " "	820	4 5	300
8 50 " "	400	4 0	400
11 55 " "	110	3 5	500
11 5 " "	Lock	3 0	505
18 0 " "	Lock	4 0	670

Removal:—Flange mounted on left front face of flywheel housing, Remove cables, 2 clips on starter linkage, oil filter lines, 2 mounting bolts Lift off.
Starting Switch:—Model SW-2813 On starter Manually operated by starter (pinion shift) pedal.

GENERATOR:—Models GDZ-4801A (Std.), GEB-4801A (Police). Armature No. GDZ-2006F (GDZ-4801A) GEB-2006F (GEB-4801A). Two brush type with current-voltage control Air cooled.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator.
See Regulator data following.
Maximum Charging Rate—35 amperes (Std), 32 amperes (Police), 8 0 volts, 2200 gen RPM (Std), 1400 (Police), approx 24 MPH (Std) and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data—GDZ-4801A

28	7 8	1075	28	7 8	1260
*32	8 0	1150	32	8 0	1400

*—Current regulator setting.

Rotation—Counter-clockwise at commutator end
Brush Spring Tension—53 ozs max (new brushes)
Field Current—1 60-1 78 amperes at 6 volts (GDZ).
Motoring Current—4 16-4 60 amperes at 6 v (GDZ).
Removal:—Pivot mounted at left side of engine at front To remove, take out pivot and clamp bolts.
Belt Adjustment:—Loosen clamp and pivot bolts, swing generator out until scale (attached to field frame) reads 40-50 lbs , tighten bolts

REGULATOR:—Model VRP-4001A (Std.), B (Police).
Current-Voltage type. In single case on dash
See article in Electrical Equipment Section for data.
NOTE—Regulator case cover is sealed Serviced on exchange basis if seals not broken.

Cutout Relay
Cuts In—6 4-6 6 volts at approximately 1000 generator RPM (Std), approx. 600 gen RPM (Police).
Cuts Out—4 8-5 6 volts (approx 7-8 amps disch).
Contact Gap— 015" minimum.
Air Gap— 034" min , 038" max with contacts open. Measure at hinge end of core.

Voltage Regulator
Setting—7 3-7 6 volts at 70° F.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal, voltmeter between 'B' terminal and ground Operate generator at speed equivalent to 30 MPH charging battery until voltage is steady Voltage reading should be 7 3-7 6 volts (room temperature), 7 1-7.4 volts (hot operating conditions).
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly See Electrical Equipment Section
Contact Gap— 012" Min (armature against stop pin).
Air Gap— 048- 052" with contacts just opening

Current Regulator
Setting—Std 34-36 amperes (marked '35' on cover), Police 31-33 amperes (marked '32' on cover)
To Check (without breaking seals)—Connect test meters as for Voltage check (above) Operate generator at speed equivalent to 30 MPH charging battery, turn on car lights and accessories so that generator charges at peak rate and Current Regulator operates Charging current should not exceed 34-36 amperes (Std), 31-33 amperes (Police). If more than slight excess noted, regulator is defective
Adjustment & Contact Gap—Same as for Voltage Regulator (above)
Air Gap— 034- 038" with contacts just opening.

LIGHTING:—Headlamps—Hall 'Sealed Beam' type
See article in Electrical Equipment Section for data.
Headlamp Adjustment—Aim upper beam for each lamp straight ahead with center of hot spot 3" below lamp center height
Beam Indicator—Red light on panel above instrument cluster Lighted with upper beam on.

Switches
Lighting—Chrysler No 854756, 854757 Optl.
Beam Selector—Chrysler No 859974.
Instrument—Chrysler No 853371
Stop Light—Chrysler No 677112

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Parking, Instrument	1½	55
Beam Indicator, Ign Sw	1	51
Stop and Tail	21-3	1158
Rear License	3	63
Dome or Reading	15	87

FUSES:—Lighting—30 amp. On back of light switch
Clock—2 ampere In connector behind clock
Transmission Overdrive Control—20 amp On relay
Horns & Windshield Wiper—No fuse used
Radio—14 amp In feed wire behind instr panel.
HORNS:—Single—Delco-Remy No 1999911 standard
Dual—Auto-Lite HO-5001 horn set HL-4001 (low pitch), HL-4002 (high pitch) operated by horn relay
Current Draw—Approx 7 amps single, 35-40 dual
Horn Relay:—Auto-Lite Model HRC-4001 (no fuse)
Contacts Close—1 5-3 0 volts **Open**— 5 volt
Contact Gap— 026" **Air Gap**— 016- 020" (closed)
WINDSHIELD WIPER:—Auto-Lite Model EBW-4001 (S7 Custom cars only). Electric type with circuit-breaker on back of switch
See article in Mechanical Equipment Section for data.
Circuit Breaker—Vibrating, thermostatic type Starts to operate with current of 12 amperes

SERIAL NUMBER:—On right front door hinge post.

	Detroit	Canada
D14 Deluxe	30,216,001	9,420,231
D17 Special	4,349,001	9,494,721

ENGINE NUMBER:—First number D14-1001. Stamped on left side of block between #1 and #2 cylinders.

COMPRESSION:—Ratio and pressure as follows:

Ratio	Pressure at 1000 RPM	At 100 RPM
6.5-1 cast-iron hd.	140-150 lbs.	Approx. 113 lbs.
7.0-1 aluminum hd.	150-160 lbs.	Approx. 120 lbs.

IGNITION:—**Coil Model IG-4661.** Service winding (less switch and cable) IG-3224JS. Mounted on dash.
Ignition Current—2.25 amperes idling, 5.5 stopped.
Ignition Switch:—Mitchellock Model 24-R, No. 8197.
Ignition Lock—Yale & Towne or Briggs & Stratton. B&S No. 80651. Key Series 1BP to 1000BP. Groove #24.
Distributor IGS-4107-1, IGS-4108B-1 (D14 Canada). Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control and manual (octane selector) adjustment.
Breaker Plate Identification—Maximum vacuum advance limited by slot and marked with number (#8—IGS-4107-1, #10—IGS-4108B-1) stamped on plate.
Breaker Gap—Set at .020". Limits .018-.022".
Cam Angle or Dwell—38° closed, 22° open (distr.).
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Clockwise viewed from the top.
Condenser—No. IG-3927A. Capacity .25-.28 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	350	0	700
3	400	6	800
6	850	12	1700
9	1300	18	2600
12	1750	24	3500

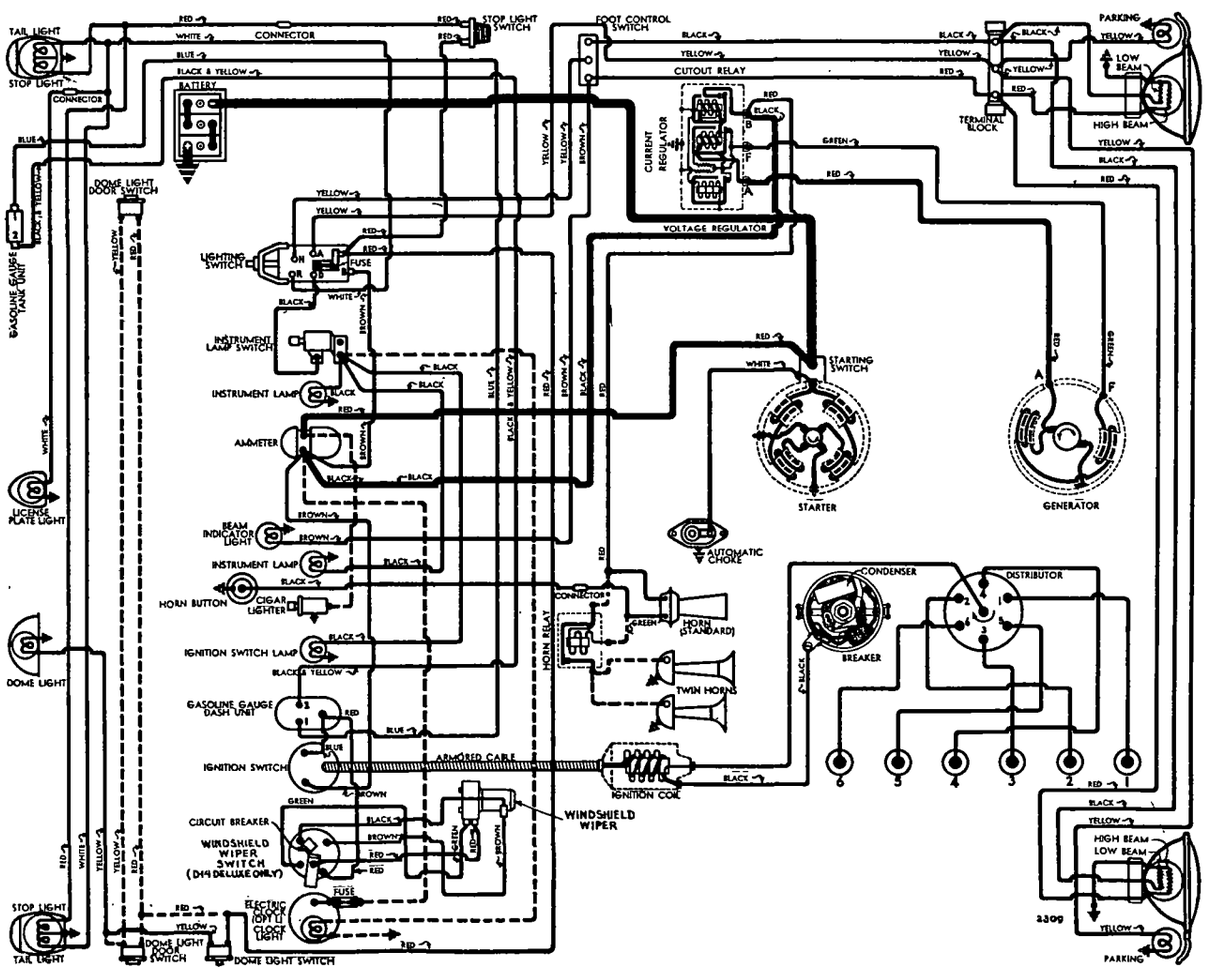
Vacuum Spark Control—Integral type (on distributor, linked directly to breaker plate). Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle (spark retarded by return spring in unit).

Vacuum Advance—IGS-4107-1

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5"
2°	4°	7¾"
4°	8°	10½"
6°	12°	13¼"
8°	16°	16"

Vacuum Advance—IGS-4108B-1

Start	0°	4¾"
2°	4°	6¼"
5°	10°	8⅜"
8°	16°	10½"
10°	20°	12"



Manual Adjustment—At distributor. Provides 10° advance or retard from center '0' position. See Ignition Timing for adjustment.
Distributor Removal:—Mounted on left side of crankcase. To remove, disconnect vacuum line, take out hold-down screw in lock plate.

IGNITION TIMING:—Initial setting (correct for fuel of 70 octane rating at low altitudes for both cast-iron and aluminum heads) shown below. See Manual adjustment (following) for correction (not to exceed 4° either way) dependent on fuel regularly used and operating conditions.

Flywheel Degrees	Piston Position
6.5 & 7.0-1 heads 0° at TDC	0000" at TDC.

NOTE—Impulse neutralizer (D14), crankshaft pulley (D17) marked 'DC' at top dead center with 15 (1°) graduations on either side.
Timing (Using Timing Light)—Connect timing light between distributor and battery terminal on the generator regulator. With #6 piston on compression, turn engine over until piston reaches firing position (see Initial Setting above), stop when correct mark on impulse neutralizer lines up with pointer on chain case cover. Loosen lock-plate hold-down screw, center pointer on scale, tighten screw. Loosen lock-plate clamp bolt, rotate distributor until timing light just goes out, tighten clamp bolt. Check Manual Adjustment as directed below.
Timing (Using Synchroscope)—Tool C-374. Clip lead to #1 spark plug, direct light on impulse neutralizer (fill in correct mark on impulse neutralizer with chalk or paint), idle engine and adjust distributor as directed above.
Manual Adjustment—Standard ignition setting should be varied not more than 4° (piston 4° or .0068" before or after top dead center) so that slight ping noticeable between 10 and 30 M.P.H. when accelerating with wide open throttle for best performance. To adjust, loosen hold-down screw, rotate distributor counter-clockwise to advance spark (if no ping noted), counter-clockwise to retard spark (if ping too severe) not more than 4°. Scale graduated in engine degrees.
Firing Order:—1-5-3-6-2-4. See diagram.
Spark Plugs:—Auto-Lite Type A-7B (cast-iron head), Type AL-7A (aluminum head). 14 MM Metric type.
Spark Plug Gaps—Set at .025".

CARBURETION:—**Carburetor**—Stromberg Model BXV-3. Single barrel, 1½" special downdaft type.
See article in Carburetor Section for complete data.
Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 6 MPH idle speed. Adjust idle adjusting screw until engine fires smoothly (turn screw in for leaner mixture). Re-

adjust idle speed. NOTE—Car manufacturer recommends use of vacuum gauge. Idle screw should be set to give highest reading on gauge.
Accelerating Pump Setting—Pump lever has three holes for pump link engagement. Set as follows:
Inner Hole (min. stroke)—Extreme hot temperatures or altitudes above 3000 feet.
Center Hole (med. stroke)—Normal setting.
Outer Hole (max. stroke)—Winter temperatures.
NOTE—If lean metering jets (High Alt. calibration) used at lower altitudes for increased economy, reduced speed and power will result (not recommended by manufacturer). See Stromberg Jet Table in Carburetor Section for complete jet data.
Float Level—Fuel level 5/8" below top edge of bowl.

Fast Idle:—Not adjustable. Throttle stopscrew should rest on high point of cam (choke valve closed).

Throttle Cracker:—Interconnector between starting pedal and accelerator rod which opens throttle approximately one-third when pedal depressed for starting. Adjust by loosening throttle pickup clamp bolt (above starter switch), shift clamp on rod.

Automatic Choke:—Sisson Type AC-758B.
See article in Carburetion Equipment Section.

Air Cleaner:—AC #1528200 oil-wetted type standard.

Fuel Pump:—AC Type AT #1523647 diaphragm type.
See article in Carburetion Equipment Section.

Gasoline Gauge:—Auto-Lite electric. No. NG-9342D (dash unit), No. NG-9329T (tank unit).
See article in Carburetion Equipment Section.

MANIFOLD HEAT CONTROL:—Thermostatic coil type. See that shaft and valve rotate freely. When installing coil, wind up free end ½ turn counter-clockwise and hook end over stop stud.
CAUTION—Do not wind coil up more than ½ turn.

VALVE TIMING:—To Check—With .011" (cold) tappet clearance, #6 intake valve should open with #6 piston 6° or .0153" ATDC with 6th graduation after DC mark on impulse neutralizer or crankshaft pulley aligned with pointer on chain case cover. Reset tappet clearance at .006" (hot and idling).

Tappet Clearance:—.006" Int., .008" Exh. (hot&idling). .002" add'tl exh. clearance desirable for sustained high speeds. NOTE—Tappet screws self-locking (no locknuts). Remove right front wheel, lower housing panel and fuel pump shield for access to valves.

Valve Spring Pressure:—34-38 lbs. at 1¾" (valve closed), 77-83 lbs. at 1 7/16" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill).
Normal Oil Pressure—30-45 lbs. at 30 MPH, 15 idling.

COOLING SYSTEM:—Capacity—15 quarts.
Thermostat—Bishop & Babcock or Fulton. In outlet on head. Starts to open 157-162°. Fully open 183°
Temperature Gauge—Motometer (Auto-Lite) Vapor tension type. A-L Part No. H-9341.
See article in Mechanical Equipment Section for data.

BATTERY:—Auto-Lite type PN-15A. 6 volt, 15 plate, 95 ampere hour capacity (20 hour rate).
Starting Capacity—117 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.1 minutes.
Grounded Terminal—Positive (+) grounded to the transmission case.
Dimensions—Length 8⅞". Width 7". Height 8⅝".
Location—Left side under front seat.

STARTER:—Model MZ-4062. Armature No. MZ-2108. MAW-4016 (D14 Canada). Armature No. MAW-2030.
See 1940 De Soto S7 'T&E' page for MAW-4016 data.
Drive—Overrunning clutch, manual pinion shift.
Rotation—Counter-clockwise at commutator end.
Cranking Engine—150-175 amperes, 5.1 volts.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.5	70
.65 " "	2500	5.5	100
2.55 " "	1325	5.0	200
4.95 " "	750	4.5	300
7.65 " "	220	4.0	400
7.8 " "	Lock	3.0	420
11.8 " "	Lock	4.0	560

Removal:—Flange mounted on left front face of flywheel housing, Remove cables, 2 clips on starter linkage, oil filter lines, 2 mounting bolts. Lift off.
Starting Switch:—Model SW-2813. On starter. Manually operated by starter (pinion shift) pedal.

GENERATOR:—Models GDZ-4801A (Std.), GEB-4801A (Police). Armature No. GDZ-2006F (GDZ-4801A) GEB-2006F (GEB-4801A). Two brush type with current-voltage control. Air cooled.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator.
See Regulator data following.
Maximum Charging Rate—35 amperes (Std.), 32 amperes (Police), 8.0 volts, 2200 gen. RPM (Std.), 1400 (Police), approx. 24 MPH (Std.) and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data—GDZ-4801A

Cold			Hot

*—Current regulator setting.

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.60-1.78 amperes at 6 volts (GDZ).
Motoring Current—4.16-4.60 amperes at 6 v. (GDZ).

Removal:—Pivot mounted at left side of engine at front. To remove, take out pivot and clamp bolts.

Belt Adjustment:—Loosen clamp and pivot bolts, swing generator out until scale (attached to field frame) reads 40-50 lbs., tighten bolts.

REGULATOR:—Model VRP-4001A (Std.), B (Police). Current-Voltage type. In single case on dash.
See article in Electrical Equipment Section for data.
NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken.

Cutout Relay
Cuts In—6.4-6.6 volts at approximately 1000 generator RPM (Std.), approx. 600 gen. RPM (Police).
Cuts Out—4.8-5.6 volts (approx. 7-8 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.034" min., .038" max. with contacts open. Measure at hinge end of core.

Voltage Regulator
Setting—7.3-7.6 volts at 70° F.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal, voltmeter between 'B' terminal and ground. Operate generator at speed equivalent to 30 MPH charging battery until voltage is steady. Voltage reading should be 7.3-7.6 volts (room temperature), 7.1-7.4 volts (hot operating conditions).
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap—.012" Min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator
Setting—Std: 34-36 amperes (marked '35' on cover), Police: 31-33 amperes (marked '32' on cover).
To Check (without breaking seals)—Connect test meters as for Voltage check (above). Operate generator at speed equivalent to 30 MPH charging battery, turn on car lights and accessories so that generator charges at peak rate and Current Regulator operates. Charging current should not exceed 34-36 amperes (Std.), 31-33 amperes (Police). If more than slight excess noted, regulator is defective.
Adjustment & Contact Gap—Same as for Voltage Regulator (above).
Air Gap—.034-.038" with contacts just opening.

LIGHTING:—Headlamps—Corcoran-Brown 'Sealed Beam' type. *See article in Electrical Equipment Section.*
Headlamp Adjustment—Aim upper beam for each lamp straight ahead with center of hot spot 3" below lamp center height.
Beam Indicator—Red light on panel above instrument cluster. Lighted with upper beam on.

Switches
Lighting—Chrysler No. 858050, 858052 Optl.
Beam Selector—Chrysler No. 859974.
Instrument—Chrysler No. 853371.
Stop Light—Chrysler No. 862556.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Parking, Instrument	1½	55
Beam Indicator, Ign. Sw.	1	51
Stop and Tail	21-3	1158
Rear License	3	63
Dome or Reading	15	87

FUSES:—Lighting—30 amp. On back of light switch.
Clock—2 ampere. In connector behind clock.
Radio—14 amp. In feed wire behind instr. panel.
Horns & Windshield Wiper—No fuse used.

HORNS:—Single—Delco-Remy No. 1999911 standard.
Dual—Auto-Lite HO-5001 horn set. HL-4001 (low pitch), HL-4002 (high pitch) operated by horn relay.
Current Draw—Approx. 7 amps. single, 35-40 dual.
Horn Relay:—Auto-Lite Model HRC-4001 (no fuse).
Contacts Close—1.5-3.0 volts. **Open**—.5 volt.
Contact Gap—.026". **Air Gap**—.016-.020" (closed).

WINDSHIELD WIPER:—Auto-Lite Model EBW-4001 (used on D14 cars only). Electric type with circuit-breaker on back of switch.
See article in Mechanical Equipment Section for data.
Circuit Breaker—Vibrating, thermostatic type. Starts to operate with current of 12 amperes.

MODEL DESIGNATION:—Model number indicates Engine size—022 or 02 (60 Engine); 01, 011, 014, 018 (85 Engine); 09, 091, 094, 098 (95 Engine)—with suffix letter indicating body type as follows:
'A'—112" Wheelbase Passenger Cars.
'C'—112" Wheelbase Commercial Chassis.
'D'—122" Wheelbase ¾ Ton Truck Chassis.
'Y'—122" Wheelbase 1 Ton Truck Chassis.
'W'—101", 134", 158" W.B. Cab-over-Engine Trucks.
'T' & 'U'—134", 158" W.B. Trucks and 194" W.B. School Bus.

ENGINE HOOD NOTE:—To raise hood, release latch by pulling up on latch handle on front of hood at center, press in on button in upper edge of grille to release secondary (safety) catch. Safety catch button concealed by latch handle in closed position.

SERIAL & ENGINE NUMBER:—Stamped on top of clutch housing and on left frame side member near generator.

COMPRESSION:—**Ratio**—6.6-1 (All 60 Engines), 6.2-1 (85 & 95 Engines—Pass. Cars, Comm'l., ¾ & 1 Ton), 5.9-1 (85 & 95 Engines—Other Trucks).
Pressure—105 lbs. (60 Engine), 100 lbs. (85 & 95 Engines) at cranking speed of 100 RPM.

VACUUM READING:—Steady 18-20" at 5-7 MPH.

IGNITION:—**Coil Model 78-12024-A** (part of ignition unit assembly). Mounted on top of distributor.
Resistor Unit—Connected in coil primary circuit. Mounted on Circuit Breaker Assembly No. 01A-12250.
Ignition Current—4½-6 amperes (engine stopped). Ignition primary circuit resistance 1-1⅓ ohms.
Ignition Switch:—Oakes Steering Column & Ignition Lock Assembly No. 302110, Ford No. 01A-3676A (Std. Pass. Car); 302126, Ford No. 01A-3676B (Deluxe Pass. Car); 302120, Ford No. 01C-3676 (Comm'l, ¾ & 1 Ton); Ford No. 81W-3676 (Cab-over-Engine), 302122, Ford No. 01T-3676 (Other Trucks). Ignition Switch No. 301683 (all models).
Lock Cylinder—Hurd or Briggs & Stratton No. 80935, Ford No. 91A-3686A (with keys).
Key Series—FK000 to FK999. **Groove**—No. 17.
Distributor Model 78-12127. (Less coil, distributor caps, and distributor plates). Double breaker, 8 lobe cam, full automatic advance type with Vacuum Brake Control (see Ignition Timing for adjustment). Same design as used on preceding V8 models.
Breaker Gap—.014-.016" (both sets). Use special two step feeler—.014" step 'go', .016 step 'no go'.
Cam Angle—36° closed, 9° open. For both sets operating together with correct coil-loading lead.
Breaker Arm Spring Tension—20-24 ozs.
Rotation—Clockwise viewed from drive end.
Condenser—No. 78-12300. Capacity .33-.36 mfd.

Automatic Advance
(High Vacuum or Vacuum Brake Inoperative)

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	200	0	400
2	325	4	650
3	425	6	850
5	825	10	1650
8	1500	16	3000

Removal:—Ignition unit mounted on front of engine. To remove, disconnect vacuum line, take off caps, take out screws in mounting flange.

IGNITION TIMING:—For each engine as follows (see Vacuum Brake Setting below for adjustment depending on type of service and fuel used).

	Flywheel Degrees	Piston Position
'60' Engines	4° BTDC	.0048" BTDC.
'85' & '95' Engines	4° BTDC	.0058" BTDC.

Timing Note—Manufacturer recommends use of Laboratory Test Set with Stroboscope attachment or V-126 Timing Fixture for all ignition settings.
Timing (On Engine)—No flywheel marks provided and timing should be set with piston on top dead center. With #1 piston on top dead center entering power stroke, loosen timing adjusting screw on left hand side of ignition unit housing, place screw in retard position at lower end of slot, move screw slowly up until timing contacts begin to open, note graduation on plate under screw head which is in line with reference mark on housing, move screw up exactly one additional graduation, tighten screw. NOTE—Dead center position can be determined by inserting gauge rod in cylinder or by measuring to tops of #2 and #3 pistons (should be equal).

Vacuum Brake Setting:—Should be adjusted to eliminate pinging when engine operated with load. To adjust, loosen locknut, back off adjusting screw until engine pings with load, turn screw in just enough to eliminate ping, tighten locknut. When adjusted on Stroboscope, vacuum brake should retard spark so that automatic advance is 2° (distr.) at 950 R.P.M. or 38 M.P.H. with no vacuum.

Firing Order:—1-5-4-8-6-3-7-2. See diagram.
Spark Plugs:—Champion Type H-10. 14 MM. Metric.
Spark Plug Gaps—.025".

CARBURETION:—**Carburetor**—Chandler-Groves Model AA-⅞ Ford No. 922A-9510A (60 Engine); AA-1, Ford No. 91A-9510-A (85 & 95 Engine). Dual, downdraft type.
See article in Carburetor Section for data.
Idle Adjustment—With engine warm, choke valve wide open, and Fast Idle inoperative, set throttle lever stopscrew for 5-7 MPH. idling speed, turn each idle adjusting screw (one for each barrel, adjust in succession) in until engine begins to miss, then out until engine begins to roll, finally turn screw in until engine fires smoothly. Final setting should be approximately ⅝-⅞ turn of screw from inner seated position. Readjust stopscrew for correct idling speed of 5-7 MPH. or 350 RPM.
NOTE—Vacuum gauge recommended for idling adjustment. Set for highest steady gauge reading.
Float Level—1⅜-1 11/32" from bottom of float to face of cover with valve seated (invert to check). Fuel level 21/32-23/32" below top edge of bowl.

Accelerating Pump Setting—Three holes provided for pump link connection as follows:
Inner (#1)—Min. stroke, Summer Temperatures.
Center (#2)—Med. stroke, Winter Temperatures.
Outer (#3)—Max. stroke, Extreme Cold Weather.
NOTE—Link locked in pump rod by snap-lock. Pull link shaft out of pump rod to disengage this lock.

Fast Idle:—Integral with carburetor. Operated by choke valve lever. No adjustment required.

Air Cleaner:—AC #1529224, Ford No. 91A-9600-A oil-wetted type Std. Heavy duty oil-bath type Optl.

Gasoline Gauge:—King-Seeley Electric. Ford No. Dash Unit—01A-9280A (Std.), 01A-9280B (Deluxe). Tank Unit—01A-9275A (All Pass. Cars & Comm'l.), 01A-9275B (Deluxe Sedan Delivery), 01Y-9275 (122" Panel Delivery), 01W-9275 (Cab - over - Engine Trucks), 01T-9275 (Other Trucks).
See article in Carburetion Equipment Section.

Fuel Pump:—AC Type R. #1523257, Ford No. 52-9350B (60 Engine); #1523307, Ford No. 68-9350 (85 & 95 Engines). Diaphragm type.
See article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing. No flywheel marks or other means provided to check timing. If dead center position for piston #1 is established on flywheel, intake opening for this cylinder should occur with piston .0270" BTDC. with flywheel mark 3.22 teeth before dead cented point (60 Engine) or with piston on top dead center and flywheel mark at dead center point (85, 95 Engines).

Tappet Clearance:—.0125-.0135" all valves. Not adj.

Valve Spring Pressure:

	(Valve Closed)	(Open)
60 Engine	26-30 lbs., 2.05"	48-52 lbs., 1.80"
85, 95 Engines	37-40 lbs., 2.13"	76-80 lbs., 1.84"

LUBRICATION:—Crankcase Capacity—4 qts. (60 Engine), 5 qts. (85, 95 Engines).

Normal Oil Pressure:—30 lbs. at 2000 R.P.M. (all).

Oil Pressure Gauge:—King-Seeley Electric. Ford No. Dash Unit—01A-9273A (Std.), 01A-9273B (Deluxe). Engine Unit—Ford No. 48-9278 (all models).
See article in Mechanical Equipment Section for data.

COOLING SYSTEM:—Capacity—13 qts. (60 Pass. Car & Comm'l.), 16 qts. (60 ¾&1Ton), 20 qts. (85 Comm'l), 22 qts. (85 Pass. Car & Trucks except Cab-over-Engine), 23 qts. (Cab-over-Engine Trucks).

Thermostat:—In each cylinder head outlet (2 used). Starts to open at 145° F. Fully open at 180° F.

Temperature Gauge:—King-Seeley Electric. Ford No. Dash Unit—01A-10883A (Std.), 01A-10883B (Deluxe). Engine Unit—99A-10884 (all models).
See article in Mechanical Equipment Section for data.
NOTE—Gauge reads 212 (Hot) with ignition off.

BATTERY:—Ford No. 01A-10655-A. 6 volt, 17 plate, 120 ampere hour capacity (20 hour rate).
Starting Capacity—150 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.0 minutes.
Grounded Terminal—Positive (+) grounded to dash.
Engine Ground—Strap connector between right rear cylinder head and dash (connected to battery ground strap bolt on Deluxe cars).
Dimensions—Length 10.6". Width 7.3". Height 9.2".
Location—On right side in engine compartment.

Battery Indicator:—King-Seeley. Voltmeter type. Ford No. 01A-10844A (Std.), 01A-10844B (Deluxe).
See article in Electrical Equipment Section.

STARTER:—No. 52-11002 (60 Eng.), 18-11002 (85, 95).
Armature—52-11005 (52-11002), 18-11005 (18-11002).
Drive—Barrel Type Bendix No. A-1806. Ford No. 52-11350-C (52-11002), Inboard Bendix No. L11FX-10, Ford No. B-11350 (18-11002).
See Electrical Equipment Section for data on Special Ford Barrel Type Bendix Drive servicing.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—2 lbs. each.
Cranking Engine—100 RPM., 190-215 amperes.

Torque	R.P.M.	Volts	Amperes
4 ft. lbs.	1070	4.6	200
8 "	660	4.3	340
12 "	300	3.65	465
14 "	Lock	3.5	500

Starting Switch:—R-B-M Model 5604, Ford No. 78-11450 Magnetic Switch mounted on dash and controlled by pushbutton on instrument panel R-B-M Model 3237, Ford No. 01A-11500A (Std), R-B-M Model 3238, Ford No. 01A-11500B (Deluxe).

Removal:—Starter mounted on right front face of flywheel housing. To remove, take off pan at right of engine, free starter-to-oil pan support bracket, take out through-bolts on commutator end plate.

GENERATOR:—Ford No. 01A-10000 (All Cars & Trucks except Cab-over-Engine), 81T-10000A or 81T-10000B Cab-over-Engine Trucks). Two brush (shunt) type with vibrating type voltage and current regulation. Ventilated by fan on drive pulley.
Armature—Ford No. 01A-10005 (01A-10000 Gen.), 78-10005-A or C (81T-10000A Gen.), 78-10005-B or D (81T-10000B Gen.).
Charging Rate Adjustment—No adjustment. See Regulator data below.
Maximum Charging Rate—Controlled by regulator and dependent on battery condition and load. To check generator output, disconnect generator field lead at generator, connect both generator terminals together (use short insulated wire). Use 'BRS' set or rheostat connected across battery terminals and apply load until voltage is exactly 6 volts. Connect ammeter in charging line, run engine at approximately 1000 RPM, check output at 3 speeds given in performance table below. Restore original connections after completing test. **Do not operate generator in service with both terminals connected together. This eliminates all regulator action and will damage generator.**

Performance Data

Amperes	01A-10000	Engine R.P.M.
Start		400
32		1100
32		3000
	81T-10000A	
Start		550
28		1300
28		3000
	81T-10000B	
Start		350
20		1050
20		3000

Rotation—Counter-clockwise at commutator end.
Field Current—2.86 amperes at 6 volts (01A-10000—field resistance 2.1 ohms at 70°), 2.22 amperes at 6 volts (81T-10000A & B—field resistance 2.7 ohms at 70°).
Brush Spring Tension—Approximately 28 ozs.

Removal:—Generator mounted on bracket between cylinder banks at front of engine, driven in tandem with water pumps by Vee belt (on Cab-over-engine Trucks, fan mounted on generator shaft and double belts used). To remove, loosen nut on bracket stud.

Belt Adjustment:—Loosen nut on bracket mounting stud, raise generator up until side movement on belt midway between generator and water pump pulley is 1" (thumb and finger pressure).

REGULATOR:—Ford No. 01A-10505-A. Vibrating type Voltage-Current regulator with Cutout Relay in case on dash. NOTE—Regulator mounted on rubber cushions and grounded through separate ground wire attached to case. Regulator case is sealed and no adjustments can be made.

Cutout Relay

Cuts In—6.2-6.5 volts (Cold or 60-80°), 400 Eng. RPM. (01A-10000), 500 Eng. RPM. (81T-10000A), 350 Eng. RPM. (81T-10000B).
Cuts Out—5.5 amperes max. (Cold 60°), 1.7 amperes (Hot 180°)—*see Regulator article in Electrical Equipment Section for specifications at other temperatures.*

Voltage-Current Regulator

Voltage Setting—7.2-7.65 volts (Cold 60°), 6.825-7.2375 volts (Hot 180°). Over-compensated for temperature.
Current Setting—32 amperes (01A-10000 Gen.), 28 amperes (81T-10000A Gen.), 20 amperes (81T-10000B Gen.).
Regulator Checking & Adjustment—*See Ford Regulator article in Electrical Equipment Section for complete testing directions.* No adjustments can be made as regulator case is sealed.

LIGHTING:—Headlamps—Ford Sealed Beam type. Controlled by switch on instrument panel and Beam Selector switch on toeboard.
See article in Electrical Equipment Section.
Headlamp Adjustment—Aim upper beam of each headlamp straight ahead with hot spot centered on horizontal line 3" below lamp center height (lamp center height 30½" Pass. Cars, 42" Trucks).
Beam Indicator—Red jewel on instrument panel directly above speedometer. Lighted when upper beams in use.

Switches

Lighting—R-B-M Model 6425. Ford No. 01A-11654 (this switch now mounted in instrument panel). Switch & Wiring Assembly Ford No. 01A-11653 (Pass. Cars), 01T-11653 (Commercial & Trucks), 01W-11653 (Cab-over-engine Trucks).
Beam Selector—R-B-M Model 2480. Ford No. 81A-13532.
Instrument—Ford No. 01A-13740A (Std.), 01A-13740B (Deluxe).
Stop Light—Ford No. 91A-13480.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Parking (Pass. Cars)	1.5	55
Parking (Comm'l., Trks.)	3	63
Instrument (Pass. Cars)	1	51
Instrmt. (Comm'l., Trks.)	3	63
Beam Indicator	1	51
Stop & Tail	21-3	1158
Pillar (Pass. Cars)	3	63

LIGHTING CIRCUIT BREAKER:—R-B-M Model 6700, Ford No. 01A-12250. Combined with Ignition Resistor on block on dash under cowl. Combination thermostatic and wound-coil type. Contacts open with current of 50 amperes. Current continues to flow through winding which is connected across the contacts resulting in rapid vibrating action.

HORNS:—Air Electric dual horns (Pass. Cars), Vibrator type single horn (Comm'l. & Trucks). Horn relay used with dual horns.
Horn Current—24-28 amperes (total—dual horns), 6-8 amperes (single horn).

Horn Relay:—R-B-M Model 4700, Ford No. 91A-13842.
Contact Closing Voltage—3.5-4.5 volts.
Current Draw—Approximately ¾ ampere.

NOTE:—New Traveler & Deluxe Six replace former "112" models and have the 3"x4⅛" Engine. Super Six and Country Club Six have the 3"x5" engine.

ENGINE HOOD (BONNET) LOCK:—*See 1940 Hudson 8 'T&E' page following for complete data.*

SERIAL NUMBER:—First number 40101 (40), 41101 (41), 43101 (43), 48101 (48). Stamped on plate on right front door hinge pillar post.

ENGINE NUMBER:—Same as Serial No. On top of cylinder block between #1 and 2 exhaust flanges.

COMPRESSION:—**Ratio**—7.0-1(40),6.5-1(others),CIhds. **Pressure:**—125 lbs. (40),120 lbs. (others) at 125 RPM.

VACUUM READING:—Steady 18-21" idling at 7 MPH.

IGNITION:—**Coil Model IG-4662.** Mounted on dash. Service Coil (less switch and cable) IG-3224JS.

Ignition Current—2.5 amperes idling, 4.5 stopped.

Ignition Switch:—Mitchellock Model 24-B, Type 8273. Connected to coil by armored cable.

Ignition Lock—Briggs & Stratton. B & S No. 50184.

Key Series—H601 to H1100. **Groove**—No. 1.

Distributor Auto-Lite IGW-4203. Full automatic advance type with separate vacuum spark control unit and manual adjustment (octane selector).

NOTE—Distributor now mounted at top of cylinder block at rear and driven through offset tongue-and-slot coupling by intermediate shaft. Rotation is now counter-clockwise (reversed from 1939 models).

Breaker Gap—.020".

Cam Angle or Dwell—35° closed, 25° open (dist.).

Breaker Arm Spring Tension—17-20 ounces.

Rotation—Counter-clockwise viewed from above.

Condenser—No. IGW-3075C. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
3	400	6	800
7	825	14	1650
11	1255	22	2510
14	1580	28	3160

Vacuum Spark Control—Mounted on distributor hold-down plate and linked to quadrant scale on side of distributor. Provides additional advance at speeds above idling (vacuum port in carburetor above throttle) except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	6¾"
2°	4°	7⅝"
4°	8°	8½"
6°	12°	9⅜"
7.5°	15°	10"

Fuel Compensator—Manual adjustment for octane rating of fuel used. See Ignition Timing.

Distributor Removal:—Mounted at top rear of cylinder block. To remove, disconnect vacuum line, take out cyl. head stud nuts on hold-down plate.

IGNITION TIMING:—Initial setting (for 70 octane fuel). See Fuel Compensator Setting following.

	Flywheel Degrees	Piston Position
All engines	0° at TDC	.0000" TDC

Timing—With #1 piston on compression, turn engine over until piston reaches top dead center, when flywheel mark 'UDC.1-6/' lines up with pointer in left front face of rear motor support above starter. Loosen advance diaphragm screw (at rear end of link), rotate distributor counter-clockwise to limit of slot, then slowly rotate clockwise until contacts begin to open, tighten diaphragm screw securely. Check Fuel Compensator Setting below.

Timing (Using Synchroscope)—Recommended by manufacturer. Mark flywheel with white chalk or paint, connect at #6 spark plug. Idle engine and adjust distributor as directed above.

Fuel Compensator Setting—Road test car with engine at normal operating temperature. With car running at 7 MPH slight ping should occur between 10-15 MPH when accelerating with wide open throttle. To adjust, loosen advance diaphragm screw, rotate distributor one graduation on quadrant scale clockwise (if no ping), counter-clockwise (if ping too severe), repeat test. Final setting not more than ¾" before 'UDC.1-6/' mark.

Firing Order:—1-5-3-6-2-4. NOTE—Distributor rotation now clockwise (reversed over 1939 models). See diagram for spark plug wiring sequence.

Spark Plugs:—Champion Type J-8. 14 MM. Metric.

Spark Plug Gaps—.032".

CARBURETION:—**Carburetor—(40, 48)** Carter Type WA-1 Model 454-S (No. 298 cast on face of flange). 1¼" single barrel, downdraft type.

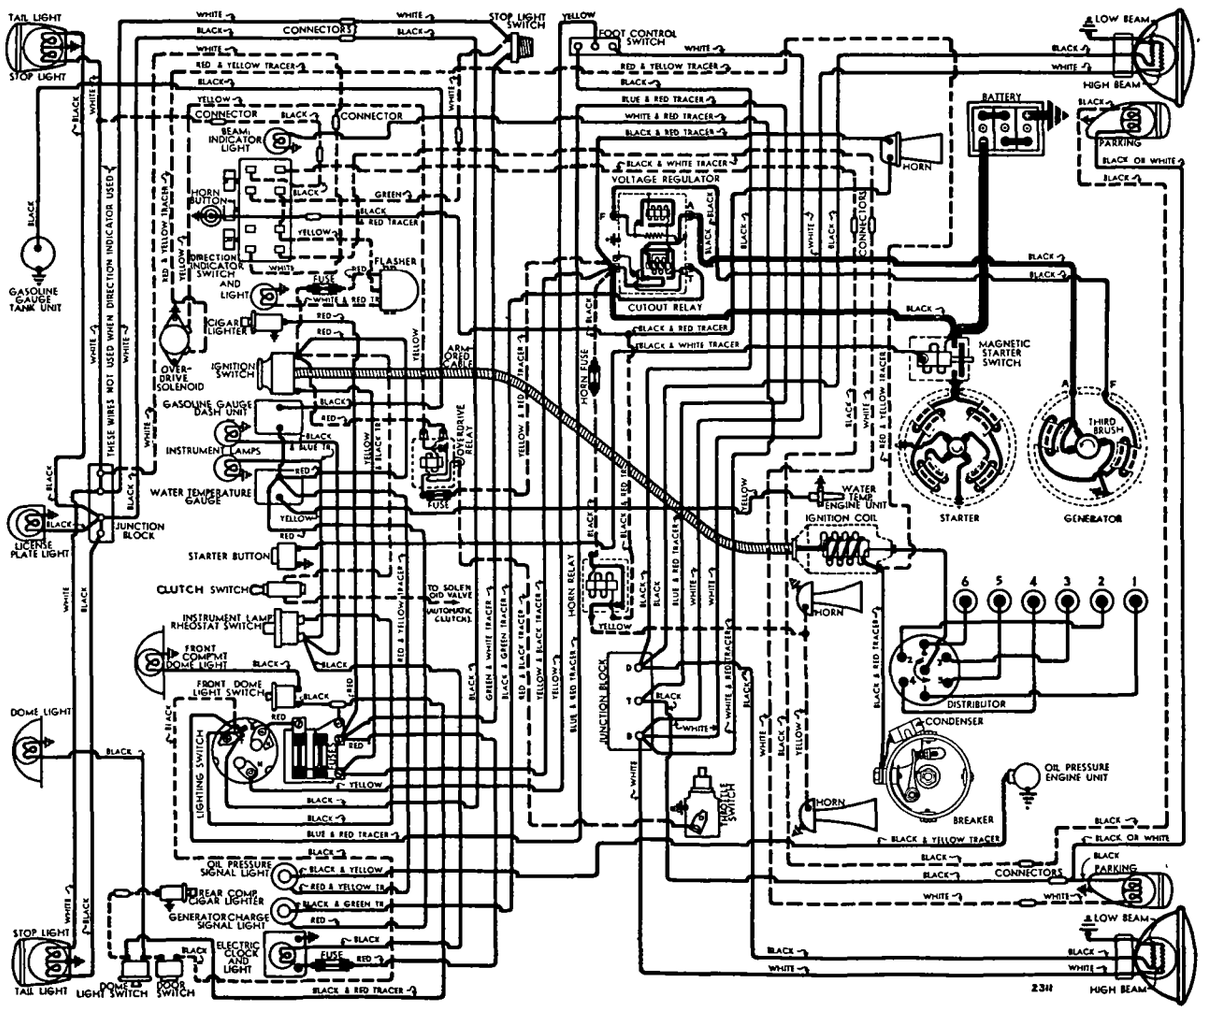
See article in Carburetor Section for complete data.

Flange Gasket Note—8 gaskets now used (was 2).

Carburetor (41, 43):—Carter dual type. *See 1940 Hudson 8 'T&E' page following for all carburetor data.*

Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 7 MPH idle speed. Adjust idle adjusting screw until engine fires smoothly (¾-1½ turns open—turn screw in for leaner mixture. Readjust idle speed. NOTE—If vacuum gauge used, set for highest steady reading.

Accelerating Pump Setting—Pump arm has 3 holes for pump link. Set as follows:
Lower Hole (med. stroke)—Normal setting.
Inner Hole (min.)—Hot weather, high-test fuel.
Lower Hole (max.)—Cold weather, low-test fuel.



Float Level—⅜" from top of machined projection on bowl cover to top of soldered seam at free end of float (invert to check).

Fast Idle:—Integral type (part of carburetor).

See article in Carburetion Equipment Section.

Setting—Adjust by bending connecting link offset for ⅝" choke valve opening with stopscrew against (not on) first step of fast idle cam.

NOTE—With choke valve fully closed and pin on fast idle cam at bottom of slot in fast idle link,

clearance between top of fast idle cam (behind link) and trip lever should be .010". To adjust, bend trip lever stop (on engine side of link).

Automatic Choke:—Carter Climatic Control.
See article in Carburetion Equipment Section.
Setting—Center thermostatic coil housing.

Air Cleaner:—AC #1528159 (40, 48), #1528161 (41, 43) oil-wetted type std. United oil-bath type optl.

Fuel Pump:—AC Type AF #1523753 (40, 48). Type AK #1523289 (41, 43) diaphragm types standard.
See article in Carburetion Equipment Section.

Gasoline Gauge:—King-Seeley Electric. K-S Nos. Dash Unit—8118 (early—white lines), 7752 (later—white diamonds). Tank Unit—7550.
See article in Carburetion Equipment Section.

MANIFOLD HEAT CONTROL:—40, 48—Manual adjustment type on center of manifold behind carburetor.
Setting—Valve is set at factory to 'W' position (pointer sloping to rear) which is correct setting for all seasons' operation.
41, 43:—Automatic thermostatic coil type. No adj'mt.

VALVE TIMING:—**To Check**—With .010" tappet clearance, #1 intake valve should open with #1 piston 10°40' or .0441" (40), .0562" (41, 43, 48) BTDC when a point on the flywheel approx. 3.95 teeth before 'UDC.1-6/' lines up with indicator in inspection hole above starter. Reset tappet clearance .006" (hot).
Tappet Clearance:—.006" Int., .008" Exh. (hot&idling). Remove right front fender plate for access to valves.
See Hudson Shop Notes ('M' Section) for removal data.
Valve Spring Pressure:—40 lbs. at 2" (valve closed), 80 lbs. at 1 21/32" (valve open). Free length 2 17/64".

LUBRICATION:—**Crankcase Capacity**—4½ quarts (refill), 5½ quarts (dry). NOTE—When pan installed, place 1½ qts. in upper tray, 4 qts. through filler.
Normal Oil Pressure—3 lbs. (no gauge).
Oil Pressure Indicator:—Hudson Teleflash indicator.
See article in Electrical Equipment Section for data.

COOLING SYSTEM:—**Capacity**—13 quarts.
Thermostat—Fulton. In cylinder head outlet. Starts to open 150-155° F. Fully open 185° F.
Temperature Gauge:—King-Seeley Electric. K-S Nos. Dash Unit—8120 (early—white lines), 7755 (later—white diamonds). Engine Unit—7000. NOTE—Gauge inoperative with ignition Off (reads 'H').
See article in Mechanical Equipment Section for data.

AUTOMATIC CLUTCH CONTROL:—Electric type. Optl.
See article in Mechanical Equipment Section for data.

TRANSMISSION OVERDRIVE CONTROL:—Electric type with accelerator pedal operated 'kick-down' switch. *See article in Mechanical Equipment Section.*
Overdrive Solenoid—Delco-Remy No. 1569.
Throttle Control Switch—R-B-M Model 6013. Adjust so contact washer on accelerator linkage just contacts switch plunger with throttle valve in wide open position.
Control Relay—Auto-Lite HR-4201. 20 ampere fuse on relay (on left side of engine dash).

BATTERY:—**National, Type HT-17.** 6 volt, 17 plate, 96 ampere hour capacity (20 hour rate).
Starting Capacity—120 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.5 minutes. Five second voltage—4.24 volts.
Grounded Terminal—Positive (+) grounded to frame. **Engine Ground**—Strap connector from rear motor support to frame.
Dimensions—Length 10½". Width 7⅛". Hght. 7 11/16".
Location—Left side of engine comp't. (under hood).

STARTER:—**Auto-Lite MZ-4079. Armature MZ-2138.**
Drive—Inboard Barrel type Bendix No. A-1684.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—150 RPM., 125 amperes, 5.4 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.5	70
.65 " "	2500	5.5	100
2.55 " "	1325	5.0	200
4.95 " "	750	4.5	300
7.65 " "	220	4.0	400
7.8 " "	Lock	3.0	420
11.8 " "	Lock	4.0	560

Removal:—Flange (new heavier casting) mounted on left front face of rear motor support. To remove, take out flange mounting screws.
Starting Switch:—R.B.M. Model 5607. Magnetic type. On starter, controlled by pushbutton on instrument panel Douglas #5751. NOTE—Switch is new type.

GENERATOR:—**Auto-Lite GDS-4801A (40, 48), GEC-4801A (41, 43).** Third brush control with external vibrating voltage regulation. Ventilated type.
Armature—GDF-2006F (GDS), GDZ-2006F (GEC).
Maximum Charging Rate—GDS—32-34 amperes (cold), 8.0 volts, 2900 RPM or approx. 35 MPH. GEC—39-44 amperes (cold), 8.0 volts, 3350 RPM or approx. 43 MPH. Actual charging rate controlled by Voltage Regulator and dependent on battery condition. See Regulator data following. To check generator output, ground 'F' terminal to eliminate regulator action.
Charging Rate Adjustment—See Regulator data. Third brush setting: GDS—1 commutator bar minus 1 mica strip minimum, 1 commutator bar maximum from insulated (nearest) main brush. GEC—1 commutator bar Min., 1 comm. bar plus 1 mica strip Max. Setting adjustable by shifting third brush.

Performance Data—GDS-4801A

Cold			Hot

28	7.5	1890	28	7.75	2440
32	7.65	2100	32	7.9	3000
36	7.8	2375	34	8.0	3800
41	8.0	3350			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.65-1.82 amperes (GDS), 1.60-1.78 amperes (GEC) at 6.0 volts.
Motoring Current—5.10-5.45 (GDS), 4.85-5.4 (GEC) amperes at 6.0 volts.
Removal:—Pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.
Belt Adjustment:—Swing generator out until possible belt deflection midway between generator and fan pulleys is ¾" (use straightedge across pulleys).

REGULATOR:—**Auto-Lite VRD-4008B (early cars), VRR-4001A (later).** Cutout Relay and vibrating Voltage Regulator in case on dash. Cutout Relay has extra set of contacts for Generator Teleflash Indicator control.
See article in Electrical Equipment Section for data.
NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken.

Cutout Relay

Cuts In—6.4-7.0 volts, 825 RPM., 9.4 MPH.
Cuts Out—1.5-4.5 amperes (VRD), 6.0 amperes (VRR) maximum discharge current.
Contact Gap—.015" minimum with ground contacts closed (ground contacts must open when main contacts close).
Air Gap—.034-.038" at hinge end of core with contacts open (ground contacts closed).

Voltage Regulator

Setting—7.35-7.65 volts (VRD), 7.1-7.4 volts (VRR) Cold (70°F).
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal, voltmeter between this terminal and ground. Operate generator at speed of 30 MPH charging battery until voltage is constant. Voltmeter reading should be within limits of 7.35-7.65 volts (VRD), 7.1-7.4 volts (VRR) at 70°F. See Electrical Equipment Section articles for voltages at other temperatures.
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap—.010-.020" (VRD), .012" Min. (VRR) (armature against stop pin).
Air Gap—.0595-.0625" (VRD), .048-.052" (VRR) with contacts just opening.

LIGHTING:—**Headlamps**—Hall 'Sealed Beam' type.
See article in Electrical Equipment Section for data.
Headlamp Adjustment—Aim upper beam of each headlamp straight ahead with hot spot centered on horizontal line 3" below lamp center height.
Beam Indicator—Red pilot bulb on speedometer dial. Lighted with Country (upper) beam in use.
Direction Indicator—Standard equipment on 43, Optl. on 40, 41, 48. *See Electrical Equipment Section.*

Switches

Lighting—Cole-Hersee.
Instrument (43 only)—R-B-M Model 5203.
Beam Selector—R-B-M Model 2467.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Side Panel (Parking—see Note)	1½	55
Front Dir. Sig. (see Note)	21-3	1154
Speedometer only (40, 41, 48)		51
Instrument & Spdmtr (43)	1½	55
All Indicators	1	51
Electric Clock	1½	55
Stop & Tail (see Note)	21-3	1154
Rear License	3	63
Dome	15	87

NOTE—Direction Indicator (Std. on 43) front bulb replaces Parking bulb in Bonnet Side Panel—rear indicator flashes Stop lamp filament.

SIGNAL LIGHTS:—Generator Charge and Oil Pressure Indicators. Hudson Teleflash Electric type.
See article in Electrical Equipment Section for data.

FUSES:—**Lighting**—20 ampere. Lower fuse on fuse block on lower edge of instrument panel to right of steering column. **Accessory**—20 amperes. Top fuse on fuse block. NOTE—Silver-plated fuses used.
Twin Horns—30 ampere on block on engine dash.
Transmission Overdrive Control—20 amp. On Relay.
Direction Indicator—10 ampere. In case on back of instrument panel near speedometer.
Electric Clock—2 ampere on back of clock.

HORNS:—**Single**—Schwarze, electric. Std. on 40T, 48.
Twin—Sparton, vibrator, trumpet type operated by relay. Standard equip. on 40P, 41, 43.
Horn Relay:—R-B-M Model 4790. On horn bracket.
Contacts Close—3.5-4.5 volts. **Current Draw** ¾ amp.

ENGINE HOOD (BONNET) LOCK:—Alligator type hood (hinged at front) with integral side panels and instrument panel lock. To raise hood, push forward on handle located under edge of instrument panel to left of steering column and lift on rear edge of hood.

SERIAL NUMBER:—44101 (Eight 44), 47101 (Country Club Eight 47). On right front door hinge pillar post.

ENGINE NUMBER:—Same as Serial No. On top of engine block between #1 & 2 exhaust flanges.

COMPRESSION:—Ratio—6.5-1 Std. No Optl. ratios. **Pressure**—120 lbs. at 125 RPM. cranking speed.

VACUUM READING:—18-21" steady idling at 7 MPH.

IGNITION:—Coil Model CE-4641. Mounted on dash. Service Coil (less switch & cable) CE-3224JS.
Ignition Current—2.5 amperes idling, 4.5 stopped.
Ignition Switch:—Mitchellock Model 24-B, Type 8273. Connected to coil by armored cable.
Ignition Lock—Briggs & Stratton. B & S No. 50184.
Key Series—H601 to H1100. **Groove**—No. 1.
Distributor Auto-Lite Model IGP-4008A. Full automatic advance type with manual (octane selector) adjustment. No vacuum spark control.
Breaker Gap—.017".
Cam Angle or Dwell—31° closed, 14° open (dist.).
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Clockwise viewed from above.
Condenser—No. IG-2671. Capacity .20-.25 mfd.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	0	600
3	400	6	800
8	850	17	1700
13	1300	26	2600
17.5	1700	35	3400

Fuel Compensator Adjustment—Manual adjustment for octane rating of fuel. See Ignition Timing.
Removal:—Mounted on right side of crankcase. To remove take out hold-down screw in advance arm.

IGNITION TIMING:—Initial Setting (for 70 octane rating fuel). See Fuel Compensator setting following.

	Flywheel Degrees	Piston Position
All Engines	0° at TDC	.0000" TDC

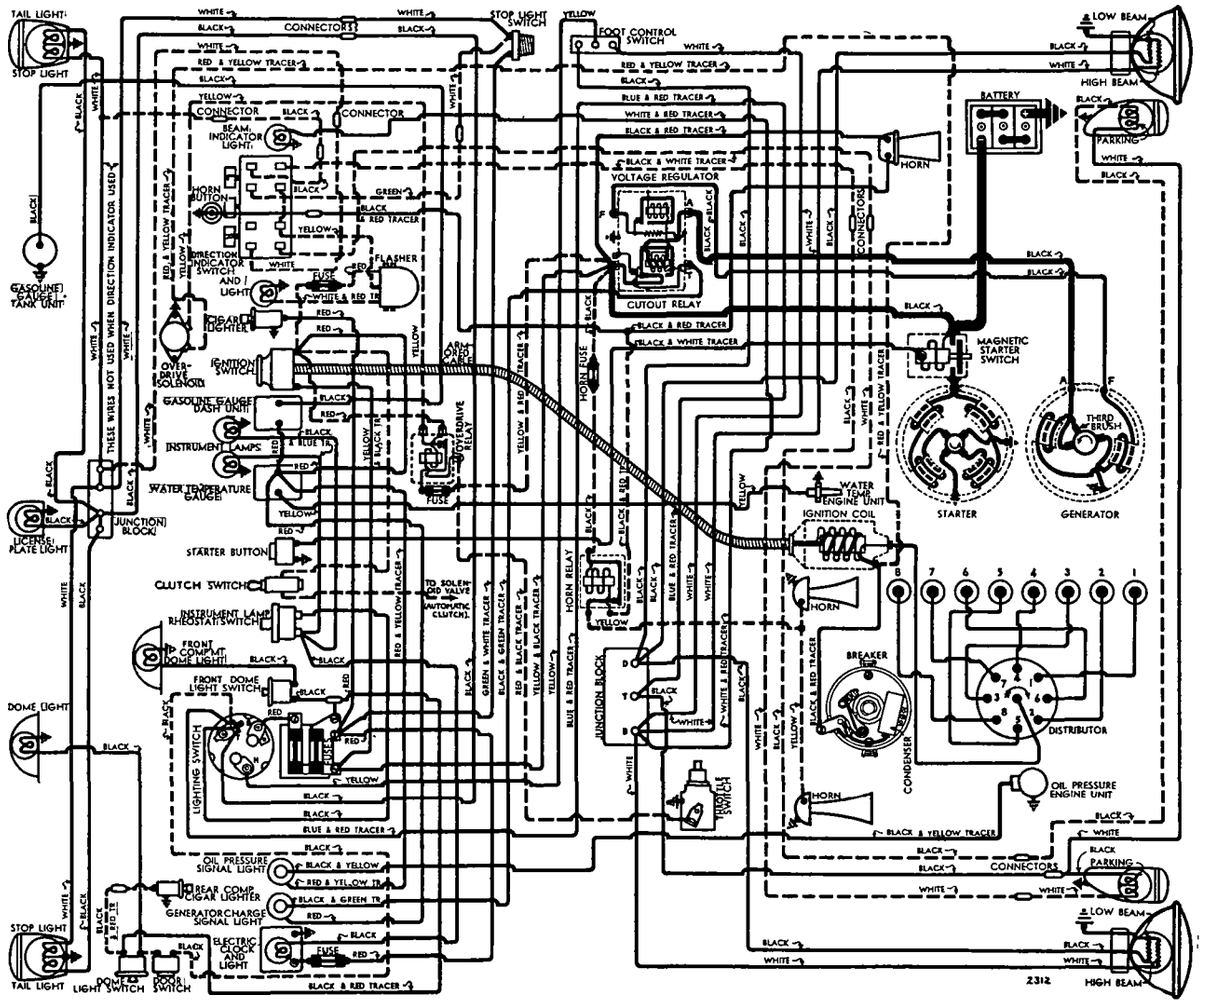
Timing—With #1 piston on compression, turn engine over until piston reaches top dead center when flywheel mark 'UDC.1-8/' lines up with pointer in left front face of rear motor support. Loosen hold-down screw in advance arm, rotate distributor clockwise to limit of advance arm slot, then slowly rotate distributor counter-clockwise until contacts begin to open, tighten hold-down screw. Check Fuel Compensator setting.
Timing (Using Synchroscope)—Recommended by manufacturer. Mark flywheel with white chalk or paint, connect at #8 spark plug. Idle engine and adjust distributor as directed above.
Motor Gauge—Weidenhoff Adapter #114, Rod #44.
Fuel Compensator Setting—Road test car and note performance when accelerating from 10-15 M.P.H. with wide open throttle on level road (warm engine). Slight ping should be evident. To adjust, loosen hold-down screw, rotate distributor one graduation on scale counter-clockwise (if no ping), clockwise (if ping too severe), repeat test. Final setting should not be more than ¾" before 'UDC. 1-8/' mark on flywheel.
Firing Order:—1-6-2-5-8-3-7-4.

Spark Plugs:—Champion Type J-8. 14 MM. Metric. **Spark Plug Gaps**—.032".

CARBURETION:—Carburetor (Eight—44, 47). Carter Type WDO, Model 455-S (#279 cast on face of flange). 1¼" dual downdraft type.
See article in Carburetor Section for complete data.

Carburetor (Six—41,43—before Eng. No. 3116):—Carter Type WDO, Model 430-SV (#199 cast on flange). 1" dual downdraft type. NOTE—This carburetor same as used on 1939 models (late 92, all 93 and Eights) except that vacuum spark port added (for new vacuum advance distributor).
See article in Carburetor Section for complete data.

Carburetor (Six—41,43—Eng. No. 3116 & Up):—Carter Type WDO, Model 461-S (#286 cast on flange). 1" dual downdraft type.
See article in Carburetor Section for complete data.



Flange Gasket Note—Eight gaskets now used (was two in 1939) on all carburetors.
Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 7 MPH idle speed. Adjust idle adjusting screws (2 used, 1 for each barrel) in succession until engine fires smoothly. Final setting should be ¾-1 (430-SV), ½-1½ (455-S), ¼-1¼ (461-S) turns open for each screw. Readjust idle speed. NOTE—Car manufacturer recommends use of vacuum gauge. Adjust one screw for maximum reading, then adjust other screw for maximum steady reading.

Accelerating Pump Setting—Pump lever (under dust cover at top of carburetor) has 2 holes for pump link engagement. Adjust as follows:
Outer Hole (Max. stroke)—Normal setting.
Inner Hole (Min. stroke)—If less charge required.

Float Level—3/32" from top of float to gasket seat on cover (invert to check).

Fast Idle:—Integral type (built-in carburetor).
See article in Carburetion Equipment Section.

Fast Idle Setting—Turn fast idle adjusting screw in to secure .018" throttle opening with choke valve tightly closed.

Automatic Choke:—Carter Climatic Control.
See article in Carburetion Equipment Section.
Choke Setting—Thermostatic coil housing centered on piston plate housing reference mark.

Air Cleaner:—AC #1528161 oil-wetted type Std. United heavy duty oil-bath type Optl.

Fuel Pump:—AC Type AK #1523289 diaphragm type Std. Type AJ #1523936 combination fuel-and-vacuum pump Optl.
See article in Carburetion Equipment Section.

Gasoline Gauge:—King-Seeley Electric. K-S Nos. Dash Unit—8118 (early—white lines), 7752 (later—white diamonds). Tank Unit—7550.
See article in Carburetion Equipment Section.

MANIFOLD HEAT CONTROL:—Automatic thermostatic coil type. No adjustment required.

VALVE TIMING:—**To Check**—With .010" tappet clearance, #1 intake valve should open with #1 piston 10°40' or .0494" BTDC when a point on the flywheel approx. 3.94 teeth before 'UDC.1-8/' mark lines up with indicator in inspection hole above starter (left side). Reset tappet clearance .006" (hot and idling).

Tappet Clearance:—.006" Intake, .008" Exhaust (with engine hot and idling). Remove right front fender plate for access to valves. *See Hudson Shop Notes ('M' Section) for fender plate removal.*

Valve Spring Pressure:—40 lbs. at 2" (valve closed). 80 lbs at 1 21/32" (valve open). Free length 2 17/64".

LUBRICATION:—**Crankcase Capacity**—7 qts. (refill), 9 qts. (dry). NOTE—When pan installed, place 2 qts. in upper tray, 7 qts. through filler.
Normal Oil Pressure—3 lbs. (no gauge).

Oil Pressure Indicator:—Hudson Teleflash indicator.
See article in Electrical Equipment Section for data.

COOLING SYSTEM:—**Capacity**—18 quarts.
Thermostat—Fulton In cylinder head outlet. Starts to open 150-155° F. Fully open 185° F.

Temperature Gauge:—King-Seeley Electric. K-S Nos. Dash Unit—8120 (early—white lines), 7755 (later—white diamonds). Engine Unit—7000. NOTE—Gauge inoperative with ignition Off (reads 'H').
See article in Mechanical Equipment Section for data.

AUTOMATIC CLUTCH CONTROL:—Electric type. Optl.
See article in Mechanical Equipment Section for data.

TRANSMISSION OVERDRIVE CONTROL:—Electric type with accelerator pedal operated 'kick-down' switch. *See article in Mechanical Equipment Section.*
Overdrive Solenoid—Delco-Remy No. 1569.
Throttle Control Switch—R-B-M Model 6013. Adjust so contact washer on accelerator linkage just contacts switch plunger with throttle valve in wide open position.
Control Relay—Auto-Lite HR-4201. 20 ampere fuse on relay (on left side of engine dash).

BATTERY:—**National Type HT-19.** 6 volt, 19 plate, 108 ampere hour capacity (20 hour rate).
Starting Capacity—135 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.0 minutes. Five second voltage—4.43 volts.
Grounded Terminal—Positive (+) grounded to frame. **Engine Ground**—Strap connector from rear motor support to frame.
Dimensions—Length 11¾". Width 7¼". Height 7 11/16".
Location—In engine compartment on left side.

STARTER:—**Auto-Lite MAB-4103. Armature MAB-2113.**
Drive—Inboard Barrel type Bendix No. A-1684.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—150 RPM, 120-125 amperes, 5 v.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4 0	400
15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

NOTE—Lock torque figures correct without switch.
Removal:—Flange (new heavier casting) mounted on left front face of rear motor support. To remove, take out flange mounting screws.
Starting Switch:—R.B.M Model 5607. Magnetic type. On starter, controlled by pushbutton on instrument panel Douglas #5751. NOTE—Switch is new type.

GENERATOR:—**Auto-Lite GEC-4801A. Armature GDZ-2006F.** Third brush control with voltage regulation. Ventilated.
Maximum Charging Rate—39-44 amperes (cold), 3350 RPM or approx. 43 MPH. Actual charging rate controlled by Voltage Regulator and dependent on battery condition. See Regulator data. When checking generator output, ground 'F' terminal to eliminate regulator action.
Charging Rate Adjustment—See Regulator data. Third brush setting 1 commutator bar minimum, 1 commutator bar plus 1 mica strip maximum, from nearest (insulated) main brush. Setting adjustable by shifting third brush.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	960	0	6.4	1040
4	6.55	1060	4	6.6	1140
8	6.7	1160	8	6.8	1280

36	7.8	2375	34	8.0	3800
41	8 0	3350			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs max. (new brushes).
Field Current—1.60-1.78 amperes at 6.0 volts.
Motoring Current—4.85-5 4 amperes at 6.0 volts.
Removal:—Pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.
Belt Adjustment:—Swing generator out until possible belt deflection midway between generator and fan pulleys is ¾" (use straightedge across pulleys).

REGULATOR:—**Auto-Lite VRD-4008B (early cars), VRR-4001A (later).** Cutout Relay and vibrating Voltage Regulator in case on dash. Cutout Relay has extra set of contacts for Generator Teleflash Indicator control.
See article in Electrical Equipment Section for data.
NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken.

Cutout Relay

Cuts In—6.4-7 0 volts, 825 RPM., 9.4 MPH.
Cuts Out—1.5-4.5 amperes (VRD), 6.0 amperes (VRR) maximum discharge current.
Contact Gap—.015" minimum with ground contacts closed (ground contacts must open when main contacts close).
Air Gap—.034-.038" at hinge end of core with contacts open (ground contacts closed).

Voltage Regulator

Setting—7.35-7.65 volts (VRD), 7.1-7.4 volts (VRR) Cold (70°F).

To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal, voltmeter between this terminal and ground. Operate generator at speed of 30 MPH charging battery until voltage is constant. Voltmeter reading should be within limits of 7.35-7.65 volts (VRD), 7.1-7.4 volts (VRR) at 70°F. See Electrical Equipment Section articles for voltages at other temperatures.

To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.

Contact Gap—.010-.020" (VRD), .012" Min. (VRR) (armature against stop pin).

Air Gap—.048-.052" with contacts just opening.

LIGHTING:—**Headlamps**—Hall 'Sealed Beam' type.
See article in Electrical Equipment Section for data.
Headlamp Adjustment—Aim upper beam of each headlamp straight ahead with hot spot centered on horizontal line 3" below lamp center height.
Beam Indicator—Red pilot bulb on speedometer dial. Lighted with Country (upper) beam in use.
Direction Indicator—Std. on 47, Optl. on 44.
See article in Electrical Equipment Section for data.

Switches

Lighting—Cole-Hersee.
Beam Selector—R-B-M Model 2467.
Instrument (47 only)—R-B-M Model 5203.

Bulb Specifications

Position	Candlepower	Mazda No. Sealed Beam
Headlamps		
Side Panel (Parking—see Note)	1½	55
Front Dir. Sig. (see Note)	21-3	1154
Speedometer only (44, 45)	1	51
Instrument & Spdmtr (47)	1½	55
All Indicators	1	51
Electric Clock	1½	55
Stop & Tail (see Note)	21-3	1154
Rear License	3	63
Dome	15	87

NOTE—Direction Indicator (Std. on 47) front bulb replaces Parking bulb in Bonnet Side Panel—rear indicator flashes Stop Lamp filament.

SIGNAL LIGHTS:—Generator Charge and Oil Pressure Indicators Hudson Teleflash Electric type.
See article in Electrical Equipment Section for data.

FUSES:—**Lighting**—20 ampere. Lower fuse on fuse block on lower edge of instrument panel to right of steering column. **Accessory**—20 amperes. Top fuse on fuse block. NOTE—Silver-plated fuses used.
Twin Horns—30 ampere on block on engine dash.
Transmission Overdrive Control—20 amp. On Relay.
Direction Indicator—10 ampere. In case on back of instrument panel near speedometer.
Electric Clock—2 ampere on back of clock.

HORNS:—**Sparton**—Twin, vibrator type, air trumpet horns standard. Operated by relay.
Horn Relay:—R-B-M Model 4790. On horn bracket. **Contacts Close**—3.5-4.5 volts. **Current Draw** ¾ amp.

ENGINE HOOD & SIDE PANELS:—Alligator type. To raise hood, tilt radiator ornament back to release catch and safety latch. Side panels removed by taking out 2 screws on upper edge and 3 screws along lower edge of panel.

SERIAL & ENGINE NUMBER:—First number (50) 2320001, (52) 4320001. Stamped on crankcase at rear of left cylinder block and on left frame side member opposite steering gear.

COMPRESSION:—**Ratio**—6.25-1 Std., 5.75-1 Optl.
Pressure—155 lbs .at 1000 RPM or approximately 105-110 lbs. at cranking speed for Std. head.

VACUUM READING:—Steady 20-21" idling at 7-8 MPH.

IGNITION:—**Coil Model 1115128.** Mounted on dash.
Ignition Current—2.2 amperes idling, 4.4 stopped.
Ignition Switch:—Delco-Remy Model 1116282. Connected to coil by armored cable.
Ignition Lock—Briggs & Stratton No. 45792. Key Series—8000 to 9499. Groove—No. 15.
Distributor Model 1110806. Single breaker, 8 lobe cam, full automatic advance type with vacuum spark control and manual adjustment.
Breaker Gap—.0125-.0175".
Cam Angle or Dwell—31° closed, 14° open (distr.).
Breaker Arm Spring Tension—19-23 ounces.
Rotation—Clockwise viewed from above.
Condenser—Part No. 1869704. Capacity .18-.25 mfd.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	500	1	1000
12	2000	24	4000

Vacuum Spark Control 1116020. Integral type (on distributor, linked to breaker plate). Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring within unit. Plunger travel 13/64" maximum

Vacuum Advance

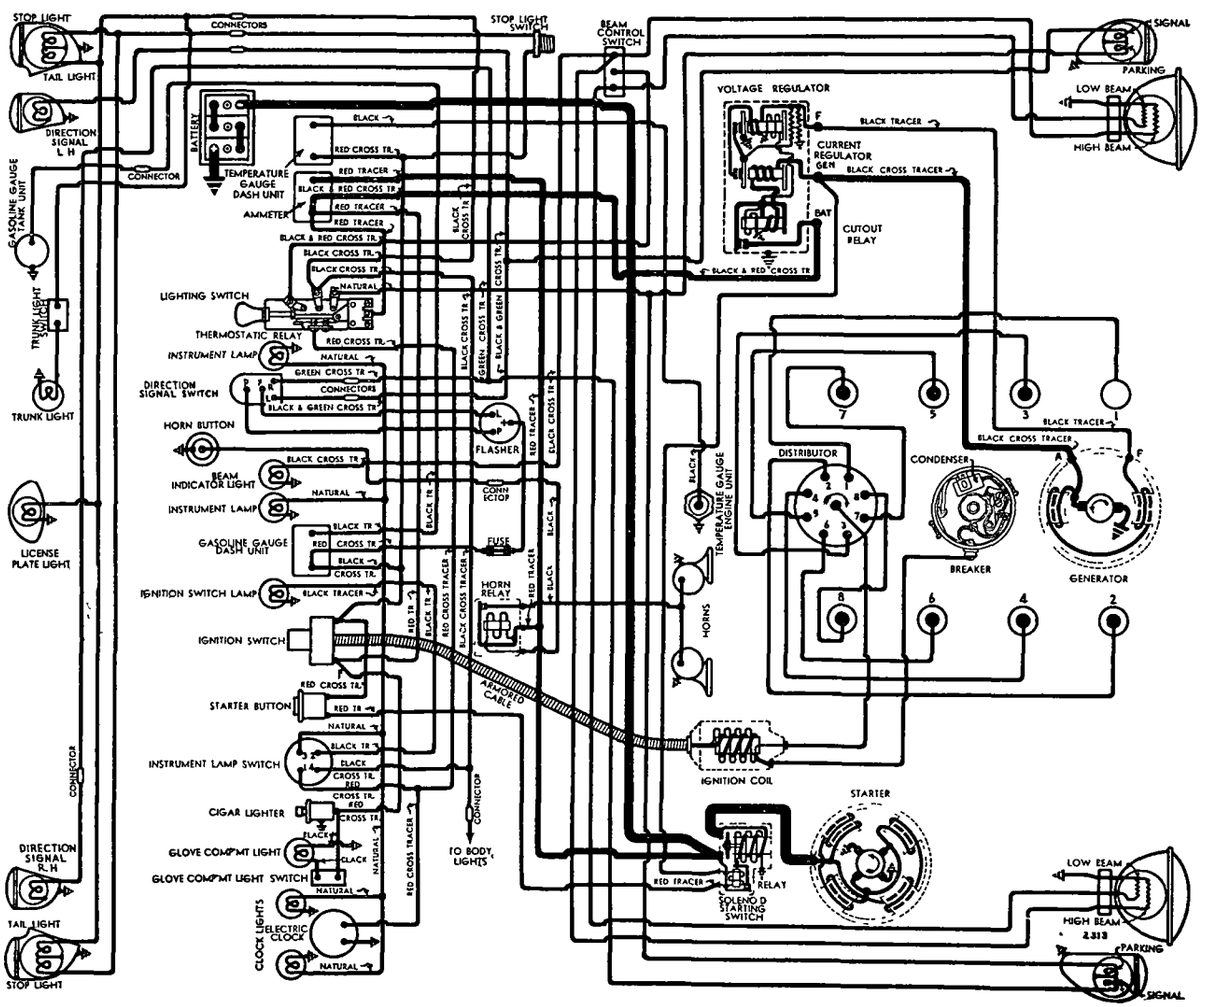
Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5.5-7.5"
9°	18°	15-18"

Manual Adjustment—Permits 10° advance or retard from center position. See Ignition Timing for adjustment.
Removal:—Distributor mounted between cylinder banks at rear of engine. To remove, disconnect vacuum line, take out two hold-down screws in advance arm, lift out. NOTE—When installing distributor, turn crankshaft to firing position for #1 cylinder, mesh distributor drive gear with slot in upper end of drive shaft offset toward left-hand or rear side of engine (narrow portion of coupling to rear).

IGNITION TIMING:—Setting for 72 octane fuel. See Manual Adjustment (following) for correction dependent on operating conditions and fuel regularly used.

Flywheel Degrees	Piston Position
5° BTDC	.0114" BTDC

Timing (With Synchroscope)—This method recommended by manufacturer. Clip synchroscope lead to #1 sparkplug, direct light on crankshaft pulley, idle engine. Loosen hold-down screw in advance arm, rotate distributor until 'IG/A' mark on pulley (5° before dead center mark 'C.1/6') appears in line with pointer on chain case cover, tighten hold-down screw. Adjust for fuel (see Manual Adjustment).



Timing (Without Synchroscope)—Turn engine over to firing position for #1 piston (front piston, left bank) with crankshaft pulley mark 'IG/A' (5° before dead center mark 'C.1/6') lined up with pointer on chain case cover. Loosen hold-down screw in advance arm, center pointer on scale, tighten screw. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, check Manual Adjustment.

Manual Adjustment—Should be set for slight ping when accelerating engine with wide open throttle at speeds below 15 M.P.H. To adjust, loosen hold-down screw in advance arm, rotate distributor clockwise (if ping too severe), counter-clockwise (if no ping noted) one graduation at a time until correct performance secured. NOTE—Check engine for faulty spark plugs, excessive carbon deposits, localized hot spots, lean carburetor setting before changing adjustment to correct pinging.

Firing Order:—1-8-7-3-6-5-4-2. See diagram for numbers.

Spark Plugs:—AC No. 104. 10 MM. Metric type. NOTE—These plugs are new small type. Do not tighten excessively (7-10 ft. lbs. tension).
Spark Plug Gaps—.025-.030".

CARBURETION:—**Carburetor**—Carter Model W D O Type 460-S (marked 277 on face of flange). 1¼" dual downdraft type with Carter Climatic Control. *See article in Carburetor Section for data.*
Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 7-8 MPH idle speed. Adjust idle adjusting screw for each barrel until engine fires smoothly (½-1½ turns out from inner seated position—turn screws in for leaner mixture). Readjust idle speed.
Accelerating Pump—Non-adjustable.
Float Level—⅛" from top of float to gasket seat on cover with needle valve seated (invert to check).
Fast Idle:—Integral type (part of carburetor). *See article in Carburetion Equipment Section.*
Setting—Adjust fast idle screw for .023" throttle opening with choke valve fully closed.

Automatic Choke:—Carter Climatic Control.
See article in Carburetion Equipment Section.
Choke Setting—Set center index mark to coincide with mark on carburetor flange.

Air Cleaner:—AC #1529297 heavy duty oil-bath type.

Fuel Pump:—AC Type AX #1537083. Diaphragm type combination fuel-and-vacuum pump.
See article in Carburetion Equipment Section.

Gasoline Gauge:—AC Electric type. #1515368 (dash unit), #1516155 (tank unit).
See article in Carburetion Equipment Section.

VALVE TIMING:—**To Check**—Intake valve for #1 cylinder (front—left bank) should open with piston on top dead center and mark 'C.1/6' behind crankshaft pulley aligned with pointer on chain case cover.

Tappet Clearance:—None (hydraulic take-up used).
See article in Mechanical Equipment Section for data.

Valve Spring Pressure:—66 lbs. at 1 59/64" (valve closed). 145 lbs. at 1 37/64" (valve open).

LUBRICATION:—**Crankcase Capacity**—7 quarts.
Normal Oil Pressure—25 lbs. at 30 MPH, 15 lbs. idling.

COOLING SYSTEM:—**Capacity**—25 quarts.

Thermostat:—In radiator top tank (operates shutters). Starts to open 153-158° F., fully open 175°. High Reading Thermostat for use with heaters (starts to open 168-173°., fully open 190°).

Temperature Gauge:—AC Electric. #1510773 (dash unit), #1510774 (engine unit).
See article in Mechanical Equipment Section for data.

BATTERY:—**Delco Model 17K-2.** 6 volt, 17 plate, 115 ampere hour capacity (20 hour rate).
Starting Capacity—135 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.3 minutes. Five second voltage—4.38 volts.
Grounded Terminal—Positive (+) terminal.
Engine Ground—Strap connector at right front engine support.
Dimensions—Length 10⅜". Width 7". Height 8⅝".
Location—Under left front floor boards.

Commercial Battery—Delco Model 19Q-1. 6 volt, 19 plate, 122 A.H. Capacity (20 hour rate).
Starting Capacity—140 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.8 minutes. Five second voltage 4.5 volts.
Dimensions—Same as 17K-2 except Height 8 9/16".
Grounded Terminal, Location—See 17K-2 above.

STARTER:—**Model 1107912, 1107913 RHD. Armature No. 820158 (all models).**
Drive—Solenoid pinion shift (overrunning clutch).
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs	5500	5.0	60
16 "	Lock	3.0	600

Removal:—Flange mounted on right front face of flywheel housing. To remove, take out flange mounting screws, pull starter forward and remove from below.

Starting Switch:—Solenoid Switch Type 1542 (all). Mounted on starter, controlled through relay (in switch) by Control Switch Type 1996005 on instrument panel.
See article in Electrical Equipment Section for data.

Solenoid Switch Specifications

Closes against 70 lb. pull with ½" air gap drawing 65-71 amperes at 5 volts. Holds switch closed with current draw of 12-14 amperes (hold-in coil only).

Solenoid Relay Specifications

Contacts Close—1.9 volts max. **Open**—1.0-1.2 volts. **Contact Gap**—.035". **Air Gap**—.012".

GENERATOR:—**Model 1102661. Armature No. 1878211.** Two brush type with current-voltage coltrol.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator.
See Regulator data following.
Maximum Charging Rate—32 amperes min. (hot), 8.0 volts, 2450 RPM, 27 MPH and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

	Amperes	Volts	R.P.M.
Cold	30*	8.0	1800

*—Not maximum output—See Current Regulator.
Rotation—Counter-clockwise at commutator end.
Field Current—1.76-1.88 amperes at 6.0 volts.
Brush Spring Tension—25 ounces each.

Removal:—Flange mounted between cylinder banks at front of engine, belt driven in tandem with water pump (separate belt for fan). To remove, take out flange mounting bolts.
IMPORTANT AIR SCOOP NOTE—When installing air scoop on generator, make certain that raised portion provides clearance at terminals and that scoop does not cover drive end oil cup.

Belt Adjustment:—Loosen generator mounting bolts, lift generator up until only slight slack evident in belt (new type belt engages bottom of pulley groove not sides), tighten bolts. Generator pivots on left hand bolt, right bolt hole slotted. NOTE—Fan belt adjustment provided at fan bracket.

REGULATOR:—**Model 1118202. 'Single Core' type.** Vibrating Voltage & Current regulator on dash.
CAUTION—Check generator for grounded fields before changing regulator settings.
See article in Electrical Equipment Section for data.

Cutout Relay

Cuts In—6.2-6.7 volts (hot).
Cuts Out—0-4.0 amperes discharge current.
Contact Gap—.020" (same for both sets).
Air Gap—.020" (with points just closed).

Voltage Regulator

Setting—7.4-7.8 volts (70° F.), 7.2-7.4 volts (hot). Regulator over-compensated for temperature.
To Check—Connect ammeter in charging line at 'BAT' regulator terminal, voltmeter between 'BAT' terminal and ground. Operate generator at 2450 RPM, adjust charging rate to 8-10 amperes (use variable rheostat or 'AVR' set). With regulator at hot operating temperature, retard generator speed until cut-out relay points open, then increase generator speed to 2450 RPM and check hot voltage setting (above).
To Adjust—Change regulator armature spring tension slightly by bending lower spring hanger for **light (left) spring (or one spring if both alike) only.** If further adjustment required, see Single Core Regulator article in Electrical Equipment Section for Heavy (or other spring) adjustment.
Air Gap—.070" between center of core and armature with contacts just closed.

Current Regulator

Setting—32-34 amperes (hot).
To Check—Remove cover, connect short jumper from voltage regulator frame to upper contact support bracket (shorting out Voltage Regulator). Connect ammeter in charging line at 'BAT' regulator terminal. Turn on lights and accessories, operate generator and increase speed until output remains stationary (run until hot). Check setting with regulator at operating temperature.
To Adjust—Change regulator armature spring tension slightly by bending lower spring hanger for **one spring.** If further adjustment required see Single Core Regulator article in Electrical Equipment Section for adjustment of other spring.
Air Gap—.075" (check same as Voltage Regulator).

LIGHTING:—**Headlamps**—Guide 'Sealed Beam' type.
See article in Electrical Equipment Section for data.
Headlamp Adjustment—Aim upper beam straight ahead with center of hot spot 3" below lamp center height.
Beam Indicator—On speedometer face. Lighted whenever Country (upper) beam in use.
Direction Signal—*See Electrical Equipment Section.*

Switches

Lighting—Delco-Remy 1995010.
Beam Selector—Delco-Remy 1997002.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Front Indic. & Park	21-3	1154
Instr., Clock, Radio	1.5	55
Glove & Trunk Comp't	1.5	55
Beam Indicator, Ign. Lock	1	51
Stop & Tail	21-3	1154
*Rear Indicator (Early)	21-3	1154
*Rear Indicator (Later)	32	1133
License Plate	3	63
Dome & Quarter	15	87

*—When replacing Rear Indicator Bulb use same type bulb as formerly used (1154 double contact—1133 single contact) in order for circuit to function properly.

THERMOSTATIC RELAY:—**Delco-Remy.** On lighting switch. Contacts remain closed with 30 amperes, open in 3 minutes with 42 ampere load at 70° F. Non-adjustable type.

FUSES:—**Direction Signal**—9 ampere. In Flasher lead under instrument panel.
Fog Lights—20 ampere. On switch.
Radio & Under Seat Heater—14 amperes each.

HORNS:—**Delco-Remy Model K-33-H.** No. 1999501, 519 (low note), 1999502, 520 (high note). Vibrator type, blended tone, operated by horn relay. Horn set 1999501 & 502 used on early cars.

Type	Current (at 6 volts)	Air Gap
1999501 (Low)	16-18 amperes	.044-.049"
1999502 (High)	15-17 amperes	.034-.039"
1999519 (Low)	19-21 amperes	.044-.049"
1999520 (High)	18-20 amperes	.034-.039"

Horn Relay:—Delco-Remy Model 1116775.
Contact Gap—.020". **Air Gap**—.015" (closed).
Contacts Close—2.75-4.0 volts.

ENGINE HOOD NOTE:—Latch is same type used on previous models (turn radiator ornament to free latch).

SERIAL & ENGINE NUMBER:—Stamped on top of clutch housing and on left side of front frame cross-member.

COMPRESSION:—**Ratio**—7.2-1 aluminum alloy head. **Pressure**—110 lbs. at cranking speed of 100 RPM.

VACUUM READING:—18-20" steady idling at 6 MPH.

IGNITION:—**Coil No. H-12024.** (2 coils in single case, part of ignition unit assembly). Mounted on distributor.

Ignition Current—Approx. 3.2 amperes idling, 4.2 stopped (per coil). Ignition primary circuit resistance 1.0-1.33 ohms.

Resistor Unit—One unit connected in each coil primary circuit (2 used). Mounted on Lighting Circuit Breaker Assembly No. 06H-11624.

Ignition Switch:—Oakes Steering Column & Ignition Lock Assembly No. 302099, Ford No. 06H-3676A (Std.); 302131, Ford No. 06H-3676B (Custom); 302180, Ford No. 06H-3676C (Contl. Cabr.). Ignition Switch No. 302136 (Std.), 302137 (Custom), 302182 (Contl. Cabr.).

Lock Cylinder—Hurd. Ford No. 91A-3686A (Std.), 06H-3686 (Custom & Contl. Cabr.) with keys.

Key Series—H000 to H999.

Distributor Model No. H-12127 (less coil, distributor caps and plates). Double breaker, 6 lobe cam, full automatic advance type with Vacuum Brake control (see Ignition Timing). Same design as used on previous Lincoln-Zephyr models.

Firing Interval—Movable contacts open 37½° after fixed set. Unequal 37½° and 22½° intervals (corresponding to 75° and 45° of crankshaft rotation) caused by 75° included angle between banks.

Breaker Gap—.014-.016" (both sets equal).

Cam Angle or Dwell—36.5° closed, 23.5° open (each set—operate independently).

Breaker Arm Spring Tension—20-24 ozs.

Rotation—Clockwise viewed from drive end.

Condenser—No. H-12300 (2 used). Cap. .30-.34 mfd.

Automatic Advance
(High Vacuum or Vacuum Brake Inoperative)

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	200	0	400
2	300	4	600
3	375	6	750
4	480	8	960
6	720	12	1440
8	950	16	1900

Distributor Removal:—Mounted on front of engine. Remove generator, disconnect vacuum line and primary leads, remove distributor cap, take out 3 capscrews in mounting flange.

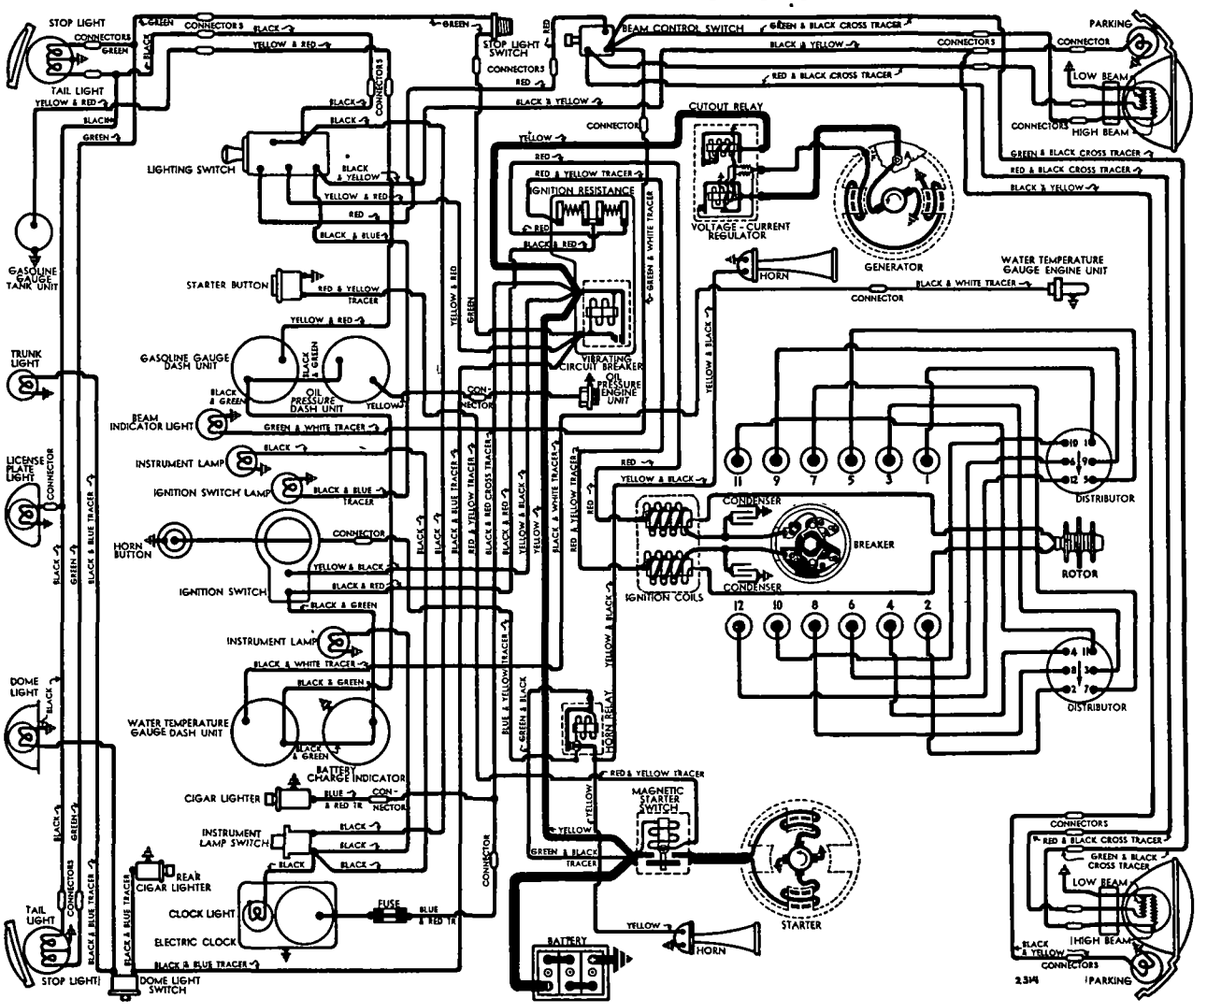
IGNITION TIMING:—See Vacuum Brake Setting below.

	Flywheel Degrees	Piston Position
All Engines	4° BTDC	.0058" BDTC

Timing & Synchronizing Note—Manufacturer recommends use of Stroboscope or V-126 Timing Fixture for both operations. See 1937 Lincoln-Zephyr 'T&E' page for Timing Fixture data. No flywheel marks of other means provided to synchronize distributor on engine.

Timing (On Engine)—With #2 piston on top dead center (starting power stroke), loosen adjusting screw on right side of ignition unit housing, move screw down to bottom of slot, then move screw up slowly until left hand (fixed contacts) begin to open, note graduation on plate under screw head in line with reference mark on housing, move screw up one additional graduation and tighten (this provides 4° BTDC. timing).

Synchronization (Movable Contacts)—No means provided for synchronization on engine (see note above). If Stroboscope, Timing Fixture, etc. used, set movable contacts to open exactly 37½° (distributor rotation) after fixed set. To adjust, remove timing adjusting screw and plate on side of housing, turn eccentric adjusting screw (visible in slot).



Vacuum Brake Setting:—Should be set for best performance with particular fuel and operating conditions. To adjust, loosen locknut and back off adjusting screw until engine pings when accelerated, then turn screw in just enough to eliminate this ping, tighten locknut. When adjusted on Stroboscope, vacuum brake should retard spark so that automatic advance is 2° (distr.) at 950 RPM. or 38 MPH. with no vacuum to release brake.

Firing Order:—1-4-9-8-5-2-11-10-3-6-7-12. See diagram for cylinder numbering and spark plug distributor connections.

Spark Plugs:—Champion Type H-10. 14 MM. Metric. **Spark Plug Gaps**—.028-.030".

CARBURETION:—**Carburetor**—Chandler-Groves Model AA-1, Ford No. 06H-9510. New larger (1") dual, downdraft type.
See article in Carburetor Section for data.

Idle Adjustment—With engine warm, choke valve wide open and Fast Idle inoperative, set throttle lever stopscrew for 6 M.P.H. idle speed. Turn each idle adjusting screw (one for each barrel, adjust in succession) in until engine begins to miss, then out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Final setting should be approximately ⅞ turn out from the inner seated position. Re-adjust throttle stopscrew for correct idle speed.
NOTE—Manufacturer recommends use of vacuum gauge for idling adjustment. Set for highest steady reading of gauge.

Accelerating Pump Adjustment—Three holes provided in throttle lever for pump link connection. Adjust for seasonal requirements as follows:
Inner (#1)—Min. stroke, Summer temperatures.
Center (#2)—Med. stroke, Winter temperatures.
Outer (#3)—Max. stroke, Extreme cold weather.
NOTE—Pump link locked in pump rod by snap lock. Pull link shaft out of pump rod to disengage lock.

Fast Idle:—Integral with carburetor. Operated by choke lever. No adjustment required.

Air Cleaner:—Oil-wetted type Std., Heavy duty oil-bath type Optl.

Gasoline Gauge:—King-Seeley Electric. Ford No. Dash Unit—06H-9280-A (except Contl.), 06H-9280-B (Contl.). Tank Unit—No. 01T-9275 (all models).
See article in Carburetion Equipment Section.

Fuel Pump:—AC Type R. #1523307. Ford No. 68-9350.
See article in Carburetion Equipment Section.

VALVE TIMING:—To Check. No flywheel marks provided. If dead center position for any cylinder established on flywheel, intake valve for this cylinder should open approximately 3.24 teeth before this point with piston .0389" before top dead center.

Tappet Clearance:—None (hydraulic type lifters).

Valve Spring Pressure:—51-57 lbs. at 2.13" (valve closed), 111-121 lbs. at 1.84" (valve open).

LUBRICATION:—Crankcase Capacity—5 quarts.

Normal Oil Pressure—40-45 lbs. at 2000 RPM.

Oil Pressure Gauge:—King-Seeley Electric. Ford No. Dash Unit—06H-9273-A (except Contl.), 06H-9273-B (Contl.), Engine Unit—No. 48-9278 (all models).
See article in Mechanical Equipment Section for data.

COOLING SYSTEM:—Capacity—27 quarts.

Thermostat:—In outlet hose for each bank (2 used). Starts to open at 145° F. Fully open at 180° F.

Temperature Gauge:—King-Seeley Electric. Ford No. Dash Unit—06H-10883-A (except Contl.), 06H-10883-B (Contl.). Engine Unit—No. 99A-10884 (all models).
See article in Mechanical Equipment Section for data.
NOTE—Gauge reads 212° (hot) when turned off.

BATTERY:—Ford No. 06H-10655-A. 6 volt, 17 plate, 120 ampere hour capacity (20 hour rate).

Starting Capacity—150 amperes for 20 minutes.

Zero Capacity—300 amperes for 4.0 minutes.

Grounded Terminal—Positive (+) grounded to cylinder head stud of right hand bank.

Location—On right side in engine compartment.

Dimensions—Length 10.6". Width 7.3". Height 9.2".

Battery Indicator:—King-Seeley. Voltmeter type. Ford No. 06H-10844-A (except Contl.), 06H-10844-B (Contl.).
See article in Electrical Equipment Section for data.

STARTER:—Ford No. 18-11002. Armature No. 18-11005.

Drive—Inboard Bendix No. L11FX-10. Ford No. B-11350.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—2 lbs. each.

Cranking Engine—100 RPM., 190-215 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
4 ft. lbs.	1070	4.6	200
8 "	660	4.3	340
12 "	300	3.65	465
14 "	Lock	3.5	500

Starting Switch:—R-B-M Model 5604, Ford No. 78-11450 magnetic switch mounted on dash and controlled by pushbutton on instrument panel, R-B-M 3243, Ford No. 06H-11500-A (Std.); 3244, Ford No. 06H-11500-B (Custom).

Removal:—Starter mounted on right front face of flywheel housing. To remove, take off pan at right of engine, take out through-bolts on commutator end plate.

GENERATOR:—Ford No. 01A-10000. Armature No. 01A-10005. Two brush (shunt) type with vibrating type voltage and current regulation. Ventilated by fan on drive pulley.

Charging Rate Adjustment—No adjustment. See Regulator data below.

Maximum Charging Rate—Controlled by regulator and dependent on battery condition and load. To check generator output, disconnect generator field lead at generator, connect both generator terminals together (use short insulated wire). Use 'BRS' set or rheostat connected across battery terminals and apply load until voltage is exactly 6 volts. Connect ammeter in charging line, run engine at approximately 1000 RPM., check output at 3 speeds given in performance table below. Restore original connections after completing test. **Do not operate generator in service with both terminals connected together. This eliminates all regulator action and will damage generator.**

Performance Data

Amperes	Engine R.P.M.
Start	400
32	1100
32	3000

Rotation—Counter-clockwise at commutator end.

Field Current—2.86 amperes at 6.0 volts (field resistance 2.1 ohms at 70° F.).

Brush Spring Tension—Approximately 28 ozs.

Removal:—Generator mounted on bracket between cylinder banks at front of engine, driven in tandem with water pumps by Vee belt. To remove, loosen nut on bracket stud.

Belt Adjustment:—Loosen nut on bracket mounting stud, raise generator up until side movement on belt midway between generator and water pump pulleys is 1" (thumb and finger pressure).

REGULATOR:—Ford No. 01A-10505-A3. Vibrating type Voltage-Current Regulator with Cutout Relay in case on dash. NOTE—Regulator mounted on rubber cushions and grounded through separate ground wire attached to case. Regulator case is sealed and no adjustments can be made.

Cutout Relay

Cuts In—6.2-6.5 volts (Cold or 60-80°), 400 Eng. RPM.

Cuts Out—5.5 amperes max. (Cold 60°), 1.7 amperes (Hot 180°)—*see Regulator article in Electrical Equipment Section for specifications at other temperatures.*

Voltage-Current Regulator

Voltage Setting—7.2-7.65 volts (Cold 60°), 6.825-7.2375 volts (Hot 180°). Over-compensated for temperature.

Current Setting—32 amperes.

Regulator Checking & Adjustment—*See Ford Regulator article in Electrical Equipment Section for complete testing directions.* No adjustments can be made as regulator case is sealed.

LIGHTING:—Headlamps—Ford Sealed Beam type. Controlled by switch on instrument panel and Beam Selector switch on toeboard.
See article in Electrical Equipment Section.

Headlamp Adjustment—Aim upper beam of each headlamp straight ahead with hot spot centered on horizontal line 3" below lamp center height.

Beam Indicator—Red jewel on instrument panel directly above speedometer. Lighted when upper beams in use.

Switches

Lighting—R-B-M Model 2440, Ford No. 06H-11654 (all models). Light Switch Knob Ford No. 06H-11661-A (Std.), 06H-11661-B (Custom).

Beam Selector—R-B-M Model 2480, Ford No. 06H-11653 (with Horn Wiring), 06H-13532 (switch only).

Instrument—Ford No. 06H-13740-A (Std.), 06H-13740-B (Custom).

Dome Light—Ford No. B-13752-A.

Stop Light—Ford No. 91A-13480 (hydraulic type).

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	...	Sealed Beam
Parking	1.5	55
Instrument	1 5	55
Beam Indicator	1	51
Stop & Tail	21-3	1158
License Plate	3	63
Dome	6	81

LIGHTING CIRCUIT BREAKER:—R-B-M Model 6720, Ford No. 06H-11624. Combined with Ignition Resistor assembly on block on dash under left side of cowl. Combination thermostatic and wound-coil type. Contacts open with current of 50 amperes and current continues to flow through winding, which is connected across the contacts, resulting in rapid vibrating action.

FUSES:—Clock—3 amperes. In clock lead.

HORNS:—Air electric type dual horns. Ford No. 06H-13832 (Right Hand—high note), 06H-13833 (Left Hand—low note). Horns operated by horn relay

Horn Current—24-28 amperes (total).

Horn Relay:—R-B-M Model 4750, Ford No. 96H-13842.
Contact Closing Voltage—3.5-4 5 volts.
Current Draw—Approximately ¾ ampere.

ENGINE HOOD NOTE:—To raise hood, release latch by pulling up on latch handle on front of hood at center, press in on button in upper edge of grille to release secondary (safety) catch. Safety catch button concealed by latch handle in closed position.

SERIAL & ENGINE NUMBER:—Stamped on top of clutch housing and on left frame side member near generator.

COMPRESSION:—**Ratio**—6.3-1 Std. Cast iron hd.
Pressure—100 lbs. at cranking speed of 100 RPM.

VACUUM READING:—Steady 18-20" at 5-7 MPH.

IGNITION:—**Coil Model 78-12024-A** (part of ignition unit assembly). Mounted on top of distributor.
Resistor Unit—Connected in coil primary circuit. Mounted on Circuit Breaker Assembly No. 01A-12250.
Ignition Current—4½-6 amperes (engine stopped). Ignition primary circuit resistance 1-1⅓ ohms.

Ignition Switch:—Oakes Steering Column & Ignition Lock Assembly No. 302142, Ford No. 09A-3676. Ignition Switch No. 302159.
Lock Cylinder—Hurd or Briggs & Stratton No. 8500, Ford No. 99A-3686 (with keys).
Key Series—FK000 to FK999. **Groove**—No. 17.

Distributor Model 78-12127. (Less coil, distributor caps, and distributor plates). Double breaker, 8 lobe cam, full automatic advance type with Vacuum Brake Control (see Ignition Timing for adjustment). Same design as used on preceding V8 models.
Breaker Gap—.014-.016" (both sets). Use special two step feeler—.014" step 'go', .016" step 'no go'.
Cam Angle—36° closed, 9° open. For both sets operating together with correct coil-loading lead.
Breaker Arm Spring Tension—20-24 ozs.
Rotation—Clockwise viewed from drive end.
Condenser—No. 78-12300. Capacity .33-.36 mfd.

Automatic Advance
(High Vacuum or Vacuum Brake Inoperative)

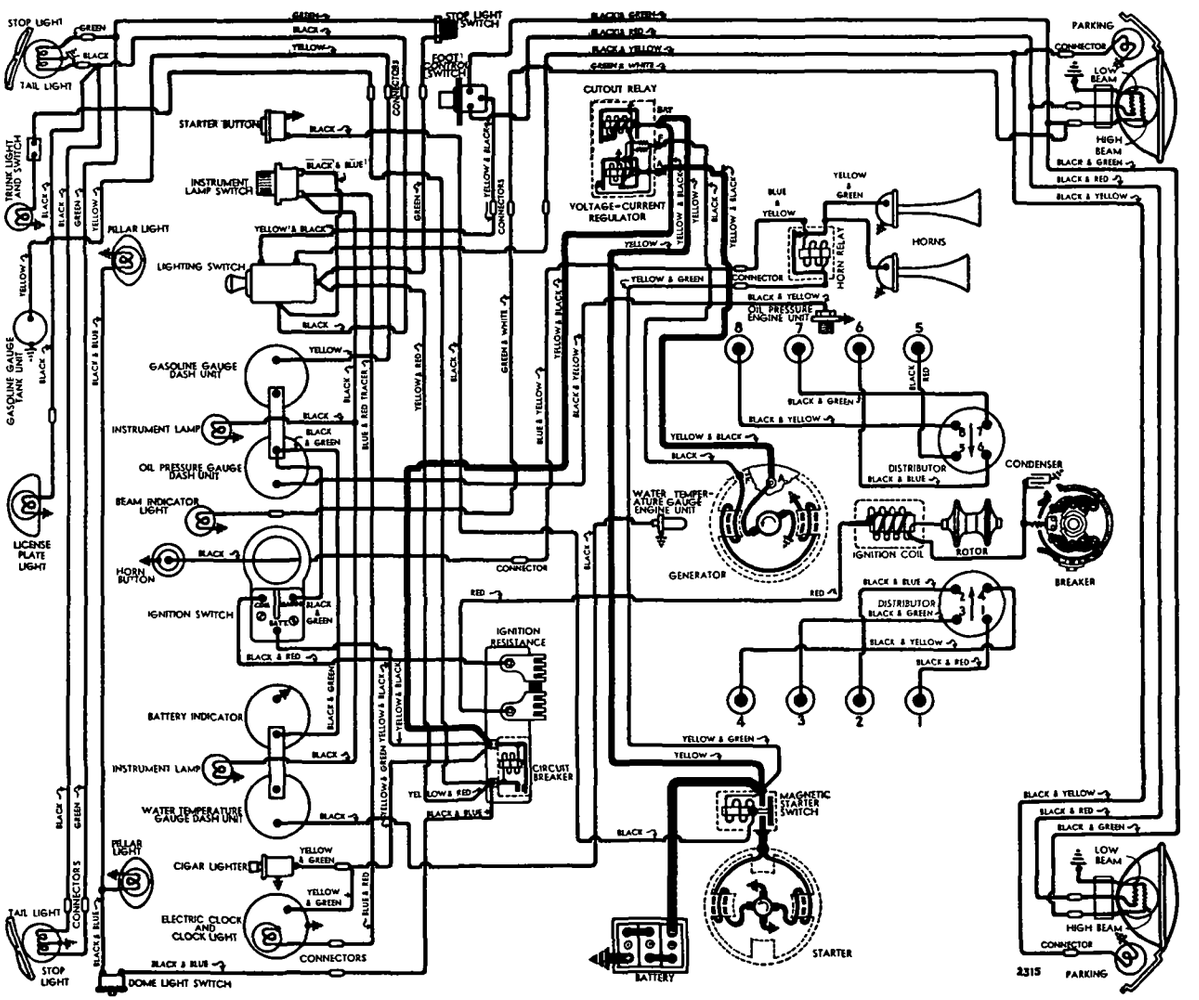
Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	200	0	400
2	325	4	650
3	425	6	850
5	825	10	1650
8	1500	16	3000

Removal:—Ignition unit mounted on front of engine. To remove, disconnect vacuum line, take off caps, take out screws in mounting flange.

IGNITION TIMING:—For each engine as follows (see Vacuum Brake Setting below for adjustment depending on type of service and fuel used).

	Flywheel Degrees	Piston Position
All Engines	4° BTDC	.0058" BTDC.

Timing Note—Manufacturer recommends use of Laboratory Test Set with Stroboscope attachment or V-126 Timing Fixture for all ignition settings.
Timing (On Engine)—No flywheel marks provided and timing should be set with piston on top dead center. With #1 piston on top dead center entering power stroke, loosen timing adjusting screw on left hand side of ignition unit housing, place screw in retard position at lower end of slot, move screw slowly up until timing contacts begin to open, note graduation on plate under screw head which is in line with reference mark on housing, move screw up exactly one additional graduation, tighten screw. NOTE—Dead center position can be determined by inserting gauge rod in cylinder or by measuring to tops of #2 and #3 pistons (should be equal).



Vacuum Brake Setting:—Should be adjusted to eliminate pinging when engine operated with load. To adjust, loosen locknut, back of adjusting screw until engine pings with load, turn screw in just enough to eliminate ping, tighten locknut. When adjusted on Stroboscope, vacuum brake should retard spark so that automatic advance is 2° (distr.) at 950 R.P.M. or 38 M.P.H. with no vacuum.

Firing Order:—1-5-4-8-6-3-7-2. See diagram.

Spark Plugs:—Champion Type H-10. 14 MM. Metric.
Spark Plug Gaps—.025".

CARBURETION:—**Carburetor**—Chandler-Groves Model AA-1, Ford No. 91A-9510-A. Dual, downdraft type.
See article in Carburetor Section for data.

Idle Adjustment—With engine warm, choke valve wide open, and Fast Idle inoperative, set throttle lever stopscrew for 5-7 MPH. idling speed, turn each idle adjusting screw (one for each barrel, adjust in succession) in until engine begins to miss, then out until engine begins to roll, finally turn screw in until engine fires smoothly. Final setting should be approximately ⅝-⅞ turn of screw from inner seated position. Readjust stopscrew for correct idling speed of 5-7 MPH. or 350 RPM.
NOTE—Vacuum gauge recommended for idling adjustment. Set for highest steady gauge reading.
Float Level—1 3/32-1 11/32" from bottom of float to face of cover with valve seated (invert to check). Fuel level 21/32-23/32" below top edge of bowl.
Accelerating Pump Setting—Three holes provided for pump link connection as follows:
Inner (#1)—Min. stroke, Summer Temperatures.
Center (#2)—Med. stroke, Winter Temperatures.
Outer (#3)—Max. stroke, Extreme Cold Weather.
NOTE—Link locked in pump rod by snap-lock. Pull link shaft out of pump rod to disengage this lock.

Fast Idle:—Integral with carburetor. Operated by choke valve lever. No adjustment required.

Air Cleaner:—AC #1529224, Ford No. 91A-9600-A oil-wetted type Std. Heavy Duty oil-bath type Optl.

Gasoline Gauge:—King-Seeley Electric. Ford No. 09A-9280 (Dash Unit), No. 99A-9275-B (Tank Unit).
See article in Carburetion Equipment Section.

Fuel Pump:—AC Type R. #1523307, Ford No. 68-9350. Diaphragm type.
See article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing. No flywheel marks or other means provided to check timing. If dead center position for piston #1 is established on flywheel, intake opening for this cylinder should occur with piston on top dead center and flywheel mark at dead center point.

Tappet Clearance:—.0125-.0135" all valves. Not adj.

Valve Spring Pressure:—37-40 lbs. at 2.13" (valve closed), 76-80 lbs. at 1.84" (valve open).

LUBRICATION:—Crankcase Capacity—5 quarts.

Normal Oil Pressure—30 lbs. at 2000 RPM.

Oil Pressure Gauge:—King-Seeley Electric. Ford No. 09A-9273 (Dash Unit), No. 48-9278 (Engine Unit).
See article in Mechanical Equipment Section for data.

COOLING SYSTEM:—Capacity—22 quarts.

Thermostat:—In each cylinder head outlet (2 used). Starts to open at 145° F. Fully open at 180° F.

Temperature Gauge:—King-Seeley Electric. Ford No. 09A-10883 (Dash Unit), No. 99A-10884 (Eng. Unit).
See article in Mechanical Equipment Section for data.
NOTE—Gauge reads 212 (Hot) with ignition off.

BATTERY:—Ford No. 01A-10655-A. 6 volt, 17 plate, 120 ampere hour capacity (20 hour rate).

Starting Capacity—150 amperes for 20 minutes.

Zero Capacity—300 amperes for 4.0 minutes.

Grounded Terminal—Positive (+) grounded to dash.

Engine Ground—Strap connector between right rear cylinder head and dash.

Dimensions—Length 10.6". Width 7.3". Height 9.2".

Location—On right side in engine compartment.

Battery Indicator:—King-Seeley. Voltmeter type. Ford No. 09A-10844.
See article in Electrical Equipment Section for data.

STARTER:—Ford No. 18-11002. Armature No. 18-11005.

Drive—Inboard Bendix No. L11FX-10. Ford No. B-11350.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—2 lbs. each.

Cranking Engine—100 RPM., 190-215 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
4 ft. lbs.	1070	4.6	200
8 "	660	4.3	340
12 "	300	3.65	465
14 "	Lock	3.5	500

Starting Switch:—R-B-M Model 5604, Ford No. 78-11450. Magnetic Switch mounted on dash and controlled by pushbutton on instrument panel R-B-M No. 3239, Ford No. 09A-11500.

Removal:—Starter mounted on right front face of flywheel housing. To remove, take off pan at right of engine, free starter-to-oil pan support bracket, take out through-bolts on commutator end plate.

GENERATOR:—Ford No. 01A-10000. Armature No. 01A-10005. Two brush (shunt) type with vibrating type voltage and current regulation. Ventilated by fan on drive pulley.

Charging Rate Adjustment—No adjustment. See Regulator data below.

Maximum Charging Rate—Controlled by regulator and dependent on battery condition and load. To check generator output, disconnect generator field lead at generator, connect both generator terminals together (use short insulated wire). Use 'BRS' set or rheostat connected across battery terminals and apply load until voltage is exactly 6 volts. Connect ammeter in charging line, run engine at approximately 1000 RPM., check output at 3 speeds given in performance table below. Restore original connections after completing test. **Do not operate generator in service with both terminals connected together. This eliminates all regulator action and will damage generator.**

Performance Data

Amperes	Engine R.P.M.
Start	400
32	1100
32	3000

Rotation—Counter-clockwise at commutator end.

Field Current—2.86 amperes at 6.0 volts (field resistance 2.1 ohms at 70° F.).

Brush Spring Tension—Approximately 28 ozs.

Removal:—Generator mounted on bracket between cylinder banks at front of engine, driven in tandem with water pumps by Vee belt. To remove, loosen nut on bracket stud.

Belt Adjustment:—Loosen nut on bracket mounting stud, raise generator up until side movement on belt midway between generator and water pump pulleys is 1" (thumb and finger pressure).

REGULATOR:—Ford No. 01A-10505-A. Vibrating type Voltage-Current regulator with Cutout Relay in case on dash. NOTE—Regulator mounted on rubber cushions and grounded through separate ground wire attached to case. Regulator case is sealed and no adjustments can be made.

Cutout Relay

Cuts In—6.2-6.5 volts (Cold or 60-80°), 400 Eng. RPM.

Cuts Out—5.5 amperes max. (Cold 60°), 1.7 amperes (Hot 180°)—*see Regulator article in Electrical Equipment Section for specifications at other temperatures.*

Voltage-Current Regulator

Voltage Setting—7.2-7.65 volts (Cold 60°), 6.825-7.2375 volts (Hot 180°). Over-compensated for temperature.

Current Setting—32 amperes.

Regulator Checking & Adjustment—*See Ford Regulator article in Electrical Equipment Section for complete testing directions.* No adjustments can be made as regulator case is sealed.

LIGHTING:—Headlamps—Ford Sealed Beam type. Controlled by switch on instrument panel and Beam Selector switch on toeboard.
See article in Electrical Equipment Section.

Headlamp Adjustment—Aim upper beam of each headlamp straight ahead with hot spot centered on horizontal line 3" below lamp center height.

Beam Indicator—Red jewel on instrument panel directly above speedometer. Lighted when upper beams in use.

Switches

Lighting—R-B-M Model 6425. Ford No. 01A-11654 (this switch now mounted on instrument panel). Light Switch Knob & Insert Ford No. 09A-11661.

Beam Selector—R-B-M Model 2480. Ford No. 81A-13532.

Instrument—Ford No. 09A-13740-A.

Stop Light—Ford No. 91A-13480.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	Sealed Beam	
Parking	1.5	55
Instrmt., Beam Ind.	1	51
Stop & Tail	21-3	1158
Pillar	3	63
License Plate	3	63

LIGHTING CIRCUIT BREAKER:—R-B-M Model 6700, Ford No. 01A-12250. Combined with Ignition Resistor on block on dash under cowl. Combination thermostatic and wound-coil type. Contacts open with current of 50 amperes. Current continues to flow through winding which is connected across the contacts resulting in rapid vibrating action.

HORNS:—Air Eletcric type dual horns. Ford No. 91A-13832 (high note), 91A-13833 (low note).

Horn Current—24-28 amperes (total).

Horn Relay:—R-B-M Model 4700, Ford No. 91A-13842.

Contact Closing Voltage—3.5-4.5 volts.

Current Draw—Approximately ¾ ampere.

NOTE:—Engine hood hinged at cowl and lifts from forward end. Hood latch handle located at lower edge of radiator grille (safety catch at top of grille).

SERIAL NUMBER:—First number R-340000. Stamped on plate on right frame side member under hood.

SERVICE SERIAL NUMBER:—First number N6-31500. On 'Caution Plate' on left front door hinge post.

ENGINE NUMBER:—First number E-339500. On engine block on right side at front. NOTE—Engine Number is 500 less than Serial Number on same car.

COMPRESSION:—Ratio—6.0-1 std. cast-iron head.
Pressure—125 lbs. at 350 RPM or approx. 100 lbs. at cranking speed of 160 RPM.

VACUUM READING:—Steady 18-20" idling at 7-8 MPH.

IGNITION:—Coil Model CE-4025-A (2 used). Coils mounted on right side of engine.
Ignition Current—2 amperes idling, 4 amperes stopped (for each coil).

Ignition Switch:—Oakes Steering Column and Ignition Lock No. 302074. Ignition Switch No. 301538.
Ignition Lock—Briggs & Stratton. B & S No. 80207. Key Digits—5 digits. Groove—No. 1.

Distributor Model IGE-4019A. 'Twin Ignition' double breaker, 6 lobe cam, full automatic advance type with Torquematic Spark Control. Contacts open simultaneously to fire both spark plugs in each cylinder at the same instant and must be synchronized (see Ignition Timing).
Breaker Gap—Set at .020".
Cam Angle or Dwell—35° closed, 25° open (distr.). For each set of contacts (operate independently).
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Counter-clockwise viewed from above.
Condenser—No. IG-2671 (2 used). Cap. .20-.25 mfd.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	275	0	550
3	370	6	740
7	500	14	1000
9	665	18	1330
11.5	875	23	1750

Torquematic Spark Control—Consists of cable anchored at dash and connected to distributor body by a travel limiting spring. Retards distributor through engine movement caused by torque action. Maximum retard 2½° (engine movement in excess of of 2½° taken up by travel limiting spring). See Ignition Timing for setting.

Removal:—Mounted on right side of engine. To remove, take out hold-down screw in advance arm, disconnect torquematic control, lift distributor off.

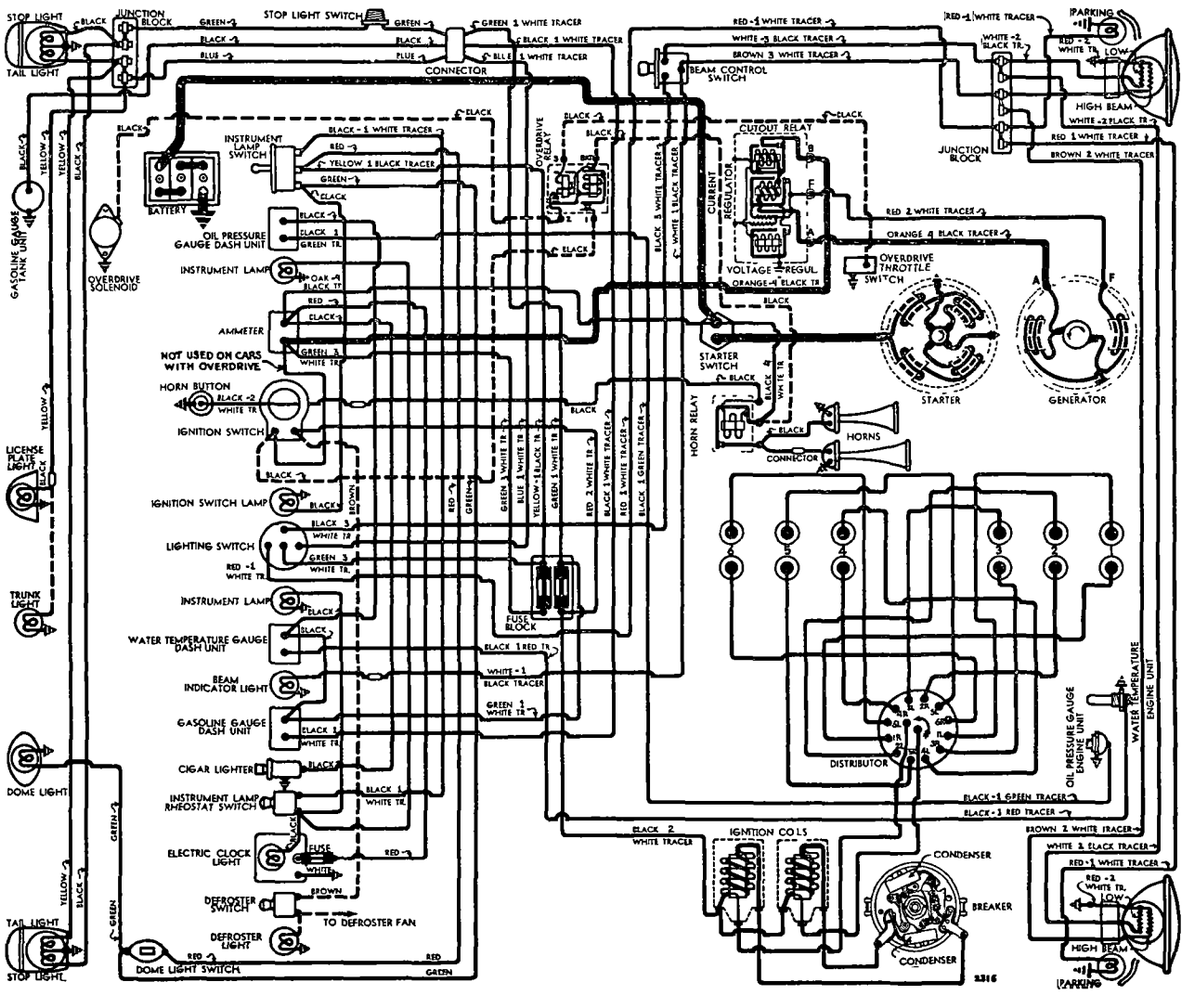
IGNITION TIMING:—Setting for all engines as follows:

Flywheel Degrees	Piston Position
6° BTDC	.0150" BTDC

To Set Timing—Car manufacturer recommends use of Nash Timing Light SE-569. Synchronize breaker points (see Synchronization following). With Timing Light connected as for Synchronization (see below), slacken torquematic cable by loosening locknuts on anchor bracket at dash. With #1 piston on compression, turn engine over until piston is 6° or .0150" BTDC, stop when 'IGN' mark on vibration dampener lines up with pointer on chain case cover (this mark is 6° or 23/64" before top dead center mark 'DC'). Loosen advance arm clamp bolt, rotate distributor until points just break (lights go on) with stop pin (hold-down bolt and nut) in advance position in slot in advance arm, tighten clamp bolt. Adjust cable locknuts at anchor bracket on dash to leave torquematic cable without slack or tension and stop pin in advance position in slot.

Synchronization—Use Nash Timing Light SE-569 (consists of two lights—one for each set of contacts) connected between each primary terminal and ground. Turn on ignition, turn engine over until fixed points just open (light for stationary contacts on). If both lights go on, synchronization correct. If not, loosen 3 lockscrews on movable subplate, shift plate by prying with screwdriver in notch on edge of plate until this set of contacts begin to open (both lights on), tighten sub-plate lockscrews, and set Ignition Timing as directed above. If other methods used, set contacts to open simultaneously at 60° (distributor) intervals.

Torquematic Spark Control Check—Distributor must be free in bracket and cable pulleys positioned to prevent cable interference with engine. Advance spring and cable take-up spring must be properly located and spring resistance centralized. Car manufacturer recommends use of Nash Synchro Light SE-417 to check torquematic retard by means of dead center mark on vibration dampener.



Motor Gauge—Weidenhoff Adapter #113, Rod #37.

Firing Order:—1-5-3-6-2-4. See diagram for spark plug cable connections on distributor cap.

Spark Plugs:—AC No. 45. 14 MM Metric type.
Spark Plug Gaps—Set at .025". Limits .023-.027".

CARBURETION:—Carburetor—Carter Type WA-1, Model 435-S (#253 cast on face of flange). Single barrel, 1¼" downdraft type.
See article in Carburetor Section for data.

Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 7-8 MPH idle speed. Adjust idle adjusting screw until engine fires smoothly (¾-1½ turns open—turn screw in for leaner mixture). Readjust idle speed.

Accelerating Pump Setting—Pump arm under dust cover at top of carburetor has three holes for pump link engagement. Set as follows
Upper Hole (max stroke)—Cold weather
Lower Hole (med stroke)—Moderate weather.
Inner Hole (min stroke)—Hot weather.
Float Level—3/8" from projection on cover to top of soldered seam at front end of float with needle valve seated (invert to check).

Fast Idle:—Integral type (built-in carburetor).
See article in Carburetion Equipment Section.

Fast Idle Setting—Part of Climatic Control Adjust by bending connecting link offset for 5/8" choke valve opening with stopscrew against (not on) first step of fast idle cam.

Automatic Choke:—Carter Climatic Control.
See article in Carburetion Equipment Section.

Choke Setting—Set thermostatic coil housing 2 Notches Rich.

Air Cleaner:—AC #1529112 oil-wetted type std.

Fuel Pump:—AC Type W #1523642 diaphragm type std. Type AD #1523643 combination fuel-and-vacuum pump optional.
See articles in Carburetion Equipment Section.

Gasoline Gauge:—King-Seeley Electric type. K-S No 7680 (dash unit), No 7780 (tank unit).
See article in Carburetion Equipment Section.

VALVE TIMING:—**To Check**—With regular running tappet clearance of .015", exhaust valve should close with piston 5° or 0104" after top dead center.

Motor Gauge—Weidenhoff Adapter #113, Rod #37

Valve Spring Pressure:—Total for inner and outer springs 59 lbs (closed), 146 lbs. (open). See 'M' page for data on each spring.

Tappet Clearance:— 015" all valves—engine warm and idling NOTE—For high speed driving, .018" maximum tappet clearance may be used

LUBRICATION:—**Crankcase Capacity**—6 qts. (dry or refill).

Normal Oil Pressure—30 lbs at 20 MPH.

Oil Pressure Gauge:—King-Seeley Electric type K-S No 7665 (dash unit), No. 6125 (engine unit).
See article in Mechanical Equipment Section for data.

COOLING SYSTEM:—**Capacity**—16 qts (add 1 qt. for heater).

Thermostat—Dole In cylinder head water outlet. Starts to open 160°F.

Temperature Gauge—King-Seeley electric type. K-S No 7670 (dash unit), No. 7000 (engine unit).
See article in Mechanical Equipment Section for data.
NOTE—Gauge inoperative with ignition 'Off' (reads to '212' in this position).

TRANSMISSION OVERDRIVE CONTROL:—Electric type with accelerator pedal operated 'kick-down' switch *See article in Mechanical Equipment Section.*
Overdrive Solenoid—Delco-Remy Model 1118004.
Throttle Switch—Adjust switch to close with throttle wide open and carburetor throttle shaft pulley spring just starting to compress
Control Relay—Delco-Remy Model 1116798.

BATTERY:—**USL Type HTL-1-15 or Auto-Lite Type CTL-1-15.** 6 volt, 15 plate, 105 ampere hour capacity (20 hour rate).
Starting Capacity—133 amperes for 20 minutes.
Zero Capacity—300 amperes for 3 8 minutes
Grounded Terminal—Positive (+) grounded to transmission. Separate ground strap from transmission to frame.
Dimensions—Length & Height 9 1/16". Width 7⅛".
Location—Under front seat.

STARTER:—**Model MAB-4076. Armature MAB-2057.**
Drive—Inboard Bendix Type LCD11FX-10
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—160 RPM, 150-160 amps, 5.2 v.

Performance Data

Torque	R P.M.	Volts	Amperes
0 ft lbs	3700	5 5	60
6 " "	1910	5 5	100
3.4 " "	1100	5 0	200
6 6 " "	695	4 5	300
10 15 " "	420	4 0	400
15 8 " "	Lock	3 0	582
22 5 " "	Lock	4 0	775

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch:—A-L #SW-4005. Mounted on body floor below clutch pedal Operated by depressing clutch pedal fully. No adjustment required.

GENERATOR:—**Model GDZ-4803A. Armature GDZ-2079-F.** Two brush type with current-voltage control.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator. *See Regulator data following.*
Maximum Charging Rate—35 amperes (hot or cold), 8.0 volts, 1900 RPM (generator) and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M	Amperes	Volts	R.P M.
0	6.4	925	0	6.4	1000
4	6 6 .	1035	4	6.6 .	1120
8	6 75	1140	8	6 75	1235
12	6 95	1250	12	6.95	1350
16	7 15	1370	16	7 15	1460
20	7 3	1480	20	7 3	1590
24	7 5	1590	24	7 5	1730
28	7.7	1710	28	7.7 .	1900
32	7 9	1820	32	7 9	2090
35	8 0	1900	35	8 0	2250

Rotation—Counter-clockwise at commutator end
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1 60-1 78 amperes at 6 0 volts.
Motoring Current—4 16-4 60 amperes at 6 0 volts.

Removal:—Generator cradle mounted at left side of engine with fan belt drive Water pump driven by generator shaft extension. To remove, disconnect water pump, loosen fan belt, remove generator clamp band and lift generator off.

Belt Adjustment:—Adjust whenever belt deflection is over 1½" (when pressed lightly midway between generator and fan pulleys). To adjust, loosen two capscrews on fan bracket, lift fan up (one screw hole slotted) for 1" belt deflection, tighten screws.

REGULATOR:—**Model VRP-4004A. Current-Voltage.** Mounted in single case on dash.
See article in Electrical Equipment Section for data.
NOTE—Regulator case cover is sealed Serviced on exchange basis if seals not broken.

Cutout Relay

Cuts In—6 4-6 6 volts.
Cuts Out—4 8-5 6 volts (approx. 7-8 amps. disch.).
Contact Gap— 015" minimum.
Air Gap— 034" min, 038" max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting—7 3-7.6 volts at 70° F.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal, voltmeter between 'B' terminal and ground Operate generator at speed equivalent to 30 MPH, charging battery until voltage is steady Voltage reading should be 7 2 volts min, and 7 7 volts max. at standard operating temperature
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly *See Electrical Equipment Section.*
Contact Gap— 012" Min (armature against stop pin).
Air Gap— 048- 052" with contacts just opening.

Current Regulator

Setting—34-36 amperes (marked '35' on cover).
To Check (without breaking seals)—Connect test meters as for Voltage check (above) Operate generator at 30 MPH, charging battery, add load (use bank of headlamp bulbs, or turn on car lights and accessories and discharge battery) so that generator charges at peak rate and Current Regulator operates Charging current should not exceed 34-36 amperes If more than slight excess noted, regulator is defective.
Adjustment & Contact Gap—Same as for Voltage Regulator (above)
Air Gap— 034- 038" with contacts just opening.

LIGHTING:—**Headlamps**—General Electric 'Sealed Beam'.
See article in Electrical Equipment Section for data.
Headlamp Adjustment—Aim upper beam for each lamp straight ahead with center of hot spot 3" below lamp center height
Beam Indicator—Red light on speedometer face. Lighted whenever Country (upper) beam in use.

Switches

Lighting—Douglas No 5754
Beam Selector—Douglas No 5733
Instrument—Douglas No 5653

Bulb Specifications

Position	Candlepower	Mazda No
Headlamps		Sealed Beam
Parking, Rear License	3	63
Instrum., Beam Indic	1½	55
Stop & Tail	21-3	1154
Dome	6	81

FUSES:—**Lighting**—30 ampere (SFE type) mounted on fuse block on back of instrument panel toward left.
Accessory—30 ampere (SFE type) on fuse block.

HORNS:—**Delco-Remy.** No 1999565 (low note), No 1999566 (high note) Vibrator type, blended tone, operated by horn relay

Type	Current (at 6 volts)	Air Gap
1999565 (Low Note)	19-21 amperes	.047- 052"
1999566 (High Note)	18-20 amperes	039-.044"

Horn Relay:—Delco-Remy Model 1116775
Contact Gap— 020" **Air Gap**— 015" (closed).
Contacts Close—2 75-4 0 volts.

NOTE:—Engine hood hinged at cowl and lifts from forward end. Hood latch handle located at lower edge of radiator grille (safety catch at top of grille).

SERIAL NUMBER:—First number B-106300. Stamped on plate on right frame side rail under hood.

SERVICE SERIAL NUMBER:—First number N8-13500. On 'Caution Plate' on left front door hinge post.

ENGINE NUMBER:—First number B-105800. On engine block on right side at front. NOTE—Engine Number is 500 less than Serial Number on same car.

COMPRESSION:—**Ratio**—6.0-1 std. cast-iron head.
Pressure—110 lbs. at 350 RPM or approx. 100 lbs. at cranking speed of 160 RPM.

VACUUM READING:—Steady 18-20" idling at 7-8 MPH.

IGNITION:—**Coil Model CE-4025A (2 used).** Coils mounted on right side of engine.
Ignition Current—2 amperes idling, 4 amperes stopped (for each coil).
Ignition Switch:—Oakes Steering Column and Ignition Lock No. 302076. Ignition Switch No. 301538.
Ignition Lock—Briggs & Stratton. B & S No. 80207. Key Series—5 digits. Groove—No. 1.
Distributor Model IGK-4102. 'Twin Ignition' double breaker, 8 lobe cam, full automatic advance type with Torquematic Spark Control. Contacts open simultaneously to fire both spark plugs in each cylinder at the same instant and must be synchronized (see Ignition Timing).
Breaker Gap—Set at .017" (alike for both sets).
Cam Angle or Dwell—28° closed, 17° open (distr.). For each set of contacts (operate independently).
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Clockwise viewed from above.
Condenser—No. IG-2671 (2 used). Cap. .20-.25 mfd.

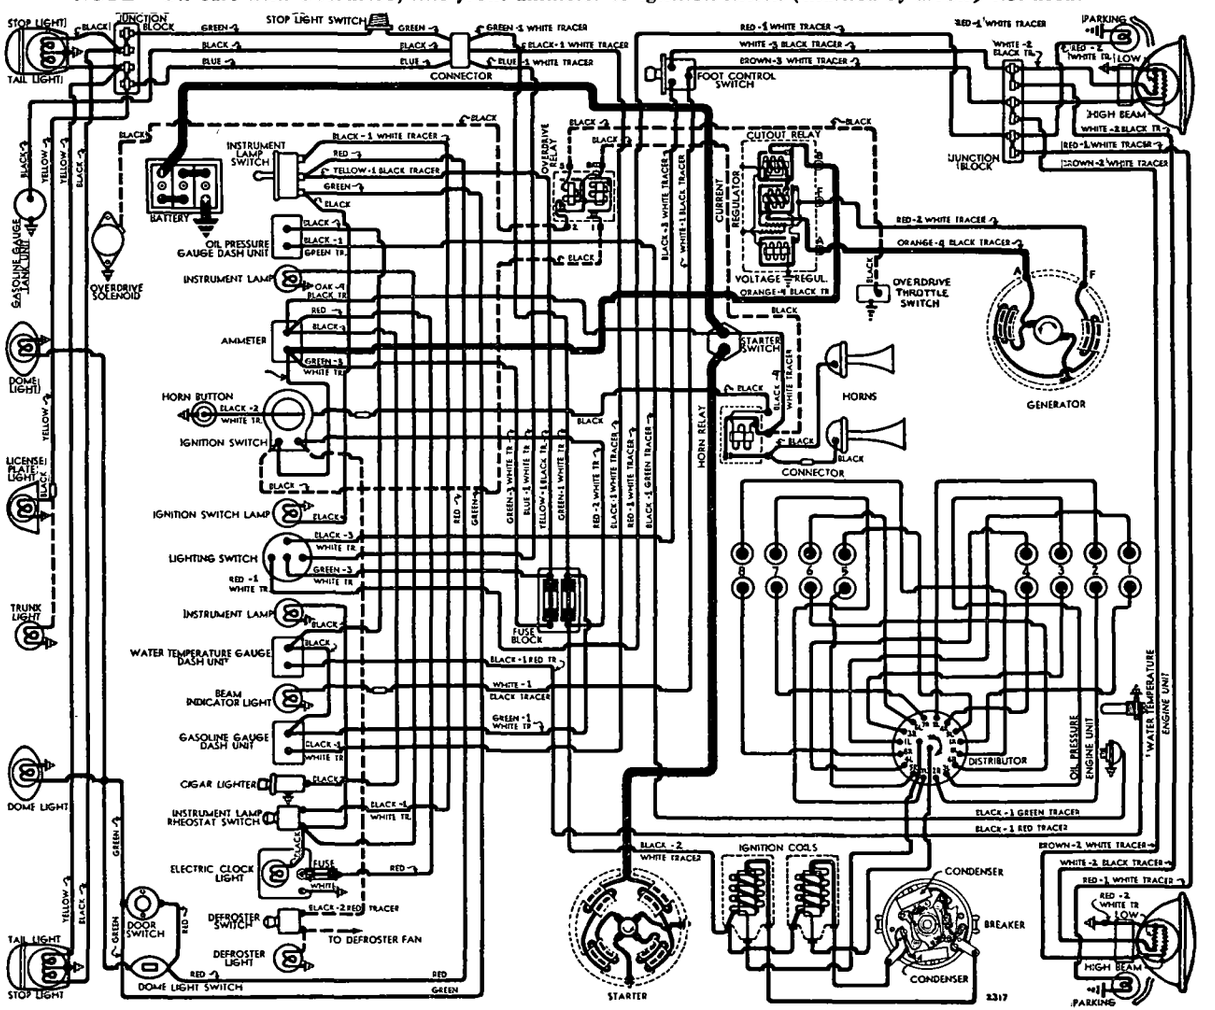
Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	275	0	550
4	400	8	800
6	575	12	1150
9	840	18	1680
12	1100	24	2200

Torquematic Spark Control—Consists of cable anchored at dash and connected to distributor body by a travel limiting spring. Retards distributor through engine movement caused by torque action. Maximum retard 2½° (engine movement in excess of 2½° taken up by travel limiting spring). See Ignition Timing for setting.
Removal:—Mounted on right side of engine. To remove, take out hold-down screw in advance arm, disconnect torquematic control, lift distributor off.

IGNITION TIMING:—Setting for all engines as follows:

Flywheel Degrees	Piston Position
9° BTDC	.0325" BTDC



To Set Timing—Car manufacturer recommends use of Nash Timing Light SE-569. Synchronize breaker points (see Synchronization following). With Timing Light connected as for Synchronization (see below), slacken torquematic cable by loosening locknuts on anchor bracket at dash. With #1 piston on compression, turn engine over until piston is 9° or .0325" BTDC, stop when 'IGN' mark on vibration dampener lines up with pointer on chain case cover (this mark is 9° or .725" before top dead center mark 'DC'). Loosen advance arm clamp bolt, rotate distributor until points just break (lights go on) with stop-pin (hold-down bolt and nut) in advance position in slot in advance arm, tighten clamp bolt. Adjust cable locknuts at anchor bracket on dash to leave torquematic cable without slack or tension and stop-pin in advance position in slot.
Synchronization—Use Nash Timing Light SE-569 (consists of two lights—one for each set of contacts) connected between each primary terminal and ground. Turn on ignition, turn engine over until fixed points just open (light for stationary contacts on). If both lights go on synchronization correct. If not, loosen 3 lockscrews on movable subplate, shift plate by prying with screwdriver in notch on edge of plate until this set of contacts begin to open (both lights on), tighten sub-plate lockscrews and set Ignition Timing as directed above. If other methods used, set contacts to open simultaneously at 45° (distributor) intervals.
Torquematic Spark Control Check—Distributor must be free in bracket and cable pulleys positioned to prevent cable interference with engine. Advance spring and cable take-up spring must be properly located and spring resistance centralized. Car manufacturer recommends use of Nash Synchro Light SE-417 to check torquematic retard by means of dead center mark on vibration dampener.
Motor Gauge—Weidenhoff Adapter #113, Rod #37.

Firing Order:—1-6-2-5-8-3-7-4. See diagram for spark plug cable connections on distributor cap.

Spark Plugs:—AC No. 45. 14 MM Metric type.
Spark Plug Gaps—Set at .025".

CARBURETION:—**Carburetor**—Carter Type WDO, Model 465-S (#255 cast on face of flange). 1" dual downdraft type.
See article in Carburetor Section for data.
Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 7-8 MPH idle speed. Adjust idle adjusting screw for each barrel (in succession) until engine fires smoothly (½-1½ turns open for each screw—turn screws in for leaner mixture). Readjust idle speed.

NOTE—On cars with Overdrive, line from ammeter to ignition switch (marked by arrow) not used.

Accelerating Pump Setting—Pump arm has 2 holes for pump link engagement. Set as follows:
Upper Hole (max. stroke)—Cold weather.
Lower Hole (min. stroke)—Hot weather.

Float Level—3/16" from top of float to gasket seat on cover with needle valve seated (invert to check).

Fast Idle:—Integral type (built-in carburetor).
See article in Carburetion Equipment Section.
Fast Idle Setting—Adjust fast idle screw for .015" throttle opening with choke valve closed.

Automatic Choke:—Carter Climatic Control.
See article in Carburetion Equipment Section.
Choke Setting—Set coil housing 1 Notch Rich.

Air Cleaner:—AC #1529113 oil-wetted type std.

Fuel Pump:—AC Type AD #1523644 combination fuel-and-vacuum type standard.
See article in Carburetion Equipment Section.

Gasoline Gauge:—King-Seeley Electric type. K-S No. 7680 (dash unit), No. 7780 (tank unit).
See article in Carburetion Equipment Section.

VALVE TIMING:—To Check—With regular running tappet clearance of .015" Exhaust valve should close with piston 10° or .0400" after top dead center.

Motor Gauge—Weidenhoff Adapter #113, Rod #37.

Valve Spring Pressure:—Total for inner and outer springs 59 lbs. (closed), 146 lbs. (open). See 'M' page for data on each spring.

Tappet Clearance:—.015" all valves—engine warm and idling. NOTE—For high speed driving, .018" maximum tappet clearance may be used.

LUBRICATION:—Crankcase Capacity—7 qts. (dry or refill).

Normal Oil Pressure—30 lbs. at 20 MPH.

Oil Pressure Gauge:—King-Seeley Electric type. K-S No. 7665 (dash unit), No. 6125 (engine unit).
See article in Mechanical Equipment Section for data.

COOLING SYSTEM:—Capacity 17 qts. (add 1 qt. for heater).
Thermostat—Dole. In cylinder head water outlet. Starts to open 160°F.
Temperature Gauge—King-Seeley electric type. K-S No. 7670 (dash unit), No. 7000 (engine unit).
See article in Mechanical Equipment Section for data.
NOTE—Gauge inoperative with ignition 'Off' (reads to '212' in this position).

TRANSMISSION OVERDRIVE CONTROL:—Electric type with accelerator pedal operated 'kick-down' switch. *See article in Mechanical Equipment Section.*
Overdrive Solenoid—Delco-Remy Model 1118004.
Throttle Switch—Adjust switch to close with throttle wide open and carburetor throttle shaft pulley spring just starting to compress.
Control Relay—Delco-Remy Model 1116798.

BATTERY:—USL Type HTL-2-17 or Auto-Lite Type CTL-2-17. 6 volt, 17 plate, 120 ampere hour capacity (20 hour rate).
Starting Capacity—152 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.9 minutes.
Grounded Terminal—Positive (+) grounded to transmission. Separate ground strap from transmission to frame.
Dimensions—Length 10 5/16". Width 7⅛". Height 9 1/16".
Location—Under front seat.

STARTER:—Model MAB-4104. Armature MAB-2057.
Drive—Inboard Bendix Type LCD11FX-10.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—160 RPM, 150-160 amps., 5.2 v.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 " "	1910	5.5	100
3.4 " "	1100	5.0	200
6.6 " "	695	4.5	300
10.15 " "	420	4.0	400
15.8 " "	Lock	3.0	582
22.5 " "	Lock	4.0	775

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch:—A-L #SW-4005. Mounted on body floor below clutch pedal. Operated by depressing clutch pedal fully. No adjustment required.

GENERATOR:—Model GDZ-4803B. Armature GDZ-2079F. Two brush type with current-voltage control.

Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator. *See Regulator data following.*

Maximum Charging Rate—35 amperes (hot or cold), 8.0 volts, 1900 RPM (generator) and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	925	0	6.4	1000
4	6.6	1035	4	6.6	1120
8	6.75	1140	8	6.75	1235
12	6.95	1250	12	6.95	1350
16	7.15	1370	16	7.15	1460
20	7.3	1480	20	7.3	1590
24	7.5	1590	24	7.5	1730
28	7.7	1710	28	7.7	1900
32	7.9	1820	32	7.9	2090
35	8.0	1900	35	8.0	2250

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.60-1.78 amperes at 6.0 volts.
Motoring Current—4.16-4.60 amperes at 6.0 volts.

Removal:—Generator cradle mounted at left side of engine with fan belt drive. Water pump driven by generator shaft extension. To remove, disconnect water pump, loosen fan belt, remove generator clamp band and lift generator off.

Belt Adjustment:—Adjust whenever belt deflection is over 1½" (when pressed lightly midway between generator and fan pulleys). To adjust, loosen two capscrews on fan bracket, lift fan up (one screw hole slotted) for 1" belt deflection, tighten screws.

REGULATOR:—Model VRP-4004A. Current-Voltage. Mounted in single case on dash.
See article in Electrical Equipment Section for data.
NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken.

Cutout Relay

Cuts In—6.4-6.6 volts.
Cuts Out—4.8-5.6 volts (approx. 7-8 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.034" min., .038" max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting—7.3-7.6 volts at 70° F.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal, voltmeter between 'B' terminal and ground. Operate generator at speed equivalent to 30 MPH, charging battery until voltage is steady. Voltage reading should be 7.2 volts min., and 7.7 volts max. at standard operating temperature.
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. *See Electrical Equipment Section.*
Contact Gap—.012" Min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator

Setting—34-36 amperes (marked '35' on cover).
To Check (without breaking seals)—Connect test meters as for Voltage check (above). Operate generator at 30 MPH, charging battery, add load (use bank of headlamp bulbs, or turn on car lights and accessories and discharge battery) so that generator charges at peak rate and Current Regulator operates. Charging current should not exceed 34-36 amperes. If more than slight excess noted, regulator is defective.
Adjustment & Contact Gap—Same as for Voltage Regulator (above).
Air Gap—.034-.038" with contacts just opening.

LIGHTING:—Headlamps—General Electric 'Sealed Beam'.
See article in Electrical Equipment Section for data.
Headlamp Adjustment—Aim upper beam for each lamp straight ahead with center of hot spot 3" below lamp center height.
Beam Indicator—Red light on speedometer face. Lighted whenever Country (upper) beam in use.

Switches

Lighting—Douglas No. 5754.
Beam Selector—Douglas No. 5733.
Instrument—Douglas No. 5653.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Parking, Rear License	3	63
Instrum., Beam Indic.	1½	55
Stop & Tail	21-3	1154
Dome	6	81

FUSES:—Lighting—30 ampere (SFE type) mounted on fuse block on back of instrument panel toward left.
Accessory—30 ampere (SFE type) on fuse block.

HORNS:—Delco-Remy. No. 1999565 (low note), No. 1999566 (high note). Vibrator type, blended tone, operated by horn relay.

Type	Current (at 6 volts)	Air Gap
1999565 (Low Note)	19-21 amperes	.047-.052"
1999566 (High Note)	18-20 amperes	.039-.044"

Horn Relay:—Delco-Remy Model 1116775.
Contact Gap—.020". **Air Gap**—.015" (closed).
Contacts Close—2.75-4.0 volts.

NOTE:—Engine hood hinged at cowl and lifts from forward end. Hood latch handle located at lower edge of radiator grille (safety catch at top of grille).

SERIAL NUMBER:—First number H-57000. Stamped on plate on right frame side member under hood.

SERVICE SERIAL NUMBER:—First number LH-57000. On upper left hand side of engine above front 'Caution Plate' on left front door hinge post.

ENGINE NUMBER:—First number HE-56500. On boss on upper left hand side of engine above front water jacket cover plate. NOTE—Engine No. is 500 less than Serial Number on same car.

COMPRESSION:—**Ratio**—6.3-1 std. cast-iron head.
Pressure—110 lbs. at cranking speed of 160 RPM.

VACUUM READING:—Steady 18-20" idling at 7-8 MPH.

IGNITION:—**Coil Model IG-4095, IG-4096.** Coil is mounted on dash.
Ignition Current—2½ amperes idling, 4 stopped.
Ignition Switch:—Oakes Steering Column and Ignition Lock No. 302072. Ignition Switch No. 301538.
Ignition Lock—Briggs & Stratton. B & S No. 80207. Key Series—5 digits. Groove—No. 1.
Distributor Model IGS-4104 (Std.), IGS-4104X (side outlet type—used with Oil Bath Air Cleaner). Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control.
Breaker Plate Identification—Maximum vacuum advance limited by slot and marked by number (#6) stamped on plate.
Breaker Gap—Set at .020".
Cam Angle or Dwell—38° closed, 22° open (distr.).
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Clockwise viewed from above.
Condenser—No. IG-2671F. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	250	0	500
1	300	2	600
2	440	4	880
4	710	8	1420
5	850	10	1700

Vacuum Spark Control—Integral with distributor. Mounted on distributor housing and linked directly to breaker plate. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

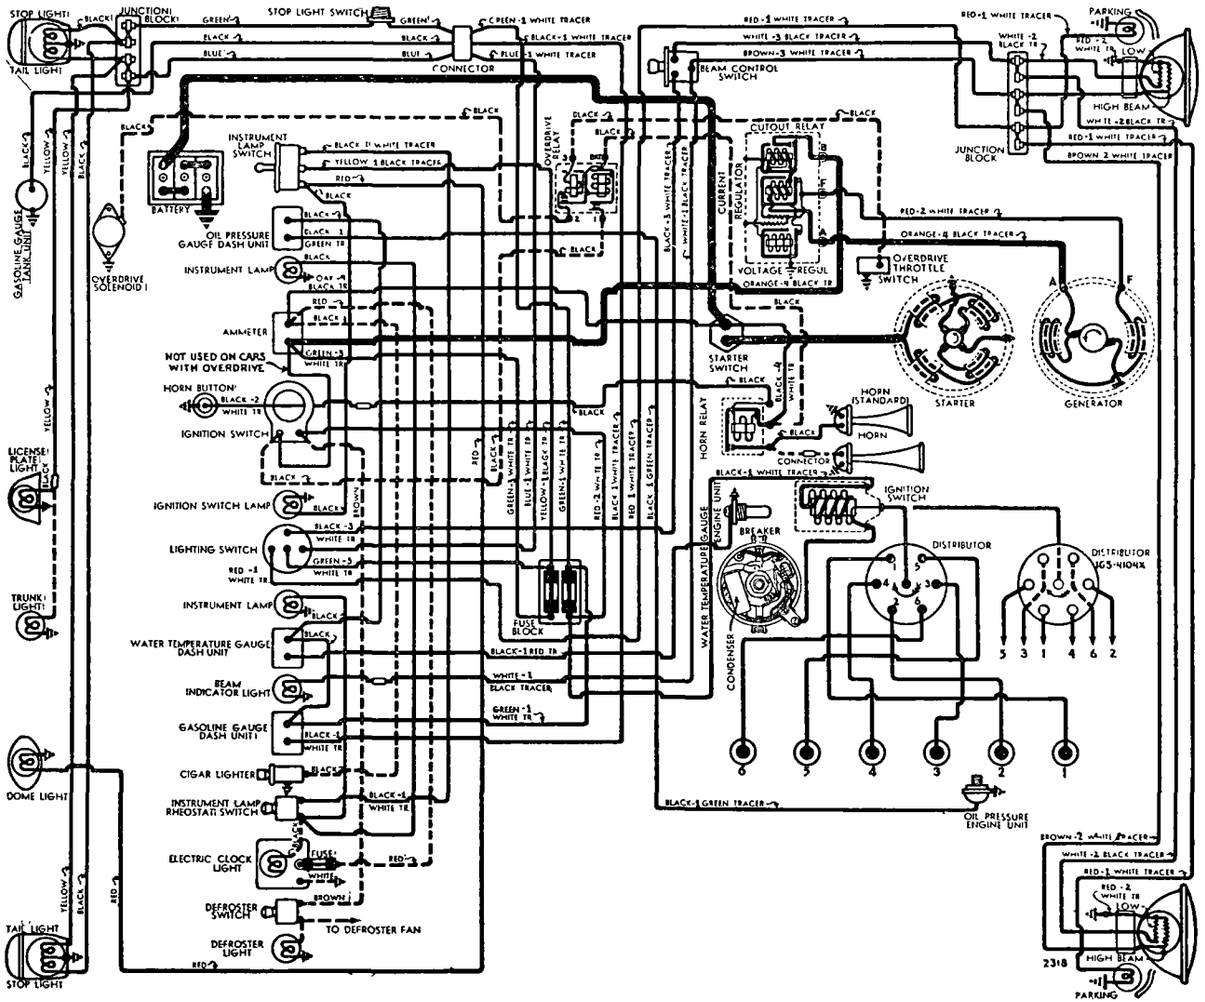
Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	6"
1°	2°	7"
3°	6°	9¼"
4°	8°	10¾"
5.5°	11°	12"

Removal:—Distributor mounted on cylinder head on right side. To remove, disconnect vacuum line, loosen advance arm clamp bolt.

IGNITION TIMING:—Setting for all engines as follows:

Flywheel Degrees	Piston Position
0° at TDC	.0000" TDC.

To Set Timing—With #1 piston on compression, turn engine over until the piston reaches top dead center, stop when 'IGN-DC' mark on vibration dampener on front of engine is directly under pointer on chain case cover. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt. NOTE—Manufacturer recommends use of timing light for accurate ignition setting.
Motor Gauge—Weidenhoff Adapter #104, Rod #40.
Firing Order:—1-5-3-6-2-4.
Spark Plugs:—Auto-Lite B-7. 18 MM Metric type.
Spark Plug Gaps—Set at .025".



CARBURETION:—**Carburetor**—Carter Type WDO, Model 458-S (#295 cast on face of flange). 1" dual downdraft type.
NOTE—New Air horn, Climatic Control assembly, and Thermostatic Coil & Housing assembly should be installed on first cars to correct warming up complaints.
See article in Carburetor Section for data.
Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 7-8 MPH idle speed. Adjust idle screw for each barrel (in succession) until engine fires smoothly (¼-1¼ turns open for each screw—turn screws in for leaner mixture). Readjust idle speed.
Accelerating Pump Setting—Pump arm has 2 holes for pump link engagement. Set as follows:
Inner Hole (min. stroke)—Hot weather.
Outer Hole (max. stroke)—Cold weather.
Float Level—3/16" from top of float to gasket seat on cover with needle valve seated (invert to check).

Fast Idle:—Integral type (built-in carburetor).
See article in Carburetion Equipment Section.
Fast Idle Setting—Adjust fast idle screw for .026" throttle opening with choke valve closed.

Automatic Choke:—Carter Climatic Control.
See article in Carburetion Equipment Section.
Choke Setting—1 Notch Rich (with first 170B64S Thermostatic Coil & Housing Assembly), centered (with later 170K64S Thermostatic Coil & Housing Assembly).

Air Cleaner:—AC #1529419 oil-wetted type std.

Fuel Pump:—AC Type W #1523640 diaphragm type Standard. Type AD #1523641 combination fuel-and-vacuum pump optional.
See article in Carburetion Equipment Section.

Gasoline Gauge:—King-Seeley Electric type. K-S No. 7680 (dash unit), No. 7780 (tank unit).
See article in Carburetion Equipment Section.

VALVE TIMING:—To Check—With regular running tappet clearance of .015", Intake valve should open with piston 21½° or .1891" BTDC., and Exhaust valve close with piston 36½° or .5118" ATDC.

Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Valve Spring Pressure:—70 lbs. at 2" (valve closed), 115 lbs at 1 11/16" (valve open).

Tappet Clearance:—.015" all valves—engine warm and idling. NOTE—For high speed driving .018" max. setting may be used. Remove right front fender dust shield for access to valve covers.

LUBRICATION:—Crankcase Capacity 6 qts. (dry or refill).

Normal Oil Pressure—30 lbs. at 20 MPH.

Oil Pressure Gauge:—King-Seeley Electric type. K-S No. 7665 (dash unit), No. 6125 (engine unit).
See article in Mechanical Equipment Section for data.

COOLING SYSTEM:—Capacity 17 qts. (add 1 qt. for heater).

Thermostat—Dole. In cylinder head water outlet. Starts to open 160°F.

Temperature Gauge—King-Seeley electric type. K-S No. 7670 (dash unit), No. 7000 (engine unit).
See article in Mechanical Equipment Section for data.
NOTE—Gauge inoperative with ignition 'Off' (reads to '212' in this position).

TRANSMISSION OVERDRIVE CONTROL:—Electric type with accelerator pedal operated 'kick-down' switch. *See article in Mechanical Equipment Section.*

Overdrive Solenoid—Delco-Remy Model 1118004.

Throttle Switch—Adjust switch to close with throttle wide open and carburetor throttle shaft pulley spring just starting to compress.

Control Relay—Delco-Remy Model 1116798.

BATTERY:—USL Type RN-15 or Auto-Lite Type PN-15. 6 volt, 15 plate, 95 AH. capacity (20 hr. rate).

Starting Capacity—117 amperes for 20 minutes.

Zero Capacity—300 amperes for 3 1 minutes.

Grounded Terminal—Positive (+) grounded to transmission. Separate ground strap from transmission to frame.

Dimensions—Length 8⅞". Width 7". Height 8⅝".

Location—Under front seat.

STARTER:—Model MAB-4076. Armature MAB-2057.

Drive—Inboard Bendix Type LCD11FX-10.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Cranking Engine—160 RPM, 150-160 amps., 5.2 v.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 " "	1910	5.5	100
3.4 " "	1100	5.0	200
6.6 " "	695	4.5	300
10.15 " "	420	4.0	400
15.8 " "	Lock	3.0	582
22.5 " "	Lock	4.0	775

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch:—A-L #SW-4005. Mounted on body floor below clutch pedal. Operated by depressing clutch pedal fully. No adjustment required.

GENERATOR:—Model GDZ-4803A. Armature GDZ-2079F. Two brush type with current-voltage control.

Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator. *See Regulator data following.*

Maximum Charging Rate—35 amperes (hot or cold), 8.0 volts, 1900 RPM (generator) and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	925	0	6.4	1000

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—53 ozs. max. (new brushes).

Field Current—1.60-1.78 amperes at 6.0 volts.

Motoring Current—4.16-4.60 amperes at 6.0 volts.

Removal:—Generator cradle mounted at left side of engine with fan belt drive. Water pump driven by generator shaft extension. To remove, disconnect water pump, loosen fan belt, remove generator clamp band and lift generator off.

Belt Adjustment:—Adjust whenever belt deflection is over 1½" (when pressed lightly midway between generator and fan pulleys). To adjust, loosen two capscrews on fan bracket, lift fan up (one screw hole slotted) for 1" belt deflection, tighten screws.

REGULATOR:—Model VRP-4004A. Current-Voltage. Mounted in single case on dash.
See article in Electrical Equipment Section for data.
NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken.

Cutout Relay

Cuts In—6.4-6.6 volts.

Cuts Out—4.8-5.6 volts (approx. 7-8 amps. disch.).

Contact Gap—.015" minimum.

Air Gap—.034" min., .038" max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting—7.3-7.6 volts at 70° F.

To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal, voltmeter between 'B' terminal and ground. Operate generator at speed equivalent to 30 MPH, charging battery until voltage is steady. Voltage reading should be 7.2 volts min., and 7 7 volts max. at standard operating temperature.

To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. *See Electrical Equipment Section.*

Contact Gap—.012" Min. (armature against stop pin).

Air Gap—.048- 052" with contacts just opening.

Current Regulator

Setting—34-36 amperes (marked '35' on cover).

To Check (without breaking seals)—Connect test meters as for Voltage check (above). Operate generator at 30 MPH, charging battery, add load (use bank of headlamp bulbs, or turn on car lights and accessories and discharge battery) so that generator charges at peak rate and Current Regulator operates. Charging current should not exceed 34-36 amperes. If more than slight excess noted, regulator is defective.

Adjustment & Contact Gap—Same as for Voltage Regulator (above).

Air Gap—.034- 038" with contacts just opening.

LIGHTING:—Headlamps—General Electric 'Sealed Beam'.
See article in Electrical Equipment Section for data.

Headlamp Adjustment—Aim upper beam for each lamp straight ahead with center of hot spot 3" below lamp center height.

Beam Indicator—Red light on speedometer face. Lighted whenever Country (upper) beam in use.

Switches

Lighting—Douglas No. 5754.

Beam Selector—Douglas No. 5733.

Instrument—Douglas No. 5653.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Parking, Rear License	3	63
Instrum., Beam Indic.	1½	55
Stop & Tail	21-3	1154
Dome	6	81

FUSES:—Lighting—30 ampere (SFE type) mounted on fuse block on back of instrument panel toward left.

Accessory—30 ampere (SFE type) on fuse block.

HORNS:—Delco-Remy. No. 1999565 (low note), No. 1999566 (high note). Vibrator type, blended tone, operated by horn relay.

Type	Current (at 6 volts)	Air Gap
1999565 (Low Note)	19-21 amperes	.047-.052"
1999566 (High Note)	18-20 amperes	.039-.044"

Horn Relay:—Delco-Remy Model 1116775.

Contact Gap—.020". **Air Gap**—.015" (closed).

Contacts Close—2.75-4.0 volts.

ENGINE HOOD NOTE:—Alligator type hood with integral side panels and instrument panel lock. To raise hood, pull out on control knob at left of steering wheel (hood will raise 1½"), press on safety catch tab under front edge of hood at center.

SERIAL NUMBER:—On left frame side member under hood. 1st No. as follows:

	F-40	G-40
Lansing, Mich.	F-703001	G-355001
Linden, N. J.	LF-556001	LG-108001
South Gate, Calif.	CF-515001	CG- 16001

ENGINE NUMBER:—First number G-79001 (F & G-40), GR-3001 (RHD). On boss on left side of cylinder block behind water pump. NOTE—Cars with Hydra-matic drive carry prefix 'GA' instead of 'G'.

COMPRESSION:—Ratio—6.1-1 Std. 5.61-1 Optl.
Pressure—146 lbs. (Std. Hd.), 120 lbs. (Optl. LC. Hd.) at 1000 RPM. or approximately 102-112 lbs. at cranking speed (100 RPM Summer) for Std. head.

VACUUM READING:—Steady 17" min. at 6 MPH.

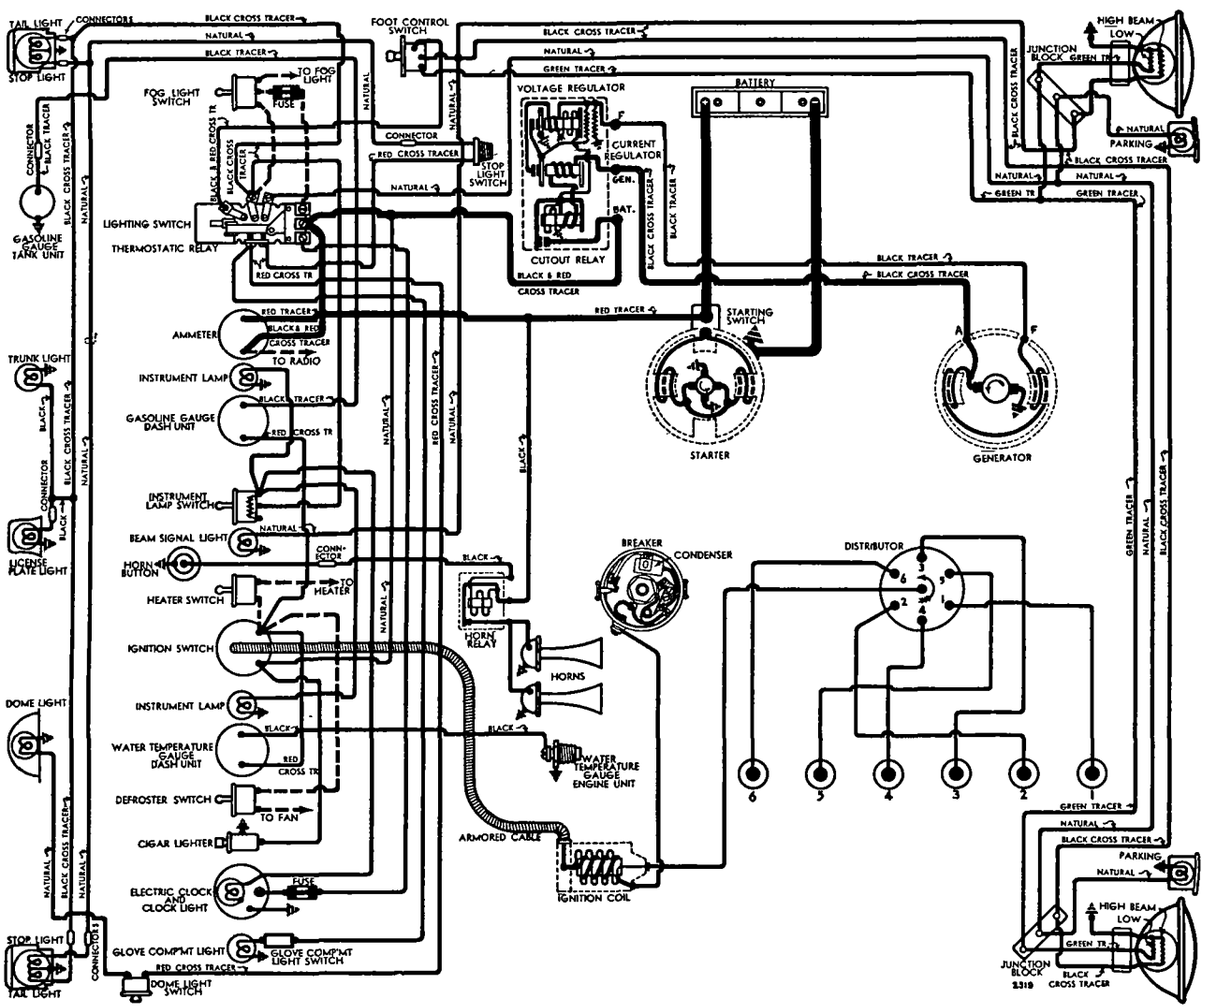
IGNITION:—Coil Model 1115129. On engine side of dash.
Ignition Current—2.0 amperes idling, 4.5 stopped.
Ignition Switch:—Delco-Remy No. 1116290 (F-40), 1116273 (G-40), 1116289 (G-40 RHD). Switch connected to coil by armored cable.
Ignition Lock—Briggs & Stratton. B & S No. 85208. Key Series—8000 to 9499. Groove—No. 15.
Distributor Model 647-F. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control and Octane Selector adjustment.
NOTE—Ground lead #1879140 now used between breaker point plate and housing.
Breaker Gap—.020". Limits .018-.024".
Cam Angle or Dwell—35° closed, 25° open (distr.).
Breaker Arm Spring Tension—17-21 ounces.
Rotation—Counter-clockwise viewed from above.
Condenser—No. 1865972. Capacity .18-.25 mfds.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	200	2	400
3	400	6	800
14	1900	28	3800

Vacuum Spark Control Model 681-P—Integral type (mounted on distributor cup, linked to breaker plate). Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring in unit. Plunger travel 3/16" total.

Vacuum Advance



Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	5-7"
10	20	15.5-18.5"

Octane Selector—Adjustment at distributor permits 10° advance or retard from center '0' position. See Ignition Timing for adjustment directions.
Removal:—Distributor mounted on left side of engine. To remove, disconnect vacuum line, take out hold-down screw in advance arm.

IGNITION TIMING:—Standard Setting as follows. See Octane Selector for correction dependent on fuel used.

	Flywheel Degrees	Piston Position
All Engines	0° At TDC	.0000" TDC.

Timing (Using Synchroscope)—This method recommended by manufacturer. Clip synchroscope lead to #1 spark plug, direct light on flywheel through inspection hole in left front face of flywheel housing beside starter. Idle engine, loosen hold-down screw, center pointer on scale, tighten hold-down screw. Loosen advance arm clamp bolt, rotate distributor until timing mark (steel ball insert in flywheel) appears in line with pointer in inspection hole, tighten clamp bolt. Check Octane Selector setting.
Timing (Without Synchroscope)—Turn engine over to firing position for #1 piston with steel ball insert in flywheel in line with pointer in inspection hole in left front face of flywheel housing. Loosen hold-down screw in advance arm, center pointer on scale, tighten hold-down screw. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open (use timing light connected between ignition terminal and ground and turn on ignition, light will go on as contacts open), tighten clamp bolt. Check Octane Selector setting.
Octane Selector Setting—Set for slight ping when accelerating engine with wide open throttle at speeds below 15 MPH. To adjust, loosen distributor hold-down screw, rotate distributor clockwise toward 'Adv.' end of scale (if no ping noted), counter-clockwise toward 'Ret' end of scale (if ping too severe). Check performance after making adjustment.
Firing Order:—1-5-3-6-2-4.
Spark Plugs:—AC No. 45. 14 MM. Metric type.
Spark Plug Gaps—.040".
CARBURETION:—Carburetor—Carter Type WA-1, Models 466-S (Std.), 467-S (with Hydra-matic drive). 1¼" single barrel, downdraft type. #194 cast on face of flange.
See article in Carburetor Section for data.
Hydra-matic Drive Car Note—Throttle linkage must be adjusted for correct transmission performance. ***See Hydra-matic Transmission article in Mechanical Equipment Section for adjustments.***
Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 6 MPH idle speed (high gear—Conv. Trans.), 375 Engine R.P.M. Hydra-matic drive). Adjust idle adjusting screw until engine fires smoothly (½-1½ turns open—turn screw in for leaner mixture). Readjust idle speed.

Accelerator Pump Setting—Pump arm (under dust cover) has three holes for pump connector link engagement. Set as follows:
Lower (med. stroke)—Normal setting.
Inner (short stroke)—Hot temperature or premium fuels.
Outer (max. stroke)—Cold temperature or low-test fuels.

Float Level—3/8" from projection on cover to top of soldered seam at front end of float with needle valve seated (invert to check).

Fast Idle:—Integral type (built-in carburetor).
See article in Carburetion Equipment Section.

Fast Idle Setting—Part of Climatic Control. Adjust by bending connecting link offset for 5/8" choke valve opening with stopscrew against (not on) first step of fast idle cam.

Accelerator Linkage Adjustment:—Must be set for correct 'throttle cracking' action for starting. To adjust, disconnect starter cable (to prevent cranking), fully depress starter switch pedal, loosen eccentric pin locknut, adjust pin to give .030" clearance between throttle stopscrew and high point of fast idle cam, tighten locknut.

Automatic Choke:—Carter Climatic Control.
See article in Carburetion Equipment Section

Choke Setting—Set coil housing 2 notches rich (466-S), center on index mark (467-S). Choke setting may be varied 2 notches.

Air Cleaner:—AC #1528602 oil wetted type std.

Fuel Pump:—AC Type AJ #1537094 diaphragm type combination fuel-and-vacuum pump.
See article in Carburetion Equipment Section.

Gasoline Gauge:—AC Electric type. #1515372 (dash unit), #1516206 (tank unit).
See article in Carburetion Equipment Section.

MANIFOLD HEAT CONTROL:—Automatic thermostatic coil type. See that valve operates freely. When installing thermostatic coil, wind coil up 105° (approx. 1/3 revolution) at room temperature.

VALVE TIMING:—#1 intake valve opens 5° (.0163") BTDC. with .0124" tappet clearance (approx. 2 teeth before steel ball TDC. flywheel mark—housing opening on left side above starter).

Tappet Clearance—.008" Int., .011" Exh. warm.

Valve Springs—50½ lbs. at 2¼" (closed), 95½ lbs. at 1 15/16" (open). Free length 2⅝".

LUBRICATION:—**Crankcase Capacity**—5 quarts.

Normal Oil Pressure—32 lbs.

COOLING SYSTEM:—**Capacity**—18 quarts.

Thermostat:—Harrison. In cyl. head water outlet. Starts to open 152° F. Fully open 173° F.

Temperature Gauge:—AC Electric. #1510918 (dash unit), #1510772 (engine unit).
See article in Mechanical Equipment Section for data.

BATTERY:—**Delco Model 15E-1.** 6 volt, 15 plate, 100 ampere hour capacity (20 hour rate).
Starting Capacity—120 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.5 minutes. Five second voltage—4.25 volts.
Dimensions—Length 19 5/16". Width 4". Height 9".
Grounded Terminal—Negative (—) grounded to starter motor housing.
Location—On left side under hood.

Police Battery:—**Delco Model 19E-1.** 6 volt. 19 plate, 130 ampere hour capacity (20 hour rate).
Starting Capacity—150 amperes for 20 minutes.
Zero Capacity—300 amperes for 5.3 minutes. Five second voltage—4.55 volts.
All other data as given above for 15E-1.

STARTER:—**Model 1107007, 1107019 (RHD).**
Armature No.—1867897 (1107007), 810601 (1107019).
Drive—Overrunning clutch (manual shift on 1107-007, solenoid pinion shift on 1107019).
Rotation—Counter-clockwise at commutator end.
Cranking Engine—125-135 amperes, 5 volts at 100 RPM (summer temperatures) for 1107007.
Brush Spring Tension—24-28 ounces.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.37	525

Removal:—Mounted on left front face of flywheel housing. To remove, take out mounting screws.

Starting Switch (1107007):—Mounted on starter. Operated by starting pedal.

Starting Switch (1107019):—Solenoid Switch type 1546 operated by pushbutton switch 1996008.
See article in Electrical Equipment Section for data.

GENERATOR:—**Delco-Remy 1102664. Armature 1879002.** Two brush with current-voltage control.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator.
See Regulator data following.
Maximum Charging Rate—33 amperes min. (hot or cold), 8.0 volts, 2400 RPM or approx. 20 MPH and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

	Amperes	Volts	R.P.M.
Cold	30*	8.0	1700

*—Not maximum output—See Current Regulator.

Field Current—1.76-1.88 amperes at 6.0 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—25 ounces each.

Removal:—Pivot mounted at left front of engine. To remove, take out clamp and pivot bolts.

Belt Adjustment:—Swing generator out until belt deflection midway between generator and fan pulley is ¾" with light pressure on belt.

REGULATOR:—**Model 1118201. 'Single Core' type.** Vibrating Voltage & Current regulator on dash.
CAUTION—Check generator for grounded fields before changing regulator settings.
See article in Electrical Equipment Section for data.

Cutout Relay

Cuts In—6.2-6.7 volts (hot), 600 Gen. RPM.
Cuts Out—0-4.0 amperes discharge current.
Contact Gap—.020" (same for both sides).
Air Gap—.020" (with points just closed).

Voltage Regulator

Setting—7.4-7.8 volts (70° F.), 7.2-7.4 volts (hot). Regulator over-compensated for temperature.
To Check—Connect ammeter in charging line at 'BAT' regulator terminal, voltmeter between 'BAT' terminal and ground. Operate generator at approx. 3000 RPM, adjust charging rate to 8-10 amperes (use variable rheostat or 'AVR' set). With regulator hot, retard generator speed until cut-out relay points open, then increase speed to approx. 3000 RPM and check hot voltage setting (above) with cover in place.
To Adjust—Change regulator armature spring tension slightly by bending lower spring hanger for **light (left) spring (or one spring if both alike) only.** If further adjustment required, see Single Core Regulator article in Electrical Equipment Section for Heavy (or other spring) adjustment.
Air Gap—.070" between center of core and armature with contacts just closed.

Current Regulator

Setting—32-34 amperes (hot).
To Check—Remove cover, connect short jumper from voltage regulator frame to upper contact support bracket (shorting out Voltage Regulator). Connect ammeter in charging line at 'BAT' regulator terminal. Turn on lights and accessories, operate generator and increase speed until output remains stationary (run until hot). Check setting with regulator at hot operating temperature.
To Adjust—Change regulator armature spring tension slightly by bending lower spring hanger for **one spring.** If further adjustment required see Single Core Regulator article in Electrical Equipment Section for adjustment of other spring.
Air Gap—.075" (check same as Voltage Regulator).

LIGHTING:—**Headlamps**—Guide 'Sealed Beam' type.
See article in Electrical Equipment Section for data.
Headlamps Adjustment—Aim upper beam straight ahead with center of hot spot 3" below lamp center height.
Beam Indicator—Red light on speedometer face. Lighted whenever Country (upper) beam in use.

Switches

Lighting—Delco-Remy 1995009.
Beam Selector—Delco-Remy 1997002,1997004 (RHD).
Stop Light—Delco-Remy 1997725.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Parking, Instrument	1½	55
Glove Comp't., Beam Indic.	1	51
License Plate	3	63
Stop & Tail	21-3	1154
Dome	6	81

THERMOSTATIC RELAY:—**Delco-Remy.** On lighting switch. Contacts remain closed with 30 amperes, open in 3 minutes with 42 amps. at 70°. Not adj.

HORNS:—**Delco-Remy Model K-33-H. No. 1999561** (low note), 1999562 (high note). Vibrator type, blended tone, operated by horn relay.

Type	Current (at 6 volts)	Air Gap
1999561 (Low Note)	19-21 amperes	.047-.052"
1999562 (High Note)	18-20 amperes	.039-.044"

Horn Relay:—Delco-Remy Model 1116775.
Contact Gap—.020". **Air Gap**—.015" (closed).
Contacts Close—2.75-4.0 volts.

ENGINE HOOD NOTE:—Alligator type hood with integral side panels and instrument panel lock. To raise hood, pull out on control knob at left of steering wheel (hood will raise 1½"), press on safety catch tab under front edge of hood at center.

SERIAL NUMBER:—On left frame side member under hood near generator. First number L-242001 (Lansing), CL-190501 (Calif.), LL-202001 (Linden, N.J.).

ENGINE NUMBER:—On boss on left side of cylinder block behind water pump. First number L-334001, LR-1801 (RHD). NOTE—Cars with Hydramatic Drive carry prefix 'LA' instead of 'L'.

COMPRESSION:—**Ratio**—6.2-1 Std. 5.8-1 Optl. **Pressure**—152 lbs. (Std. Hd.), 125 lbs. (Optl. LC. Hd.) at 1000 RPM. or approx. 104-114 lbs. at cranking spd. of 100 R.P.M. (summer temperatures).

VACUUM READING:—Steady 17" min. at 6 MPH.

IGNITION:—**Coil Model 1115129.** On engine side of dash. **Ignition Current**—2.0 amperes idling, 4.5 stopped.

Ignition Switch:—Delco-Remy No. 1116273, 1116289 (RHD). Connected to coil by armored cable. **Ignition Lock**—Briggs & Stratton. B & S No. 85208. Key Series—8000 to 9499. Groove—No. 15.

Distributor Model 1110802. Single breaker, 8 lobe cam, full automatic advance type with auxiliary vacuum spark control and Octane Selector adjustment. NOTE—New ground lead #1879140 used between breaker point plate and housing after first 1250 distributors. This lead cannot be used on earlier cars. For first 1250 distributors and earlier models use longer ground lead #1858574.
Breaker Gap—.015". Limits .0125-.0175".
Cam Angle or Dwell—31° closed, 14° open (distr.).
Breaker Arm Spring Tension—19-23 ounces.
Rotation—Counter-clockwise viewed from above.
Condenser—Part No. 1869704. Capacity .18-.25 mfd.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	300	2.5	600
3.5	500	7	1000
15	2000	30	4000

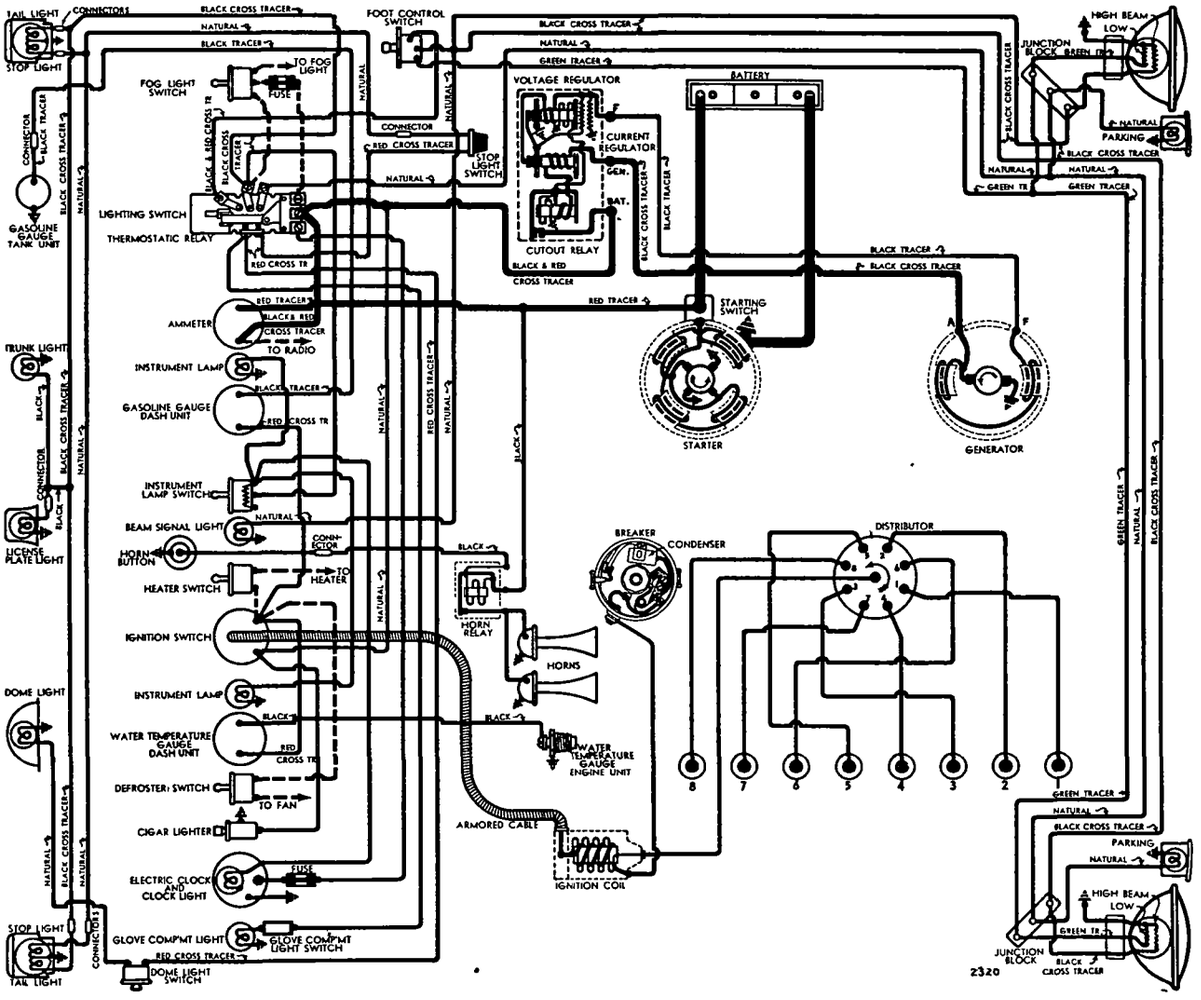
Vacuum Spark Control Model 681-R—Integral type (mounted on distributor cup, linked to breaker plate). Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring in unit. Plunger travel 11/64" total.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	5-7"
7.5	15	14-17"

Octane Selector—Adjustment at distributor. Permits 10° advance or retard from center '0' position. See Ignition Timing for adjustment directions.

Removal:—Distributor mounted on left side of engine. To remove, disconnect vacuum line, take out hold-down screw in advance arm.



IGNITION TIMING:—Standard setting as follows. See Octane Selector for correction dependent on fuel used.

	Flywheel Degrees	Piston Position
All Engines	2° BTDC	.002" BTDC.

IMPORTANT—Timing mark for #1 cylinder, not #6 cylinder as on previous models.
Timing (Using Synchroscope)—This method recommended by manufacturer. Clip synchroscope lead to #1 spark plug, direct light on flywheel through inspection hole in left front face of flywheel housing beside starter. Idle engine, loosen hold-down screw, center pointer on scale, tighten hold-down screw. Loosen advance arm clamp bolt, rotate distributor until timing mark (steel ball insert in flywheel) appears in line with pointer in inspection hole, tighten clamp bolt. Check Octane Selector setting.

Timing (Without Synchroscope)—Turn engine over to firing position for #1 piston with steel ball insert in flywheel in line with pointer in inspection hole in left front face of flywheel housing. Loosen hold-down screw in advance arm, center pointer on scale, tighten hold-down screw. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open (using timing light connected between ignition terminal and ground and turn on ignition, light will go on as contacts open), tighten clamp bolt. Check Octane Selector setting.

Motor Gauge—Weidenhoff Adapter #114, Rod #40.
Octane Selector Setting—Set for slight ping when accelerating engine with wide open throttle at speeds below 15 MPH. To adjust, loosen distributor hold-down screw, rotate distributor clockwise toward 'Adv' end of scale (if no ping noted), counterclockwise toward 'Ret' end of scale (if ping too severe). Check performance after making adjustment.
Firing Order:—1-6-2-5-8-3-7-4.
Spark Plugs:—AC No. 45. 14 MM. Metric type. **Spark Plug Gaps**—.030".
CARBURETION:—**Carburetor**—Carter Type WDO, Model 389-S (Conventional transmission), Model 471-S (with Hydra-matic drive). 1¼" dual downdraft type. #192 cast on face of flange. ***See article in Carburetor Section for data.***
Hydra-matic Drive Car Note—Throttle linkage must be adjusted for correct transmission performance. ***See Hydra-matic Transmission article in Mechanical Equipment Section for adjustments.***
Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 6 MPH idle speed (high gear—Conv. Trans.), 375 Engine R.P.M. Hydra-matic drive). Adjust idle adjusting screw for

each barrel (in succession) until engine fires smoothly (½-1¼ turns open—turn screws in for leaner mixture). Readjust idle speed.

Float Level—⅜" from top of float to gasket seat on cover with needle valve seated (invert to check). NOTE—This setting supersedes former setting of 9/32" (also 13/32" setting to correct hard starting).

Accelerator Pump Setting—Not adjustable.

Fast Idle—Integral type (built-in carburetor).
See article in Carburetion Equipment Section.

Fast Idle Setting—Adjust fast idle screw to give .030" clearance between throttle stopscrew and stop (choke valve closed, stopscrew set for 6 MPH idle). NOTE—On cars with Hydra-matic drive, setting should be .025".

Accelerator Linkage Adjustment:—Must be set for correct 'throttle cracking' action for starting. To adjust, disconnect starter cable (to prevent cranking), fully depress starter switch pedal, loosen eccentric pin locknut, adjust pin to give .070" clearance between throttle lever stopscrew and stop on carburetor body (with fast idle screw contacting highest step of fast idle cam—fast idle position), tighten lockscrew.

Automatic Choke:—Carter Climatic Control.
See article in Carburetion Equipment Section.

Choke Setting—Set at center index mark.

Air Cleaner:—AC #1528974 oil wetted type std.

Fuel Pump:—AC Type AJ #1523895 combination fuel-and-vacuum pump mounted on special adapter, AC #1523903, which has additional operating linkage.
See article in Carburetion Equipment Section.

Gasoline Gauge:—AC Electric type. #1515372 (dash unit), #1516206 (tank unit).
See article in Carburetion Equipment Section.

MANIFOLD HEAT CONTROL:—Automatic thermostatic coil type. See that valve operates freely. When installing thermostatic coil, wind coil up 105° (approx. 1/3 revolution) at room temperature.

VALVE TIMING:—#1 intake valve opens at TDC. with .0124" tappet clearance ("TDC/' mark on flywheel at indicator on housing above starter).

Tappet Clearance—.008" Int., .011" Exh. warm.

Valve Springs—50½ lbs. at 2¼" (closed), 95½ lbs. at 1 15/16" (open). Free length 2⅝".

LUBRICATION:—**Crankcase Capacity**—6 quarts.

Normal Oil Pressure—32 lbs.

COOLING SYSTEM:—**Capacity**—21 quarts.

Thermostat:—Harrison. In cyl. head water outlet. Starts to open 152°F. Fully open 173°F.

Temperature Gauge:—AC Electric. #1510918 (dash unit), #1510772 (engine unit).
See article in Mechanical Equipment Section for data.

BATTERY:—**Delco Model 17E-1.** 6 volt, 17 plate, 115 amperes hour capacity (20 hour rate).

Starting Capacity—137 amperes for 20 minutes.

Zero Capacity—300 amperes for 4.3 minutes. Five second voltage—4.40 volts.

Grounded Terminal—Negative (—) terminal grounded to starter motor housing.

Dimensions—Length 19 5/16". Width 4". Height 9".

Location—Left side under engine hood.

Police Battery:—**Delco Model 19E-1.** 6 volt, 19 plate, 130 amperes hour capacity (20 hr. rate).

Starting Capacity—150 amperes for 20 minutes.

Zero Capacity—300 amperes for 5.3 minutes. Five second voltage—4.55 volts.

All other data as given above for 17E-1.

STARTER:—**Delco-Remy 1107907. Armature 1867897.**

Drive—Overrunning clutch (manual pinion shift).

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-28 ounces each.

Cranking Engine—140-150 amperes, 5 volts, 100 RPM (summer temperatures).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	600	5.0	60
15 " "	Lock	3.0	600

Removal:—Mounted on left front face of flywheel housing. To remove, take out mounting screws.

Starting Switch—No. 820052. Mounted on starter. Operated by starting pedal.

GENERATOR:—**Model 1102664. Armature No. 1879002.** Two brush type with current-voltage control.

Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator.
See Regulator data following.

Maximum Charging Rate—33 amperes min. (hot or cold), 8.0 volts, 2400 RPM or approx. 20 MPH and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

	Amperes	Volts	R.P.M.
Cold	30*	8.0	1700

*—Not maximum output—See Current Regulator.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—25 ounces each.

Field Current—1.76-1.88 amperes at 6.0 volts.

Removal:—Pivot mounted at left front of engine. To remove, take out clamp and pivot bolts.

Belt Adjustment:—Swing generator out until belt deflection midway between generator and fan pulley is ¾" with light pressure on belt.

REGULATOR:—**Model 1118201. 'Single Core' type.** Vibrating Voltage & Current regulator on dash. CAUTION—Check generator for grounded fields before changing regulator settings.
See article in Electrical Equipment Section for data.

Cutout Relay

Cuts In—6.2-6.7 volts (hot), 600 Gen. RPM.

Cuts Out—0-4.0 amperes discharge current.

Contact Gap—.020" (same for both sides).

Air Gap—.020" (with points just closed).

Voltage Regulator

Setting—7.4-7.8 volts (70° F.), 7.2-7.4 volts (hot). Regulator over-compensated for temperature.

To Check—Connect ammeter in charging line at 'BAT' regulator terminal, voltmeter between 'BAT' terminal and ground. Operate generator at approx. 3000 RPM, adjust charging rate to 8-10 amperes (use variable rheostat or 'AVR' set). With regulator hot, retard generator speed until cut-out relay points open, then increase speed to approx. 3000 RPM and check hot voltage setting (above) with cover in place.

To Adjust—Change regulator armature spring tension slightly by bending lower spring hanger for **light (left) spring (or one spring if both alike) only.** If further adjustment required, see Single Core Regulator article in Electrical Equipment Section for Heavy (or other spring) adjustment.

Air Gap—.070" between center of core and armature with contacts just closed.

Current Regulator

Setting—32-34 amperes (hot).

To Check—Remove cover, connect short jumper from voltage regulator frame to upper contact support bracket (shorting out Voltage Regulator). Connect ammeter in charging line at 'BAT' regulator terminal. Turn on lights and accessories, operate generator and increase speed until output remains stationary (run until hot). Check setting with regulator at hot operating temperature.

To Adjust—Change regulator armature spring tension slightly by bending lower spring hanger for **one spring.** If further adjustment required see Single Core Regulator article in Electrical Equipment Section for adjustment of other spring.

Air Gap—.075" (check same as Voltage Regulator).

LIGHTING:—**Headlamps**—Guide 'Sealed Beam' type.
See article in Electrical Equipment Section for data.

Headlamps Adjustment—Aim upper beam straight ahead with center of hot spot 3" below lamp center height.

Beam Indicator—Red light on speedometer face. Lighted whenever Country (upper) beam in use.

Switches

Lighting—Delco-Remy 1995009.

Beam Selector—Delco-Remy 1997002,1997004 (RHD).

Stop Light—Delco-Remy 1997725.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Parking, Instrument	1½	55
Glove Comp't., Beam Indic.	1	51
License Plate	3	63
Stop & Tail	21-3	1154
Dome	6	81

THERMOSTATIC RELAY:—**Delco-Remy.** On lighting switch. Contacts remain closed with 30 amperes, but open in 3 minutes with load of 42 amperes at 70°F. Not adjustable.

HORNS:—**Delco-Remy Model K-33-H.** No. 1999561 (low note), 1999562 (high note). Vibrator type, blended tone, operated by horn relay.

Type	Current (at 6 volts)	Air Gap
1999561 (Low Note)	19-21 amperes	.047-.052"
1999562 (High Note)	18-20 amperes	.039-.044"

Horn Relay:—Delco-Remy Model 1116775.

Contact Gap—.020". **Air Gap**—.015" (closed).

Contacts Close—2.75-4.0 volts.

SERIAL NUMBER:—On left side of cowl (use Eng. No.).

ENGINE NUMBER:—First number C-1501. On left side of block between #1 and #2 cylinders.

COMPRESSION:—**Ratio**—6.39-1 Std., 6.71-1 Optl. **Pressure**—110 lbs. (6.39-1 Std. cast-iron hd.), 118 lbs. (6.71-1 Optl. cast-iron hd.) at 125 RPM.

VACUUM READING:—Steady 18-20" idling at 6 MPH.

IGNITION:—**Coil Model CE-4632.** On left hand side of engine near distributor. Service coil CE-3224ES. **Ignition Current**—½ ampere idling, 2½ stopped.

Ignition Switch:—Mitchellock Model 24-B, No. 8058. **Ignition Lock**—Briggs & Stratton. B & S No. 50184. **Key Series**—P1251 to P1500. **Groove**—No. 2.

Distributor Model IGW-4143, IGW-4143A. Single breaker, 6 lobe cam, full automatic advance type with Fuel Compensator adjustment at distributor. NOTE—No vacuum spark control is used.

Breaker Gap—Set at .020".

Cam Angle or Dwell—(IGW-4143) 35° closed, 25° open. (IGW-4143A) 41° closed, 19° open (Dist. °).

Breaker Arm Spring Tension—17-20 ounces.

Rotation—Counter-clockwise viewed from above.

Condenser—No. IGW-3075E, Capacity .20-.25 mfd. (Before 1U-0000); IGW-3128, Capacity .28-.32 mfd. (After 1U-0000—all models).

Automatic Advance—IGW-4143

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
2	550	4	1100
4	800	8	1600
6	1300	12	2600
8.75	2000	17.5	4000

Automatic Advance—IGW-4143A

Degrees	R.P.M.	Degrees	R.P.M.
Start	300	0	600
3	590	6	1180
5	780	10	1560
7	1150	14	2300
9.5	1600	19	3200

Fuel Compensator—Manual adjustment at distributor provides 12° advance or retard from center '0' position. See Ignition Timing for setting.

Distributor Removal:—Mounted on left side of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—Standard setting listed below (see Fuel Compensator Setting following):

	Flywheel Degrees	Piston Position
All heads	4½-6° BTDC	.0083-.0149" BTDC.

NOTE—Flywheel marked '1 UP DC' with five 2° graduations before and after this point.

Timing—Remove inspection hole cover (left front face of flywheel housing below starter). Loosen thumbnut, set Fuel Compensator pointer at '0' (center graduation on scale), tighten thumbnut. With #1 piston on compression, turn engine over until piston reaches firing position (see table above), stop when correct graduation on flywheel lines up with pointer. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor opposite #1 segment in distributor cap, check Fuel Compensator setting.

Timing (Neon Timing Light)—White mark provided on flywheel to indicate timing range (leading edge of mark 6° BTDC). Idle engine and adjust distributor as directed above.

Motor Gauge—Weidenhoff Adapter #104, (with 10 M.M. adapter). Rod #5.

Fuel Compensator Setting—Should be set for slight ping when accelerating with wide open throttle. To adjust, loosen thumbnut, rotate distributor counter-clockwise (if ping too severe), clockwise (if no ping noted), tighten thumbnut and recheck performance.

Firing Order:—1-5-3-6-2-4 (see diagram).

Spark Plugs:—AC No. 104 or Champion Y-4 10 MM. Metric type. NOTE—Do not use more than 50 in. lb. (10 lb. pull on 5" wrench) when tightening these plugs.

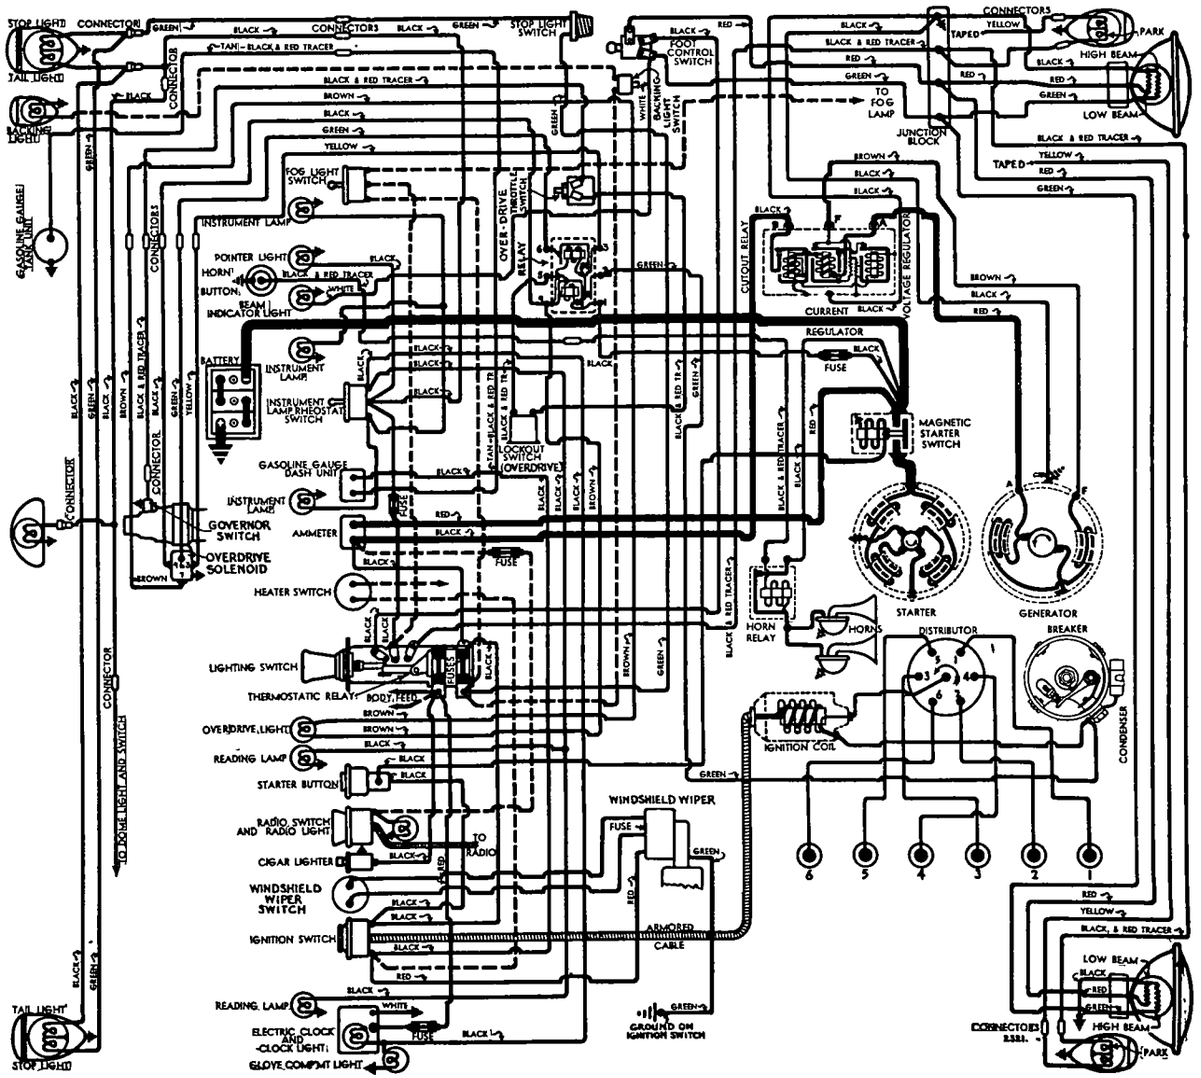
CARBURETION:—**Carburetor**—Stromberg Model BXOV-26 (No. A-19162). 1¼" single barrel, down-draft type. Code marked 10-39.

See article in Carburetor Section for complete data.

Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 6 MPH idle speed. Adjust idle adjusting screw until engine fires smoothly (1-1¼ turns open—turn screw in for leaner mixture). Readjust idle speed.

Accelerating Pump Setting—Three holes provided in pump lever for pump link engagement as follows: Inner (min. stroke)—Hot weather or high-test fuel. Center Hole—Normal temperatures and fuel. Outer (max. stroke)—Cold weather or low test fuel.

Float Level—Fuel level ⅝" below top edge of bowl.



Fast Idle:—Integral type, operated by automatic choke. ***See article in Carburetion Equipment Section.***

Fast Idle Setting—Not adjustable.

Automatic Choke:—Stromberg BXOV-26 carburetor type.

See article in Carburetion Equipment Section.

Choke Setting—5 Notches Rich ('V' on scale centered on mark on housing). May be varied 2 notches.

Throttle Guard (Cars with Econo-Drive):—Vacuum operated throttle kicker to prevent engine stalling when operating below 20 MPH.
See article in Carburetion Equipment Section.

Air Cleaner:—AC #1529340 oil-wetted type standard. Heavy duty oil-bath type optl. Crankcase filler tube cap equipped with copper mesh cleaner.

Fuel Pump:—AC Type AT #1537060 diaphragm type.
See article in Carburetion Equipment Section.

Gasoline Gauge:—Stewart (Stewart-Warner) Electric.
See article in Carburetion Equipment Section.

MANIFOLD HEAT CONTROL:—Thermostatic coil type. Make certain that valve operates freely (valve must not bind or stick). Do not oil control.

VALVE TIMING:—**To Check**—With .0125" tappet clearance #1 intake valve should open with #1 piston 1° or .0004" BTDC when 1° point on flywheel (½ graduation before '1 UP DC' mark) lines up with pointer in inspection hole in flywheel housing below starter (left side). Permissable variation plus or minus 2 graduations. Reset tappet cl. .007" (hot & idling).

Tappet Clearance:—.007" Intake, .010" Exhaust (hot and idling). NOTE—Remove right front fender apron for access to valves.

Valve Spring Pressure:—47-52 lbs. at 1⅝" (valve closed), 114-124 lbs. at 1 5/16" (valve open).

LUBRICATION:—**Crankcase Capacity**—5 quarts.
Normal Oil Pressure—45 lbs. at 45 MPH.

COOLING SYSTEM:—**Capacity**—17 quarts.
Thermostat—Harrison. In cylinder head outlet. Starts to open at 145° F.

TRANSMISSION OVERDRIVE CONTROL:—New electric type with solenoid operated 'kick-down' through accelerator switch and a new governor control switch.
See article in Mechanical Equipment Section for data.

Overdrive Solenoid—Delco Remy Model 1118005.

Overdrive Indicator Light—In light switch knob. Lighted when overdrive is ready to engage (light goes out when accelerator pedal released so that overdrive can engage).

Throttle Switch—Cole-Hersee, Packard No. 347496. Adjust tappet screw on throttle lever to just contact switch plunger with carburetor throttle valve in wide open position.

Lock-out Switch—Ark-less or Soreng-Manegold, Packard No. 354820 or 347641.

Control Relay—Delco-Remy Model 1116801.

Governor Switch—Bendix, Packard No. 347478 Std.
See Warner (Packard) Overdrive Control article in Mechanical Equipment Section for optl. switches.

BATTERY:—**Prest-O-Lite, Type MT1-15.** 6 volt, 15 plate, 95 ampere hour capacity (20 hour rate).
Starting Capacity—300 amperes for 3.1 minutes.
Zero Capacity—300 amperes for 3.1 minutes.
Grounded Terminal—Positive (+) grounded to the frame 'X' member. **Engine Ground**—Strap connector between transmission cover bolt and frame.
Dimensions—Length 9". Width 7". Height 8¾".
Location—Under left front seat.

STARTER:—**Model MZ-4078. Armature MZ-2134.**
Drive—Outboard Barrel Type Bendix No. A-1792.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—150-175 amperes, 5.1 volts.

Performance Data

Torque			R.P.M.	Volts	Amperes
0	ft. lbs.		4300	5.5	70
.65	"	"	2500	5.5	100
2.55	"	"	1325	5.0	200
4.95	"	"	750	4.5	300
7.65	"	"	220	4.0	400
7.8	"	"	Lock	3.0	420
11.8	"	"	Lock	4.0	560

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws, lift out starter and switch assembly.
Starting Switch:—Model SS-4001. Magnetic type. Mounted on starter, controlled by switch on instrument panel. *See article in Electrical Equipment Section.*

GENERATOR:—**Model GEA-4801A. Armature GDZ-2006F.** Two brush with current-voltage control.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator.
See Regulator data following.
Maximum Charging Rate—35 amperes (hot or cold), 8.0 volts, 1570 RPM and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	780	0	6.4	840
4	6.6	870	4	6.6	935
8	6.8	960	8	6.8	1025
12	6.95	1050	12	6.95	1120
16	7.15	1140	16	7.15	1220
20	7.3	1230	20	7.3	1320
24	7.6	1320	24	7.6	1420
28	7.7	1410	28	7.7	1550
32	7.85	1500	32	7.85	1685
35	8.0	1570	35	8.0	1800

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.57-1.75 amperes at 6.0 volts.
Motoring Current—4.45-4.9 amperes at 6.0 volts.
Removal:—Pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.
Belt Adjustment:—Swing generator out until 25 lb. reading secured on scale hooked to clamp bolt lug parallel to clamp link or until belt deflection midway between generator and water pump pulley is ½" with thumb pressure.

REGULATOR:—**Model VRB-4012B-1 (First Cars), VRP-4002A (Later Cars). Current-Voltage Type.** Mounted in single case on engine side of dash.
See article in Electrical Equipment Section for data.
NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken.

Cutout Relay
Cuts In—6.4-7.0 volts (VRB), 6.4-6.6 volts (VRP).
Cuts Out—.5-3.0 ampere discharge (VRB), 4.8-5.6 volts with approx. 7-8 ampere discharge (VRP).
Contact Gap—.015" minimum.
Air Gap—.034" min., .038" max. with contacts open. Measure at hinge end of core.

Voltage Regulator
Setting—7.3-7.6 volts at 70° F.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal, voltmeter between 'B' terminal and ground. Operate generator at speed equivalent to 30 MPH, charging battery until voltage is steady. Voltage reading should be within limits of 7.36 to 7.66 volts.
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap—.010-.020" (VRB), .012" Min. (VRP) with armature against stop pin.
Air Gap—.0595-.0625" (VRB), .048-.052" (VRP) with contacts just opening.

Current Regulator
Setting—34-36 amperes (marked '35' on cover).
To Check (without breaking seals)—Connect test meters as for Voltage check (above). Operate generator at 30 MPH, charging battery, add load (use bank of headlamp bulbs, or turn on car lights and accessories and discharge battery) so that generator charges at peak rate and Current Regulator operates. Charging current should not exceed 34-36 amperes. If more than slight excess noted, regulator is defective.
Adjustment & Contact Gap—Same as for Voltage Regulator (above).
Air Gap—.0595-.0625" (VRB), .034-.038" (VRP) with contacts just opening.

LIGHTING:—**Headlamps**—Hall 'Sealed Beam' type.
See article in Electrical Equipment Section for data.
Headlamp Adjustment—Aim upper beam for each lamp straight ahead with center of hot spot 3" below lamp center height.
Beam Indicator—Tell-tale light on speedometer face. Lighted when Country (upper) beams in use.

Switches
Lighting—Delco-Remy 1995011.
Beam Selector—R-B-M Model 1050D.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Front Turn Indic. & Fender	21-3	1158
Instr., Speed'mtr., Clock	1½	55
Front Reading, Radio, Trunk	1½	55
Glove Comp't., Rear Radio	1	51
Beam, Heater & Defrost Indic.	1	51
Dome and Rear Reading	6	81
Stop & Tail	21-3	1158
Stop (Trunk Rack Equip)	15	87
Tail (Trunk Rack Equip)	3	63
Rear License	3	63
Fog Light	32	1321
Spot Light	32	1323
Backing Light	15	87

THERMOSTATIC RELAY:—**Delco-Remy.** On lighting switch. Contacts remain closed with 30 amperes, open in 3 minutes with 42 amps. @ 70°F. Not adj.
FUSES:—**Dome, Stop Light and Accessories**—Two 20 ampere. Mounted on back of lighting switch.
Instrument and Tail Light—20 ampere. In connector in tail light lead near light switch.
Clock—2 ampere. In feed wire.
Radio—14 ampere. In feed wire.
Overdrive—30 ampere. In relay lead near starter.
Windshield Wiper—14 ampere. On dynamic breaker to right of wiper motor.
HORNS:—**Sparton Model H-32.** Vibrator type, Air tone, Twin horns operated by horn relay.
Air Gap—.032-.035" (low note—long horn), .026-.030" (high note—short air column).
Horn Current—22-25 amperes (total).
Horn Relay:—R-B-M Model 4760.
NOTE—Relay not adjustable (cover welded on).
Closing Voltage—3.5-4.5 volts.
WINDSHIELD WIPER:—**Stewart-Warner Series 645.** Electric type. 14 ampere fuse mounted on dynamic breaker (behind instrument panel to right of wiper motor).
See article in Mechanical Equipment Section for data.

SERIAL NUMBER:—On left side of cowl (use Eng. No.)

ENGINE NUMBER:—First number C-300001. On left side of block between #1 and #2 cylinders.

COMPRESSION:—**Ratio**—6.41-1 Std., 6.85-1 Optl. **Pressure**—110 lbs. (6.41-1 Std. cast-iron hd.), 118 lbs. (6.85-1 Optl. cast-iron hd.) at 125 RPM.

VACUUM READING:—Steady 18-20" idling at 6 MPH.

IGNITION:—**Coil Model CE-4632.** On left hand side of engine near distributor. Service coil CE-3224ES. **Ignition Current**—½ ampere idling, 2½ stopped.

Ignition Switch:—Mitchellock Model 24-B, No. 8058. **Ignition Lock**—Briggs & Stratton. B & S No. 50184. **Key Series**—P1251 to P1500. **Groove**—No. 2.

Distributor Model IGP-4501, IGP-4501A. Single breaker, 8 lobe cam, full automatic advance type with Fuel Compensator adjustment at distributor. NOTE—No vacuum spark control is used.

Breaker Gap—Set at .015".
Cam Angle or Dwell—27° clsd., 18° open (.017" gap).
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Counter-clockwise viewed from the top.
Condenser—No. IG-2671K. Capacity .20-.25 mfd.

Automatic Advance—IGP-4501

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	0	600
3	400	6	800
4	560	8	1120
6	875	12	1750
8	1200	16	2400

Automatic Advance—IGP-4501A

Degrees	R.P.M.	Degrees	R.P.M.
Start	250	0	500
3	525	6	1050
6	800	12	1600
9	1210	18	2420
11.5	1550	23	3100

Fuel Compensator—Manual adjustment at distributor provides 12° advance or retard from center '0' position. See Ignition Timing for setting.

Distributor Removal:—Mounted on left side of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—Standard setting listed below (see Fuel Compensator Setting following):

	Flywheel Degrees	Piston Position
Std. 6.41-1 head	6½-8° BTDC	.0174-.0262" BTDC
Optl. 6.85-1 HC hd.	5½-7° BTDC	.0124-.0202" BTDC

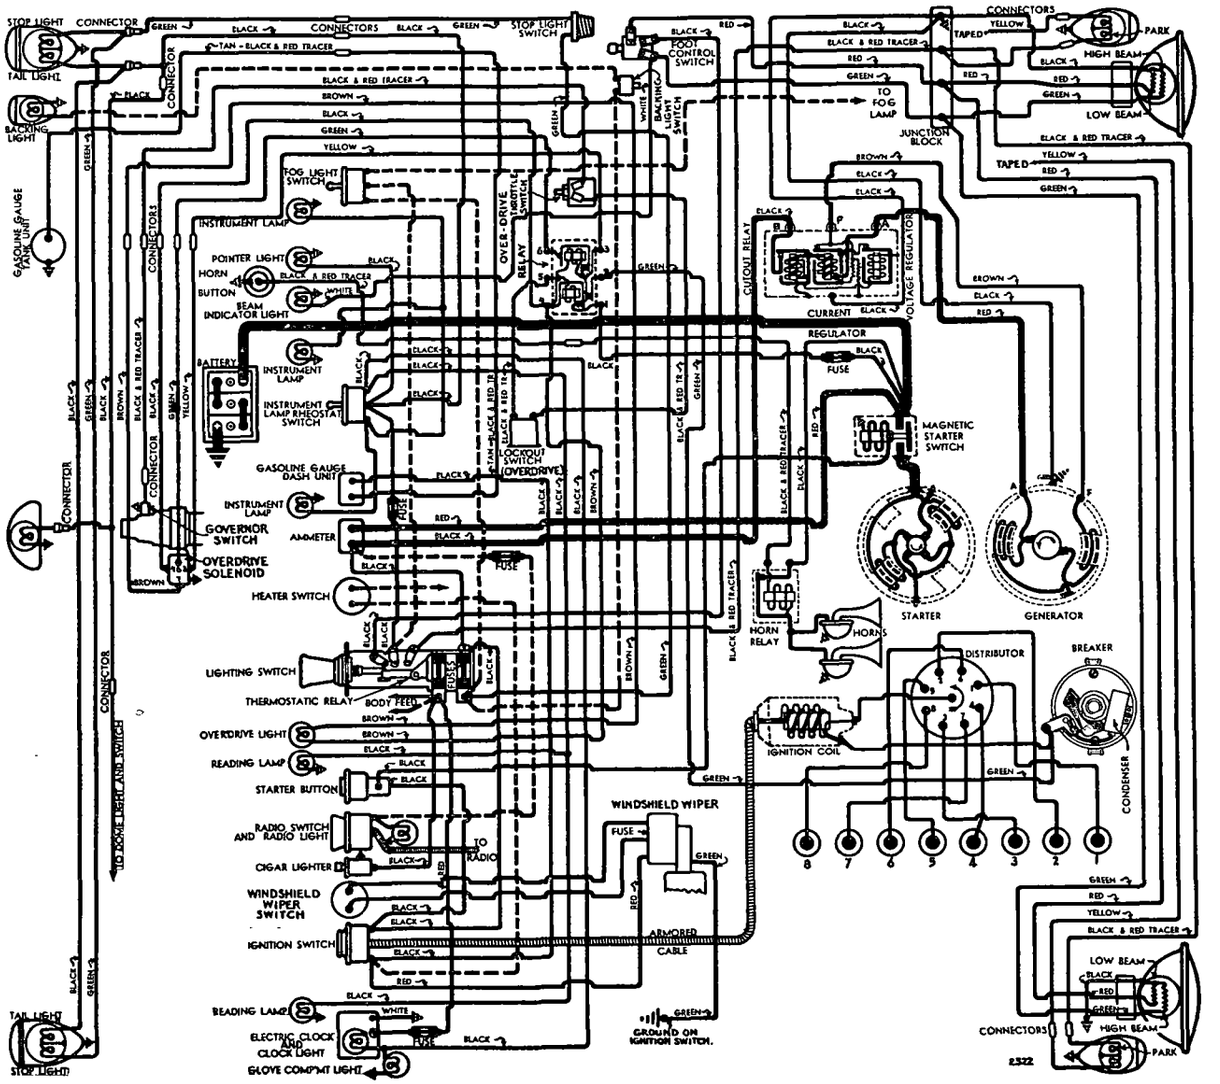
NOTE—Flywheel marked '1 UP DC' with five 2° graduations before and after this point.

Timing—Remove inspection hole cover (left front face of flywheel housing below starter). Loosen thumbnut, set Fuel Compensator pointer at '0' (center graduation on scale), tighten thumbnut. With #1 piston on compression, turn engine over until piston reaches firing position (see table above), stop when correct graduation on flywheel lines up with pointer. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor opposite #1 segment in distributor cap, check Fuel Compensator setting.

Timing (Neon Timing Light)—White mark provided on flywheel to indicate timing range (leading edge of mark 8° BTDC). Idle engine and adjust distributor as directed above.

Motor Gauge—Weidenhoff Adapter #104, (with 10 M.M. adapter). Rod #5.
Fuel Compensator Setting—Should be set for slight ping when accelerating with wide open throttle. To adjust, loosen thumbnut, rotate distributor counter-clockwise (if ping too severe), clockwise (if no ping noted), tighten thumbnut and recheck performance.

Firing Order:—1-6-2-5-8-3-7-4 (see diagram).



Spark Plugs:—AC No. 104 or Champion Y-4 10 MM. Metric type. NOTE—Do not use more than 50 in. lb. (10 lb. pull on 5" wrench) when tightening these plugs.

CARBURETION:—**Carburetor**—Stromberg EE-16, No. A-18341 (code marked 10-33A on upper main body flange or float bowl cover. 1" Duplex double barrel downdraft type. ***See article in Carburetor Section.***
Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 6 MPH idle speed. Adjust idle adjusting screw (one for each barrel) in succession until engine fires smoothly (2-2½ turns open for each screw—turn screws in for leaner mixture). Readjust idle speed.
Accelerating Pump—Not adjustable.
Float Level—Fuel level 15/32" below top edge of bowl.

Fast Idle:—Stromberg EE-16 carburetor type. ***See article in Carburetion Equipment Section.***
Fast Idle Setting—Turn screw in to contact lowest step of fast idle cam, then back out ½ turn.

Automatic Choke:—Stromberg EE-16 carburetor type. ***See article in Carburetion Equipment Section.***
Choke Setting—4 Notches Rich ('V' on scale centered on mark on housing). May be varied 2 notches.

Throttle Guard (Cars with Econo-Drive):—Vacuum operated throttle kicker to prevent engine stalling when operating below 20 MPH. ***See article in Carburetion Equipment Section.***

Air Cleaner:—AC # 1529339 oil-wetted type standard. Heavy duty oil-bath type optl. Crankcase filler tube cap equipped with copper mesh cleaner.

Fuel Pump:—AC Type AH #1537067 diaphragm type. *See article in Carburetion Equipment Section.*

Gasoline Gauge:—Stewart (Stewart-Warner) Electric. *See article in Carburetion Equipment Section.*

MANIFOLD HEAT CONTROL:—Thermostatic coil type. Make certain that valve operates freely (valve must not bind or stick). Do not oil control.

VALVE TIMING:—**To Check**—With .0125" tappet clearance #1 intake valve should open with #1 piston 1° or .0004" BTDC when 1° point on flywheel (½ graduation before '1 UP DC' mark) lines up with pointer in inspection hole in flywheel housing below starter (left side). Permissable variation plus or minus 2 graduations. Reset tappet cl. .007" (hot & idling).

Tappet Clearance:—.007" Intake, .010" Exhaust (hot and idling). NOTE—Remove right front fender apron for access to valves.

Valve Spring Pressure:—47-52 lbs. at 1⅝" (valve closed), 114-124 lbs. at 1 5/16" (valve open).

LUBRICATION:—**Crankcase Capacity**—6 quarts.
Normal Oil Pressure—45 lbs. at 45 MPH.

COOLING SYSTEM:—**Capacity**—18 quarts.
Thermostat—Harrison. In cylinder head outlet. Starts to open at 145° F.
NOTE—Thermostatic controlled radiator shutters are used on 1801A instead of cylinder head thermostat.

TRANSMISSION OVERDRIVE CONTROL:—New electric type with solenoid operated 'kick-down' through accelerator switch and a new governor control switch.
See article in Mechanical Equipment Section for data.
Overdrive Solenoid—Delco Remy Model 1118005.
Overdrive Indicator Light—In light switch knob. Lighted when overdrive is ready to engage (light goes out when accelerator pedal released so that overdrive can engage).
Throttle Switch—Cole-Hersee, Packard No. 347496. Adjust tappet screw on throttle lever to just contact switch plunger with carburetor throttle valve in wide open position.
Lock-out Switch—Ark-less or Soreng-Manegold, Packard No. 354820 or 347641.
Control Relay—Delco-Remy Model 1116801.
Governor Switch—Bendix, Packard No. 355075 Std. *See Warner (Packard) Overdrive Control article in Mechanical Equipment Section for optl. switches.*

BATTERY:—**Willard, Type SW-2-113.** 6 volt, 17 plate, 113 ampere hour capacity (20 hour rate).
Starting Capacity—134 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.2 minutes.
Grounded Terminal—Positive (+) grounded to the frame 'X' member. **Engine Ground**—Strap connector between transmission cover bolt and frame.
Dimensions—Length 10 5/16". Width 7 1/16". Height 8 13/16".
Location—Under left front seat.

STARTER:—**Model MAW-4018. Armature MAW-2006.**
Drive—Outboard Barrel Type Bendix No. A-1718.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—125 RPM, 175 amperes, 5.1 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4900	5.5	65
.6 " "	3300	5.5	100
2.75 " "	1480	5.0	200
5.45 " "	820	4.5	300
8 50 " "	400	4.0	400
11.55 " "	110	3.5	500
11.5 " "	Lock	3.0	505
18.0 " "	Lock	4.0	670

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws, lift out starter and switch assembly.
Starting Switch:—Model SS-4001. Magnetic type. Mounted on starter, controlled by switch on instrument panel. *See article in Electrical Equipment Section.*

GENERATOR:—**Model GEA-4801A. Armature GDZ-2006F.** Two brush with current-voltage control.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator. *See Regulator data following.*
Maximum Charging Rate—35 amperes (hot or cold), 8.0 volts, 1570 RPM and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	780	0	6.4	840
4	6.6	870	4	6.6	935

32	7.85	1500	32	7.85	1685
35	8.0	1570	35	8.0	1800

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.57-1.75 amperes at 6.0 volts.
Motoring Current—4.45-4.9 amperes at 6 0 volts.
Removal:—Pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.
Belt Adjustment:—Swing generator out until 25 lb. reading secured on scale hooked to clamp bolt lug parallel to clamp link or until belt deflection midway between generator and water pump pulley is ½" with thumb pressure.

REGULATOR:—**Model VRB-4012B-1 (First Cars), VRP-4002A (Later Cars). Current-Voltage Type.** Mounted in single case on engine side of dash.
See article in Electrical Equipment Section for data.
NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken

Cutout Relay
Cuts In—6.4-7.0 volts (VRB), 6.4-6.6 volts (VRP).
Cuts Out—.5-3.0 ampere discharge (VRB), 4.8-5.6 volts with approx. 7-8 ampere discharge (VRP).
Contact Gap—.015" minimum.
Air Gap—.034" min., .038" max. with contacts open. Measure at hinge end of core.

Voltage Regulator
Setting—7.3-7.6 volts at 70° F.
To Ch ck (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal, voltmeter between 'B' terminal and ground. Operate generator at speed equivalent to 30 MPH, charging battery until voltage is steady. Voltage reading should be within limits of 7.36 to 7.66 volts.
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap—.010-.020" (VRB), .012" Min. (VRP) with armature against stop pin.
Air Gap—.0595-.0625" (VRB), .048-.052" (VRP) with contacts just opening.

Current Regulator
Setting—34-36 amperes (marked '35' on cover).
To Check (without breaking seals)—Connect test meters as for Voltage check (above). Operate generator at 30 MPH, charging battery, add load (use bank of headlamp bulbs, or turn on car lights and accessories and discharge battery) so that generator charges at peak rate and Current Regulator operates. Charging current should not exceed 34-36 amperes. If more than slight excess noted, regulator is defective.
Adjustment & Contact Gap—Same as for Voltage Regulator (above).
Air Gap—.0595-.0625" (VRB), .034-.038" (VRP) with contacts just opening.

LIGHTING:—**Headlamps**—Hall 'Sealed Beam' type.
See article in Electrical Equipment Section for data.
Headlamp Adjustment—Aim upper beam for each lamp straight ahead with center of hot spot 3" below lamp center height.
Beam Indicator—Tell-tale light on speedometer face. Lighted whenever Country (upper) beam in use.

Switches
Lighting—Delco-Remy 1995011.
Beam Selector—R-B-M Model 1050D.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam

Backing Light	15	87

THERMOSTATIC RELAY:—**Delco-Remy.** On lighting switch. Contacts remain closed with 30 amperes, open in 3 minutes with 42 amps. @ 70°F. Not adj.
FUSES:—**Dome, Stop Light and Accessories**—Two 20 ampere. Mounted on back of lighting switch.
Instrument and Tail Light—20 ampere. In connector in tail light lead near light switch.
Clock—2 ampere. In feed wire.
Radio—14 ampere. In feed wire.
Overdrive—30 ampere. In relay lead near starter.
Windshield Wiper—14 ampere. On dynamic breaker to right of wiper motor.
HORNS:—**Sparton Model H-32.** Vibrator type, Air tone, Twin horns operated by horn relay.
Air Gap—.032-.035" (low note—long horn), .026-.030" (high note—short air column).
Horn Current—22-25 amperes (total).
Horn Relay:—R-B-M Model 4760.
NOTE—Relay not adjustable (cover welded on).
Closing Voltage—3.5-4 5 volts.
WINDSHIELD WIPER:—**Stewart-Warner Series 645.** Electric type. 14 ampere fuse mounted on dynamic breaker (behind instrument panel to right of wiper motor).
See article in Mechanical Equipment Section for data.

SERIAL NUMBER:—On left side of cowl (use Eng. No.).

ENGINE NUMBER:—First number C-500,051 (1803,4,5), CC-500,051 (1806,7,8). Stamped on left side of cylinder block between #3 and #4 cylinders.

COMPRESSION:—**Ratio**—6.45-1 Std., 6.85-1 Optl. (both heads are cast-iron).
Pressure—118 lbs. at cranking speed.

VACUUM READING:—Steady 18½" idling at 6 MPH.

IGNITION:—**Coil Model CE-4639.** Service Coil CE-3224RS.
Ignition Current—½ ampere idling, 2½ stopped.
Ignition Switch:—Mitchellock Model 24-B, No. 8187.
Ignition Lock—Briggs & Stratton. B & S No. 50184. Key Series—P1251 to P1500. Groove—No. 2.
Distributor Model IGT-4102. Single breaker, 8 lobe cam, full automatic advance type with auxiliary vacuum spark control and Fuel Compensator adj.
Breaker Plate Identification—Maximum vacuum advance limited by slot and marked by number (#5½) on plate.
Breaker Gap—Set at .015".
Cam Angle or Dwell—27° clsd., 18° open (.017" gap).
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Counter-clockwise viewed from the top.
Condenser—No. IG-2671J. Capacity .20-.25 mfd.

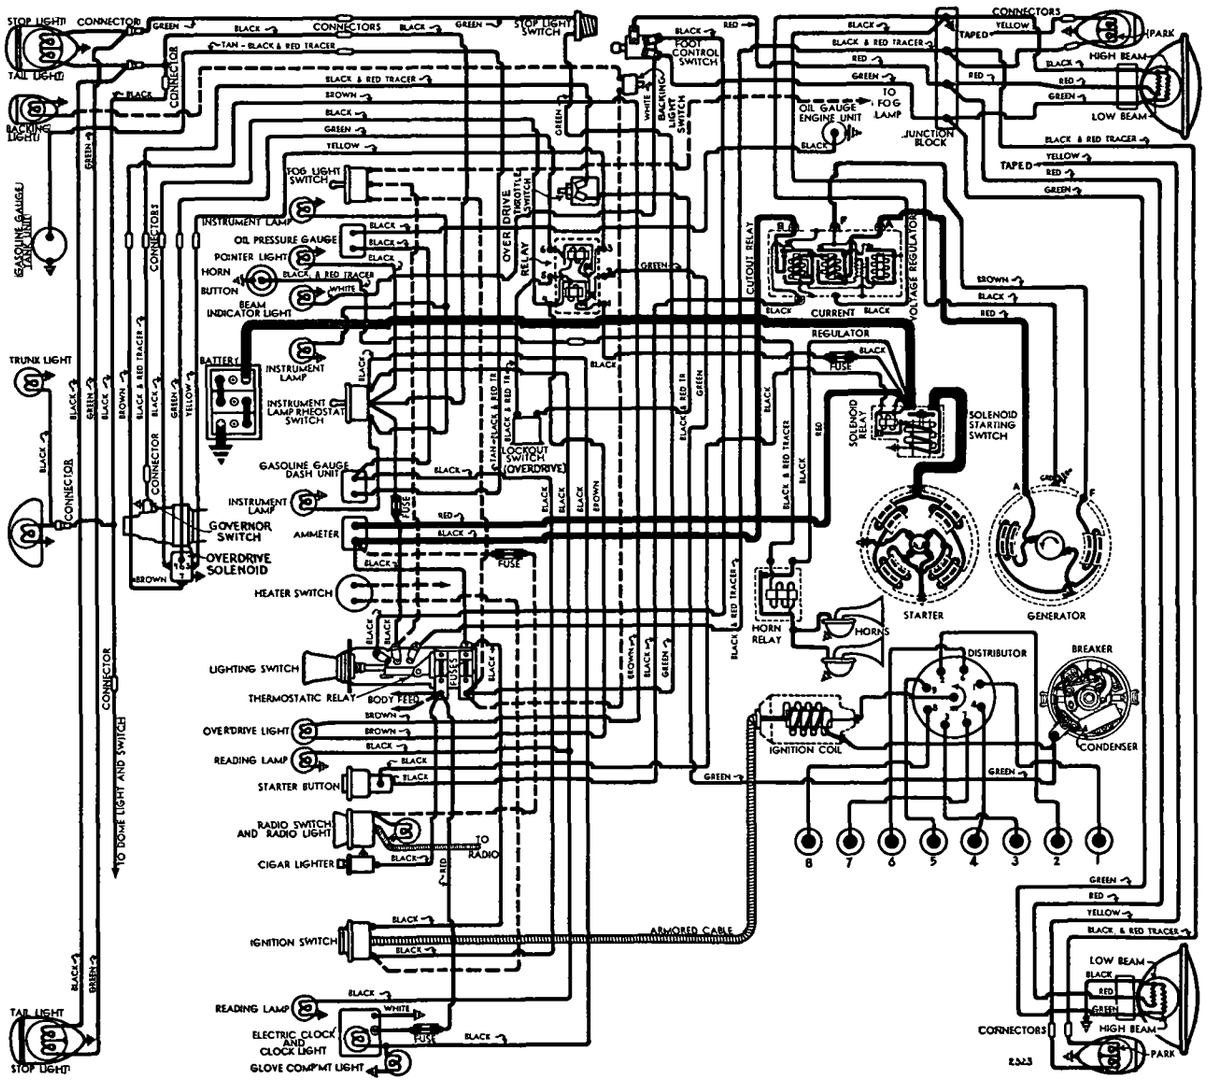
Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	250	0	500
3	475	6	950
6	700	12	1400
9	1300	18	2600
11½	1800	23	3600

Vacuum Spark Control—Integral type (on distributor, linked directly to breaker plate). Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle (spark retarded by return spring in unit).

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	7"
1°	2°	8⅝"
3°	6°	12"
4°	8°	13½"
5½°	11°	16"



Fuel Compensator—Manual adjustment at distributor providing 10° advance or retard from center '0' position. See Ignition Timing for setting.
Distributor Removal:—Mounted on left side of crankcase. To remove, disconnect vacuum line and take out hold-down screw in advance arm.

IGNITION TIMING:—Standard setting listed below (see Fuel Compensator Setting following):

	Flywheel Degrees	Piston Position
6.45-1 Std. hd.	3½-5° BTDC	.0053-.0110" BTDC
6.85-1 Optl. HC hd.	2½-4° BTDC	.0027-.0040" BTDC

NOTE—Vibration damper marked 'UDC' at TDC with 15 (1°) graduations before this point.
Timing—Loosen thumbnut, set Fuel Compensator pointer at '0', tighten thumbnut. With #1 piston on compression, turn engine over until piston reaches firing position (see table above), stop when correct graduation on vibration dampener at front of engine lines up with pointer on chain case cover. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor opposite #1 segment in distributor cap, check Fuel Compensator setting.
Timing (Neon Timing Light)—Mark vibration dampener with white paint at proper point, idle engine below 500 RPM, adjust distributor (above).
Motor Gauge—Weidenhoff Adapter #104, (with 10 M.M. adapter). Rod #5.
Fuel Compensator Setting—Should be set for slight ping when accelerating with wide open throttle. To adjust, loosen thumbnut, rotate distributor counter-clockwise (if ping too severe), clockwise (if no ping noted), tighten thumbnut and recheck performance.
Firing Order:—1-6-2-5-8-3-7-4 (see diagram).
Spark Plugs:—AC No. 104 or Champion Y-4 10 MM. Metric type. NOTE—Do not use more than 50 in. lb. (10 lb. pull on 5" wrench) when tightening these plugs.

CARBURETION:—**Carburetor**—Stromberg Model AAV-26. No. A-19172 (Code marked 10-40). 1¼" dual, downdraft type. ***See article in Carburetor Section for data.***
Idle Adjustment—With engine warm and running, at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 6 MPH idle speed. Adjust idle adjusting screw (one for each barrel) in succession until engine fires smoothly: (1½-1¾ turns open for each screw—turn screws in for leaner mixture). Readjust idle speed.
Accelerating Pump Setting—Two holes provided in throttle lever for pump link engagement as follows:
Lower (max. stroke)—Normal setting.
Upper (min. stroke)—If less charge required.
Float Level—Fuel level ⅝" below top edge of bowl.

Fast Idle:—Stromberg AAV-26 carburetor type. Not adjustable.
See article in Carburetion Equipment Section.
Automatic Choke:—Stromberg AAV-26 carburetor type.
See article in Carburetion Equipment Section.
Choke Setting—Aligned 'V' mark on thermostat cover with reference mark on housing. Setting may be varied 2 notches on either side.
Throttle Guard (Cars with Econo-Drive):—Vacuum operated throttle kicker to prevent engine stalling when operating below 20 MPH.
See article in Carburetion Equipment Section.
Air Cleaner:—AC #1529361 oil-wetted type standard. Heavy duty oil-bath type optional. Crankcase filler tube cap equipped with copper mesh cleaner.
Fuel Pump:—AC Type AJ #1523867 combination fuel-and-vacuum pump. Diaphragm type.
See article in Carburetion Equipment Section.
Gasoline Gauge:—Stewart (Stewart-Warner) Electric.
See article in Carburetion Equipment Section.

MANIFOLD HEAT CONTROL:—Thermostatic coil type. Make certain that valve operates freely (valve must not bind or stick). Do not oil control.

VALVE TIMING:—**To Check**—#1 exhaust valve closes 10° or .0438" past top dead center with hydraulic lifter dry (no oil) and built up with shim stock for zero tappet clearance.
Tappet Clearance:—None in service (Wilcox-Rich 'zero lash' hydraulic tappet take-up used).
See article in Mechanical Equipment Section for data.
Valve Spring Pressure:—147-157 lbs. at 1 13/32" (valve open).

LUBRICATION:—**Crankcase Capacity**—7½ quarts.
Normal Oil Pressure—50 lbs. at 45 MPH.

COOLING SYSTEM:—**Capacity**—20 quarts.
Thermostat—Harrison. In radiator top tank (operates radiator shutters). Starts to open at 145° F.
Radiator Filler Cap—Pressure type. Opens at 7 lb. pressure (raises boiling point to 230° F.).

TRANSMISSION OVERDRIVE CONTROL:—New electric type with solenoid operated 'kick-down' through accelerator switch and a new governor control switch.
See article in Mechanical Equipment Section for data.
Overdrive Solenoid—Delco Remy Model 1118005.
Overdrive Indicator Light—In light switch knob. Lighted when overdrive is ready to engage (light goes out when accelerator pedal released so that overdrive can engage).
Throttle Switch—Cole-Hersee, Packard No. 347496. Adjust tappet screw on throttle lever to just contact switch plunger with carburetor throttle valve in wide open position.
Lock-out Switch—Ark-less or Soreng-Manegold, Packard No. 354820 or 347641.
Control Relay—Delco-Remy Model 1116801.
Governor Switch—Bendix, Packard No. 355075 Std.
See Warner (Packard) Overdrive Control article in Mechanical Equipment Section for optl. switches.

BATTERY:—**Willard, Type SW-2-113.** 6 volt, 17 plate, 113 ampere hour capacity (20 hour rate).
Starting Capacity—134 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.2 minutes.
Grounded Terminal—Positive (+) grounded to the frame 'X' member. **Engine Ground**—Strap connector between transmission cover bolt and frame.
Dimensions—Length 10 5/16". Width 7 1/16". Height 8 13/16".
Location—Under left front seat.

STARTER:—**Model MAX-4041. Armature MAW-2069.**
Drive—Overrunning clutch (solenoid pinion shift) through reduction gears.
Rotation—Clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	**R.P.M.	Volts	Amperes
0 ft. lbs.	2695	5.5	77
33.5 " "	Lock	3.0	652
45.9 " "	Lock	4.0	906

**—Pinion shaft R.P.M.

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws, lift out starter and switch assembly.
Starting Switch:—Solenoid Switch Type SS-4205. Controlled through relay by pushbutton on instrument panel. *See article in Electrical Equipment Sect'n.*
NOTE—Cutout relay has extra set of contacts ("T" terminal on regulator connected to starter button) which grounds starter circuit at speeds above cut-in point of Cutout Relay.

GENERATOR:—**Model GEA-4802A. Armature GDZ-2006F.** Two brush with current-voltage control.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator.
See Regulator data following.
Maximum Charging Rate—35 amperes (hot or cold), 8.0 volts, 1570 RPM and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	780	0	6.4	840
4	6.6	870	4	6.6	935
8	6.8	960	8	6.8	1025
12	6.95	1050	12	6.95	1120
16	7.15	1140	16	7.15	1220
20	7.3	1230	20	7.3	1320
24	7.6	1320	24	7.6	1420
28	7.7	1410	28	7.7	1550
32	7.85	1500	32	7.85	1685
35	8.0	1570	35	8.0	1800

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.57-1.75 amperes at 6.0 volts.
Motoring Current—4.45-4.9 amperes at 6.0 volts.
Removal:—Pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.
Belt Adjustment:—Swing generator out until 25 lb. reading secured on scale hooked to clamp bolt lug parallel to clamp link or until belt deflection midway between generator and water pump pulley is ½" with thumb pressure.

REGULATOR:—**Mounted VRP-4003A. Current-Voltage type.** Mounted in single case on engine side of dash. Cutout Relay has extra set of contacts ("T" terminal) for grounding starter circuit.
See article in Electrical Equipment Section for data.
NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken.

Cutout Relay

Cuts In—6.4-6.6 volts, 700 Gen. RPM.
Cuts Out—4.8-5.6 volts (approx. 7-8 amps. disch.).
Contact Gap—.015" minimum with upper ground contacts closed (upper contacts must close when main contacts open).
Air Gap—.034" min., .038" max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting—7.3-7.6 volts at 70° F.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal, voltmeter between 'B' terminal and ground. Operate generator at speed equivalent to 30 MPH, charging battery until voltage is steady. Voltage reading should be within limits of 7.36 to 7.66 volts.
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap—.012" Min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator

Setting—34-36 amperes (marked '35' on cover).
To Check (without breaking seals)—Connect test meters as for Voltage check (above). Operate generator at 30 MPH, charging battery, add load (use bank of headlamp bulbs, or turn on car lights and accessories and discharge battery) so that generator charges at peak rate and Current Regulator operates. Charging current should not exceed 34-36 amperes. If more than slight excess noted, regulator is defective.
Adjustment & Contact Gap—Same as for Voltage Regulator (above).
Air Gap—.034-.038" with contacts just opening.

LIGHTING:—**Headlamps**—Hall 'Sealed Beam' type.
See article in Electrical Equipment Section for data.
Headlamp Adjustment—Aim upper beam for each lamp straight ahead with center of hot spot 3" below lamp center height.
Beam Indicator—Tell-tale light on speedometer face. Lighted whenever Country (upper) beam in use.

Switches

Lighting—Delco-Remy 1995011.
Beam Selector—Delco-Remy 1997001, 2 (RHD).

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam

Stop (Trunk Rack Equip)	15	87
Tail (Trunk Rack Equip)	3	63
Rear License	3	63
Fog Light	32	1321
Spot Light	32	1323
Backing Light	15	87

THERMOSTATIC RELAY:—**Delco-Remy.** On lighting switch. Contacts remain closed with 30 amperes, open in 3 minutes with 42 amps. @ 70°F. Not adj.
FUSES:—**Dome, Stop Light and Accessories**—Two 20 ampere. Mounted on back of lighting switch.
Instrument and Tail Light—20 ampere. In connector in tail light lead near light switch.
Clock—2 ampere. In feed wire.
Radio—14 ampere. In feed wire.
Overdrive—30 ampere. In relay lead near starter.
HORNS:—**Sparton Model H-32.** Vibrator type, Air tone, Twin horns operated by horn relay.
Air Gap—.032-.035" (low note—long horn), .026-.030" (high note—short air column).
Horn Current—22-25 amperes (total).
Horn Relay:—R-B-M Model 4760.
NOTE—Relay not adjustable (cover welded on).
Closing Voltage—3.5-4.5 volts.

SERIAL NUMBER:—On right front door hinge post.

	Detroit	Los Angeles	Evansville	Canada
P9	1,378,001	3,114,801	9,062,201	9,368,516
P10	10,883,001	3,242,501	20,063,001	9,607,611

ENGINE NUMBER:—P9-1001 Up (P9), P10-1001 Up (P10). On left side of block between #1 & #2 cyls.

COMPRESSION:—Ratio and pressure as follows:

Ratio	Pressure at 1000 RPM	At 100 RPM
6.7-1 cast-iron hd.	145-155 lbs.	Approx. 115 lbs.
7.0-1 aluminum hd.	150-160 lbs.	Approx. 120 lbs.

IGNITION:—Coil Model IG-4661. Service winding (less switch and cable) IG-3224JS. Mounted on dash.

Ignition Current—2.25 amperes idling, 5.5 stopped.

Ignition Switch:—Mitchellock Model 24-R, No. 8197.

Ignition Lock—Yale & Towne or Briggs & Stratton. B&S No. 80651. Key Series 1BP to 1000BP. Groove #24.

Distributor Model IGS-4109-1, IGS-4108A-1 or IGS-4108-1 (Canada—see Note). Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control and manual (octane selector) adjustment.

Canada Note—IGS-4108A-1 used on P9 before Eng. No. 1375, P10 before Eng. No. 1942. IGS-4108-1 used on cars after these engine numbers.

Breaker Plate Identification—Maximum vacuum advance limited by slot and marked with number (#10—IGS-4109-1, #11—IGS-4108A-1, #7—IGS-4108-1) stamped on breaker plate.

Breaker Gap—Set at .020". Limits .018-.022".

Cam Angle or Dwell—38° closed, 22° open (distr.).

Breaker Arm Spring Tension—17-20 ounces.

Rotation—Clockwise viewed from the top.

Condenser—No. IG-3927A. Capacity .25-.28 mfd.

Automatic Advance—IGS-4108-1, IGS-4801A-1

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	350	0	700
3	400	6	800
6	850	12	1700
9	1300	18	2600
12	1750	24	3500

Automatic Advance—IGS-4109-1

Start	350	0	700
3	400	6	800
6	950	12	1900
9	1500	18	3000
11	1850	22	3700

Vacuum Spark Control—Integral type (on distributor, linked directly to breaker plate). Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle (spark retarded by return spring in unit).

Vacuum Advance—IGS-4108-1

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5"
1°	2°	6½"
3°	6°	9¼"
5°	10°	12⅛"
7°	14°	15"

Vacuum Advance—IGS-4108A-1

Start	0°	5"
2°	4°	7¼"
5°	10°	10½"

11°	22°	17"

Vacuum Advance—IGS-4109-1

Start	0°	5"
2°	4°	7⅜"
5°	10°	11"
8°	16°	14⅝"
10°	20°	17"

Manual Adjustment—At distributor. Provides 10° advance or retard from center '0' position. See Ignition Timing for adjustment.

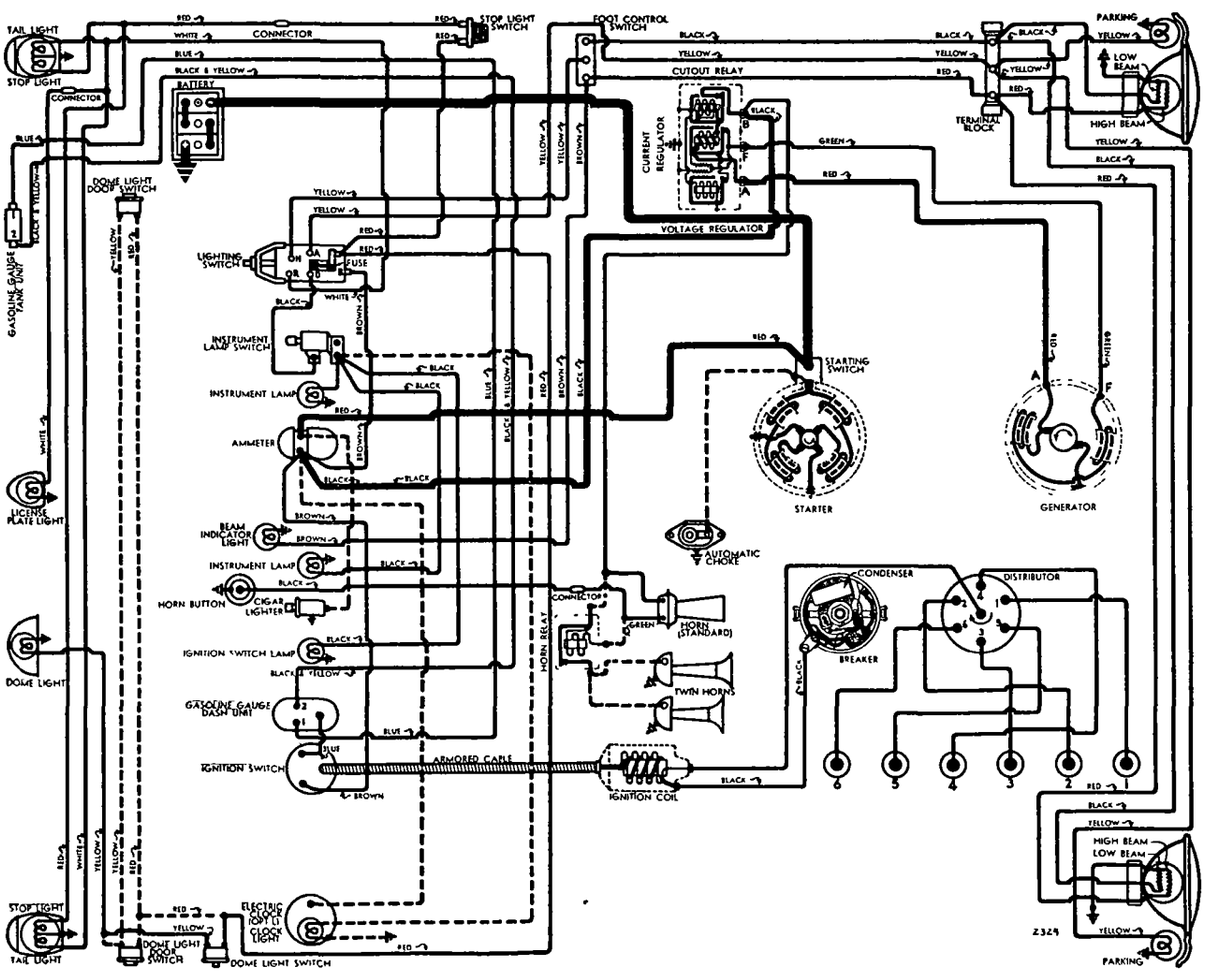
Distributor Removal:—Mounted on left side of crankcase. To remove, disconnect vacuum line, take out hold-down screw in lock plate.

IGNITION TIMING:—Initial setting (correct for fuel of 70 octane rating at low altitudes for both cast-iron and aluminum heads) shown below. See Manual adjustment (following) for correction (not to exceed 4° either way) dependent on fuel regularly used and operating conditions.

	Flywheel Degrees	Piston Position
6.7 & 7.0-1 heads	.0° at TDC.	.0000" at TDC.

NOTE—Crankshaft pulley marked *'DC'* at *TDC* with 15 (1°) graduations on either side.

Timing (Using Timing Light)—Connect timing light between distributor and battery terminal on generator regulator. With #6 piston on compression, turn engine over until piston reaches firing position (see Initial Setting), stop when correct mark on crankshaft pulley lines up with pointer on chain case cover. Loosen advance arm hold-down screw, center pointer on scale, tighten screw. Loosen advance arm clamp bolt, rotate distributor until timing light just goes out, tighten clamp bolt. Check manual adjustment setting as directed below.



Timing (Using Synchroscope)—Tool No. C-374. Clip lead to #1 spark plug, direct light on crankshaft pulley (correct mark filled in with paint or chalk), idle engine and adjust distributor as directed above.

Manual Adjustment—Initial ignition setting should be varied not more than 4° (piston 4° or .0068" before or after top dead center) so that slight ping noticeable between 10 and 30 MPH. when accelerating with wide open throttle for best performance. To adjust, loosen hold-down screw, rotate distributor counter-clockwise to advance spark (if no ping noted), clockwise to retard spark (if ping too severe) not more than 4°. Scale graduated in engine degrees.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion Type J-8 (P9 Std. head). Auto-Lite Type A-7B (P10 Std. head). Champion Type H-10 or Auto-Lite Type AL-7A (Optl. HC hd.). All are 14 MM Metric type.

Spark Plug Gaps—Set at .025".

CARBURETION:—Carburetor—Carter (Ball & Ball) Model D6A2. 1½" downdraft type. NOTE—Model D6C2 used on cars with automatic choke optl.
Economy Carburetor—Carter (Ball & Ball) Model B6P1. 1¼" single barrel, downdraft type.
See article in Carburetor Section for complete data.
Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative on D6A2 & D6C2), set throttle stopscrew for 6 MPH idle speed Adjust idle adjusting screw until engine fires smoothly (½-1¼ turns open D6A2 & D6C2, ½-1½ turns open B6P1—turn screw in for leaner mixture). Readjust idle speed. NOTE—Car manufacturer recommends use of vacuum gauge. Set idle screw for highest reading on gauge
Accelerating Pump Setting—Pump lever has three holes for pump link engagement. Set as follows: Inner Hole (min. stroke)—Extreme hot temperatures or altitudes above 3000 feet.
Center Hole (med. stroke)—Normal setting.
Outer Hole (max stroke)—Winter temperatures.
NOTE—If lean metering jets (High Alt. calibration) used at lower altitudes for increased economy, reduced speed and power will result (not recommended by manufacturer). See Carter (B&B) Jet Table in Carburetor Section for complete jet data.
Float Level—5/64" from top of float (not soldered seam) to top edge of float bowl.
Fast Idle:—Used on D6A2 and D6C2 only. Not adjustable
Throttle Cracker:—Interconnector between starting pedal and accelerator rod which opens throttle approximately one-third when pedal depressed for starting Adjust by loosening throttle pickup clamp bolt (above starter switch), shift clamp on rod.
Automatic Choke:—Sisson Type AC-758B. Used on D6C2 optional carburetor
See article in Carburetion Equipment Section.
Air Cleaner:—AC #1528196 oil-wetted type standard.
Fuel Pump:—AC Type AT #1523647 diaphragm type std Type AS #1523648 comb. fuel-and-vacuum pump optl.
See article in Carburetion Equipment Section.
Gasoline Gauge:—Auto-Lite electric. No. NG-9355D (dash unit). No. NG-9329T (tank unit).
See article in Carburetion Equipment Section.

MANIFOLD HEAT CONTROL:—Thermostatic coil type. See that shaft and valve rotate freely. When installing coil, wind up free end ½ turn counterclockwise and hook end over stop stud.
CAUTION—Do not wind coil up more than ½ turn.

VALVE TIMING:—To Check—With .011" (cold) tappet clearance, #6 intake valve should open with #6 piston 6° or 0153" ATDC with 6th graduation after DC mark on crankshaft pulley aligned with pointer on chain cover. Reset tappet clearance .006" (hot).
Tappet Clearance:— 006" Int., .008" Exh. (hot&idling) 002" add'tl exh clearance desirable for sustained high speeds NOTE—Tappet screws self-locking (no locknuts). Remove right front wheel, lower housing panel and fuel pump shield for access to valves.
Valve Spring Pressure:—34-38 lbs. at 1¾" (valve closed), 77-83 lbs. at 1 7/16" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill).
Normal Oil Pressure—30-45 lbs. at 30 MPH, 15 idling.

COOLING SYSTEM:—Capacity—14 quarts.
Thermostat:—Bishop & Babcock or Fulton (Fulton only on P9) Starts to open 157-162°F. Fully open 183°.
Temperature Gauge—Motometer (Auto-Lite) Vapor tension type. A-L Part No. H-9334.
See article in Mechanical Equipment Section for data.

BATTERY:—Auto-Lite Type CT-1-13. 6 volt, 13 plate, 90 ampere hour capacity (20 hour rate).
Grounded Terminal—Positive (+) grounded to the transmission case
Dimensions—Length 9 1/16". Width 7 1/16". Height 8 15/16".
Location—Left side under front seat

STARTER:—Model MZ-4062. Armature No. MZ-2108. MAW-4016 (Canada). Armature No. MAW-2030.
See 1940 De Soto S7 'T&E' page for MAW-4016 data.
Drive—Overrunning clutch, manual pinion shift
Rotation—Counter-clockwise at commutator end
Cranking Engine—150-175 amperes, 5 1 volts.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R P M.	Volts	Amperes
0 ft lbs	4300	5 5	70
65 " "	2500	5 5	100
2 55 " "	1325	5 0	200
4 95 " "	750	4 5	300
7 65 " "	220	4 0	400
7 8 " "	Lock	3 0	420
11 8 " "	Lock	4 0	560

Removal:—Flange mounted on left front face of flywheel housing, Remove cables, 2 clips on starter linkage, oil filter lines, 2 mounting bolts Lift off
Starting Switch:—Model SW-2813 On starter Manually operated by starter (pinion shift) pedal.

GENERATOR:—Models GDZ-4801A (Std.), GEB-4801A (Police). Armature No. GDZ-2006F (GDZ-4801A) GEB-2006F (GEB-4801A). Two brush type with current-voltage control Air cooled
Charging Rate Adjustment—No adjustment at generator Charging rate controlled by Voltage Regulator and maximum output by Current Regulator
See Regulator data following.
Maximum Charging Rate—35 amperes (Std), 32 amperes (Police), 8 0 volts, 2200 gen RPM (Std), 1400 (Police), approx 24 MPH (Std) and above with load or discharged battery (Current Regulator setting) Actual charging rate controlled by Voltage Regulator and dependent on battery condition

Performance Data—GDZ-4801A

*—Current regulator setting.

Rotation—Counter-clockwise at commutator end
Brush Spring Tension—53 ozs max (new brushes)
Field Current—1 60-1 78 amperes at 6 volts (GDZ)
Motoring Current—4 16-4 60 amperes at 6 v. (GDZ).
Removal:—Pivot mounted at left side of engine at front To remove, take out pivot and clamp bolts
Belt Adjustment:—Loosen clamp and pivot bolts, swing generator out until scale (attached to field frame) reads 40-50 lbs , tighten bolts

REGULATOR:—Model VRP-4001A (Std.), B (Police). Current-Voltage type. In single case on dash.
See article in Electrical Equipment Section for data.
NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken

Cutout Relay

Cuts In—6 4-6 6 volts at approximately 1000 generator RPM (Std), approx 600 gen RPM (Police)
Cuts Out—4 8-5 6 volts (approx. 7-8 amps. disch).
Contact Gap— 015" minimum
Air Gap— 034" min , 038" max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting—7 3-7.6 volts at 70° F.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal, voltmeter between 'B' terminal and ground Operate generator at speed equivalent to 30 MPH charging battery until voltage is steady. Voltage reading should be 7 3-7 6 volts (room temperature), 7 1-7 4 volts (hot operating conditions).
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly See Electrical Equipment Section
Contact Gap— 012" Min (armature against stop pin).
Air Gap—.048- 052" with contacts just opening.

Current Regulator

Setting—Std · 34-36 amperes (marked '35' on cover), Police 31-33 amperes (marked '32' on cover)
To Check (without breaking seals)—Connect test meters as for Voltage check (above) Operate generator at speed equivalent to 30 MPH charging battery, turn on car lights and accessories so that generator operates Charging current should not exceed 34-36 amperes (Std), 31-33 amperes (Police). If more than slight excess noted, regulator is defective
Adjustment & Contact Gap—Same as for Voltage Regulator (above).
Air Gap— 034- 038" with contacts just opening

LIGHTING:—Headlamps—Corcoran-Brown 'Sealed Beam' type *See article in Electrical Equipment Section.*
Headlamp Adjustment—Aim upper beam for each lamp straight ahead with center of hot spot 3" below lamp center height.
Beam Indicator—Red light above speedometer dial Lighted with Country (upper) beam in use.

Switches

Lighting—Chrysler No 854756, 854757 Optl.
Beam Selector—Chrysler No 859974
Instrument—Chrysler No 853371
Stop Light—Chrysler No 677112

Bulb Specifications

Position	Candlepower	Mazda No Sealed Beam
Headlamps		
Parking, Instrument	1½	55
Beam Indicator, Ign Sw.	1	51
Stop and Tail	21-3	1158
Rear License	3	63
Dome or Reading	15	87

FUSES:—Lighting—30 amp On back of light switch.
Clock—2 ampere In connector behind clock
Radio—14 amp. In feed wire behind instr. panel.
Horns—No fuse used on either single or duals
HORNS:—Single—Delco-Remy No *1999911* standard.
Dual—Auto-Lite HO-5001 horn set HL-4001 (low pitch), HL-4002 (high pitch) operated by horn relay
Current Draw—Approx 7 amps single, 35-40 dual.
Horn Relay:—Auto-Lite Model HRC-4001 (no fuse).
Contacts Close—1 5-3 0 volts **Open**— 5 volt
Contact Gap— 026" **Air Gap**—.016- 020" (closed).

SERIAL NUMBER:—First number 6HA-1001 (Special), 6HB-1001 (Deluxe) with prefixes indicating factory as follows: P—Pontiac, Mich., C—South Gate, Calif., L—Linden, N. J. On plate fastened to left end of frame front cross member.

ENGINE NUMBER:—First number 6-595801. Stamped on boss on top left front corner of engine block.

COMPRESSION:—Ratio—6.5-1 Std., 7.2-1 Optl.
Pressure—155-158 lbs. at 1000 RPM, or approximately 118-120 lbs. at cranking speed (Std. head).

VACUUM READING:—Steady 18-20" idling at 7 MPH.

IGNITION:—Coil Model 1115023. Mounted on dash.
Ignition Current—2.5 amperes idling, 4.5 stopped.
Ignition Switch:—Delco-Remy Model 1116284 (40-25), 1116294 (40-25 RHD), 1116285 (40-26). Switch and cable assembly. Connected to coil by armored cable.
Ignition Lock—Briggs & Stratton. B & S No. 45792.
Key Series—8000 to 9499. **Groove**—No. 15.

Distributor:—Delco-Remy 647-D, 1110202 (Taxi)—Single breaker, 6 lobe cam, full automatic advance with vacuum spark control and Gaselector adjustment (for fuel compensation) at distributor.
Breaker Gap—.020". Limits .018-.024".
Cam Angle or Dwell—35° closed, 25° open (distr.).
Breaker Arm Spring Tension—17-21 ounces.
Rotation—Counter-clockwise viewed from top.
Condenser—#1865972 (647-D), #1869704 (1110202). Capacity .18-.25 mfds.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	400	4.0	800
8.0	1050	16.0	2100
8.5	1450	17.0	2900
14.25	2000	28.5	4000

Vacuum Spark Control Model 681-M. Integral with distributor. Mounted on housing and linked directly to breaker plate. Provides additional advance at speeds above idling (vacuum port in carburetor above throttle) except when engine accelerated or operated with wide open throttle when spark is retarded by return spring within unit. Total plunger travel 9/64".

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	7-9"
7.5°	15°	16-18"**

** at .125" travel.

Gaselector—Manual adjustment at distributor providing 10° advance or retard from center '0' position. See Gaselector Setting following.

Distributor Removal:—Mounted on left side of engine. To remove, disconnect vacuum line, take out hold-down screw in Gaselector and lift out.

IGNITION TIMING:—Standard setting given below (regular fuel Std. hd., Ethyl fuel HC hd.). See Gaselector Setting following for final setting.

	Flywheel Degrees	Piston Position
All engines	6° BTDC	.0138" BTDC.

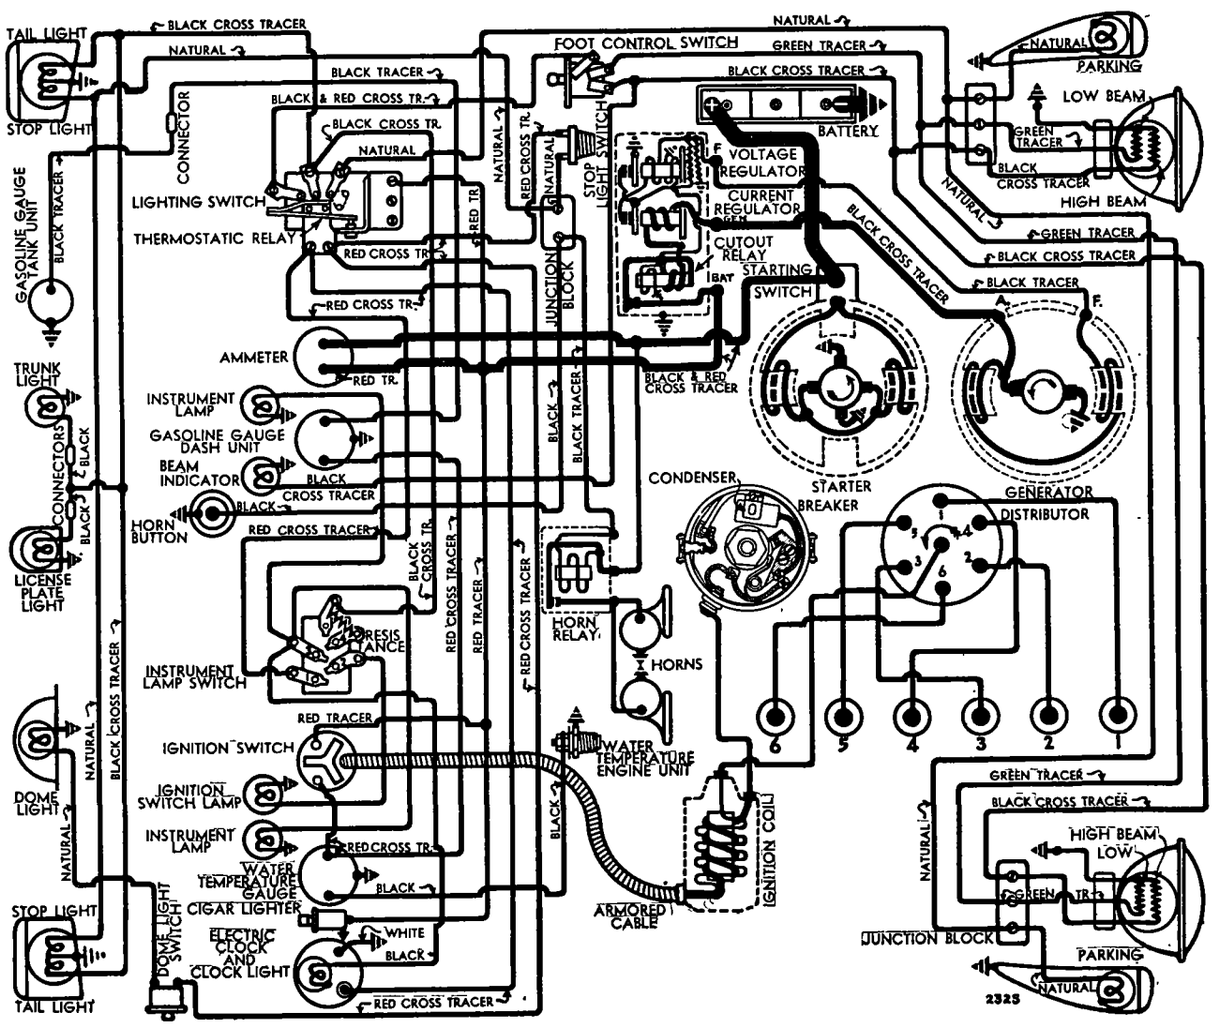
NOTE—The two straight lines of the ignition mark '/IGN.ONE/' indicates allowable timing range of 4° on flywheel. Use first or 6° line in setting ignition. Car manufacturer recommends use of Timing Light (Tool HM-494) or Synchroscope (HMO-161).

To Set Timing (using Timing Light)—Connect timing light between distributor terminal and ground, turn on ignition. With #1 piston on compression, turn engine over until piston is 6° or .0138" before top dead center, stop when first line of ignition mark '/IGN.ONE/' lines up with pointer in inspection hole in left front face of flywheel housing. Loosen Gaselector screw, center pointer on scale, tighten screw, loosen advance arm clamp bolt, rotate distributor until timing lamp lights (contacts opening), tighten clamp bolt.

To Set Timing (using Synchroscope)—Clip one synchroscope lead to #1 spark plug cable, insert other lead in distributor cap terminal from which #1 spark plug wire removed. Fill in first line of flywheel mark '/IGN.ONE/' with white chalk or paint. Direct synchroscope on flywheel through inspection hole in left front face of flywheel housing. Idle engine at 376 R.P.M. or 7 M.P.H., adjust distributor (as directed for Timing Light above) until white line coincides with pointer on housing.

Motor Gauge—Weidenhoff Adapter #114. Rod #42.

Gaselector Setting—Should be set to provide best performance without spark knock or ping for particular operating conditions and octane rating of fuel used. To adjust, loosen screw, move pointer clockwise to advance or counter-clockwise to retard spark.



Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—AC. Type 45. 14 MM. Metric Type.
Spark Plug Gaps—Set at .025".

CARBURETION:—Carburetor—Carter Type WA-1, Model 463-S (first), 463-SP (later). 1¼" downdraft type with Carter Climatic Control.

Production Change—To correct engine hesitating when starting in second gear, a new pump plunger 64-70S used on 463-SP. On 463-S, change pump link to lower hole in arm and plunger shaft to correct this condition.
See article in Carburetor Section for data.

Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 7 MPH idle speed. Adjust idle adjusting screw until engine fires smoothly (½-1½ turns open—turn screw in for leaner mixture). Readjust idle speed.

Accelerator Pump Setting—Pump arm and plunger under dust cover at top of carburetor have two holes for connector link engagement. Recommended settings as follows:
Upper Holes (short stroke)—Normal setting.
Lower Holes (long stroke)—Cold temperatures or to correct hesitating when starting car in second gear on 463-S carburetors.
Float Level—7/16" from projection on cover to top of soldered seam at front end of float with needle valve seated (invert to check).

Fast Idle:—Integral type, built-in carburetor.
See article in Carburetion Equipment Section.
Fast Idle Setting—Adjust by bending connecting link offset for 5/8" choke valve opening with stop-screw against (not on) first step of fast idle cam.

Accelerator Linkage Adjustment:—Must be maintained to provide correct 'Throttle cracking' action for starting. To adjust, after setting carburetor idle speed at 6-7 MPH, loosen hand throttle wire lock screw, pull button 1/8" out from instrument panel, position hand throttle lever so that no clearance exists between lever and throttle cross shaft, tighten lock screw. Turn throttle stopscrew in 2 turns (with throttle stopscrew on high point of cam or 'cold' position), disconnect battery cable at starting motor to prevent cranking, fully depress starter pedal, adjust throttle cracker lever to take up all clearance on pin. Connect starting motor and reset idle speed.

Automatic Choke:—Carter Climatic Control.
See article in Carburetion Equipment Section.
Choke Setting—Set coil housing 1 notch Rich.

Air Cleaner:—AC #1523985 oil-wetted type Std., #1528944 oil-bath type Optl. with Crankcase Vent Cleaner #502783 Std., #1529288 Optl.

Fuel Pump:—AC Type AH #1523985 standard. Type AJ #1523986 fuel-and-vacuum pump optional.
See article in Carburetion Equipment Section.

Gasoline Gauge:—AC Electric. #1515371 (dash unit), #1515481 (tank unit).
See article in Carburetion Equipment Section.

MANIFOLD HEAT CONTROL:—Themostatic coil type. Non-adjustable (anchor pin fixed). Counter-weight must be tightly clamped to shaft and should be about vertical with valve closed (engine cold).

VALVE TIMING:—#1 intake valve opens 5° (.0096") BTDC. with .015" tappet clearance (first line of flywheel mark "/IGN.ONE/" slightly past indicator.
Tappet Clearance—.011-.013" all valves (warm). .011 "go" and .013" "no go."
NOTE—.013" exhaust setting recommended by car manufacturer for sustained high speeds.
Valve Spring Pressure—56-63 lbs. at 1 29/32" (valve closed). 97-105 lbs. at 1 19/32" (open).

LUBRICATION:—**Crankcase Capacity**—6 quarts.
Normal Oil Pressure—35-40 lbs. above 40 MPH.

COOLING SYSTEM:—**Capacity**—17 quarts.
Thermostat:—Harrison. In cyl. head water outlet. Closed 140° F. Starts to open 145° F. Fully open 172°.
Temperature Gauge:—AC Electric. #1510916 (dash unit), #1510772 (engine unit).
See article in Mechanical Equipment Section for data.

BATTERY:—**Delco Type 15E-1.** 6 volt, 15 plate, 100 A. H. capacity (20 hour rate). End-to-end type.
Starting Capacity—120 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.5 minutes. Five second voltage—4.25 volts.
Grounded Terminal—Negative (—) grounded to lower left side of block. No separate engine ground.
Dimensions—Length 19 5/16". Width 4". Height 9".
Location—Under engine hood on left side.
Police Battery:—**Delco Type 19E-1.** 6 volt, 19 plate, 130 A. H. capacity (20 hr. rate). End-to-end type.
Starting Capacity—150 amperes for 20 minutes.
Zero Capacity—300 amperes for 5.3 minutes. Five second voltage—4.55 volts.
All other date same as for 15E-1 above.

STARTER:—**Delco-Remy 1107022, 727-S (RHD).**
Armature No.—810601 (1107022), 823881 (727-S).
Drive—Overrunning clutch (manual shift on 1107022, solenoid pinion shift on 727-S).
Cranking Engine—200 amperes at 5 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.

Performance Data—1107022

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 ft. lbs.	Lock	3.37	525

Performance Data—727-S

0 ft. lbs.	5500	5.0	65
15 " "	Lock	3.0	600

Removal:—Mounted on left front face of flywheel housing. To remove take out mounting screws.
Starting Switch (1107022):—Delco-Remy Part #820052. Mounted on starter. Operated by starting pedal.
Starting Switch (727-S):—Solenoid Switch type 1546 operated by pushbutton switch 1996007.
See article in Electrical Equipment Section.

GENERATOR:—**Delco-Remy 1102665 (Std.), 1106403 (Police). Armature No. 1879002 (1102665 Gen.).** Two brush types with voltage & current regulation.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator.
See Regulator data following.
Maximum Charging Rate—Standard: 32 amperes min. (hot), 8.0 volts, 2450 RPM, 25 MPH; Police: 34 amperes Min. (hot), 8.0 volts, 1040 RPM., 19.0 MPH. with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data—1102665

	Amperes	Volts	R.P.M.
Cold	30*	8.0	1700

*—Not maximum output—See Current Regulator.

Performance Data—1106403

Cold	35*	8.0	1040

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—25 ounces each.
Field Current—1.76-1.88 amperes (Standard), 1.77-2.0 amperes (Police) at 6.0 volts.
Removal:—Pivot mounted at left front of engine. To remove, take out clamp and pivot bolts.
Belt Adjustment:—Loosen pivot and clamp bolts, move generator out or away from engine to take up stretch or slack in belt. Belt play should be 1" between pulleys when belt grasped with fingers.

REGULATOR:—**Delco-Remy 1118201 (Std.), 1118229 (Police). Single Core Type.** Vibrating current and voltage regulator in case on dash.
CAUTION—Check generator for grounded fields before changing regulator settings. If field coils defective, new field coil parts 1877893 and 1878427 should be installed. Also check regulator terminals for clearance at dash.
See article in Electrical Equipment Section for data.

Cutout Relay

Cuts In—6.2-6.7 volts (hot).
Cuts Out—0-4.0 amperes discharge current.
Contact Gap—.020" (same for both sets).
Air Gap—.020" (with points just closed).

Voltage Regulator

Setting (1118201)—7.4-7.8 volts (70° F), 7.2-7.4 volts (hot). **(1118229)**—7.0-7.4 volts (70° F.), 7.0-7.2 volts (hot). Regulator over-compensated for temperature.
To Check—Connect ammeter in charging line at 'BAT' regulator terminal, voltmeter between 'BAT' terminal and ground. Operate generator at approx. 3000 RPM, adjust charging rate to 8-10 amperes (use variable rheostat or 'AVR' set). With regulator at hot operating temperature, retard generator speed until cut-out relay points open, then increase generator speed to 3000 RPM and check hot voltage setting (above). Cover must be in place.
To Adjust—Change regulator armature spring tension slightly by bending lower spring hanger for **light (left) spring (or one spring if both alike) only.** If further adjustment required see Single Core Regulator article in Electrical Equipment Section for Heavy (or other) Spring Adjustment.
Air Gap—.070" between center of core and armature with contacts just closed.

Current Regulator

Setting—32-34 amperes (Std.), 34-36 (Police) hot.
To Check—Remove cover, connect short jumper from voltage regulator frame to upper contact support bracket (shorting out Voltage Regulator). Connect ammeter in charging line at 'BAT' regulator terminal. Turn on lights and accessories, operate generator and increase speed until output remains stationary (run until hot). Check setting with regulator at operating temperature.
To Adjust—Change regulator armature spring tension slightly by bending lower spring hanger for **one spring.** If further adjustment required see Single Core Regulator article in Electrical Equipment Section for adjustment of Other Spring.
Air Gap—.075" (check same as Voltage Regulator).

LIGHTING:—**Headlamps**—Guide 'Sealed Beam' type.
See article in Electrical Equipment Section for data.
Headlamp Adjustment—Aim upper beam for each headlamp straight ahead with center of hot spot on horizontal line 3" below lamp center height.
Beam Indicator—Red light on speedometer dial. Lighted with upper beam in use.

Switches

Lighting—Delco-Remy 1995009. NOTE—New switch with 9 ampere fuse for **Stop Light** circuit used after Serial No. P6HA-40968 (Spec. 6), P6HB-34427 (Del. 6). P8HA-14188 (Del. 8), P8HB-15513 (Torpedo 8). This new switch furnished for service after first type stock exhausted.
Beam Selector—Delco-Remy 1997002, 465-V (RHD).
Instrument Lamp—Delco-Remy 1997719.
Stop Light—Delco-Remy 1997725.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Parking, Rear License	3	63
Instrument	1½	55
Ign. Switch, Beam Indic.	1	51
Stop & Tail	21-3	1154
Dome	6	81

THERMOSTATIC RELAY:—**Delco-Remy.** On lighting switch. Contacts remain closed with 30 amperes, but open in 3 minutes with load of 42 amperes at 70°F.

FUSES:—**Stop Light**—9 ampere on lighting switch. Used on later cars only (see Light Switch Note above).

HORNS:—**Delco-Remy Model K-33-H.** No. 1999501, 519 (low note), 1999502, 520 (high note). Vibrator type, blended tone, operated by horn relay. Horn set 1999501 & 502 used on early cars.

Type	Current (at 6 volts)	Air Gap
1999501 (Low)	16-18 amperes	.044-.049"
1999502 (High)	15-17 amperes	.034-.039"
1999519 (Low)	19-21 amperes	.044-.049"
1999520 (High)	18-20 amperes	.034-.039"

Horn Relay:—Delco-Remy Model 1116775.
Contact Gap—.020". **Air Gap**—.015" (closed).
Contacts Close—2.75-4.0 volts.

SERIAL NUMBER:—First number 8HA-1001 (Deluxe), 8HB-1001 (Torpedo) with prefixes indicating factory as follows: P—Pontiac, Mich., C—South Gate, Calif., L—Linden, N. J. On plate fastened to left end of frame front cross member under hood.

ENGINE NUMBER:—First number 8-194401. Stamped on boss on top left front corner of engine block.

COMPRESSION:—**Ratio**—6.5-1 Std., 7.2-1 Optl.

Pressure—155-158 lbs. at 1000 RPM or approximately 118-120 lbs. at cranking speed (Std. head).

VACUUM READING:—Steady 18-20" idling at 7 MPH.

IGNITION:—**Coil Model 1115129.** Mounted on dash.

Ignition Current—2.5 amperes idling, 4.5 stopped.

Ignition Switch:—Delco-Remy Model 1116286 (40-28), 1116285 (40-29). Switch and cable assembly. Connected to coil by armored cable.

Ignition Lock—Briggs & Stratton. B & S No. 45792. Key Series—8000 to 9499. Groove—No. 15.

Distributor Delco-Remy 1110804. Single breaker, 8 lobe cam, full automatic advance type with vacuum spark control and Gaselector adjustment (for fuel compensation) at distributor.

Breaker Gap—.015". Limits .0125-.0175".

Cam Angle or Dwell—31° closed, 14° open (distr.).

Breaker Arm Spring Tension—19-23 ounces.

Rotation—Counter-clockwise viewed from above.

Condenser—Part No. 1869704. Capacity .18-.25 mfd.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	400	4.0	800
7.0	1100	14.0	2200
8.5	1500	17.0	3100
13.0	2000	26.0	4000

Vacuum Spark Control Model 1116021. Integral with distributor. Mounted on housing and linked directly to breaker plate. Provides additional advance at speeds above idling (vacuum port in carburetor above throttle) except when engine accelerated or operated with wide open throttle when spark is retarded by return spring within unit. Total plunger travel 7/32".

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	7-9"
10°	20°	16-21"

Gaselector—Manual adjustment at distributor providing 10° advance or retard from center '0' position. See Gaselector Setting following.

Distributor Removal:—Mounted on left side of engine. To remove, disconnect vacuum line, take out hold-down screw in Gaselector and lift out.

IGNITION TIMING:—Standard setting given below (regular fuel Std. hd., Ethyl fuel HC hd.). See Gaselector following for final setting.

	Flywheel Degrees	Piston Position
All engines	6° BTDC	.0128" BTDC.

NOTE—The two straight lines of the ignition mark '/IGN.ONE/' indicates allowable timing range of 4° on flywheel. Use first or 6° line in setting ignition. Car manufacturer recommends use of Timing Light (Tool HM-494) or Synchroscope (HMO-161).

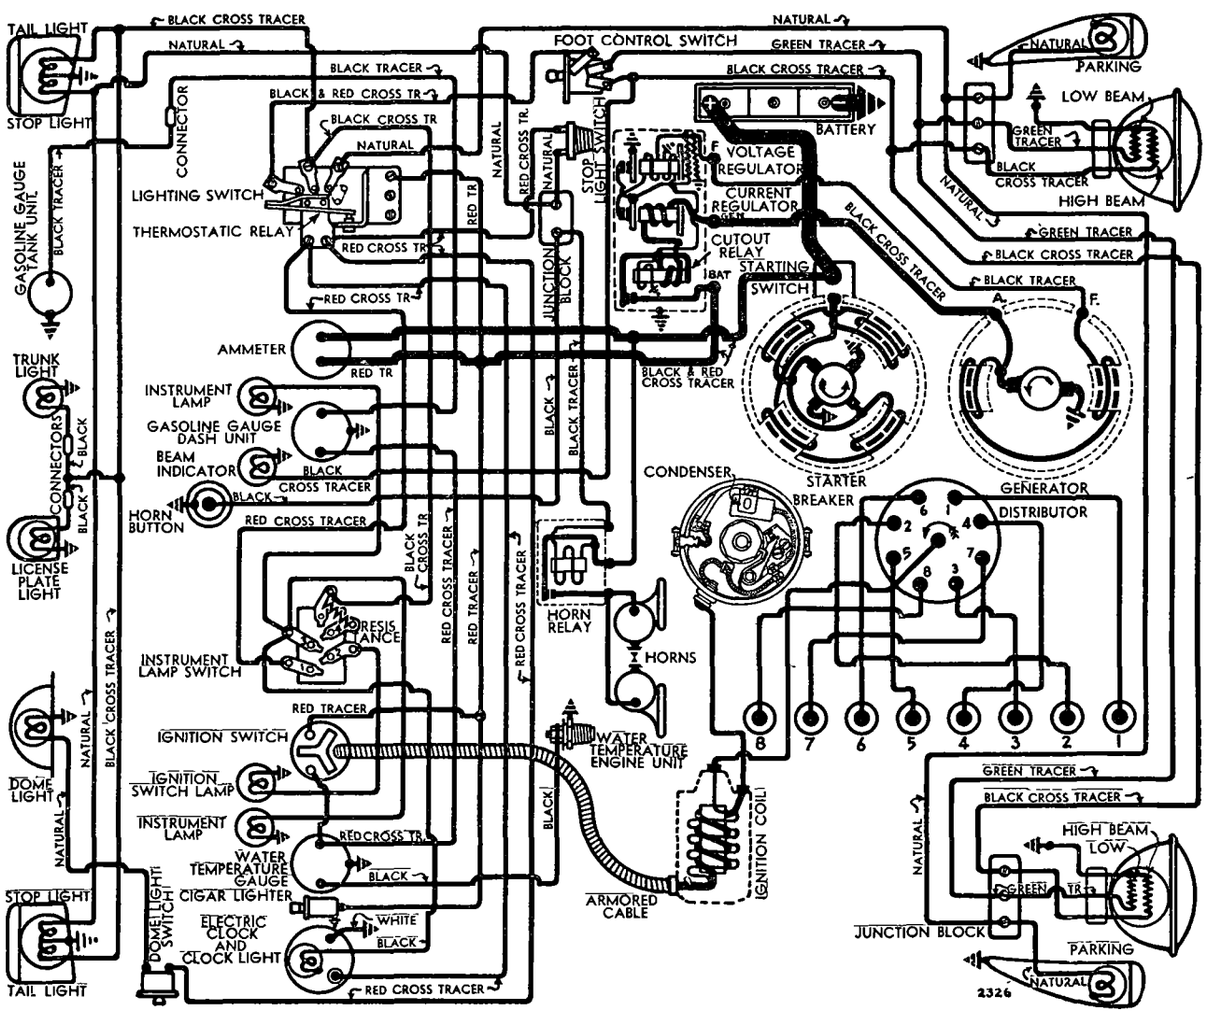
To Set Timing (using Timing Light)—Connect timing light between distributor terminal and ground, turn on ignition. With #1 piston on compression, turn engine over until piston is 6° or .0128" before top dead center, stop when first line of ignition mark '/IGN.ONE/' lines up with pointer in inspection hole in left front face of flywheel housing. Loosen Gaselector screw, center pointer on scale, tighten screw, loosen advance arm clamp bolt, rotate distributor until timing lamp lights (contacts opening), tighten clamp bolt.

To Set Timing (using Synchroscope)—Clip one synchroscope lead to #1 spark plug cable, insert other lead in distributor cap terminal from which #1 spark plug wire removed. Fill in first line of flywheel mark '/IGN.ONE/' with white chalk or paint. Direct synchroscope on flywheel through inspection hole in left front face of flywheel housing. Idle engine at 376 R.P.M. or 7 M.P.H., adjust distributor (as directed for Timing Light above) until white line coincides with pointer on housing.

Motor Gauge—Weidenhoff Adapter #114. Rod #42.

Gaselector Setting—Should be set to provide best performance without spark knock or ping for particular operating conditions and octane rating of fuel used. To adjust, loosen screw, move pointer clockwise to advance or counter-clockwise to retard spark.

Firing Order:—1-6-2-5-8-3-7-4.



Spark Plugs:—AC No. 45. 14 MM. Metric type.

Spark Plug Gaps—.025".

CARBURETION (DELUXE):—**Caburetor**—Carter Type WA-1, Model 462-S (first), 462-SP (later). 1¼" downdraft type with Carter Climatic Control.

Production Change—To correct engine hesitating when starting in second gear, a new pump plunger 64-70S used on 462-SP. On 462-S, change pump link to lower hole in arm and plunger shaft to correct this condition.

See article in Carburetor Section for data.

Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 7 MPH idle speed. Adjust idle adjusting screw until engine fires smoothly (½-1¼ turns open—turn screw in for leaner mixture). Readjust idle speed.

Float Level—5/16" from top of float to gasket seat on cover with needle valve seated (invert to check).

Accelerator Pump Setting—Pump arm and plunger under dust cover at top of carburetor have two holes for connector link engagement. Recommended settings as follows:

Upper Holes (short stroke)—Normal setting.

Lower Holes (long stroke)—Cold temperatures or to correct hesitating when starting car in second gear on 462-S carburetors.

Fast Idle:—Integral type, built-in carburetor.
See article in Carburetion Equipment Section.

Fast Idle Setting—Adjust by bending connecting link offset for 5/8" choke valve opening with stopscrew against (not on) first step of fast idle cam.

Accelerator Linkage Adjustment:—Must be maintained to provide correct 'Throttle cracking' action for starting. To adjust, set carburetor idle speed at 6-7 MPH, loosen hand throttle wire lock screw, pull button ⅛" out from instrument panel, position hand throttle lever so that no clearance exists between lever and throttle cross shaft, tighten lockscrew. Turn throttle stopscrew in 2 turns (with throttle stopscrew on high point of cam or 'cold' position), disconnect battery cable at starting motor, to prevent cranking, fully depress starting pedal, adjust throttle cracking pin so that all clearance between pin and cross shaft lever is taken up. Connect starting motor cable and reset idle speed.

Automatic Choke:—Carter Climatic Control.
See article in Carburetion Equipment Section.

Setting—Set coil housing one notch rich.

Air Cleaner:—AC #1528128 oil wetted type with crankcase ventilator #502783 standard. #1529478 oil bath type with #499327 ventilator cleaner optl.

Fuel Pump:—AC Type AH #1523985 standard. Type AJ #1523986 fuel-and-vacuum pump optional.
See article in Carburetion Equipment Section.

Gasoline Gauge:—AC Electric. #1515371 (dash unit), #1515481 (tank unit).
See article in Carburetion Equipment Section.

CARBURETION (TORPEDO): — Carburetor — Carter Type WDO, Model 469-S (first), 469-SM (later). 1 5/16" dual downdraft type with Carter Climatic Control. *See article in Carburetor Section for data.*

Production Change—New metering rods used on 469-SM. *See article in Carburetor Section for data.*

Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 7 MPH idle speed. Adjust idle adjusting screw for each barrel (in succession) until engine fires smoothly (setting ½-1¼ turns open—turn screws in for leaner mixture). Readjust idle speed. Car manufacturer recommends use of vacuum gauge for this adjustment.

Accelerator Pump Setting—Not adjustable.

Float Level—5/16" from top of float to gasket seat on cover with needle valve seated (invert to check).

Fast Idle:—Integral type, built-in carburetor.
See article in Carburetion Equipment Section.

Fast Idle Setting—Adjust fast idle screw for .010" throttle opening with choke valve fully closed.

Accelerator Linkage Adjustment:—Same as for De-luxe Eight. See instructions listed above.

Automatic Choke:—Carter Climatic Control.
See article in Carburetion Equipment Section.

Choke Setting—1½ Notches Rich (may be set 4 notches rich to correct poor starting or leanness after starting) for first type thermostat marked '170-G-16S' on choke housing. Later type thermostat marked '170-F-16S' set 1½ Notches Rich.

Air Cleaner:—AC #1529478 heavy duty oil bath type standard.

Fuel Pump:—AC Type AJ #1537087 diaphragm type combination fuel-and-vacuum pump standard.
See article in Carburetion Equipment Section.

Gasoline Gauge:—AC Electric. #1515371 (dash unit), #1515481 (tank unit).
See article in Carburetion Equipment Section.

MANIFOLD HEAT CONTROL:—Thermostatic coil type. Counterweight must be tightly clamped to shaft and about vertical with valve closed (engine cold).

Setting—Adjustment provided by shifting anchor pin for following settings: Normal temperatures (center hole). Extremely cold temperatures (inner hole). Extremely hot temperatures (outer hole).

VALVE TIMING:—#1 intake valve opens 5° (.0089") BTDC with .015" tappet clearance (first line of flywheel mark "/IGN.ONE/" just past indicator above starter).

Motor Gauge—Weidenhoff Adapter #114, Rod #42.

Tappet Clearance:—.011-.013" all valves (warm). Use .011" and .013" feelers as 'go' and 'no go' gauges. NOTE—.013" exhaust setting recommended by car manufacturer for sustained high speed driving.

Valve Spring Pressure:—56-63 lbs. at 1 29/32" (valve closed), 97-105 lbs. at 1 19/32" (valve open).

LUBRICATION:—Crankcase Capacity—6 quarts.

Normal Oil Pressure—35-40 lbs. above 40 MPH.

COOLING SYSTEM:—Capacity—19 quarts.

Thermostat:—Harrison. In cyl. head water outlet. Closed 140° F. Starts to open 145° F. Fully open 172°.

Temperature Gauge:—AC Electric. #1510916 (dash unit), #1510772 (engine unit).
See article in Mechanical Equipment Section for data.

BATTERY:—Delco Type 15E-1. 6 volt, 15 plate, 100 A. H. capacity (20 hour rate). End-to-end type.

Starting Capacity—120 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.5 minutes. Five second voltage—4.25 volts.

Grounded Terminal—Negative (—) grounded to lower left side of block. No separate engine ground.

Dimensions—Length 19 5/16". Width 4". Height 9".

Location—Under engine hood on left side.

Police Battery:—Delco Type 19E-1. 6 volt, 19 plate, 130 A. H. capacity (20 hr. rate). End-to-end type.

Starting Capacity—150 amperes for 20 minutes.

Zero Capacity—300 amperes for 5 3 minutes. Five second voltage—4.55 volts.

All other data same as for 15E-1 above.

STARTER:—Delco-Remy 1107914. Armature 1867897.
Drive—Overrunning clutch (manual pinion shift).
Rotation—Counter-clockwise at commutator end.
Cranking Engine—220-225 amperes at 5 volts.
Brush Spring Tension—24-28 ounces.

Performance Data

Torque	R.P M.	Volts	Amperes
0 ft. lbs.	6000	5.0	. .60
15 " "	Lock	3 0	. 600

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out capscrews.
Starting Switch:—Delco-Remy Part #820052. Mounted on starter. Operated by starting pedal.

GENERATOR:—Delco-Remy 1102665 (Std.), 1106403 (Police). Same as used on 40-25,26. *See preceding 1940 Pontiac Six 'T&E' page for complete data.*
Torpedo Note—On some early cars, generator to regulator wire (between generator and wiring harness clip at fender side apron) is tight and may be broken in normal service causing generator to operate on open-circuit. To correct, loosen wiring harness clips at fender side apron and move harness forward to provide slack in this wire.

REGULATOR:—Delco-Remy 1118201 (Std.), 1118229 (Police). Same as used on 40-25,26. *See preceding 1940 Pontiac Six 'T&E' page for complete data.*

LIGHTING:—Headlamps—Guide 'Sealed Beam' type.
See article in Electrical Equipment Section for data.
Headlamp Adjustment—Aim upper beam for each headlamp straight ahead with center of hot spot on horizontal line 3" below lamp center height.
Beam Indicator—Red light on speedometer dial. Lighted with upper beam in use.

Switches

Lighting—Delco-Remy 1995009. NOTE—New switch with 9 ampere fuse for **Stop Light** circuit used after Serial No. P6HA-40968 (Spec. 6), P6HB-34427 (Del. 6). P8HA-14188 (Del. 8), P8HB-15513 (Torpedo 8). This new switch furnished for service after first type stock exhausted.
Beam Selector—Delco-Remy 1997002.
Instrument Lamp—Delco-Remy 1997719.
Stop Light—Delco-Remy 1997725.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Parking, Rear License	3	63
Instrument	1½	55
Ign. Switch, Beam Indic.	1	51
Stop & Tail	21-3	1154
Dome	6	81

THERMOSTATIC RELAY:—Delco-Remy. On lighting switch. Contacts remain closed with 30 amperes, but open in 3 minutes with load of 42 amperes at 70°F. Non-adjustable.

FUSES:—Stop Light—9 ampere on lighting switch. Used on later cars only (see Light Switch Note above).

HORNS:—Delco-Remy Model K-33-H. No 1999501, 519 (low note), 1999502, 520 (high note). Vibrator type, blended tone, operated by horn relay. Horn set 1999501 & 502 used on early cars.

Type	Current (at 6 volts)	Air Gap
1999501 (Low)	16-18 amperes	.044-.049"
1999502 (High)	15-17 amperes	.034-.039"
1999519 (Low)	19-21 amperes	.044-.049"
1999520 (High)	18-20 amperes	.034-.039"

Horn Relay:—Delco-Remy Model 1116775.
Contact Gap—.020". **Air Gap**—.015" (closed).
Contacts Close—2.75-4.0 volts.

HOOD LOCK:—Alligator type hood with lock handle in driver's compartment. To raise hood, press down on lock handle at right of steering column (hood will raise slightly) and lift up at forward end.

Hood Side Panels:—Secured by wing nut at radiator, 2 wing nuts at lower edge and one nut at engine dash on upper edge of panel.

SERIAL NUMBER:—First number G-30501 (South Bend), G-803701 (Los Angeles). Stamped on right hand body front hinge pillar.

ENGINE NUMBER:—First number 34101. Stamped on pad on upper left front corner of engine block.

COMPRESSION:—**Ratio**—6.5-1 std. cast-iron head. **Pressure**—105 lbs. at 150 RPM.

VACUUM READING:—Steady 17-18" at 8 MPH idle spd.

IGNITION:—**Coil Model CE-4632.** Service coil (less switch and cable) CE-3224US. Mounted on dash.

Ignition Current—½-1½ amps. idling, 4-5 stopped.

Ignition Switch:—Mitchellock Model 24-R. No. 8271.

Ignition Lock—Yale & Towne. Mitchell No. 6966.

Distributor Model IGW-4131. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control and Octane Selector adjustment (at distributor).

Breaker Gap—Set at .020".

Breaker Arm Spring Tension—17-20 ounces.

Cam Angle or Dwell—35° closed, 25° open (distr.).

Rotation—Counter-clockwise viewed from the top.

Condenser—No. IGB-1025. Capacity .20-.25 mfd.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	400	0	800
2	680	4	1360
4	975	8	1950
6	1265	12	2530
7	1400	14	2800

Vacuum Spark Control Model VC-4009—Mounted on hold-down plate and linked to advance plate. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle (spark retarded by return spring in unit).

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	4"
2°	4°	5½"
5°	10°	7¾"
7°	14°	11¼"
9°	18°	14¾"

Octane Selector—Provides manual adjustment at distributor (hold-down plate marked with scale) for variation in timing depending on fuel regularly used. See Ignition Timing following for adjustment.

Distributor Removal:—Mounted on left side of engine. To remove, disconnect vacuum line, take out screw in hold-down plate and lift distributor off.
NOTE—When installing distributor, insert .016" feeler between hold-down plate and advance plate while tightening advance plate clamp bolt to prevent binding and allow free advance plate motion.

IGNITION TIMING:—Standard setting as follows (see Octane Selector Setting following for correction dependent on fuel regularly used):

Flywheel Degrees	Piston Position
2° BTDC	.0015" BTDC

To Set Timing—Crank engine by engaging gears and rolling car on floor. With #1 piston on compression, turn engine over until 'IGN' mark (approx. 13/16" ahead of U.D.C. 1-6 mark) on flywheel is in line with pointer on engine rear plate on left side of car. Loosen hold-down plate screw and center scale on pointer, tighten screw. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, insert .016" feeler between advance arm and hold-down plate (to insure clearance for free advance arm movement), tighten clamp bolt, remove feeler gauge. Check Octane Selector Setting (following).

NOTE—Car manufacturer recommends use of Neon Timing Light for setting ignition timing.

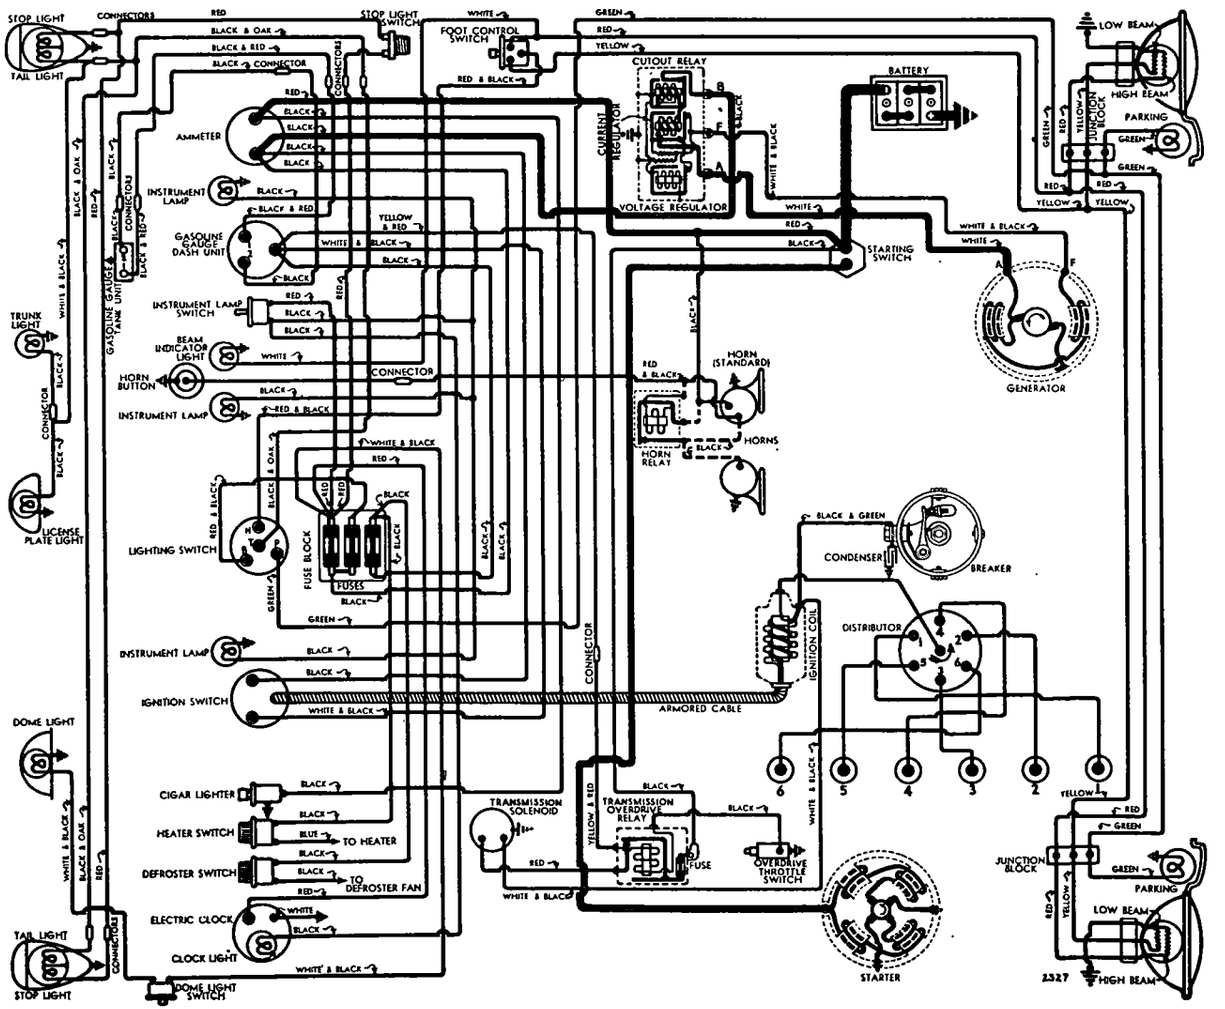
Octane Selector Setting—After setting ignition timing, loosen selector (hold-down plate) screw and advance (move selector so that pointer toward 'A' end of scale) until motor 'pings' when it is hot and pulling hard. Then retard (move selector with pointer toward 'R' end of scale) until 'ping' just disappears.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion No. 8. 18 MM Metric.

NOTE—Champion No. 7 or 13 (colder plugs) may be used for extremely fast driving in hot weather.

Spark Plug Gaps—Set at .025".



CARBURETION:—**Carburetor**—Carter Type WO Model 468-S (#229 cast on flange). 1¼" single barrel, downdraft type.

See article in Carburetor Section for complete data.

Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 8 MPH or 600 RPM idle speed. Adjust idle adjusting screw until engine fires smoothly (¾-1¼ turns open—turn screw in for leaner mixture). Readjust idle speed.

Accelerating Pump—Non-adjustable type.

Float Level—¼" from top of float (free end) to gasket seat on cover. Invert to check with float hanging freely and spring in valve stem not compressed.

Fast Idle Setting—Choke connector link opens throttle .018-.022" with choke valve closed. Adjust by bending offset on connector link.

Air Cleaner:—AC #1529210 oil-wetted type std. Heavy duty oil-bath type optional. Oil filler cap equipped with copper mesh cleaner.

Fuel Pump:—AC Type W # 1523957 diaphragm type. *See article in Carburetion Equipment Section.*

Gasoline Gauge:—Auto-Lite electric type. No. NG-9211D (dash unit). *See article in Carburetion Equipment Section.*

MANIFOLD HEAT CONTROL:—Thermostatic coil type. To check, unhook coil from pin (valve in closed position, counterweight up). Hooked end of coil should be ¼ revolution away from pin (replace coil if not within this limit). Car manufacturer recommends application (every 1000 miles) of kerosene and baking soda solution on shaft at coil to insure free operation of valve shaft.

Valve Noise Note—Manifold heater valve (No. 196657) has been changed to prevent rattle or noise by tapering lower (curved portion) of valve where it contacts manifold. Edge has been cut back ⅛" at one edge and tapers out to within ¼" from opposite edge of valve (leaving ¼" straight portion with remainder of edge tapered). If noise develops on early cars, valves should be tapered as above to remedy this condition.

VALVE TIMING:—**To Check.** With .020" tappet clearance #1 intake valve should open with #1 piston 15° or .0835" BTDC with flywheel mark 'IN-OP.1-6/' aligned with pointer on left rear engine plate. Reset tappet clearance at .016" (cold).

Tappet Clearance:—.016" all valves with engine cold. NOTE—Self-locking tappet screws used.

Valve Spring Pressure:—49-53 lbs. at 1 21/32" (valve closed), 90-94 lbs. at 1 11/32" (valve open).

LUBRICATION:—**Crankcase Capacity**—5 quarts.
Normal Oil Pressure—40 lbs. at 25-30 MPH.
Oil Pressure Relief Valve—On right front corner of engine block. Opens at 40 lbs.

COOLING SYSTEM:—**Capacity**—10½ quarts.
Thermostat—Bishop & Babcock. In cylinder head water outlet. Starts to open at 156-160° F.
Temperature Gauge—Auto-Lite (Motometer) Vapor tension type. No. H-9210-A.
See article in Mechanical Equipment Section for data.

TRANSMISSION OVERDRIVE CONTROL:—Electric type with accelerator pedal 'kick-down' switch.
See article in Mechanical Equipment Section for data.
Throttle Switch—Cole-Hersee No. 1687-S. Adjust so that shoe on accelerator linkage just contacts switch plunger with carburetor throttle in wide open position.
Control Relay—Auto-Lite HR-4201S. 14 ampere fuse mounted in holder on relay.

BATTERY:—**Willard, Type SW-1-90.** 6 volt, 13 plate, 90 Ampere Hour capacity (20 hour rate).
Starting Capacity—114 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.0 minutes. Five second voltage—4.1 volts.
Grounded Terminal—Positive (+) grounded to dash.
Engine Ground—Strap connector at right front mounting bolt.
Dimensions—Length & Height 9". Width 7".
Location—In carrier on left front side of dash in engine compartment.

STARTER:—**Model MZ-4074. Armature MZ-2130.**
Drive—Barrel type Bendix No. A-2033 (similar in design to Ford '60' type A-1806).
IMPORTANT—A-2033 drive marked 'D' on pinion barrel. Must not be interchanged with Ford type due to difference in structure of pinion teeth.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—160 amperes, 5.2 volts, 130 RPM.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.5	70
.65 " "	2500	5.5	100
2.55 " "	1325	5.0	200
4.95 " "	750	4.5	300
7.65 " "	220	4.0	400
7.8 " "	Lock	3.0	420
11.8 " "	Lock	4.0	560

Removal:—Starter flange mounted on right rear engine plate. To remove take out mounting bolts and lift starter off.

Starting Switch:—A-L Model SW-4011. Mounted on left side of car below clutch pedal. Operated by depressing clutch pedal fully.

GENERATOR:—**Model GEA-4804A. Armature No. GDZ-2006F.** Two brush type with current-voltage control.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator. *See Regulator data following.*
Maximum Charging Rate—35 amperes (hot or cold), 8.0 volts, 1800 gen. RPM or 18.3 MPH and above with load or discharged battery (Current Regulator Setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	780	0	6.4	840
4	6.6	870	4	6.6	935
8	6.8	960	8	6.8	1025
12	6.95	1050	12	6.95	1120
16	7.15	1140	16	7.15	1220
20	7.3	1230	20	7.3	1320
24	7.6	1320	24	7.6	1420
28	7.7	1410	28	7.7	1550
32	7.85	1500	32	7.85	1685
35	8.0	1570	35	8.0	1800

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.57-1.75 amperes at 6.0 volts.
Motoring Current—4.45-4.9 amperes at 6.0 volts.

Removal:—Pivot mounted at left front of engine. To remove, take out clamp and pivot bolts.

Belt Adjustment:—Loosen pivot and clamp bolts, move generator out away from engine until fan can just be rotated with belt held stationary.

REGULATOR:—**Model VRP-4004A. Current-Voltage type.** In a single case mounted on engine dash.
See article in Electrical Equipment Section for data.
NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken.

Cutout Relay

Cuts In—6.4-6.6 volts, 850 Gen. RPM., 8.6 MPH.
Cuts Out—4.8-5.6 volts (approx. 7-8 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.034" min., .038" max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting—7.3-7.6 volts at 70° F.

To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal, voltmeter between 'B' terminal and ground. Operate generator at speed equivalent to 30 MPH, charging battery until voltage is steady. Voltage reading should be 7.3-7.6 volts at 70° F.

To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.

Contact Gap—.012" Min. (armature against stop pin).

Air Gap—.048-.052" with contacts just opening.

Current Regulator

Setting—34-36 amperes (marked '35' on cover).

To Check (without breaking seals)—Connect test meters as for Voltage Check (above). Operate generator at 30 MPH, charging battery, add load (use bank of headlamp bulbs or turn on car lights and accessories and discharge battery) so that generator charges at peak rate and Current Regulator operates. Charging current should not exceed 34-36 amperes. If more than slight excess noted, regulator is defective.

Adjustment & Contact Gap—Same as for Voltage Regulator (above).

Air Gap—.034-.038" with contacts just opening.

LIGHTING:—**Headlamps**—Own 'Sealed Beam' type.
See article in Electrical Equipment Section for data.

Headlamp Adjustment—Aim upper beam for each lamp straight ahead with center of hot spot 3" below lamp center height.

Beam Indicator—Red light on speedometer face. Lighted whenever Country (upper) beam in use.

Switches

Lighting—Douglas Model 5724.
Beam Selector—Delco-Remy 1997002.
Instrument—Douglas Model 5645.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	Sealed Beam	
Parking, Instr., Trunk	1½	55
Beam Indicator	1	51
Stop & Tail	21-3	1158
Rear License	3	63
Dome	15	87

FUSES:—**Lighting**—Three 20 ampere. On fuse block on back of instrument panel at center. Protects circuits as follows: **Top**—Clock, Dome, Stop, Instrument lamps. **Center**—Head and Tail lamps. **Lower**—Accessories.
Transmission Overdrive Control—14 amp. On relay.

HORNS:—**Single**—Delco-Remy 1999805 standard.
Dual—Delco-Remy 1999511 (low note), 1999512 (high note) electric, air tone horns operated by relay.

Type	(Current at 6 volts)	Air Gap
1999805	7-9 amperes	.027-.033"
1999511 (low note)	19-21 amperes	.044-.049"
1999512 (high note)	18-20 amperes	.034-.039"

Horn Relay:—Delco-Remy Model 1116792.
Contact Gap—.020". **Air Gap**—.015" (closed).
Contacts Close—2.75-4.0 volts.

HOOD LOCK:—Alligator type hood with lock handle in driver's compartment. To raise hood, press down on handle at left of steering column (hood will raise slightly) allowing safety latch behind latch bolt and spring to be pressed back which will release hood.

SERIAL NUMBER:—First number 4148501 (South Bend), 4807601 (Los Angeles). Stamped on left hand body front hinge pillar.

ENGINE NUMBER:—First number H-87601. Stamped on boss on left hand side of cylinder block.

COMPRESSION:—**Ratio**—6.0-1 standard cast-iron hd., 7.0-1 optl. high-altitude aluminum head.
Pressure—105 lbs. (6.0-1 head), 110 lbs. (7.0-1 head) at 150 RPM cranking speed.

VACUUM READING:—18-20" at 450 RPM or 8 MPH.

IGNITION:—**Coil Model IG-4663.** Service coil (less switch and cable) IG-3224JS. Mounted on dash.
Ignition Current—½-1½ amps. idling, 4-5 stopped.
Ignition Switch:—Mitchellock Model 24-R, No. 8229.
Ignition Lock—Yale & Towne, Mitchell No. 8078.
Distributor Model IGW-4101. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control and Octane Selector adjustment (at distributor).
Breaker Gap—Set at .020".
Breaker Arm Spring Tension—17-20 ounces.
Cam Angle or Dwell—35° closed, 25° open (distr.).
Rotation—Counter-clockwise viewed from the top.
Condenser—No. IGB-1025. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	400	0	800
2	600	4	1200
5	900	10	1800
8	1200	16	2400
10	1400	20	2800

Vacuum Spark Control Model VC-4004—Mounted on hold-down plate and linked to advance plate. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle (spark retarded by return spring in unit).

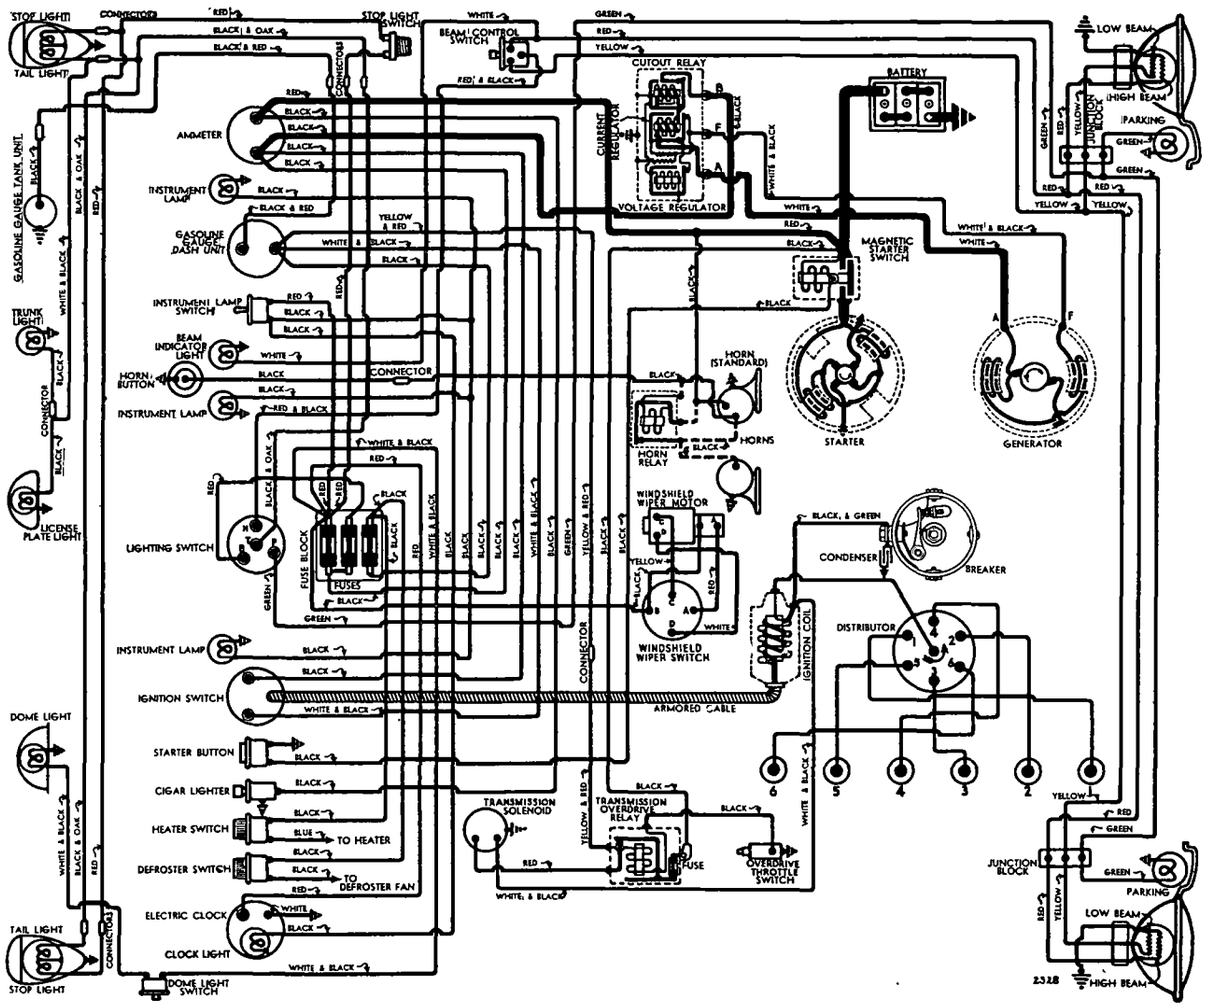
Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	3"
2°	4°	5"
3°	6°	6"
5°	10°	10"
6°	12°	12"

Octane Selector—Provides manual adjustment at distributor (hold-down plate marked with scale) for variation in timing depending on fuel regularly used. See Ignition Timing following for adjustment.
Distributor Removal:—Mounted on left side of engine. To remove, disconnect vacuum line, take out screw in hold-down plate and lift distributor off.
NOTE—When installing distributor, insert .016" feeler between hold-down plate and advance plate while tightening advance plate clamp bolt to prevent binding and allow free advance plate motion.

IGNITION TIMING:—For all engines as follows (see Octane Selector Setting following for correction dependent on fuel regularly used):

Flywheel Degrees	Piston Position
2° BTDC	.0016" BTDC.



To Set Timing—Crank engine by engaging gears and rolling car on floor. With #1 piston on compression, turn engine over until 'IGN/' mark on vibration dampener at front of engine lines up with pointer on timing gear cover (this mark is 2° or 9/64" before top dead center mark '/UDC.1-6'). Loosen hold-down plate screw and center scale on pointer, tighten screw. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, insert .016" feeler between advance arm and hold-down plate (to insure clearance for free advance arm movement), tighten clamp bolt, remove feeler gauge.
Motor Gauge—Weidenhoff Adapter #104, Rod #2.
Octane Selector Setting—After setting ignition timing, loosen selector (hold-down plate) screw and advance (move selector so that pointer toward 'A' end of scale) until motor 'pings' when it is hot and pulling hard. Then retard (move selector with pointer toward 'R' end of scale) until 'ping' just disappears.
Firing Order:—1-5-3-6-2-4. See diagram.
Spark Plugs:—Champion No. 8. 18 MM Metric.
NOTE—Champion No. 7 or 13 (colder plugs) may be used for extremely fast driving in hot weather.
Spark Plug Gaps—Set at .025".

CARBURETION:—**Carburetor**—Carter Type WA-1 Model 410-S or Stromberg Model BXO-26 (code marked 6-84 on float chamber). 1¼" single barrel, downdraft types. ***See separate articles in Carburetor Section for data on each model.***

Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 8 MPH idle speed. Adjust idle adjusting screw until engine fires smoothly (½-1¼ turns open for Carter—turn screw in for leaner mixture). Readjust idle speed.

Accelerating Pump Setting—3 holes provided in pump arm (Carter), throttle lever (Stromberg) for pump link engagement. Set as follows:
Inner Hole (min. stroke)—Extreme warm weather.
Center Hole (Stromberg) or Lower Hole (Carter)—Normal operating conditions.
Outer Hole (Stromberg) or Upper Hole (Carter)—Extreme cold weather.

Float Level (Carter)—¼" from top of machined projection on float bowl cover to top of soldered seam at free end of float (invert to check).

Float Level (Stromberg)—Fuel level 5/8" below top edge of float bowl.

Fast Idle (Carter):—Integral (built-in carburetor). *See article in Carburetion Equipment Section.*
Fast Idle Setting—Part of climatic control. Adjust by bending connector link offset to secure 5/8" choke valve opening with throttle stopscrew against (not on) first step of fast idle cam.

Fast Idle (Stromberg):—Stromberg BXO-26 carburetor type. *See article in Carburetion Equipm't Section.*
Fast Idle Setting—With throttle stopscrew against second step of fast idle cam, choke valve should be 11/32" open. To adjust, bend choke lever.

Automatic Choke (Carter):—Carter Climatic Control. *See article in Carburetion Equipment Section.*
Setting—Set thermostatic coil housing 1 Notch Rich.

Automatic Choke (Stromberg):—Stromberg BXO-26 carburetor type. *See article in Carburetion Equip. Sec.*
Setting—Mark 'R' on thermostatic spring case should line up with projection on housing (ordinary fuel). If setting too rich rotate case to 'M' mark (leaner setting). Use 'H' position only for very volatile fuels.

Air Cleaner:—AC #1528630 oil-wetted type Std. Heavy duty oil-bath type optional. Oil filler cap equipped with copper mesh cleaner.

Fuel Pump:—AC Type W #1522227 diaphragm type. *See article in Carburetion Equipment Section.*

Gasoline Gauge:—Stewart (Stewart-Warner) Electric. Stewart-Warner No. G-102158. *See article in Carburetion Equipment Section for data.*

MANIFOLD HEAT CONTROL:—Thermostatic coil type. To check valve, unlatch thermostatic coil by freeing outer end from bracket on manifold, operate valve by hand and see that valve is free (shaft can be cleaned with emery if necessary). Make certain that coil is properly latched on bracket and that tension spring (from shaft to clip on manifold flange) is in place.

VALVE TIMING:—To Check. With .020" tappet clearance #1 intake valve should open with #1 piston 15° or .0942" BTDC when mark 'IN-OP.1-6/' on vibration damper at front of engine lines up with pointer on gear case cover. Reset tappet clearance at .016" (cold).
Tappet Clearance:—.016" all valves with engine cold.
Valve Spring Pressure:—54-60 lbs. at 2 3/32" (valve closed). 125-135 lbs. at 1¾" (valve open).

LUBRICATION:—Crankcase Capacity—6 quarts.
Normal Oil Pressure—40 lbs. at 25-30 MPH.

COOLING SYSTEM:—Capacity—14½ quarts.
Thermostat—Bishop & Babcock or Fulton. In cylinder head outlet. Starts to open 156-160° F.
Temperature Gauge—Stewart (Stewart-Warner). No. G-102072.

TRANSMISSION OVERDRIVE CONTROL:—Electric type with accelerator pedal 'kick-down' switch. *See article in Mechanical Equipment Section for data.*
Overdrive Solenoid—Delco-Remy Model 1118001.
Throttle Switch—Cole-Hersee No. 1687-S. Adjust so that shoe on accelerator linkage just contacts switch plunger with carburetor throttle in wide open position.
Control Relay—Auto-Lite HR-4201S. 14 ampere fuse mounted in holder on relay.

BATTERY:—Willard Type SW-1-95. 6 volt, 15 plate, 95 A. H. capacity (20 hour rate).
Starting Capacity—117 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.1 minutes. Five second voltage 4.2 volts.
Grounded Terminal—Positive (+) grounded to frame. **Engine Ground**—Separate ground strap.
Dimensions—Length 9". Width 7". Height 8 13/16".
Location—In engine compartment on left side.

STARTER:—Model MAW-4015. Armature MAW-2091.
Drive—Outboard Barrel Type Bendix No. A-1729.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—43-52 ozs. (new brushes).
Cranking Engine—130 RPM., approximately 175 amperes at 5.0-5.5 volts.

Performance Data

Torque	R P.M.	Volts	Amperes
0 ft. lbs.	4900	5 5	65
.6 " "	3300	5.5	100
2.75 " "	1480	5.0	200
5.45 " "	820	4 5	300
8.5 " "	400	4.0	400
11.5 " "	Lock	3.0	505
18.0 " "	Lock	4.0	670

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out two flange mounting screws, remove starter and switch as assembly.

Starting Switch:—R.B.M. Model 5607. Magnetic type. Mounted on starter and controlled by Douglas #5701 pushbutton switch on instrument panel.

GENERATOR:—Model GEA-4803A. Armature No. GDZ-2006F. Two brush type with current-voltage control. NOTE—If GDA-4804A Generator and VRB-4012A Regulator used, refer to 1939 Commander 'T&E' page for data.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator. *See Regulator data following.*
Maximum Charging Rate—35 amperes (hot or cold), 8.0 volts, 1600 gen. RPM or 17 MPH and above with load or discharged battery (Current Regulator Setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	780	0	6.4	840
4	6.6	870	4	6 6	935
8	6.8	960	8	6.8	1025

32	7.85	1500	32	7.85	1685
35	8.0	1570	35	8.0	1800

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.57-1.75 amperes at 6.0 volts.
Motoring Current—4.45-4.9 amperes at 6.0 volts.
Removal:—Pivot mounted at left front of engine. To remove, take out clamp and pivot bolts.
Belt Adjustment:—Loosen pivot and clamp bolts, move generator out away from engine until fan can just be rotated with belt held stationary.

REGULATOR:—Model VRP-4004A. Current-Voltage type. In a single case mounted on engine dash. *See article in Electrical Equipment Section for data.*
NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken.

Cutout Relay

Cuts In—6.4-6.6 volts, 800 Gen. RPM., 6.1 MPH.
Cuts Out—4.8-5.6 volts (approx. 7-8 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.034" min., .038" max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting—7.3-7.6 volts at 70° F.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal, voltmeter between 'B' terminal and ground. Operate generator at speed equivalent to 30 MPH, charging battery until voltage is steady. Voltage reading should be 7 3-7 6 volts at 70° F.
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap— 012" Min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator

Setting—34-36 amperes (marked '35' on cover).
To Check (without breaking seals)—Connect test meters as for Voltage Check (above). Operate generator at 30 MPH, charging battery, add load (use bank of headlamp bulbs or turn on car lights and accessories and discharge battery) so that generator charges at peak rate and Current Regulator operates. Charging current should not exceed 34-36 amperes If more than slight excess noted, regulator is defective.
Adjustment & Contact Gap—Same as for Voltage Regulator (above).
Air Gap—.034-.038" with contacts just opening.

LIGHTING:—Headlamps—Own 'Sealed Beam' type. *See article in Electrical Equipment Section for data.*
Headlamp Adjustment—Aim upper beam for each lamp straight ahead with center of hot spot 3" below lamp center height.
Beam Indicator—Red light on speedometer face. Lighted whenever Country (upper) beam in use.

Switches

Lighting—Douglas Model 5704.
Beam Selector—Delco-Remy 1997002.
Instrument—Douglas Model 7290.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Parking, Instr., Trunk	1½	55
Beam Indicator	1	51
Stop & Tail	21-3	1158
Rear License	3	63
Dome	15	87

FUSES:—Lighting—Three 20 ampere. On fuse block on back of instrument panel at center. Protects circuits as follows: **Top**—Clock, Dome, Stop, Instrument Lamps and Windshield Wiper. **Center**—Head and Tail lamps. **Lower**—Accessories.
Transmission Control—14 ampere. On relay.
Windshield Wiper—No separate fuse (protected by accessory fuse on fuse block).

HORNS:—Single—Delco-Remy 1999512 standard.
Dual—Use Delco-Remy Package #1874459 (horn 1999515) to make matched set. Electric type, air tone horns operated by relay.

Type	Current (at 6 volts)	Air Gap
1999512 (low note)	19-21 amperes	.044-.049"
1999515 (high note)	18-20 amperes	.034-.039"

Horn Relay:—Delco-Remy Model 1116756.
Contact Gap—.020". **Air Gap**—.015" (closed).
Contacts Close—2.75-4.0 volts.

WINDSHIELD WIPER:—Auto-Lite Model EBW-4002. Electric type. NOTE—No separate fuse used. *See article in Mechanical Equipment Section for data.*

HOOD LOCK:—Alligator type hood with lock handle in driver's compartment. To raise hood, press down on handle at left of steering column (hood will raise slightly) allowing safety latch behind latch bolt and spring to be pressed back which will release hood.

SERIAL NUMBER:—On left front body hinge post. First No. 7133101 (South Bend), 7803301 (L.A.).

ENGINE NUMBER:—First number B-38501. Stamped on left rear of cylinder block.

COMPRESSION:—Ratio—6.0-1 Std. CI. Hd. 6.5-1 Optl. **Pressure**—105 lbs. at 150 RPM.

VACUUM READING:—Steady 18" at 450 RPM, 8 MPH.

IGNITION:—Coil Model 1115201. Mounted on dash.
Ignition Current—½-1½ amps. idling, 4-5 stopped.
Ignition Switch:—Mitchellock Model 24-R, No. 8229. Delco-Remy No. 1116274, 1116288 (RHD) switch and cable.
Ignition Lock—Yale & Towne. Mitchell No. 8078.
Distributor Model 662-M:—Double breaker, 4 lobe cam, full automatic advance type with auxiliary vacuum spark control and Octane Selector. NOTE—Contacts must be synchronized (see Timing).
Firing Interval—Movable contacts open 45° (distr.) after fixed set.
Breaker Gap—.020". Limits .018-.024".
Cam Angle or Dwell—33° (closed), 14° (open).
Breaker Arm Spring Tension—19-23 ounces.
Rotation—Clockwise viewed from above.
Condenser—Part No. 1838163. Capacity .18-.25 mfd.

Automatic Advance

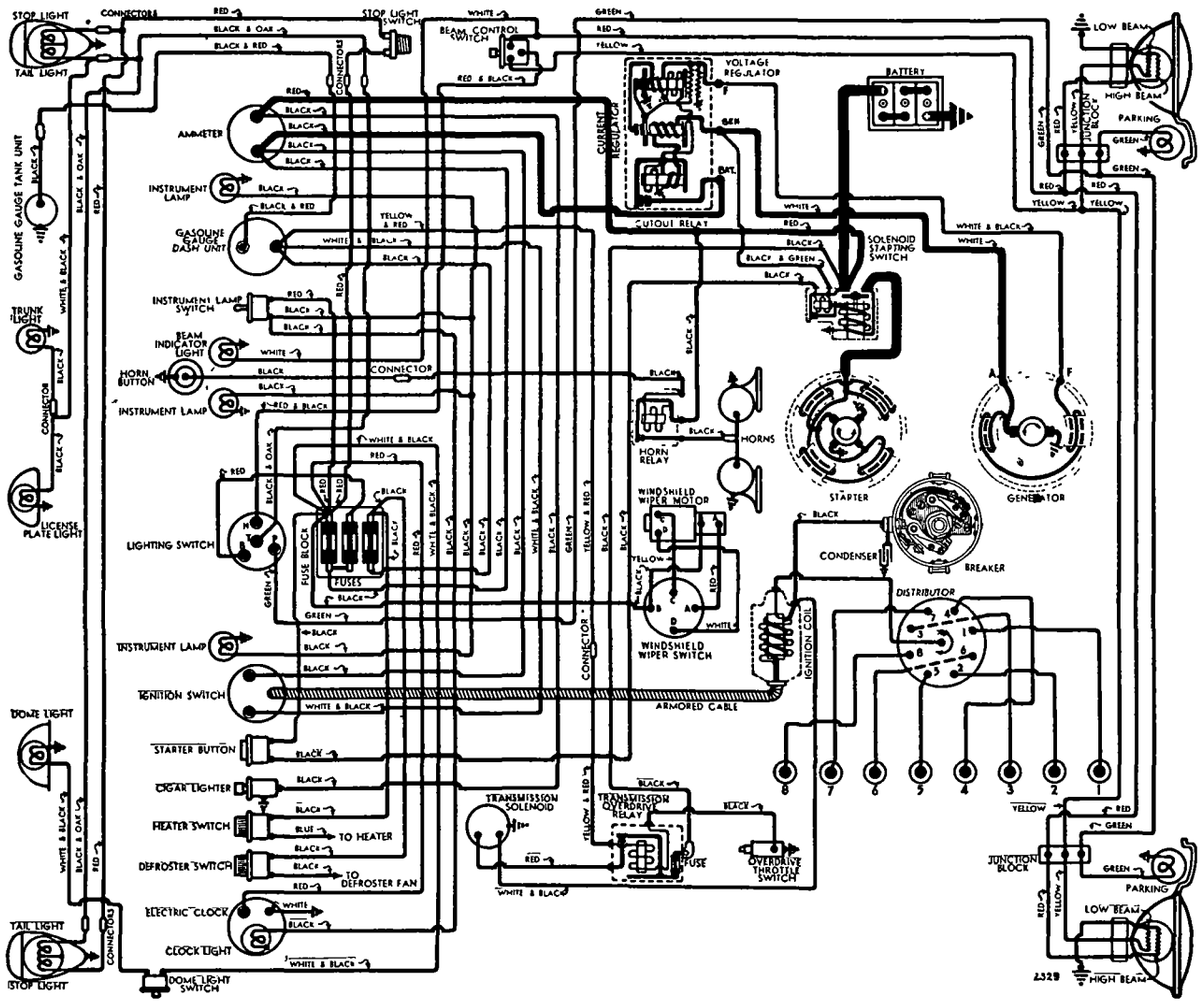
Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	2.5	600
14.5	1800	29	3600

Vacuum Spark Control Model 681-S.—Mounted under distributor and linked to advance arm. Provides additional advance at speeds above idling except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit. Total plunger travel ¼".

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5-7"
**6°	12°	11-14"

**—at .125" travel.
Octane Selector—Provides manual adjustment at distributor (hold-down plate marked with scale) for variation in timing depending on fuel regularly used. See Ignition Timing following for adjustment.
Distributor Removal:—Mounted on right side of cylinder head. To remove, take out screw in hold-down plate, loosen advance arm clamp bolt (not necessary to disturb vacuum unit or vacuum connections).



IGNITION TIMING:—Standard setting as follows (see Octane Selector Setting following for correction dependent on fuel regularly used):

Flywheel Degrees	Piston Position
0° (At TDC)	.0000" TDC.

To Set Timing (Stationary Contacts)—Crank engine by engaging gears and rolling car on floor. With #1 piston on compression, turn engine over until piston reaches top dead center, stop when dead center mark 'U.D.C.1-8' on vibration dampener at front of engine lines up with pointer on timing gear cover. Loosen hold-down plate screw, center scale on pointer, tighten screw. Loosen advance arm clamp bolt, rotate distributor until stationary breaker contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt, then synchronize movable contacts.
Synchronization (On Engine)—Turn engine over 90° to #6 firing position with vibration dampener mark 'U.D.C.3-6' lined up with pointer on timing gear cover. Loosen lockscrews on movable sub-plate carrying second set of contacts, turn eccentric adjusting screw until contacts begin to open, tighten lockscrews.
Synchronization (Using Tool)—Use Delco-Remy tool #1838182. See Distributor Synchronization in Electrical Equipment Section for complete instructions. Distributor firing intervals regular 45-45-45°.
Motor Gauge—Weidenhoff Adapter #104. Rod #2.
Octane Selector Setting—After setting ignition timing, loosen selector (hold-down plate) screw and advance (move selector so that pointer toward 'A' end of scale) until motor 'pings' when it is hot and pulling hard. Then retard (move selector with pointer toward 'R' end of scale) until 'ping' just disappears.

Firing Order:—1-6-2-5-8-3-7-4 (see diagram).
Spark Plugs:—Champion No. 8. 18 MM Metric.
NOTE—Champion No. 7 or 13 (colder plugs) may be used for extremely fast driving in hot weather.
Spark Plug Gaps—Set at .025".

CARBURETION:—Carburetor—Carter Type WDO Model 409-S or Stromberg Model AAO-161 (code marked 6-85 on top of float chamber cover). 1¼" (Carter), 1" (Stromberg) dual, downdraft types. ***See separate articles in Carburetor Section for data.***
Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 8 MPH idle speed. Adjust idle adjusting screw for each barrel (in succession) until engine fires smoothly (¼-1¼ turns open for each screw on Carter—turn screws in for leaner mixture). Readjust idle speed.
Accelerating Pump Setting—2 holes provided in pump arm (Carter), throttle lever (Stromberg) for pump link engagement. Set as follows:
Inner Hole (min. stroke)—Summer temperatures.
Outer Hole (max. stroke)—Winter temperatures.

Float Level (Carter)—3/16" from top of float to gasket seat on cover with needle valve seated (invert float chamber cover to check).

Float Level (Stromberg)—Fuel level 5/8" below top edge of bowl (level sight plug on engine side of carburetor—check with engine idling).

Fast Idle (Carter):—Integral (built-in carburetor). *See article in Carburetion Equipment Section.*

Fast Idle Setting—Adjust fast idle screw for .018" throttle opening with choke valve fully closed.

Fast Idle (Stromberg):—Stromberg AAO-161 carburetor type. *See article in Carburetion Equipm't Section.*

Fast Idle Setting—No adjustment provided.

Automatic Choke (Carter):—Carter Climatic Control. *See article in Carburetion Equipment Section.*

Setting—Set coil housing one Notch Rich.

Automatic Choke (Stromberg):—Stromberg AAO-161 carburetor type. *See Carburetion Equip. Sec. article.*

Setting—Mark 'R' on thermostatic spring case should line up with projection on housing (ordinary fuel). If this setting too rich, rotate case to 'M' mark (leaner setting). Use 'H' setting for high test fuels.

Air Cleaner:—AC #1529440 oil-wetted type Std. Heavy duty oil-bath type optl. Oil filler cap equipped with copper mesh cleaner.

Fuel Pump:—AC Type E #1523926 diaphragm type. *See article in Carburetion Equipment Section.*

Gasoline Gauge:—Stewart (Stewart-Warner) Electric Stewart-Warner No. G-102158. *See article in Carburetion Equipment Section.*

MANIFOLD HEAT CONTROL:—Thermostatic coil type. To check valve, unlatch thermostatic coil (free outer end from bracket on manifold), operate valve by hand and see that shaft is free (shaft can be cleaned with emery if necessary). Make certain that thermostatic coil is properly latched to bracket and that tension spring (from shaft to clip on flange) is in place.

VALVE TIMING:—#1 intake valve opens 15° (.0915") BTDC. with .020" tappet clearance ("IN.OP/1-8" mark on vibration dampener in line with pointer).

Tappet Clearance—.016" (cold) all valves.

Valve Spring Pressure—54-60 lbs. at 2 3/32" (valve closed), 125-135 lbs. at 1¾" (valve open).

LUBRICATION:—Crankcase Capacity—8 quarts.

Normal Oil Pressure—60 lbs. at 25-30 MPH.

COOLING SYSTEM:—Capacity—17 quarts.

Thermostat—Bishop & Babcock or Fulton. In cylinder head outlet. Starts to open 156-160° F.

Temperature Gauge—Stewart (Stewart-Warner). No. G-102072.

TRANSMISSION OVERDRIVE CONTROL:—Electric type with accelerator pedal 'kick-down' switch. *See article in Mechanical Equipment Section for data.*

Overdrive Solenoid—Delco-Remy Model 1118001.

Throttle Switch—Cole-Hersee No. 1687S. Adjust so that end of accelerator rod just contacts switch plunger with throttle valve wide open.

Control Relay—Auto-Lite HR-4201S. 14 ampere fuse mounted in holder on relay.

BATTERY:—Willard Type SW-1-95. 6 volt, 15 plate, 95 A. H. capacity (20 hour rate).

Starting Capacity—117 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.1 minutes. Five second voltage 4.2 volts.

Grounded Terminal—Positive (+) grounded to frame. **Engine Ground**—Separate ground strap.

Dimensions—Length 9". Width 7". Height 8 13/16".

Location—In engine compartment on left side.

STARTER:—Model No. 1107903. Armature No. 820158.
Drive—Solenoid pinion shift & overrunning clutch.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ozs. each.
Cranking Engine—110 RPM., 150-200 amperes, 5-5.5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	6000	5.0	60
16 "	Lock	3.0	600

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws (remove starter and solenoid switch as an assembly).

Starting Switch:—Solenoid Switch Type 1546. Mounted on starter and controlled through relay (in switch case by pushbutton switch Douglas #5700 on instrument panel. *See article in Electrical Equipment Section.*

GENERATOR:—Delco-Remy Model 1102671. Two-brush (shunt) type with voltage-current regulation.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator. *See Regulator data following.*
Maximum Charging Rate—33-35 amperes (hot or cold), 8.0 volts, 1850 gen. RPM or 22 MPH and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

	Amperes	Volts	R.P.M.
Cold	30*	8.0	1700

*—Not maximum output—See Current Regulator.

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—25 ounces each.
Field Current—1.76-1.88 amperes at 6.0 volts.

Removal:—Pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.

Belt Adjustment:—Swing generator out until fan can just be turned with belt held stationary.

REGULATOR:—Model 1118202. 'Single Core' type. Vibrating Voltage & Current regulator on dash.
CAUTION—Check generator for grounded fields before changing regulator settings. *See article in Electrical Equipment Section for data.*

Cutout Relay

Cuts In—6.2-6.7 volts (hot), 750 RPM., 8.9 MPH.
Cuts Out—0-4.0 amperes discharge current.
Contact Gap—.020" (same for both sets).
Air Gap—.020" (with points just closed).

Voltage Regulator

Setting—7.4-7.8 volts (70° F.), 7.2-7.4 volts (hot). Regulator over-compensated for temperature.
To Check—Connect ammeter in charging line at 'BAT' regulator terminal, voltmeter between 'BAT' terminal and ground. Operate generator at 3000 RPM, adjust charging rate to 8-10 amperes (use variable rheostat or 'AVR' set). With regulator at hot operating temperature, retard generator speed until cut-out relay points open, then increase generator speed to 3000 RPM and check hot voltage setting (above).
To Adjust—Change regulator armature spring tension slightly by bending lower spring hanger for **light (left) spring (or one spring if both alike) only.** If further adjustment required see Single Core Regulator article in Electrical Equipment Section for Heavy (or Other) Spring adjustment.
Air Gap—.070" between center of core and armature with contacts just closed.

Current Regulator

Setting—32-34 amperes (hot).
To Check—Remove cover, connect short jumper from voltage regulator frame to upper contact support bracket (shorting out Voltage Regulator). Connect ammeter in charging line at 'BAT' regulator terminal. Turn on lights and accessories, operate generator and increase speed until output remains stationary (run until hot). Check setting with regulator at operating temperature.
To Adjust—Change regulator armature spring tension slightly by bending lower spring hanger for **one spring.** If further adjustment required see Single Core Regulator article in Electrical Equipment Section for adjustment of other spring.
Air Gap—.075" (check same as Voltage Regulator).

LIGHTING:—Headlamps—Own 'Sealed Beam' type. *See article in Electrical Equipment Section for data.*
Headlamp Adjustment—Aim upper beam for each lamp straight ahead with center of hot spot 3" below lamp center height.
Beam Indicator—Red light on speedometer face. Lighted whenever Country (upper) beam in use.

Switches

Lighting—Douglas Model 5704.
Beam Selector—Delco-Remy 1997002.
Instrument—Douglas Model 7290.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Parking, Instr., Trunk	1½	55
Beam Indicator	1	51
Stop & Tail	21-3	1158
Rear License	3	63
Dome	15	87

FUSES:—Lighting—Three 20 ampere. On fuse block on back of instrument panel at center. Protects circuits as follows: **Top**—Clock, Dome, Stop, Instrument Lamps and Windshield Wiper. **Center**—Head and Tail lamps. **Lower**—Accessories.
Transmission Control—14 ampere. On relay.
Windshield Wiper—No separate fuse (protected by accessory fuse on fuse block).

HORNS:—Delco-Remy. Model 1999511 (low note), 1999512 (high note). Electric type, air tone operated by relay.

Type	Current (at 6 volts)	Air Gap
1999511 (low note)	19-21 amperes	.044-.049"
1999512 (high note)	18-20 amperes	.034-.039"

Horn Relay:—Delco-Remy Model 1116756.
Contact Gap—.020". **Air Gap**—.015" (closed).
Contacts Close—2.75-4.0 volts.

WINDSHIELD WIPER:—Auto-Lite Model EBW-4002. Electric type. NOTE—No separate fuse used. *See article in Mechanical Equipment Section for data.*

PANEL DELIVERY NOTE:—Before Engine No. 35129, Engine used was similar to Model 48 and specifications listed below as 'First' apply. After Engine No. 35129, Model 440 Engine was used (same as Pick-up Model) and specifications marked 'Later' apply.

SERIAL NUMBER:—First No. 440-17001 (all models). Stamped on plate on frame front cross-member (all models), and on right side of cowl under hood (Pass. cars & Pick-up), or on right front door riser (Panel Delivery).

ENGINE NUMBER:—First No. 17001. Stamped on right front upper corner of engine block.

COMPRESSION:—**Note**—All heads are Cast Iron except 7.0-1 H.C. Pass. Car head which is Aluminum.

Model	Ratio	Pressure (Crk. Speed)
Pass. Cars Std.	6.48-1	111 lbs., 185 RPM.
Pass Cars High Alt.	6.81-1	111 lbs., 185 RPM.
Pass. Cars Optl. H.C.	7.0-1	111 lbs., 185 RPM.
Pick-up&Panel (later)	6.1-1	107 lbs., 185 RPM.
Panel Dlvry. (first)	5.7-1	87 lbs., 216 RPM.

VACUUM READING:—Steady 21-23" at 8 MPH. idling speed. NOTE—18½" on First Panel Delivery (5.7-1 Ratio).

IGNITION:—**Coil Model IG-4090A.** Mounted on right side of engine block near distributor. Service Coil No. IG-4070.
Ignition Current—2.5 amperes idling, 4 stopped.
Ignition Switch:—Douglas. Coil connection not armored.
Ignition Lock—Douglas #2975.
Distributor Auto-Lite IGW-4129 (Pass. Car, Pick-up & Later Panel Delivery), IGW-4129A (First Panel Delivery). Full automatic advance type with auxiliary Vacuum Spark Control (VC-4010).
Breaker Gap—.020".
Cam Angle or Dwell—41° closed, 49° open (distr.).
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Counter-clockwise viewed from above.
Condenser—No. IGB-1025. Capacity .20-.25 mfd.

Automatic Advance—IGW-4129

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
2	550	4	1100
5	930	10	1860
7	1190	14	2380
9.5	1500	19	3000

Automatic Advance—IGW-4129A

Start	300	0	600
4	400	8	800
7	790	14	1580
11	1310	22	2620
14	1700	28	3400

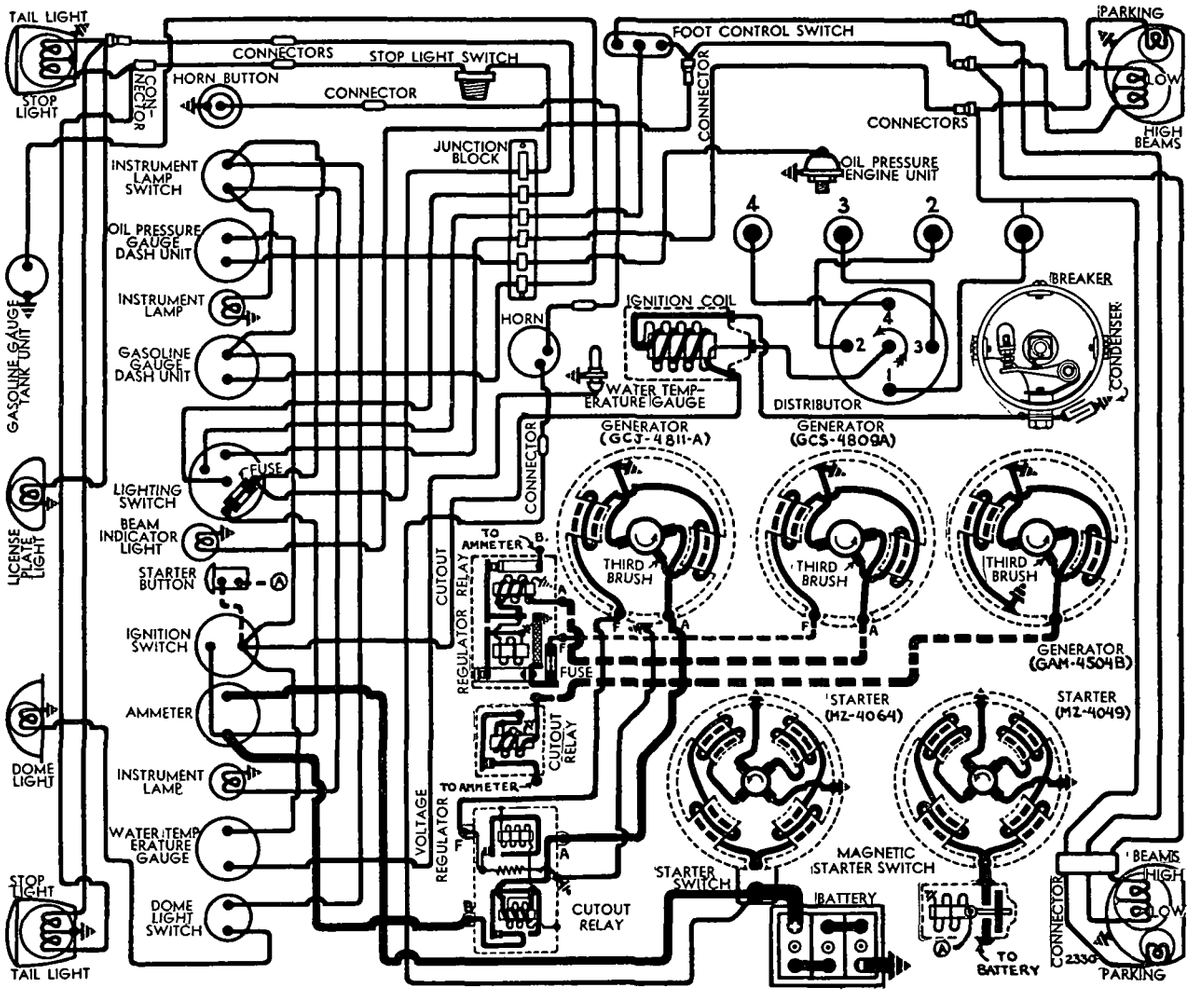
Vacuum Spark Control—Type VC-4010. Mounted on distributor bracket and linked to advance arm. Provides additional advance at all speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring within unit.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	3½"
2°	4°	5¾"
5°	10°	9¼"
8°	16°	12¾"
10°	20°	15"

Distributor Removal:—Mounted on right side of engine. To remove (without disturbing vacuum unit), loosen advance arm clamp bolt.

Note—If oil pump removed, turn crankshaft so that #1 piston on compression and flywheel mark 'TC-IGN' at indicator on housing, turn distributor shaft so that rotor at #1 terminal in cap, install oil pump and mesh gears so that shaft engages distributor tongue-and-slot coupling without disturbing distributor shaft position. Check ignition timing.



IGNITION TIMING:—

	Flywheel Deg.	Piston Pos.
Pass. Cars (All heads)	At TDC	.0000" TDC
Pick-up & Panel (later)	4° BTDC	.0066" BTDC
Panel Dlvry. (first 5.7-1)	5° ATDC	.0103" ATDC

Timing—With #1 piston on compression, turn engine over until piston reaches firing position (see above) with flywheel mark 'TC-IGN' or 'IGN' centered in inspection hole in front face of engine right rear support. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open (eliminate backlash in drive gears by pressing on rotor in clockwise direction), tighten clamp bolt, see that rotor is at #1 terminal in distributor cap. NOTE—Ignition mark on First Panel Delivery on top left of housing.

Firing Order:—1-3-4-2. See diagram.
Spark Plugs:—Champion Type J8, 14 MM. Metric (Except First Panel Delivery), Type C7, 18 MM. Metric (First Panel Delivery).
Spark Plug Gaps—.030".

CARBURETION:—**Carburetor**—Carter Model WO Type 450-S (Pass. Cars), Tillotson Model U-1B (Pick-up & Panel Delivery). 1⅛" downdraft type.
See articles in Carburetor Section for data.
Idle Adjustment—If preliminary adjustment required (to warm up engine), turn idle adjusting screw in until just seated, then turn screw out 1¼ turns (Carter), ¾ turn (Tillotson); start engine and run until warm. With engine warm, set throttle stopscrew for slightly faster than normal idling speed, turn idle adjusting screw out until engine begins to roll, then turn screw in until engine fires smoothly. Recheck adjustment and set throttle stopscrew for 8 MPH idle speed pulling in high gear.
Float Level (Carter)—⅜" from top of float (free end) to gasket seat on cover with needle valve seated (invert to check—do not compress spring in valve stem).

Float Level (Tillotson)—Fuel level 13/16" below top edge (gasket seat) of bowl with engine running.

Air Cleaner:—AC #1529478 oil-wetted type Std. Heavy duty oil-bath type optional.

Fuel Pump:—AC Type AF #1523306. Diaphragm type. *See article in Carburetion Equipment Section.*

Gasoline Gauge:—King-Seeley Electric. K-S Nos. 7855—first, 8112—later (Dash Unit), No. 7695 (Tank Unit). **Note**—Dials on first dash units have ivory lines, later units have ivory dots. *See article in Carburetion Equipment Section.*

MANIFOLD HEAT CONTROL:—Automatic thermostatic type (no adjustment) on Pass. Cars, Pick-up & Later Panel Delivery. NOTE—On first Panel Delivery, manual type with seasonal adjustment used. See Willys 48 (1939) T&E page for adjustment instructions.

VALVE TIMING:—To Check (Pass. Cars, Pick-up & Later Panel Delivery)—Set tappet clearance #1 intake valve at .020". This valve should open with piston 9° or .039" before top dead center when flywheel mark 'I.O' centered in inspection hole in front face of right rear motor support (¼" variation permissible). Reset tappet clearance at .014" cold.

First Panel Delivery—With .010" tappet clearance, #1 intake valve opens with piston on top dead center and flywheel mark 'I.O-T.C.' at indicator (inspection hole in left top of housing). Reset tappet clearance at .004" warm.

Tappet Clearance:—.014" all valves—engine cold (except First Panel Delivery), .004" Int., .006" Exh. Warm (First Panel Delivery).

Valve Spring Pressure—46 lbs. at 2¼" (valve closed), 85½ lbs. at 1 15/16" (valve open). Spring free length 2 11/16".

LUBRICATION:—Crankcase Capacity—4 quarts.

Normal Oil Pressure—75 lbs. (gauge) at 30 MPH.

Oil Pressure Gauge:—King-Seeley Electric. K-S Nos. 7860—first, 8115—later (Dash Units); No. 6425 (Engine Unit). **Note**—Dial on first dash unit has ivory lines, later unit has ivory dots. *See article in Mechanical Equipment Section for data.*

COOLING SYSTEM:—Capacity—11¾ qts. (except First Panel Delivery), 11 qts. (First Panel Delivery).

Thermostat—Harrison. In outlet elbow on cylinder head. Starts to open 148-155°. Fully open at 173° F. NOTE—Thermostat not used on First Pick-up & Panel Delivery.

Temperature Gauge:—King-Seeley Electric. K-S Nos. 7850—first, 8110—later (Dash Units); No. 7000 (Engine Unit). **Note**—Dial on first dash unit has ivory lines, later unit has ivory dots. *See article in Mechanical Equipment Section for data.*

BATTERY:—National Type HT-13. 6 volt, 13 plate, 77 ampere hour capacity (20 hour rate).
NOTE—When USL battery used, specifications same as for 1939 models (Type A-13).

Starting Capacity—90 amperes for 20 minutes.

Zero Capacity—300 amperes for 1.7 minutes.

Grounded Terminal—Negative (—) grounded to front frame cross-member. **Engine Ground**—Strap connector at front engine mounting on left side.

Location—On right side in engine compartment.

Dimensions—Length 9". Width 7". Hgt. 8 9/16".

(Pick-up Battery) Auto-Lite Type AB-13. 6 volt, 13 plate, 80 AH. Capacity (20 hour rate).

Starting Capacity—96 amperes for 20 minutes.

Zero Capacity—300 amperes for 2.0 minutes.

Dimensions—Length 9". Width 7". Hgt. 8⅝".

Grounded Terminal & Location—See above.

STARTER:—Auto-Lite MZ-4064 (Pass. Car & Pick-up), MZ-4049 (Panel Delivery). Armature MZ-2089.

Drive—Special Outboard Bendix #RC10HD.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Cranking Engine—185 RPM, 150-175 amperes, 5 volts (Pass. Car & Pick-up), 216 RPM. 135-150 amperes, 5.35 volts (Panel Delivery).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.5	70
.65 " "	2500	5.5	100
2.65 " "	1325	5.0	200
4.95 " "	750	4.5	300
7.65 " "	220	4.0	400
7.8 " "	Lock	3.0	420
11.8 " "	Lock	4.0	560

Removal:—Starter flange mounted on right front face of rear motor support. To remove, take out two flange capscrews and one capscrew in bracket at commutator end, remove starter and switch as an assembly.

Starting Switch (MZ-4064):—Type SW-3737S. Mounted on starter, cable operated by button on instrument panel. Pull required to close switch should be 2.3 lbs. min. (at right angles to hole at end of lever).
(MZ-4049)—Type SS-4001. Magnetic switch mounted on starter, controlled by pushbutton on instrument panel. *See article in Electrical Equipm't Section.*

GENERATOR (PASS. CARS):—Auto-Lite GCJ-4811-A. Armature GCJ-2006-F. Third brush control in conjunction with vibrating type voltage regulator. Ventilated by fan on drive pulley.

Maximum Charging Rate—25 amperes (cold), 8.0 volts, 2500 RPM. Actual charging rate controlled by voltage regulator and dependent on battery condition. See Regulator data below. When checking generator output, ground 'F' terminal to eliminate regulator action.

Charging Rate Adjustment—See Regulator data. Third brush setting 2 commutator bars minus 2 mica strips minimum, 2 bars minus 1 mica strip maximum for insulated (nearest) main brush. Setting adjustable by removing commutator cover band and moving third brush by hand counterclockwise to increase, clockwise to decrease output. Maximum output given above must not be exceeded.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	760	0	6.4	850
4	6.65	920	4	6.7	1020
8	6.9	1080	8	7.0	1240
12	7.2	1240	12	7.3	1400
16	7.45	1400	16	7.6	1650
20	7.7	1580	20	7.9	2100
25	8.0	2500	22	8.0	2700

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—53 ozs. max. (new brushes).

Field Current—1.9-2.1 amperes at 6.0 volts.

Motoring Current—4.0-4.4 amperes at 6.0 volts.

Removal:—Conventional pivot mounting at right front of engine. To remove, take out pivot and clamp bolts.

Belt Adjustment:—Loosen pivot and clamp bolts, swing generator out until fan can be turned with belt stationary.

GENERATOR (STD. PICK-UP & PANEL DLVRY.):—Auto-Lite GAM-4504-B. Armature GAM-2055. Third brush control.

Maximum Charging Rate—16.5 amperes (cold), 8.0 volts, 1950 RPM.

Charging Rate Adjustment—Remove commutator cover band, shift third brush by hand counterclockwise to increase, clockwise to decrease output. Brush held in position by friction.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	720	0	6.4	720
4	6.8	880	4	6.9	900
8	7.2	1050	8	7.4	1160
12	7.6	1280	12	7.95	1700
16.5	8.0	1950	12.5	8.0	2000

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—18-22 ozs. (all brushes).

Field Current—3.89-4.31 amperes at 6.0 volts.

Motoring Current—4.08-4.52 amperes at 6.0 volts.

Removal & Belt Adjustment:—Same as above.

GENERATOR (SPEC. PICK-UP & PANEL DLVRY.):—Auto-Lite GCS-4809-A. Armature GCS-2049F. Third brush control in conjuction with non-vibrating type two-charge (Current) regulator. Ventilated by fan on pulley.

Maximum Charging Rate—20 amperes (cold), 8.0 volts, 2000 RPM. Use test meters to check output, connect jumper between fuse cup on regulator and ground (to eliminate regulator action). Remove jumper after completing test. See Regulator data.

Charging Rate Adjustment—Remove commutator cover band, shift third brush by hand counterclockwise to increase, clockwise to decrease output. Do not exceed rated maximum (secured with third brush 1⅔ commutator bars maximum, 1⅔ bars minus 1 mica strip minimum, from nearest (insulated) main brush).

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	500	0	6.4	550
4	6.75	620	4	6.8	700
8	7.1	750	8	7.2	915
12	7.4	925	12	7.6	1200
16	7.7	1200	16.5	8.0	2150
20	8.0	2000			

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—53 ozs. max. (new brushes).

Field Current—3.56-3.94 amperes at 6.0 volts.

Field Fuse—5 ampere (in knurled cup on regulator).

Motoring Current—4.99-5.51 amperes at 6.0 volts.

Removal & Belt Adjustment:—Same as above.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

REGULATOR (GCJ-4811A GEN.):—Model VRR-4004A. Vibrating type voltage regulator (with Cutout Relay) in case.

NOTE—Regulator cover is sealed. Serviced on exchange basis if seals not broken.

See article in Electrical Equipment Section for data.

Cutout Relay

Cuts In—6.4-7.0 volts.

Cuts Out—6 amperes discharge (maximum).

Contact Gap—.015" minimum.

Air Gap—.034-.038" (hinge end of core with contacts open).

Voltage Regulator

Setting—7.3-7.6 volts at 70°F.

To Check (without breaking seal)—Connect ammeter in charging line at regulator 'BAT' terminal, voltmeter between this terminal and ground. Operate generator at speed of 30 MPH. charging battery until voltage is constant. Voltmeter reading should be within limits of 7.3-7.6 volts (Cold—70°), 7.19-7.49 volts (Hot—110°). See article in Electrical Equipment Section for voltages at other temperatures.

To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.

Contact Gap—.012" min. (armature against stop).

Air Gap—.048-.052" with contacts just opening.

CUTOUT RELAY (GAM-4504B GEN.):—Model CB-4025. ***See article in Electrical Equipment Section for data.***

Cuts In—6.5-7.25 volts.

Cuts Out—.5-2.5 ampere discharge current (after charging at 15 amperes).

Contact Gap—.015-.045".

Air Gap—.010-.030" with contacts closed.

REGULATOR (GCS-4809A GEN.):—Model TC-4317A. Two-charge non-vibrating current regulator (in case with Cutout Relay). ***See article in Electrical Equipment Section.***

Cutout Relay

Cuts In—6.5-7.25 volts.

Cuts Out—.5-2.5 ampere discharge current.

Contact Gap—.015-.045".

Air Gap—.010-.030" with contacts closed.

Regulator

Contact Opening Voltage—8.25-8.75 volts at 70°F. NOTE—Unit over-compensated for temperature. ***See Electrical Equipment Section for complete data.***

Contact Closing Voltage—1.2-1.4 volts below opening voltage at same temperature.

Contact Gap—.005" minimum.

Air Gap—.044-.046" with contacts closed.

LIGHTING:—Headlamps—Corcoran-Brown pre-focused double filament type with upper and lower beams controlled by Beam Selector Switch on toeboard.

Headlamp Adjustment—With upper beam lighted and car 25' from screen, aim each headlamp so that beams centered on vertical line directly ahead of lamp center, and upper edge at horizontal line at lamp-center height, with lamp door and lens in place. To adjust, remove door and lens, turn 3 adjusting screws on reflector rim.

Beam Indicator—Red jewel in upper edge of speedometer dial. Lighted when upper beams in use.

Switches

Lighting—Douglas. **Beam Selector**—Douglas.
Instrument—Douglas.
Stop Light—A-L. #100640A (hydraulic type).

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320
Parking	1.5	55
Instrument, Beam Ind.	1	51
Stop & Tail	21-3	1158
Dome, License Plate	3	63

FUSES:—Lighting—20 ampere. On lighting switch.
Generator Field—5 ampere (in knurled cup on regulator). Used on GCS-4809A generator only.

HORNS:—Schwarze. Vibrating, disc type.
Horn Current—10 amperes.

ELECTRICAL EQUIPMENT SECTION

'EE' PAGES

The ELECTRICAL EQUIPMENT SECTION contains the *Complete Separate Treatment* of the Performance, Adjustment, Trouble Shooting and Circuit Diagrams of the SPECIAL ELECTRICAL EQUIPMENT that has been adapted for the modern Automobile.

Often SPECIAL EQUIPMENT is found on cars which was *Not Factory Installed*. Such Equipment is *fully covered* in this section so that no trouble will be experienced in Service Work.

Part No. **Used On:**
91A-10844-B—FORD '85', DELUXE MODEL 91A (1939)
91A-10844-A—FORD MODELS WITH OPTL. 2-BRUSH GENERATOR (1939)
99A-10844 —MERCURY, MODEL 99A (1939)
96H-10844 —LINCOLN-ZEPHYR, MODEL 96H (1939)

DESCRIPTION:—This gauge is a 'hot wire' type voltmeter calibrated to show battery voltage ranges rather than actual volts. It consists of a simple bimetal arm linked to the gauge pointer and wound with a heater wire. The heater wire circuit is controlled by the ignition switch.

OPERATION:—When the ignition switch is turned on, a current flows through the heater wire on the bimetal arm (approximately 1/10 ampere—heater wire resistance is 60 ohms), heating the arm and causing it to bend so that a reading is indicated on the gauge. This gauge reading indicates the line voltage (battery voltage when generator not charging, generator voltage when charging) since the current in the heater wire, and consequent deflection of the bimetal arm, is directly proportional to the voltage at the gauge terminal.

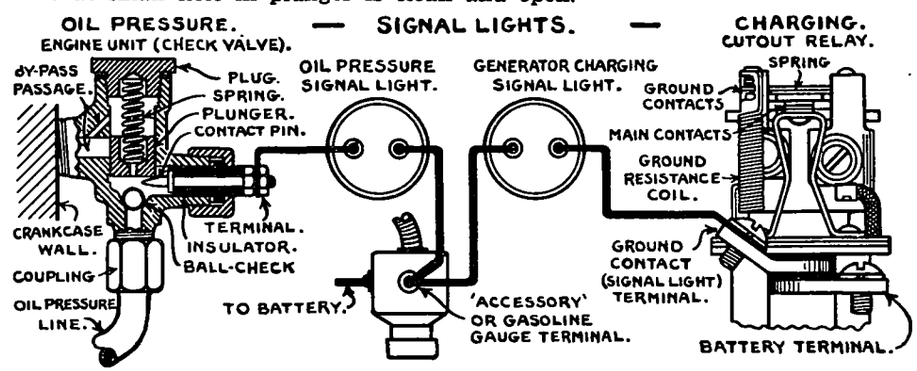
READING THE GAUGE:—See illustration for gauge dial markings. This marking should be interpreted as follows: **Left hand Line Marked 'L'**—2 volts. **Unmarked line to left of 'N' range**—6 volts. If pointer drops below this mark, battery, starter, wiring, and generator should be checked (Performance Test). If pointer is above this 6 volt mark, but below the 'N' range, battery load is greater than generator charging rate and electrical system and generator should be checked. **'N' Range**—This segment indicates the normal line voltage range from 6.75 volts (left hand end) to 8.25 volts (right hand end) and indicates that generator charging rate is in excess of the load. **Right Hand Line Marked 'H'**—9 volts. This voltage is too high and unsafe for lamp bulbs and wiring. Check wiring and generator and correct conditions causing this high voltage.

TESTING & SERVICING:—To check gauge accuracy, connect test voltmeter in parallel with Battery Indicator (connect one test voltmeter lead to battery indicator terminal, ground other voltmeter lead), turn on ignition switch and note if both gauge readings agree (see 'Reading the Gauge' section above for meaning of battery indicator dial markings). Replace defective units.

HUDSON SIGNAL LIGHTS

DESCRIPTION:—These signal lights consist of a Battery Charge Tell-tale and Oil Pressure Tell-tale on the instrument panel which are used instead of gauges to indicate when generator is charging battery and if oil pressure is satisfactory. They are regular lamp bulbs connected to the accessory terminal of the ignition switch (operative only with ignition switch turned 'on') and are controlled by the generator cutout relay and oil line check-valve as described below.

GENERATOR CHARGE TELL-TALE:—The cutout relay is provided with an extra set of ground contacts above the armature and the tell-tale lamp lead is connected to this contact terminal on the relay case. The lamp circuit is completed to ground through these contacts (on some types a resistance is connected between the contacts and ground to protect the contacts and contact spring from damage due to excessive current flow in case the two terminals on the relay case are shorted as this would throw the entire battery voltage across the contacts).



Operation:—The ground contacts are normally closed with the main contacts open and open when the main contacts close. When the ignition is turned on, the tell-tale lamp lights and remains lighted until the main contacts close and the generator begins to charge the battery. The lamp should not remain lighted after the car speed is brought up beyond the cut-in point (8-10 M.P.H.).

Trouble Shooting:—If the tell-tale lamp does not light when ignition is turned on, ground tell-lamp lead terminal on relay case. If lamp does not light, replace bulb. If lamp lights, examine ground contacts and see that they are closed. Check contact mounting spring. If tell-tale lamp does not go out at speeds above cut-in point, examine ground contacts and see that they open when main contacts close. See separate article on Auto-Lite Cut-out Relays. Check generator performance by connecting accurate test ammeter in charging circuit.

OIL PRESSURE TELL-TALE:—The oil line check valve on the right side of the crankcase is provided with an insulated terminal pin which is grounded by the check-valve plunger when no pressure exists in the oil line. The oil pressure tell-tale lamp lead is connected to this terminal. A small hole in the check-valve plunger and a by-pass in the body allow the passage of sufficient oil so that the plunger alternately opens and closes the circuit at idling speeds, causing the tell-tale lamp to flash.

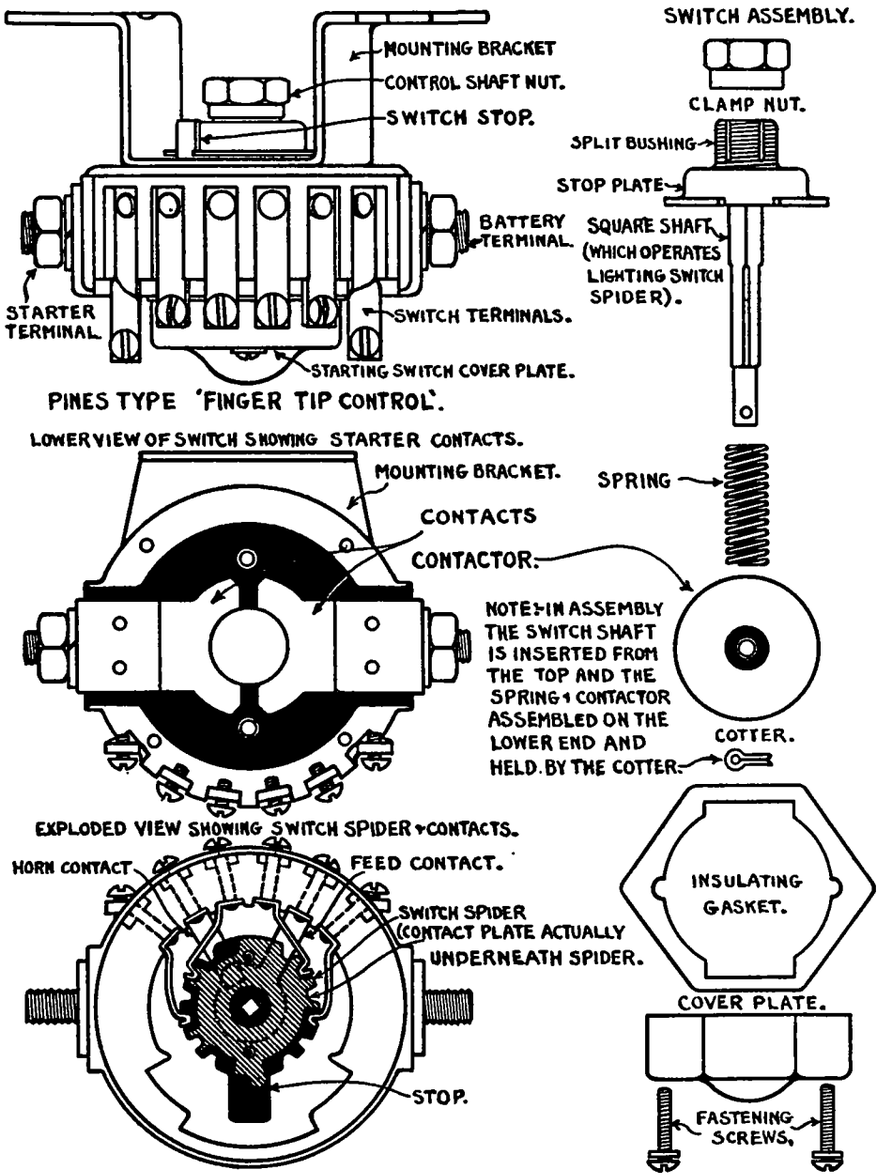
Operation:—The plunger rests normally against the pin when no pressure exists in the oil line so that the tell-tale lamp will light when the ignition is turned on. At idling speeds the plunger alternately opens and closes the circuit so that tell-tale lamp flashes. At speeds above idling (approximately 7 M.P.H.), the oil pressure holds the check-valve plunger off its seat so that the tell-tale lamp does not burn or flash.

Trouble Shooting:—If the tell-tale lamp does not light when the ignition is turned on, ground check-valve terminal to engine. If lamp does not light, replace bulb. If lamp does light, remove terminal pin and see that it is straight and clean. Take off plug on top of check-valve housing, remove plunger and see that it is clean and moves freely up and down. Examine spring above plunger. If tell-tale lamp does not flash at idling speeds, see that small hole in plunger is clean and open.

FINGER TIP CONTROL

DESCRIPTION:—The Pines Type 'Finger Tip Control' consists of a starting switch, lighting switch, and horn button combined in a single unit which is designed to be mounted at the lower end of the steering column and controlled by a button on the steering wheel. The starting switch is operated by lifting the button slightly, the horn circuit is closed by depressing the button, and the various lighting circuits are completed by rotating the button. There is no electrical connection between the starting switch unit and the lighting and horn control unit, which permits an ammeter to be placed in circuit to show the discharge current. The two terminals on the side of the unit are the starting switch terminals and one terminal should be connected to the car battery. The lead for the generating and lighting circuits should be taken from this terminal. The other starting switch terminal should be connected directly to the starting motor. The six lighting switch terminals are grouped on the front of the switch. These terminals should be connected as follows (left to right facing the bottom of the switch):

1. Headlight (High Beam—lower filament).
2. Lead—Connect to ammeter through fuse or circuit breaker.
3. Tail—Tail light. On some cars, the dash light is taken off also.
4. Park—Parking bulbs, fender lights or side lights.
5. Horn—This is the horn feed lead. The other horn terminal is grounded.
6. Headlight (Low or depressed beam—upper filament).



The lighting switch terminals terminate in switch fingers within the switch housing (see exploded view of switch). These switch fingers rest on the notched edge of the switch spider which carries a contact plate on its lower surface. This contact plate bears against the circular plate connected to the 'Lead' terminal and is kept in contact with it by a spring under the plate. The horn terminal contact is directly under this contact plate and they are brought together whenever the control shaft is pushed downward.

The switch control shaft extends through the switch housing to the starting switch housing on the lower end of the switch. The starting switch terminals terminate in two semi-circular copper contacts. A circular contactor is mounted on the lower end of the control shaft below these contacts and is normally separated from them by a spring on the control shaft above the contactor. When the control button is lifted up, this spring is compressed by the upward movement of the control shaft and the contactor completes the circuit between the two starting switch contacts. The contactor is insulated from the control shaft.

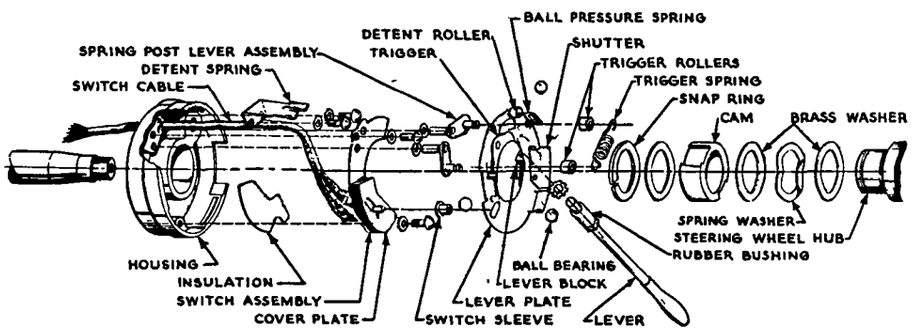
MOUNTING:—The switch is fitted with a universal mounting bracket so that it can be mounted on the steering column or on the chassis frame at the lower end of the column. The control shaft upper end is fitted with a slotted bushing and lock nut and grips the control tube in the steering column when the lock nut is tightened. To remove the switch, first disconnect battery cable and tape to prevent short-circuits. Then disconnect starter cable and all lighting lines. Loosen the lock nut on the upper end of the control shaft. Then take out bolts or screws in mounting bracket. The switch can be removed by pulling it straight downward until the control tube slips out of the control shaft bushing.

SERVICING:—The starting switch contacts can be examined by taking off the lower cover plate. To remove cover plate, take out the two screws and lift off the plate and insulating gasket. The contactor on the control shaft can be removed by taking out the cotter pin in the lower end of the shaft. The spring, which will come off with the contactor, must be replaced when the switch is reassembled. If the control shaft is removed, it must be replaced so that the slot in the stop plate is against the stop when the lug on the switch spider is against the stop on the switch body. To secure this result, insert the control shaft and turn the switch spider as far as possible in one direction. Then remove shaft and assemble so that the stop on the top of the switch body prevents the shaft from turning any further in that direction.

The cover plate over the lighting switch spider is riveted in place and it is not practical to attempt any repairs to the lighting switch unit. If tests through the lighting switch with a voltmeter or lamp and test points indicate that the lighting switch is defective, it should be replaced with a new unit.

BUICK TYPE

Std. Equipment On:



BUICK SERIES 40-40, 50, 60, 70, 80, 90 (1940)

DESCRIPTION:—Direction signals consist of a special 21 cp. filament combined with the parking lamp in the Front Fender Lamps (front of car), separate bulbs illuminating red arrows on trunk cover (rear of car), and pilot bulbs illuminating green arrows on instrument panel. Control switch is built in steering wheel housing with switch handle directly below steering wheel. Flasher unit is mounted in back of instrument panel.

Control Switch—Consists of a bakelite movable member supported on ball bearings, and a lever plate carrying the trigger release and operating handle which is also mounted on ball bearings. This plate is held in one of three positions—'Left', 'Off', 'Right'—by a roller which engages a detent spring in the switch housing. Switch cam is assembled on lower end of steering wheel hub within switch housing (retained by locking ring) with spring washer assembled between brass washers to form a friction clutch for the cam which prevents jamming or locking of the wheel in case of switch failure.

Wiring Diagram—See Buick wiring diagram on 'T&E' page for complete Direction Signal circuit wiring and fuse data.

OPERATION:—Switch is operated manually to indicate a turn, and is turned off automatically by the steering wheel movement when the turn is completed (switch can also be turned off manually if desired). If turn is made in opposite direction than that for which the switch has been set, switch is turned off automatically as the turn is begun. Switch handle should be moved in same direction as wheel is rotated for the intended turn (move handle up for left turn, down for right turn).

Control Switch—When switch is operated to indicate a turn, circuit is completed through flasher unit to right or left Front Signal Light, Rear Signal Light, and Pilot Light. If pilot light on instrument panel does not flash when switch operated, check all bulbs (pilot light will not flash if front or rear signal bulbs burned out). Operation of the switch also presses the spring-loaded pawl or trigger on the lever plate against the notched cam on the steering wheel hub. When the steering wheel is moved in the same direction to turn the car, the trigger ratchets over the notch in the cam, however when the wheel is turned in the opposite direction after the turn has been completed, the trigger engages the cam notch and the switch is carried around to the off position. The trigger is then released so that the switch is ready for further operation.

ADJUSTMENT:—Important Note—Steering wheel must be installed so that lower spoke points straight down with wheels in straight ahead position (see Saginaw Steering Gear article for servicing directions). Whenever steering wheel removed or installed, direction signal switch lever must be placed in 'off' position to prevent damage to switch assembly.

To Adjust Switch—With correct adjustment, automatic release will occur only when wheel returned to center position after being rotated at least one-third revolution. To adjust switch, set switch lever for Right Hand Turn, turn steering wheel to right until first click is heard or slight movement felt in switch lever after right hand spoke on steering wheel has passed lower center position. Hold switch lever down firmly and turn steering wheel back slowly until right hand spoke is approximately 2" past or to right of lower center position, release switch lever and return wheel to straight ahead position which will return switch to off position. This adjustment causes switch cam to shift on steering wheel hub by slipping the friction clutch. No further adjustment is required for left turn switch release (positioning cam for right turn release as above will automatically regulate left return release also).

SERVICING:—Disassembly—Make certain that switch lever set in 'off' position, remove steering wheel. Switch will then be accessible for inspection and servicing. To correct complaints of switch getting out of adjustment (adjustment changing in service), check tension of crimped steel spring washer assembled between two brass washers on steering wheel hub above switch cam). Pressure of 85-100 lbs. should be required to flatten washer to height of ⅛". Replace spring washer if pressure is less than this amount. See illustration for correct assembly of switch cam washers and other switch parts.

DIRECTION SIGNAL LAMPS & FUSE:—See Buick 'T&E' page for complete data.

CADILLAC TYPE

Optional Equipment On:

CADILLAC, V8 SERIES 40-60S, 62, 72, 75; V16 SERIES 40-90 (1940)

LA SALLE, V8 SERIES 40-50, 52 (1940)

IMPORTANT PRODUCTION CHANGE:—Rear Signal bulbs changed. Direction Signals will not operate if wrong type bulb installed. See Signal Lamp & Fuse section below for data.

DESCRIPTION:—Direction Signals consist of a special 21 cp. filament combined with the parking lamp in the front Fender Lamps (front of car), separate bulbs in Rear Lamp (at rear of car), and an indicator lamp on the control switch which flashes while the signal is in operation. Control switch is mounted on left hand side of steering column below steering wheel and flasher unit is mounted in back of instrument panel.

Wiring Diagram—See Cadillac and La Salle wiring diagrams on 'T&E' pages for complete Direction Signal wiring circuits, Lamp Bulb and Fuse data.

OPERATION:—Switch is operated manually and control lever should be pressed 'up' for Right Turn, 'down' for Left Turn. When switch operated, circuit is completed through flasher unit to right or left Front & Rear Signal Lights and pilot light on switch also flashes. If pilot light does not flash, check for burned out or incorrect type bulbs (see Rear Signal Lamp Caution below). Switch must be turned off manually after turn is completed and pilot bulb on switch serves as a warning that signals are operating.

DIRECTION SIGNAL LAMPS & FUSE:—See Cadillac & La Salle 'T&E' pages for data. **Important Rear Signal Lamp Caution**—Two types of bulbs have been used in Rear Signal Lamp as follows: **First Cars**—32 cp. single contact type bulb used in single contact type socket. **Later Cars**—21 cp. filament of a No. 1154 21-3 cp. bulb used in a double contact socket (3 cp. filament not used). CAUTION—Flasher will not operate if any other than correct type bulb used on each car (flasher units specially calibrated for each of the above lamp types and will not operate if bulbs interchanged).

HUDSON TYPE

Optional Equipment On:

MODELS 40T, 40P, 41, 43, 44, 45, 47, 48 (1940)

DESCRIPTION:—Direction Signals consist of a special 21 cp. filament combined with the parking lamp (double filament bulb) in the Bonnet Panel Lamps (front of car), and the Stop Lights at the rear of car (stop light switch is hooked up to Direction Signal Switch so that both stop lights operate in usual manner when brake applied, one lamp only flashes when direction signal switch operated to indicate a turn). The control switch is mounted on the steering column directly below the steering wheel and has three buttons—'L' left turn, 'off' center, 'R' right turn—and an indicator bulb under a jewel below the center button which flashes while the signals are operating.

Wiring Diagram—See Hudson wiring diagrams on 'T&E' pages for complete direction signal circuit wiring and fuse data.

OPERATION:—Control is operated manually and 'L' (left) or 'R' (right) button is pressed to indicate a turn. This completes circuit through flasher, and Front & Rear Signals and indicator bulb on switch flash until the center 'off' button of the switch is pressed which releases the operating button and turns the switch off. If indicator bulb does not flash when switch operated, check for burned out bulbs.

SERVICING:—Indicator Bulb Replacement—Switch cover retained by screws concealed under button on switch case. To remove cover, pull buttons off, remove screws located on flat terminals under buttons, lift switch cover off. Take out mounting screws in switch and lift switch out. Indicator bulb and switch can then be inspected and serviced.

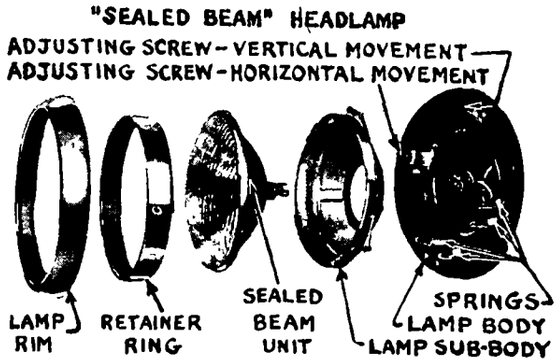
DIRECTION SIGNAL LAMPS & FUSE:—See Hudson 'T&E' pages for data.

SEALED BEAM HEADLAMPS

REPLACEMENT NOTE:—Two types of Sealed Beam Lamp Units are available for replacement: (1) Composite Type with metal reflector and glass lens (has conventional lamp bulb assembled in unit) and (2) All Glass Type with hard glass reflector and lens (no lamp bulb used, filaments mounted directly on reflector). ***Both types and all makes are fully interchangeable on all 1940 car models with Sealed Beam Headlamps.***

DESCRIPTION:—Sealed Beam Headlamps, as used on 1940 car models, consist of a reflector, lens, and lamp filaments assembled as a single sealed unit. This excludes all dirt and moisture so that the original effciency of the lamp is retained throughout the life of the filaments. When replacement is required, the entire sealed beam unit is discarded and a new unit is installed. No attempt should be made to disassemble the sealed beam unit.

NOTE—Sealed Beam Headlamps used on all 1940 cars except Bantam, Crosley, Graham, Hupmobile, and Willys.



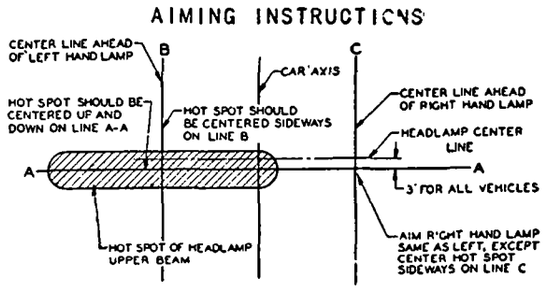
OPERATION:—Sealed Beam lamps have double "bar" type filaments (filaments parallel and slightly offset so that lower "Traffic" beam deflected slightly toward right side of road) with an upper "Country Beam" of 40-45 watts intensity and a lower "Traffic Beam" of 30-35 watts (these lamps not rated by candlepower but upper beam is approximately 50% brighter than former 32 cp. headlamps). Beams are controlled by a Beam Selector Switch on the toeboard in the usual manner.

INSTALLATION & REMOVAL:—On all cars, a sub-body or housing is provided in the headlamp for the sealed beam unit mounting. This sub-body is retained in the headlamp by the two adjusting screws and by two sets of two springs which are hooked to the sub-body diametrically across from each screw. The sealed beam unit seats directly in the sub-body and is positioned by three heavy lugs which fit into slots in the sub-body. A retainer ring is fitted over the outer edge of the sealed beam unit. This retainer ring has three lugs which engage three clamp screws on the sub-body rim so that the retainer ring and sealed beam unit are securely clamped in place when the clamp screws are tightened (on some cars a gasket is used between the retainer ring and the sealed beam unit). A lamp rim which fits over the retainer ring in such a manner as to conceal the clamp screws and adjusting screws completes the assembly.

Removing Sealed Beam Units—Remove headlamp rim (retained by one or more screws and clips). Loosen, but do not remove, three clamp screws which engage retainer ring lugs (use care not to turn adjusting screws located at top and one side of lamp). Rotate retainer ring counter-clockwise until lugs disengage from clamp screws, lift retainer ring off. Pull sealed beam unit out to disengage lugs from slots in sub-body, disconnect cable plug from clips on sealed beam unit.

Installing Sealed Beam Units—Terminal clips on sealed beam units and cable plug are designed so that plug can be connected only in correct position. Plug terminals (facing end of plug) are as follows:

Left Side—Upper Country Beam. **Center (Top)**—Lower Traffic Beam. **Right Side**—Ground wire connected to lamp sub-body or lamp housing. When installing new sealed beam unit, connect plug, see that sealed beam unit lugs properly engage slots in sub-body, install retainer ring and rotate ring clockwise until lugs on ring engage under clamp screw heads on sub-body, tighten clamp screws securely. Then adjust headlamps as directed below.



ADJUSTMENT:—All sealed beam lamp units are "prefocused" type so that the only adjustment required is to aim the lamp beam for correct horizontal and vertical position.

Headlamp Adjustment (All Cars)—Use conventional headlamp adjusting screen with vertical lines drawn directly ahead of each lamp center-line and horizontal line drawn 3" below and parallel to lamp center-line. Place car at 25 feet distance from screen, turn on lights and make certain that Upper Country Beam (lower filament) is lighted. Aim each headlamp as follows:

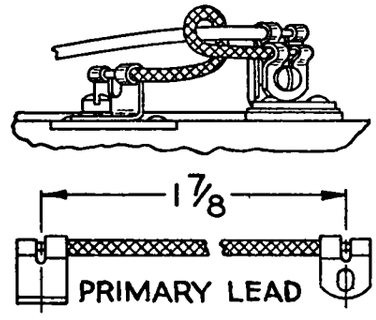
Horizontal Adjustment—With headlamp rim removed, turn adjusting screw at one side of lamp sub-body (do not confuse with retainer ring clamp-screws) until hot spot is centered on vertical line directly ahead of this lamp. Adjust other headlamp in same manner (both lamps aimed straight ahead).

Vertical Adjustment—With headlamp rim removed, turn adjusting screw at top or bottom of lamp sub-body (do not confuse with retainer ring clamp-screws) until hot spot is centered on horizontal line 3" below lamp center height. IMPORTANT—Beam may be directed downward as required by state laws, but should never be aimed higher than 3" below lamp center height.

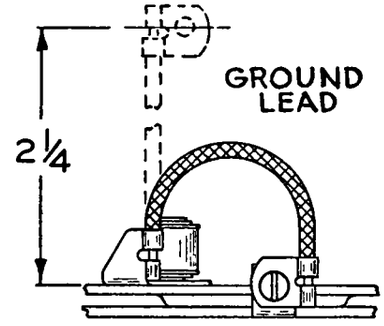
SERVICING ALL 'IGS' AND 'IGT' TYPES

'POOR IGNITION' COMPLAINTS:—May be caused by breaking of strands within flexible breaker plate leads (these leads flexed by rotation of breaker plate when vacuum unit advances spark). Examine both primary (contact) lead and ground lead carefully for broken strands or replace both leads with new type (see below).

NEW TYPE IGNITION LEADS:—May be identified by color (Red with Black or Yellow Tracer—old leads were Black with red or orange tracer). These leads have several strands of steel piano wire which support the copper strands and distribute flexing action throughout entire length of the lead (this prevents flexing being centered at one point which caused breaking of strands in old type leads). Part Nos. for new leads as follows:



New Type Lead	Replaces Old Lead
IGS-59A	IGS-59
IGT-11A	IGT-11
IGT-14A	IGT-14

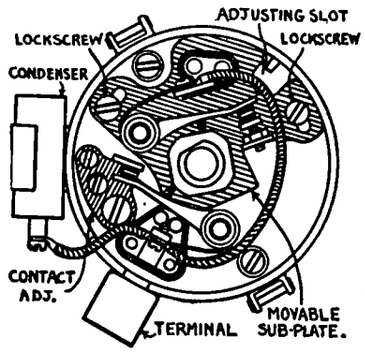


IGNITION LEAD INSTALLATION & CHANGES:—Leads must be properly installed to prevent any contact or close proximity to rotor which may allow secondary current to short-circuit through these leads. See illustration for correct primary and ground lead lengths and installation. This new IGS-59A lead (1⅞" plus ⅛", minus 0") was installed on all distributors after October 1, 1937 (approximate). Earlier distributors with longer lead should be changed as follows:

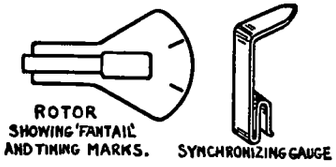
Primary Lead Changes:—On distributors before Oct. 1, 1937 with IGS-59A (Red with black or yellow tracer) leads which were 2½" (plus ⅛", minus 0") long, these leads should be shortened to 1⅞" by cutting off one terminal and section of wire and securely soldering new terminal in place. See illustration for correct installation of lead.

Ground Lead Changes:—On all distributors with long ground lead (may be identified by right angle clip at breaker arm pivot pin end and vertical mounting of clip on breaker plate at opposite end), this lead should be shortened by cutting off terminal clip and section of wire so that length with new terminal (IGS-56) is 2¼"—see illustration. Make certain that terminal is securely soldered to lead. New type leads (of correct length) have flat terminal at breaker arm pivot pin end and opposite end is mounted horizontally on breaker plate.

CORRECT BREAKER PLATE INSTALLATION:—Maximum vacuum advance is determined by size of hole cut in breaker plate which registers with small tongue on sub-plate. Correct breaker plate can be identified by number stamped on upper side of each breaker plate which indicates maximum vacuum advance in distributor degrees. Refer to Vacuum Advance table on each car model 'T&E' page for maximum vacuum advance (last figure in 'Distributor Degree' column), see that this figure corresponds with figure stamped on breaker plate in distributor used on that particular car model. Some breaker plates are identical except for this vacuum advance limiting slot and it is important that correct breaker plate be installed.



TYPE 'IGH' SYNCHRONIZATION

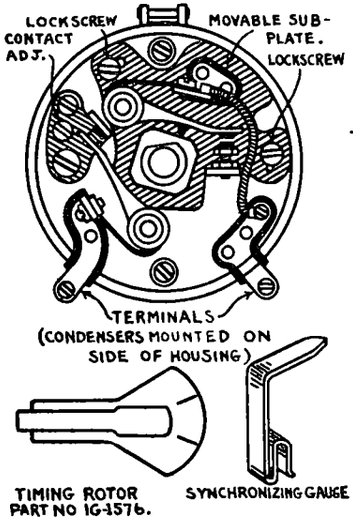


DESCRIPTION:—The two sets of contacts on the Type IGH distributors are connected in parallel to the breaker terminal on the distributor housing. The condenser is mounted on the side of the case. Only one ignition coil is used and the primary circuit is broken by the two sets of contacts alternately. For this reason it will be necessary to use a special synchronizing tool to establish the correct relation between the contacts.

CONTACT ADJUSTMENT:—Breaker contacts separate .020-.024 inch. This gap should be maintained at all times. To set contact gap (fixed contacts mounted on base plate), loosen the two lock screws on the stationary contact mounting plate and turn eccentric adjusting screw until correct gap is secured with breaker arm rubbing block on lobe of cam. Then tighten the lock screws. The other set of contacts (mounted on movable breaker plate) are adjusted by loosening lock nut on stationary contact mounting stud and turning up stud. Tighten the lock nut after making the adjustment. It is important that the contact gap of each set of contacts should be the same. Use a feeler gauge to accurately determine the gap.

TIMING DISTRIBUTOR TO ENGINE:—Distributor is timed to the engine in the usual manner by cranking engine over until piston No. 1 reaches firing position and then loosening the advance arm clamp bolt and rotating the distributor housing and breaker assembly until the contacts open. The correct firing position of the piston and full directions for each installation will be found on the car model pages.

SYNCHRONIZATION OF CONTACTS:—Connect a six volt test lamp between the primary terminal inside the breaker housing and ground (snap the other test lamp lead on the distributor case). Block open the second set of contacts (mounted on movable breaker plate) with a piece of cardboard. Then turn on ignition and slowly crank engine over until the first set of contacts open as indicated by the lighting of the lamp. If this position is accurately determined the backlash in the gears will be sufficient to open and close the contacts and the lamp should go out as the distributor shaft is rocked. Place rotor button on distributor shaft. It will be noted that rotor is built with a 'fantail' marked with two lines. These lines are exactly 45 degrees apart (distributor degrees) and represent the firing interval of the distributor. Clamp the special synchronizing gauge (Auto-Lite Part No. ST-206 on the side of the distributor case so that the pointer of the gauge is directly opposite the leading line (determined by direction of rotation of the distributor) n the fantail. Then carefully crank engine over 90 degrees until the second line on the fantail is directly opposite the synchronizing gauge. Remove the insulation from between the breaker contacts and block open the first set in the same manner. If the lamp lights when the second line on the fantail is opposite the gauge the distributor contacts are correctly synhronized. If it does not, loosen the two lock screws on the movable breaker plate and turn the eccentric adjusting screw until the contacts open and the lamp lights. Tighten the lock screws.



AUTO-LITE

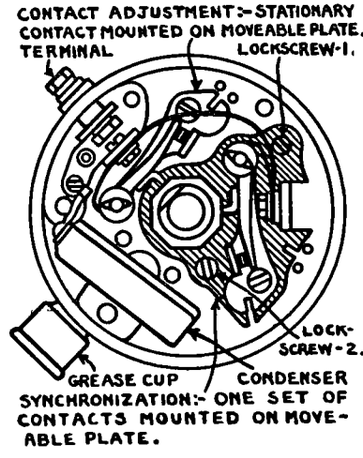
TYPE IGJ

DESCRIPTION:—This type distributor is used in conjunction with two coils, each coil controlled by one set of contacts. There is no electrical connection between the two breakers although they operate on the same cam. It is very important to synchronize these contacts as the ignition of one half the entire number of cylinders will be thrown off if the contacts are allowed to get out of synchronization.

CONTACT ADJUSTMENT:—Breaker contacts separate .020-.024 inch. Set contact gap by loosening lock nut on stationary contact mounting stud and turning up stud until correct gap is secured with breaker arm rubbing block on lobe of cam. The other set of contacts (mounted on fixed base plate) are adjusted by loosening the two lock screws on the stationary contact mounting plate and turning the eccentric screw. Tighten the lock screws. The contact gap should be the same on both sets and a feeler gauge should be used to accurately set contacts.

SYNCHRONIZATION OF CONTACTS:—Connect a six volt test lamp across each set of contacts. It will not be necessary to block open one set of contacts since they are electrically separate. Crank the engine over slowly until the contacts (mounted on stationary base plate) begin to open and the lamp lights with the igniton turned on. Then place the special 'Master Timing Rotor,' Part No. IG-1576, on the shaft and clip the synchronizing gauge, Part No. ST-206, on the edge of the case opposite the leading mark on the fantail of the rotor. Carefully crank the engine over until the second mark is directly opposite the gauge. If the second lamp does not light at this point, indicating that the second set of contacts are opening, loosen the lock screws on the movable breaker plate and turn the eccentric adjusting screw until the contacts begin to open. With the correct adjustment the back lash in the gears will be sufficient to open and close the contacts and the lamp should light and go out as the distributor shaft is rocked. The regular production rotor used on these distributors will be equipped with timing marks and it will only be necessary to use the special master timing rotor on the early equipment.

NOTE:—All production rotors furnished as car equipment will be equipped with the fantail and timing marks. However, rotors have been used without these marks. It is possible to secure special rotors to use in timing these distributors from the Auto-Lite Company. These are known as "Special Master Timing Rotors" and carry the regular production rotor part number IG-1576.



NORTH EAST

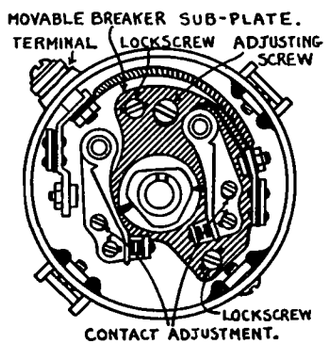
PACKARD TYPES

DESCRIPTION:—These distributors are designed for eight cylinder engines and have two sets of contacts operating on an eight lobe cam. Contacts must be synchronized so as to open at the same instant in order to distribute the ignition load equally. If one set of contacts opens early, it will have no effect on the timing, which will be determined by the second set of contacts, but this second set will carry all the ignition load and will consequently wear more rapidly than would be the case if the contacts were properly synchronized. Contacts should be synchronized whenever the contacts are resurfaced and synchronization should be checked whenever the ignition timing is checked or set.

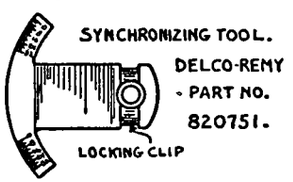
CONTACT ADJUSTMENT:—Contact gap should be set at .020 inch. Set contact gap by loosening the lock nut on the stationary contact mounting stud and turning up the stud until the gap is .020 inch with breaker arm rubbing block on lobe of cam. On the new type distributor (new Packard equipment) the stationary contact is carried on a moveable sub-plate. The lock screw on this plate should be loosened and the plate shifted by inserting the point of a screwdriver in the slot in the end of the plate and prying sideways on the screwdriver. Tighten the lock screw after making the adjustment.

SYNCHRONIZATION OF CONTACTS:—**First Type.** Distributors of this type were constructed with both breaker arms and contact assemblies mounted on a plate which was constructed with .020 inch clearance in the distributor cup. To synchronize contacts, loosen the lock screws on the breaker plate and shift the entire plate within the distributor cup until both contacts open simultaneously.

Second Type. Distributors of this type were constructed with one set of contacts mounted on a movable sub-plate. To synchronize contacts, loosen the two lock screws on the sub-plate, insert the point of a screwdriver in the slot in the plate and pry the plate to one side. Two small pins in the base-plate are designed to be used as fulcrums for the screwdriver. Tighten the lock screws after making the adjustment. The synchronization can be checked as part of the timing operation (see next paragraph.



TIMING DISTRIBUTOR TO ENGINE:—The synchronization can be accurately and easily checked while the distributor is being timed to the engine by using one set of contacts at a time. First block open the second set of contacts (mounted on the movable sub-plate) with a piece of cardboard or fiber insulator and proceed with the timing operation, using a test lamp to check the contact opening. Then change the insulator to the first set of contacts and repeat the timing operation except that the distributor advance plate clamping screw should be loosened and the plate shifted until the second set of contacts begin ot open. Check the contact gap after synchronization has been completed.

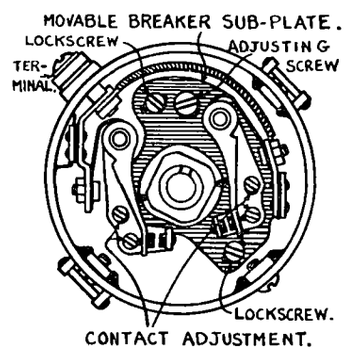


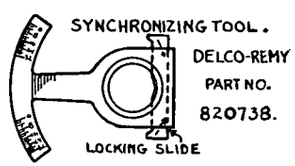
TYPES 650, 656, 659

DESCRIPTION:—These types are designed for use n six cylinder engines. They are fitted with two sets of contacts operating on a three sided cam. Contacts open alternately (one set opening an instant before the other set closes) at intervals of 60 degrees which corresponds with the 120 degree firing interval of the engines on which they are designed to be used. The two sets of contacts control the same coil and are connected in parallel in the primary circuit of the ignition system. All these types are identical in principle and are synchronized in the same manner although they differ in constructional details.

CONTACT ADJUSTMENT:—Contacts should be set at .022 inch and must be held within limits of .018-.024 inch at all times. Set contact gap by loosening lock screw on stationary contact mounting plate (located directly behind breaker arm) and turning eccentric adjusting screw until correct gap is secured with breaker arm rubbing block on lobe of cam. This must be done before attempting to synchronize contacts. If the synchronizing operation affects the setting sufficiently to throw the gap outside the limit of .018-.024 inch it must be reset at .022 inch and the synchronization repeated.

SYNCHRONIZATION OF CONTACTS:—A special tool has been developed to synchronize contacts. This is Delco-Remy Part No. 820751. To synchronize contacts, remove distributor head and rotor. Set contact gaps. Then place the synchronizing tool on shaft so that the 'A' side of the spring rests in the slot on the shaft (clockwise distributors) or the 'B' side of the spring rests in the slot (counter-clockwise distributors). Rotate the distributor shaft until the graduations on the leading tool scale approach the slot in the distributor housing. Connect a six volt test lamp in series with the coil primary and turn on the ignition. Continue to turn the shaft until the lamp goes out, indicating that the contacts have opened. Note the scale graduation which is in line with the edge of the slot. Then continue to turn shaft until the same figure on the other scale is opposite the same edge of the slot. This will indicate that the distributor has been turned through 60 degrees and the lamp should go out at this point, indicating that the second set of contacts has opened. If it does not, loosen the lock screws on the movable breaker plate on which this set of contacts is mounted and turn the eccentric adjusting screw until the contacts begin to open. Tighten the lock screws and check the contact opening. It must be within limits of .018-.024 inch. If outside these limits, reset at .022 inch and repeat synchronization. If the slot cannot be used as a reference mark, a mark may be made on the edge of the distributor housing opposite the '0' mark on the scale when the first set of contacts open. The tool is graduated in engine degrees. Contacts must be synchronized within two degrees or one graduation on the tool.



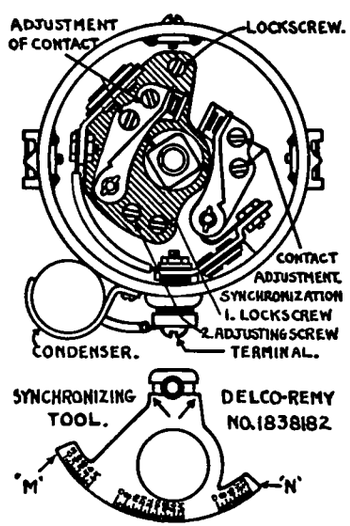


TYPES 651, 652, 657, 658

DESCRIPTION:—These types are designed for use on eight cylinder engines. They are fitted with two sets of contacts on a four sided cam. The contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engines on which they are used. Both sets of contacts control the same coil and they are connected in parallel in the primary circuit of the ignition system. Both contacts must be open to secure a spark at the spark plug. This is accomplished by designing one set of contacts to close immediately after the other set opens. All these types operate on the same principle although they differ in constructional details.

CONTACT ADJUSTMENT:—Contacts should be set at .022 inch and must be held within limits of .018-.024 inch. Set contact gap by loosening lock screw on stationary contact mounting plate (directly behind breaker arm) and turning eccentric adjusting screw until correct gap is secured with breaker arm rubbing block on lobe of cam. Tighten the lock screw. This must be checked before the contacts are synchronized.

SYNCHRONIZATION OF CONTACTS:—A special Delco-Remy synchronizing tool, Part No. 820738, has been developed for this purpose. To synchronize contacts, remove distributor head and rotor and check contact gap. Then place synchronizing tool on shaft and lock it in place by pushing the slide through from the side. The slide is marked with an arrow at each end. One arrow will be visible when the tool is locked on the shaft and the slide should be locked so that the visible arrow points in the direction of distributor rotation. Turn the distributor shaft until the contact set mounted on the base plate begins to open when a six volt test lamp, which should be connected in series in the primary circuit, will go out. Carefully note the reading on the leading scale at a point directly opposite the edge of the terminal plate slot in the distributor housing. Then continue to turn the distributor shaft until the same point on the other scale is opposite the same slot edge on the housing. This will indicate that the shaft has been turned through 45 degrees and the lamp will go out, indicating that the second set of contacts are opening if they are properly synchronized. If the lamp does not go out at this point, loosen the two lock screws on the movable breaker plate and turn the eccentric adjusting screw until the contacts begin to open. Tighten the lock screws and check the contact gap. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

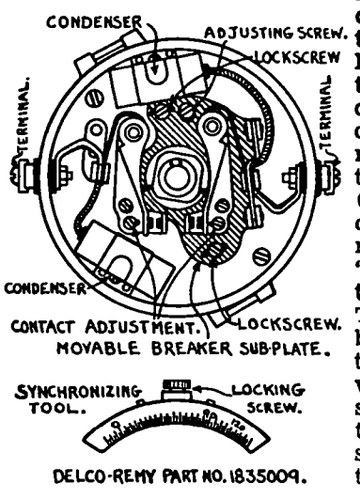


TYPES 660 AND 662

DESCRIPTION:—This type distributor is designed for use on eight cylinder engines. It is fitted with two sets of contacts operating on a four sided cam. The contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engines on which it is used. Both sets of contacts are connected in parallel in the primary circuit of the ignition coil. One condenser mounted on the side of the distributor shaft housing is used for both contacts. The breaker arms are designed so that one set of contacts closes immediately after the other set opens which provides a longer period of time for building up the coil primary current. Both sets of contacts must open to secure a spark at the plugs.

CONTACT ADJUSTMENT:—Contacts should be set at .022 inch and must be held within limits of .018-.024 inch. Set contact gap by loosening the lock screw on the stationary contact mounting plate (directly behind the breaker arm) and turning the eccentric adjusting screw. The breaker gap must be measured with the breaker on the lobe of the cam. Tighten the lock screw. Contacts can be resurfaced when necessary with a fine flat contact file or on a medium hard oilstone. The contact gap must be set before the contacts are synchronized and should be checked after the synchronization has been completed. If synchronizing has affected the gap sufficiently to throw it outside the limits of .018-.024 inch, reset the gap at .022 inch and repeat the synchronization.

SYNCHRONIZATION OF CONTACTS:—A special Delco-Remy synchronizing tool, Part No. 1838182, has been developed for use in synchronizing contacts on Type 660 distributors. Place the synchronizing tool in position on the upper end of the distributor shaft with the spring on the left or 'M' side of the tool in the slot in the cam (if the distributor rotates clockwise) or with the right or 'N' side of the spring in the cam slot (if the distributor rotates counter-clockwise) and connect a test lamp or ammeter in the primary circuit and turn on the ignition so that an accurate check of the contact opening can be made. Then turn the distributor shaft in the direction of rotation until the first set of contacts (mounted directly on the breaker plate—the so-called stationary contacts) begin to open. Note the reading on the center scale which is directly in line with the leading edge of the slot in the distributor housing. Continue to turn the distributor until the same reading on the 'N' side of the scale (for clockwise distributors) or the 'M' side of the scale (for counter-clockwise distributors) is in line with the same edge of the distributor housing slot. Then loosen the two lock screws on the movable sub-plate (on which the second set of contacts are mounted) and turn the eccentric adjusting screw until the contacts begin to open. Tighten the lock screws and check synchronization by turning the distributor shaft through a complete revolution and again noting scale readings as contacts open. The variation must not be greater than 2 tool graduations which corresponds to 2 degrees of crankshaft rotation. The contact gap must be checked after synchronizing contacts. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.



TYPE 668

DESCRIPTION:—This type distributor has two sets of contacts operating on a four sided cam. Contacts open alternately at intervals of 45 degrees which corresponds with the 90 degree firing interval of the eight cylinder engines on which the distributor is designed to be used. Each set of contacts is fitted with a condenser and there is no electrical connection between the two sets. The distributor is used with two ignition coils and each set of contacts controls one coil, firing four cylinders of the engine. The synchronization of the contacts is very important in that the timing of four cylinders will be thrown out if the contacts are allowed to get out of synchronization and the engine performance will be unsatisfactory.

CONTACT ADJUSTMENT:—Breaker contacts should be set at .022 inch and must be held within limits of .018-.024 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until correct gap is secured with breaker arm rubbing block on lobe of cam. Tighten the lock screw. Contacts can be resurfaced when necessary with a fine flat contact file or on a medium hard oilstone. The contact gap must be set before the contacts are synchronized and should be checked after the synchronization has been completed. If synchronizing has affected the gap sufficiently to throw it outside the limits of .018-.024 inch, reset the gap at .022 inch and repeat the synchronization.

SYNCHRONIZATION OF CONTACTS:—One set of contacts is mounted on the base plate while the second set of contacts is mounted on a movable breaker plate. To synchronize contacts, first connect a six volt test lamp in series with each primary circuit. Then remove distributor head and turn distributor shaft until the first set of contacts begin to open when the lamp will go out. Clip the special synchronizing tool, Delco-Remy Part No. 1835009, on the edge of the distributor housing so that the '0' mark on the scale is opposite the leading edge of the rotor contact (for clockwise distributors) or with the '90' mark on the scale opposite the rotor (counter-clockwise distributors). Then turn the distributor shaft until the same edge of the rotor contact is opposite the '90' mark (if the '0' mark was used) or opposite the '0' mark (if the '90' mark was used for initial reference). This will indicate that the distributor shaft has been turned through 45 degrees and if the contacts are in synchronization the second lamp will go out at this point, indicating that the second set of contacts have begun to open. If the lamp does not go out, loosen the two lock screws on the movable breaker plate and turn the eccentric adjusting screw until the contacts begin to open. Tighten the lock screws and check the contact gap. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization. The tool is graduated in engine degrees. The allowable variation in contact synchronization is 2 degrees or one graduation on the tool.

MODEL R & S DISTRIBUTORS

NOTE:—Models R and S distributors are same design except that Vacuum Spark Control (see data below) is fitted on Model R only.

DESCRIPTION:—Furnished in 4, 6, and 8 cylinder types. These distributors have Mallory double contact system and special features as follows:

Contacts—Each distributor has two sets of contacts, each set being operated independently by an "L" shaped breaker arm. One set of contacts is used to load the ignition coil (this set close first and open first), the other set of contacts being used to time the ignition (this set opens last—see Ignition Timing below). No synchronization is necessary and no means is provided to change the relation of the two breaker arms.

Distributor Cap—Spark is distributed by a special type rotor arm which has a "wiping" action. Spark plug cables are inserted through a rubber pad which is compressed when the bakelite cap is tightened down so moisture is excluded from the cable terminals.

Governor Advance Weights—New design mounted in pairs (4 used) so that rolling action secured between weights. Springs are linked between governor advance plate (outer ends) and subplate which is loose on shaft but having pins which engage notches in cam mounting plate (inner ends).

INSTALLATION:—Distributors furnished with correct advance characteristics for each particular engine. Sub-assemblies also furnished from which distributors may be built up for any desired specifications.

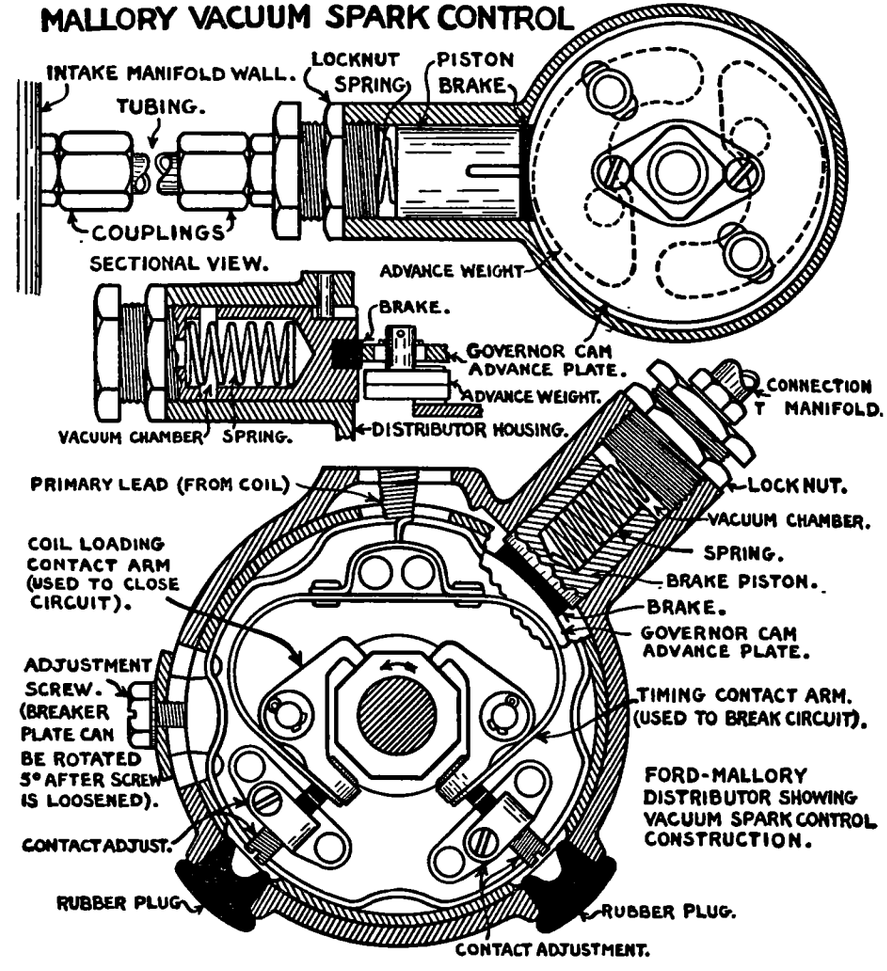
BREAKER CONTACTS:—**Contact Gap**—Should be set at .012" (both sets alike). **Contact Adjustment**—Loosen lockscrew on stationary contact mounting bracket and turn stationary contact stud (outer end slotted for screwdriver).

TIMING:—Contact assemblies on breaker plate are stamped "LH" and "RH". When timing engine at firing point for #1 cylinder, set distributor so that "RH" contacts are just opening (distributors with clockwise rotation), "LH" contacts just opening (distributors with counter-clockwise rotation). Rotation is indicated by arrow on top of breaker cam. NOTE—The other set of contacts will open first, but timing is controlled by contacts opening last as indicated above.

MALLORY VACUUM SPARK CONTROL

NOTE:—Vacuum Spark control mechanism shown in illustration (single piston) is type used on Ford distributor and early Mallory models. On Model R, same design is used but two vacuum pistons are located at 180° on distributor housing. Both cylinders are connected to the vacuum port on the distributor by a channel cast in the housing. Vacuum spark control is not adjustable on this model.

DESCRIPTION:—The Mallory Vacuum Spark Control consists of a mechanical brake operated by the vacuum in the intake manifold of the engine which tends to retard the governor cam advance plate in its rotation and so counteract the effect of the automatic advance governor under certain conditions of engine operation.



The Vacuum Spark Control consists of a piston in a cylinder in the side of the distributor housing. This piston has on its inner end a brake shoe which bears against the edge of the governor cam advance plate and is kept in contact with the plate by a spring behind the piston. The outer end of the cylinder behind the piston forms the vacuum chamber and is connected to the intake manifold of the car engine by tubing (see diagram for sectional view of entire assembly).

OPERATION:—Whenever the vacuum in the manifold is high, as when the engine is idling or being operated under light load with the throttle closed, the vacuum behind the piston will allow the brake piston and brake shoe to move out (away from the governor cam advance plate) against the spring. The governor cam advance plate is then controlled solely by the centrifugal advance weights and the spark will occur at a point determined by the speed of the engine (the advance in degrees will of course depend upon the particular curve for which the distributor has been designed).

Whenever the engine is accelerated or is being operated under heavy load with the throttle open, the vacuum in the manifold will decrease sufficiently so that the spring will force the piston in toward the governor cam advance plate, engaging the brake shoe with the edge of the plate. This drag on the governor cam advance plate tends to counteract the advancing action of the centrifugal weights so the spark occurs later than would otherwise be the case. At extremely high speeds when the vacuum in the manifold is low, the centrifugal force of the advance weights will be sufficient to overcome the effect of the brake so that no retarding of the spark occurs.

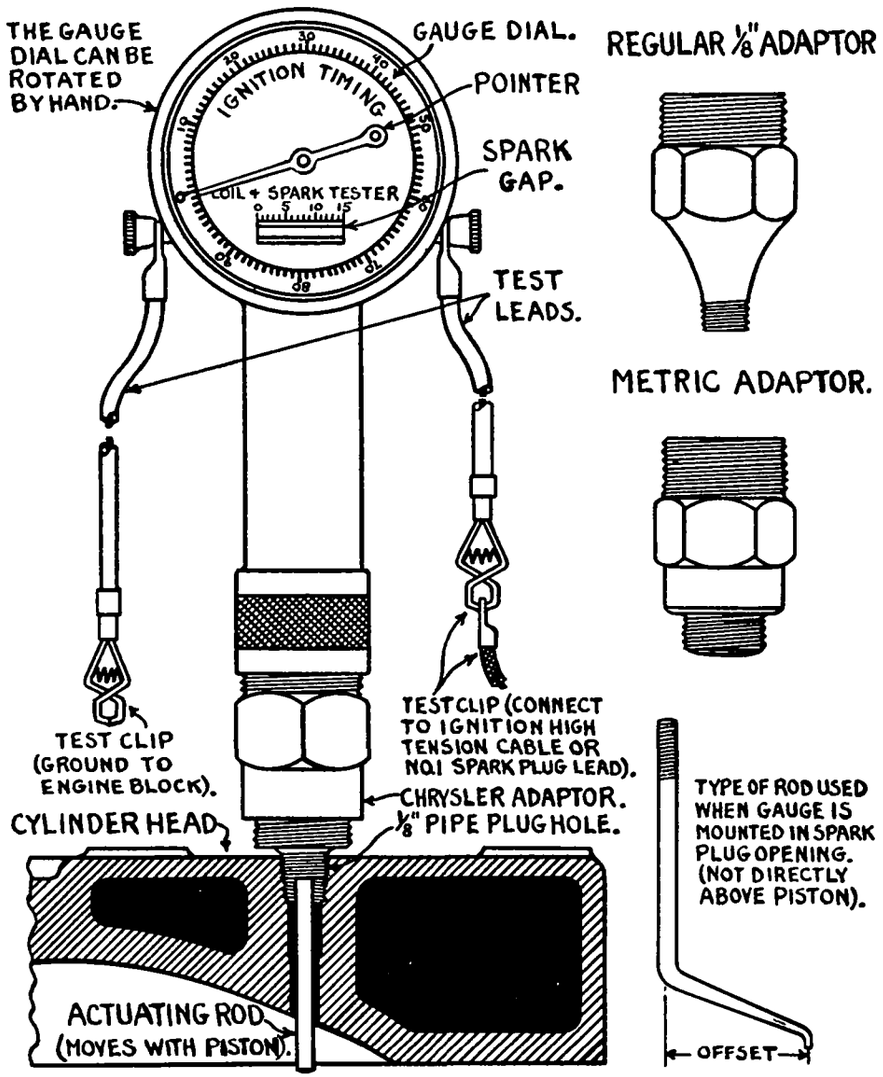
The Vacuum Spark Control has the effect of providing two distinct advance curves for the distributor, a relatively rapid advance for engine operation at light loads, and a slower advance for operation under heavy loads. It also provides a retard when the engine is suddenly accelerated, preventing spark knock. In operation the intake manifold vacuum will be high enough to keep the brake disengaged most of the time. With standard setting the brake begins to engage when the manifold vacuum falls to 10 inches (mercury column) and the full force of the brake is only applied when there is no vacuum in the manifold, as when the engine is operated with wide open throttle or under heavy load at low speeds.

ADJUSTMENT (FORD TYPE):—Spring tension adjustable by loosening nut on the end of the cylinder and changing the position of the adjusting nut. If the engine pings on acceleration or with heavy load, the locknut should be loosened and the adjusting screw turned in just enough to eliminate the ping. NOTE—No adjustment provided on Model R.

FORD-MALLORY DISTRIBUTOR SHOWING VACUUM SPARK CONTROL CONSTRUCTION.

TIMING GAUGE

DESCRIPTION:—The timing indicator is a special micrometer gauge with a direct reading dial which is designed to be mounted on the cylinder head to measure the piston travel directly in thousandths of an inch.



OPERATION:—The operating piston of the gauge is contained in the shaft which is designed to be screwed into the spark plug port in the cylinder head or in the opening in the cylinder head closed normally by a ⅛ inch pipe plug on engines where this plug is provided (the plug will usually be found in the cylinder head directly over No. 6 piston). Special adaptors for use with ⅞ inch S.A.E. spark plug, ½ inch pipe thread, 18 MM. Metric thread and the ⅛ inch pipe plug openings are furnished with the gauge. These adaptors are used in connection with rods which rest on the head of the piston and move with it and thus actuate the gauge piston. Straight rods are used when the gauge is mounted in the ⅛ inch opening directly over the piston and offset rods must be used when the gauge is mounted in the spark plug port which is not directly over the piston head. The gauge is calibrated in thousandths of an inch and one complete revolution of the indicator hand registers .100 inch. The limit of travel of the gauge is six complete revolutions of the indicator or .600 inch and care must be taken when the gauge is used that the rod does not engage the piston more than .6 inch before top dead center.

IGNITION SETTING, USING GAUGE:—In timing the distributor to the engine, first crank the engine over until piston to be used in timing is on compression stroke (see specific car data sheet—the piston used may be No. 1, No. 4 or No. 6). Take out the spark plug or remove the ⅛ inch pipe plug in the cylinder head. Clean the carbon off the cylinder head. This is very important. Assemble the correct adaptor and rod on the gauge and screw the adaptor into the cylinder head. Turn engine over very slowly and see that the gauge indicator does not make more than six revolutions before top dead center. With the piston on top dead center set the gauge dial at zero. Connect the high tension lead from the coil to one of the spark gap terminals on the gauge. Ground the other gauge terminal to the engine and turn on ignition. Turn engine over until, with piston approaching top dead center on compression stroke, the gauge reading indicates the firing position (see car data sheet).

SYNCHRONIZATION OF CONTACTS, USING GAUGE:—The timing gauge can be used to synchronize contacts on distributors using double breakers if it is not desired to use the regular synchronizing tools. To synchronize contacts on a six cylinder engine (distributors with two sets of contacts opening alternately at intervals of 60 degrees corresponding to 120 degrees of crankshaft rotation) after the distributor has been timed to the engine, crank the engine over 180 degrees until the piston again approaches top dead center on the exhaust stroke and repeat the timing operation.

In synchronizing contacts on eight cylinder engines (with two sets of contacts opening alternately at intervals of 45 degrees corresponding to 90 degrees of crankshaft rotation) it will be necessary to move the timing gauge to the next firing cylinder after the distributor has been timed to the engine and repeating the timing operation.

This gauge is Chrysler tool No. DC-150. It is manufactured by the Joseph Weidenhoff Company of Chicago.

SYNCHROSCOPE (NEON LIGHT) IGNITION TIMING

DESCRIPTION:—This device consists of a Neon light which is clipped to #1 spark plug terminal so that the light flashes whenever the spark plug fires. When this light is used to illuminate the flywheel timing mark by being directed at the flywheel housing inspection hole, it gives a stroboscopic effect so that the timing mark appears to be standing still while the engine is being idled. This allows the ignition timing to be checked and set with the engine running.

OPERATION:—Clip one Synchroscope lead terminal to #1 spark plug terminal (on Buick cars with spark plugs covered by shield, disconnect #1 cable at distributor, clip one lead to this cable, insert other lead in #1 terminal on distributor cap). Ground the other Synchroscope lead to the engine. Remove cover plate over inspection hole in flywheel housing, mount Synchroscope so that light is directed at flywheel, inspect flywheel ignition mark (if mark is not distinctive and is likely to be confused with others, fill in mark with white paint or chalk so as to be easily discernible). Start engine and allow to idle at specified speed (do not exceed this speed). If flywheel mark does not appear to be opposite pointer or reference line on flywheel housing, loosen distributor clamp bolt and advance or retard spark until mark is directly in line with pointer. Tighten clamp bolt and remove Synchroscope.

SERVICING IGNITION COILS

BEFORE 1935:—The coil assembly can be serviced either by replacing the entire unit or by disconnecting the coil and replacing the coil or the switch and cable assembly. The entire unit should first be taken off the car by disconnecting the switch leads and removing the switch from the instrument board mounting and removing the ignition coil from the dash mounting. Then bend up the ears that hold the cup on the end of the cable in place on the coil. This will expose the primary terminal at the base of the coil. Disconnect primary lead in the cable from this terminal, connect the new coil and bend down the ears so that the new coil is securely held on the cable.

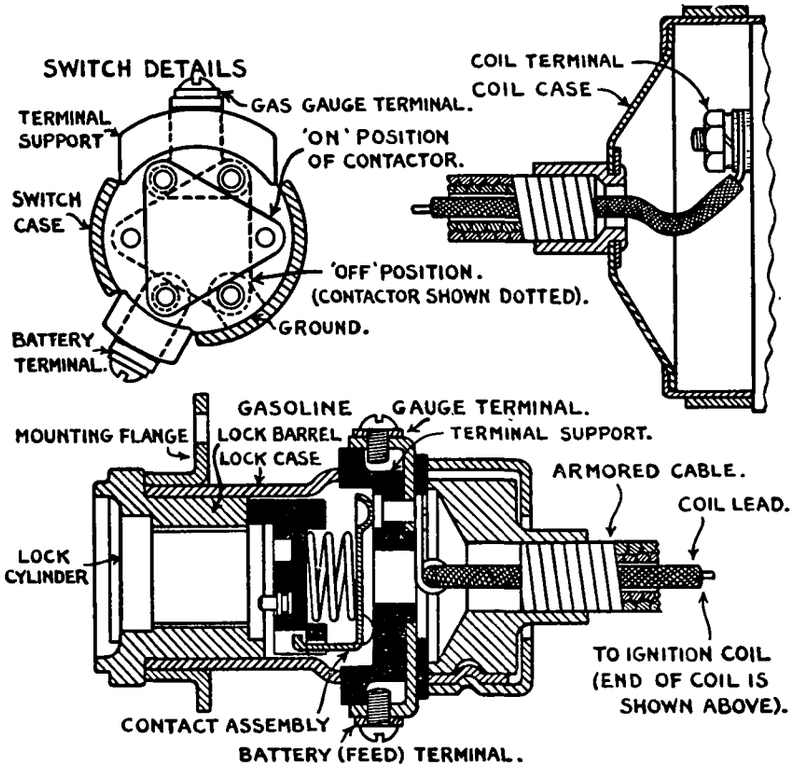
AFTER 1935:—The cable cap on end of the coil is held in place by two small tangs which lock in 'L' shaped grooves similar to the bayonet socket locking principle of light bulbs. A large flexible tang on the cap snaps into a groove on the coil case when the cap is assembled to prevent the reverse turn which is necessary to free the cap. Use special tool with thin flexible blade (Oldsmobile No. J-726) to free tang. To disconnect coil, insert blade of tool between coil case and cap at a point approximately 1" to right of cable outlet on cap. The tool will press the large tang out of the groove in the coil case. Then turn cap counter-clockwise until it can be withdrawn. Disconnect coil lead wire at terminal on bottom of coil case.

1. Coil Primary Shorted. Check current draw of coil. If current exceeds 6 amperes at 6 volts, coil is probably shorted.

2. Coil Primary Grounded. See Test (4) under Trouble Shooting above. Test from coil terminal on case to ground (unpainted surface of case). Lamp should not light.

3. Coil Secondary Grounded. Test from secondary terminal of coil to ground on coil case. Use 110 volt test lamp. Lamp should not light with coil disconnected from switch.

TYPES 428, 429, 430



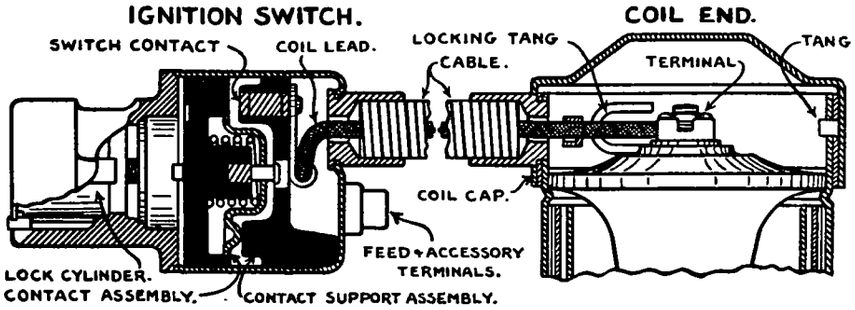
DESCRIPTION:—These ignition locks differ from previous designs in that the primary lead or 'feed' wire from the switch to the coil is armored instead of the breaker lead. The breaker lead from the coil is not taken through the switch but is connected directly to the distributor.

OPERATION:—On this type switch the lock cylinder does not spring out and the turning of the key completes the ignition and gasoline gauge circuits. The key cannot be removed with the switch on. The gasoline gauge terminal and ignition coil are grounded with the switch turned 'off'.

TROUBLE SHOOTING:—Circuits through the switch should be tested with a lamp and test points to determine if the switch is operating satisfactorily. In making the following tests place the test points on the points indicated and note whether the lamp lights or not.

1. Switch off. Disconnect feed wire on switch. Test from feed terminal to to gasoline gauge terminal. Lamp should not light.
2. Switch off. Disconnect feed wire on switch. Test from gasoline gauge terminal to switch case or armored cable. Lamp should light.
3. Switch on. Disconnect feed wire on switch. Test from gasoline gauge terminal to feed terminal. Lamp should light.
4. Switch on. Disconnect feed wire from switch. Test from feed terminal to breaker terminal of ignition coil. Lamp should light. If lamp does not light and previous test indicated switch circuit was satisfactory, coil should be disconnected and tested separately (see next paragraph).
5. Switch on. Disconnect feed wire from switch and block open breaker contacts or disconnect breaker lead at coil. Test from feed terminal on switch to switch case. Lamp should not light. If lamp lights, the switch, coil lead or ignition coil are grounded. Disconnect coil and test separately.

SERVICING COIL:—Coil can be disconnected and tested or replaced separately. See preceding page for complete data.



TYPES 431, 432, 435

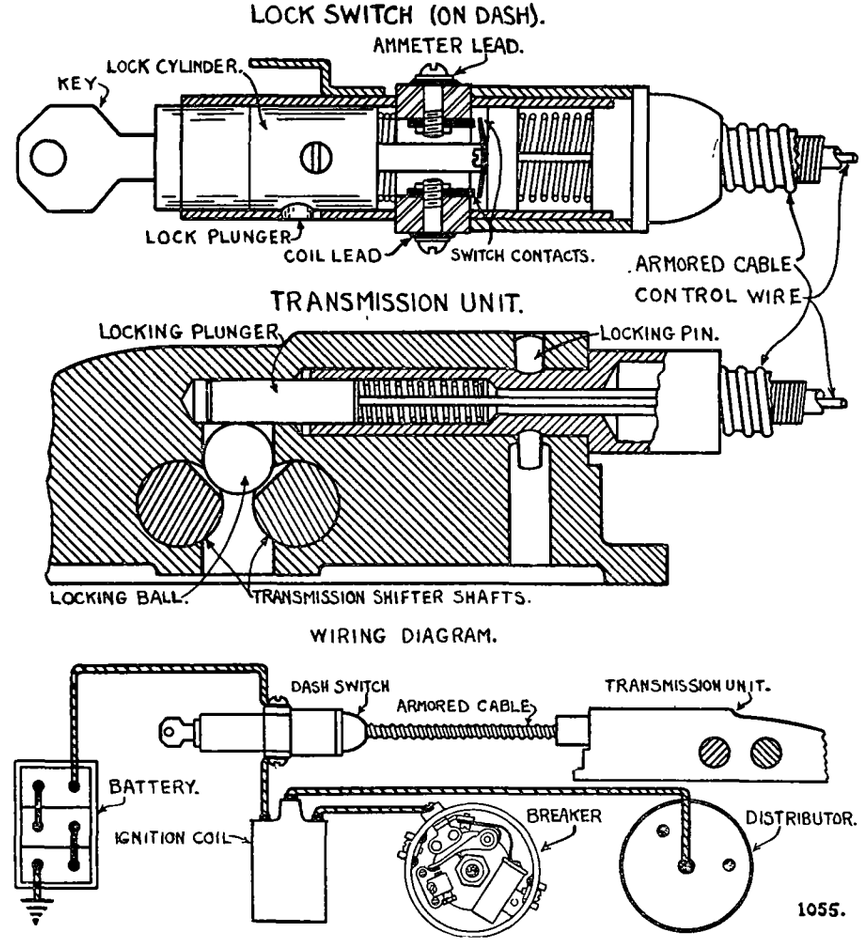
DESCRIPTION:—This type switch is similar to previous designs in that the ignition coil lead from the switch is enclosed in an armored cable so that the coil can be mounted at a distance from the switch, usually on the engine block or engine side of the dash. An accessory terminal is provided on the switch for the gasoline gauge connection. The method of mounting the cable end cap on the ignition coil is new (see directions below for disconnecting ignition coil).

TROUBLE SHOOTING:—Circuits through the switch can be tested with a test lamp and battery or other current source and test leads as follows: In each case test leads should be connected at points indicated and it should be noted whether test lamp lights or not.

1. Switch Off. Disconnect feed wire on switch. Test from feed terminal on switch to gasoline gauge or accessory terminal. Lamp should not light.
2. Switch On. Disconnect feed wire on switch. Test from feed terminal to gasoline gauge terminal. Lamp should light.
3. Switch On. Disconnect feed wire on switch. Test from feed terminal to breaker terminal on ignition coil. Lamp should light. If lamp does not light and previous test indicated that switch circuits were satisfactory, disconnect coil (as directed below) and test separately.
4. Switch On. Disconnect feed wire from switch and block open breaker contacts or disconnect breaker lead at coil. Test from feed terminal on switch to switch case. Lamp should not light. If lamp lights; switch, coil lead or ignition coil are grounded. Disconnect coil and test separately.

SERVICING COIL:—See directions on preceding page for coil disassembly.

NOTE:—These switches used as standard equipment on the following car models:



Car Model and Year	Switch Type Number
Cadillac 452 (1930-31)	426-T, 426-U (RHD.
Cadillac 355, 370 (1931)	426-P
Cadillac 355B, 370B, 452B (1932)	426-T, 426-U (RHD.)
Cadillac 355C, 370C, 452C (1933)	426-T
La Salle 345 (1931)	426-P, 426-M (RHD.)
La Salle 345B (1932), 345C (1933)	426-T
Nash 960 (1931), 8, 9, 10, 1170 (1931-33)	425-S
Nash 8, 9, 10, 1180 (1931-33)	425-S
Nash 8, 9, 10, 1190 (1931-33)	425-S
Nash 1220 (1934)	425-U
Nash 1280, 1290 (1934)	425-V
Stutz LA, LAA (1931-32-33)	426-J, 426-K

DESCRIPTION:—The Delco-Remy Dual Lock is a co-incidental ignition switch lock and transmission lock. It consists of an ignition switch and lock mounted on the dash and connected through a flexible control wire with a transmission lock on the transmission case cover. The control wire is protected by an armored steel cable throughout the entire distance between the dash switch and the transmission. This makes it impossible to tamper with the lock action and prevents operation of the tranmission with the switch locked. The ignition switch is fitted with a tumbler lock and acts as a straight ignition switch connected between the battery and the ignition coil.

OPERATION:—The dash switch unit is shown in sectional view in the illustration. When the ignition key is inserted in the lock and turned to unlock the ignition, the spring behind the lock cylinder forces the lock cylinder and the cup on the forward end of the control wire (which fits in a recess in the rear of the lock cylinder) forward withdrawing the locking plunger in the transmission case cover. This permits the locking ball to move upward freeing the transmission shafts and permitting the transmission to be operated. The movement of the control wire assembly in the lock case on the dash permits the spring behind the contacts to force the contactor block forward and close the circuit between the two switch terminals. One of these terminals is connected to the ignition coil and the other is connected to a 'hot' terminal in the car circuit usually the ammeter. When the lock cylinder is pressed in to cut off the ignition and stop the engine, the movement of the control wire assembly positively opens the switch contacts and forces the locking plunger across the top of the locking ball which in turn is forced down into the grooves of the transmission shifter shafts. The transmission must be in neutral (first switch types) to operate the lock. On later models a second locking position was provided with the transmission gears in 'reverse' so that the car could be parked in gear on hills.

SERVICING DUAL LOCK:—The Dual Lock should not be disassembled for service or repair. When it is necessary to service these locks, the key and lock assembly should be taken off and assembled in a new conduit and tube assembly. To test for switch performance, disconnect both lines at switch terminals and test circuit through switch with a lamp and test points. Place one test point on each terminal. With the switch locked the lamp should not burn. With the switch unlocked the lamp should burn. To remove Dual Lock from car, first disconnect switch assembly on dash. Unlock lock cylinder and remove. On the first type switch, the lock cylinder was not connected to the control wire assembly. On the second type, the cup on the forward end of the control wire was pinned to the lock cylinder and it will be necessary to drive out this pin through the hole in the case. Then remove transmission case cover and drive out lock retaining pin. The locking plunger assembly can then be withdrawn.

DELCO-REMY DUAL-LOCK

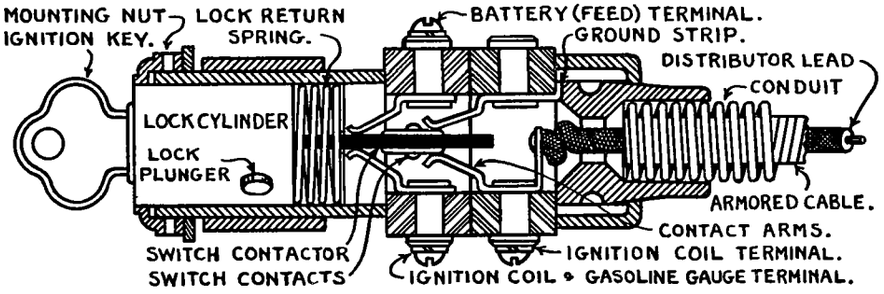
DELCO-REMY ELECTROLOCK

DESCRIPTION:—The Electrolock is an ignition switch mounted on the dash and connected to the distributor housing terminal through an armored steel cable. The breaker lead from the coil is taken through the switch and then to the distributor through this cable which is fastened to the distributor by a special non-removable clip connection. The breaker is grounded through the switch case when the switch is in the 'Off' position. This absolutely prevents tampering with the car when the ignition is locked since it is impossible to wire around the switch.

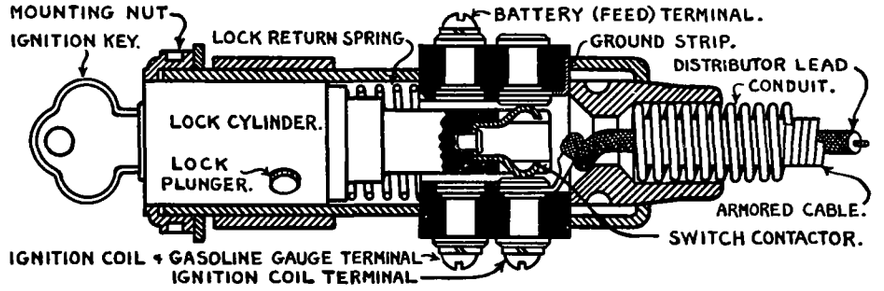
OPERATION:—The dash switch consists of a tumbler lock cylinder mounted directly in front of a spring in the lock case. The switch contact is mounted on the rear of the lock cylinder. When the key is inserted in the lock and turned to the right as far as possible, the lock is released and the lock cylinder is forced out by the spring closing the switch contacts and breaking the ground connection. The key may then be removed. To turn off the ignition, the lock cylinder is pressed in. This opens the switch, grounds the distributor and locks the ignition. It is only necessary to make certain that the lock cylinder remains in the 'In' position and that the lock has snapped. This feature makes it impossible for the driver to neglect to lock the switch.

TROUBLE SHOOTING:—To test the Electrolock for possible ignition trouble, first disconnect wire on Electrolock case leading to coil. Turn the distributor shaft until contacts open or block open contacts with a piece of cardboard or any insulating substance. Then make the following tests with a lamp and test points:

1. Place one test point on the terminal stud inside the distributor housing and place the other test point on the terminal on the side of the Electrolock case from which coil lead was disconnected (one terminal type) or on the battery terminal (three terminal type). With the switch unlocked, the lamp should be lighted. With the switch locked, the lamp should not light.



2. Place one test point on the distributor terminal stud as in test (1) and place the second test point on the switch case. With the switch locked the lamp should burn. With the switch unlocked the lamp should not burn. If the lamp burns with the switch unlocked the condenser may be shorted or grounded. Disconnect the condenser and repeat the test. If these tests indicate Electrolock is operating satisfactorily, check coil, breaker contacts, distributor, spark plugs and wiring. If tests indicate trouble in Electrolock, disassemble as directed in the following paragraph.



3. Place one test point on battery terminal (three terminal type only), place the second test point on each of the other terminals in turn (coil and gasoline gauge terminals). With the switch unlocked, the lamp should be lighted. With the switch locked, the lamp should not light.

DISASSEMBLY OF ELECTROLOCK:—Remove mounting nut with a spanner wrench and remove switch assembly from dash. Then unlock the switch and depress the plunger in the elongated slot in the side of the case. Then remove the contact assembly and inspect. In reassembling switch make certain that the retainer washer which holds the lock return spring in position does not touch either of the switch contacts. Assemble contact assembly so that the small tang on the side next to the lock cylinder is opposite the terminal screw. This tang fits into a hole on the end of the lock cylinder. On the three terminal type see that the tang on the contact finger base registers with the hole in the lock cylinder. To install this type lock cylinder in the barrel, apply pressure on key in direction key is turned to unlock switch, depress lock plunger, insert lock cylinder in barrel so that plunger lines up with elongated slot in lock barrel.

SERVICING DISTRIBUTOR:—To remove the distributor to the bench for service, remove the Electrolock from the dash and remove distributor from the engine as directed on the car data sheet. Then take entire distributor and Electrolock off the car. To remove Electrolock from the distributor, use special Electrolock wrench Part No. 829034 to remove square nut on terminal stud inside the distributor housing. On the Chevrolet distributor (on which this type Electrolock is standard equipment), it will first be necessary to turn the distributor shaft until advance weight mounting plate studs are 90 degrees from terminal stud, remove the three screws mounting the breaker plate and tilt the breaker plate down on the side nearest the

THREE TERMINAL TYPE.

terminal stud. The breaker arm must be slid up on the pin at the same time. Then remove the square nut and pull the Electrolock cable and stud assembly straight out. To remove the stud from the cable, use the special wrench to loosen the retainer nut in the end of the ferrule. A new locking washer must be used in reassembling. The various parts of the ferrule and stud assembly are illustrated in proper positions. Assemble these parts in order as shown. It will be necessary to remove the Electrolock from the distributor to replace the condenser and it is advisable also in replacing breaker arms.

NOTE—All switches manufactured by the Mitchell Specialty Company and designed to be connected to the distributor by armored cable are known as Electrolocks. Later types connected to ignition coil are known as Mitchellocks. See following section for Mitchellock application list and complete data.

TYPE 5

DESCRIPTION:—The Electrolock is an ingnition switch mounted on the dash consisting of a lock cylinder in a steel case which is connected to the distributor housing terminal by an armored cable. The breaker lead from the coil is carried inside the cable which is fastened to the breaker terminal by a special design non-removable clip connection. This absolutely prevents tampering with the ignition circuit and prevents the car being started with the ignition turned off since the breaker is grounded through the Electrolock case and through the distributor attachment.

To unlock Electrolock, insert key in lock cylinder and turn ¼ turn to right. The lock cylinder will spring out closing the ignition switch. The key should then be removed since it is not necessary to lock the ignition. To turn off ignition, press lock cylinder in and make certain that it does not spring out again. This will turn off ignition, ground the breaker and lock the Electrolock itself to the car.

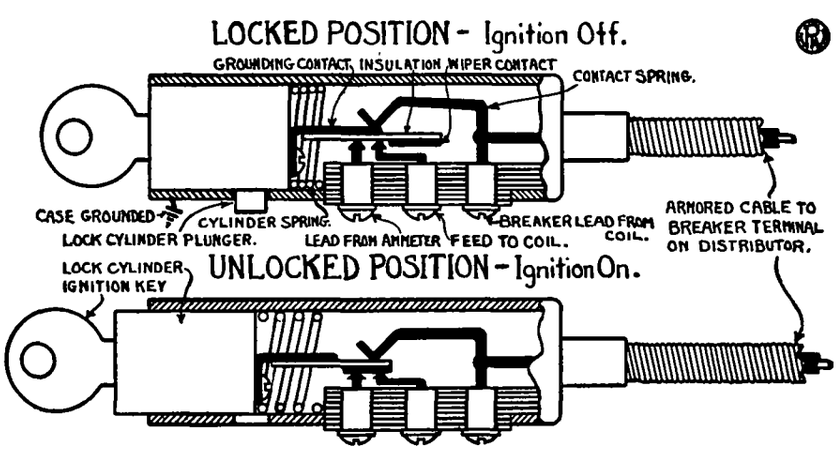
Connections:—The Type 5-B Electrolock has three connections on the side of the case. The ignition feed wire from the ammeter is connected to the terminal nearest the front or lock cylinder end of the case. The ignition coil lead and all accessories such as gasoline gauges or temperature indicators are connected to the middle terminal. The breaker lead from the coil is connected to the third terminal and the breaker circuit is completed through the armored cable to the terminal on the side of the distributor housing.

Servicing Distributor:—To remove distributor from car, unlock Electrolock, disconnect wires from side of case and remove Electrolock from mounting on dash. Then remove distributor from engine as directed on car data sheet. Lift out entire distributor and Electrolock assembly and remove to bench for distributor tests or repairs.

Trouble Shooting on Car:—Disconnect all wires on side of lock case and block open distributor contacts with a piece of cardboard or turn cam until contacts open. Then make following tests with six volt lamp circuit and test points:

(1) Place one test point on the primary terminal inside the distributor and place the second test point on the lock case. With the switch locked the lamp should burn. With the switch unlocked the lamp should not burn.

(2) Place one test point on the primary terminal inside the distributor and place the second test point on the No. 2 (or center) terminal of the switch. Unlock the switch, push the lock cylinder in half way and release it. The lamp should not light during this movement of the lock cylinder.



(3) Place one test point on the lock case and place the second test point on the No. 3 (or last) terminal. With the switch locked the lamp should burn. With the switch unlocked the lamp should not burn. If the lamp burns the Electrolock is grounded or the condenser is shorted or grounded. Disconnect condenser and repeat test.

If these tests indicate Electrolock is operating satisfactorily look for ignition trouble in the coil, breaker, distributor or spark plugs. If tests indicate trouble in the Electrolock, disassemble, examine and repair Electrolock as directed in the following paragraph.

SERVICING ELECTROLOCK:—Unlock Electrolock and remove from dash mounting. Disconnect all wires from case. Then take out small set screw on side of lock case and take out lock cylinder. Remove the coil spring directly behind the lock cylinder and pull out metal wedge holding bakelite terminal block in position. With terminal screws removed, the part of the bakelite piece in which the terminal screws are located can be pushed into the lock casing and the lock casing can then be slid back on the cable allowing the switch to be inspected. Any trouble in the switch due to broken parts can then be discovered. New parts for replacement can be obtained and the lock repaired.

If the lock cylinder does not work freely because of dirt in the lock case, the lock cylinder should be removed and cleaned off. Do not put oil or grease in the lock cylinder. If tumblers stick use graphite. In assembling Electrolock make certain that all terminals are insulated down to the screw heads to avoid possibility of short circuits.

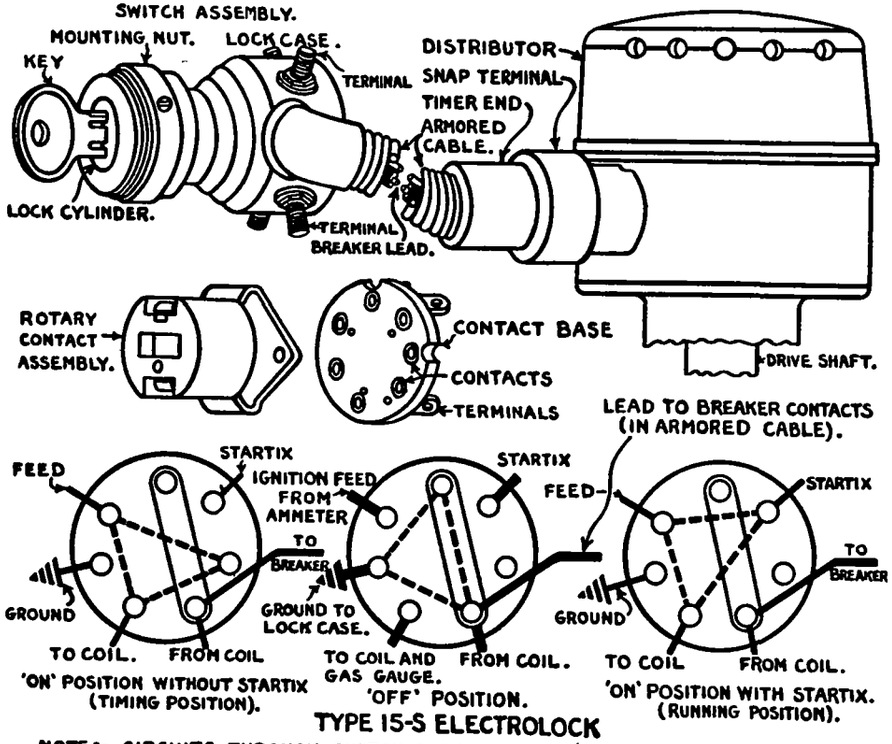
ELECTROLOCK-TYPE 5B.

TYPES 15-S, 15-SD

DESCRIPTION:—These types follow Electrolock principles in that the breaker and ignition coil are grounded with the switch turned 'Off' and the breaker lead is armored to prevent the ground being relieved by cutting the lead.

These Electrolocks correspond to the previous 'B' type switches in that provision is made for the connection of accessories such as gasoline gauges (these should be connected to the coil feed terminal—see diagram) and in addition an extra terminal for Startix connection is provided. This terminal should be connected to the 'IGN' terminal on the Startix case.

The Type 15-SD Electrolock is designed for use with ignition systems using two coils, each controlled by a separate set of breaker contacts (see diagram on Auburn 12-160 using this system and Electrolock). Two breaker lead terminals are provided on the Electrolock switch assembly and these are connected to two insulated wires in the armored cable. These wires terminate in a special distributor terminal on the distributor housing from which the connection to each breaker arm is made.



OPERATION:—These switches are provided with two 'On' positions and a special terminal for Startix connection. The 'On' position with Startix operative (key turned to the right) is the normal running position. The second 'On' position (key turned to the left) closes the ignition circuit but does not complete Startix circuit so that Startix is inoperative.

SERVICING:—Switch Assembly. To disassemble assembly for inspection and servicing, remove the lock from the mounting, disconnect all wires from terminals, turn back stakings and remove lock case cover. Take out all terminal screws and bushings, pull out contact base assembly and rotary contact for inspection. Replace all parts in reversed order and take care to securely stake lock case cover before reinstalling Electrolock.

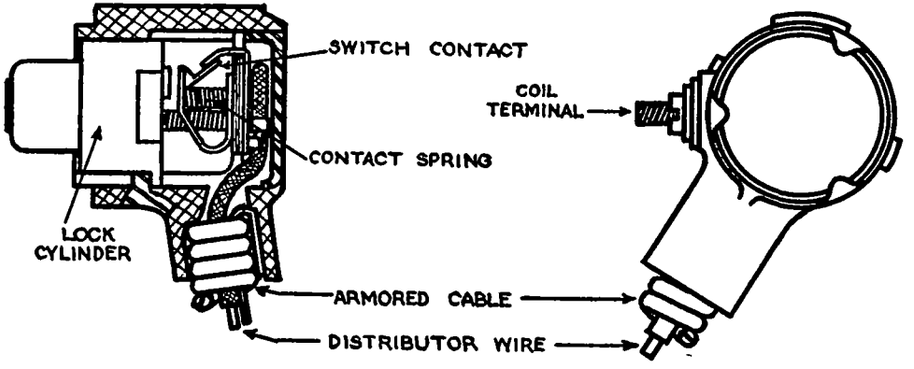
Distributor Terminal and Current Wire Assembly. To disassemble Distributor Terminal for inspection and servicing, first remove lock case cover on switch assembly (see above) and open clips which hold end of current wire, then remove timer end and timer parts assembly from distributor housing, drill out distributor connection cup opposite timer end locking pin, drive out locking pin, turn back stakings and remove distributor terminal and current wire assembly through timer end.

Yale Type Lock Cylinders. To remove these lock cylinders, turn key toward left hand running position and press a small pointed tool into the hole on the side of the lock case at the same time. When the tool enters the hole in the lock cylinder, the retaining pin can be driven out and the lock cylinder withdrawn. In replacing the lock cylinder the retaining pin should be driven in securely.

TROUBLE SHOOTING:—Test circuits through Electrolock with lamp and test points to determine if switch is operating satisfactorily (see diagram for circuits). It should be remembered that 'Startix' terminal is connected to the feed terminal only with the switch in the right hand 'On' position. If these tests indicate that Electrolock is not operating correctly it should be disassembled and examined.

TYPE 15-S ELECTROLOCK

NOTE:- CIRCUITS THROUGH SWITCH COMPLETED BY ROTARY CONTACTOR ARE SHOWN BY DOTTED LINES THUS---- FOR EACH SWITCH POSITION. THE JUMPER ON THE CONTACT BASE ASSEMBLY IS NOT USED ON THE TYPE 15-SD



FORD TYPE 12-A

DESCRIPTION:—The design of the Ford Electrolock is different than the other types (see illustration). The plunger (distributor terminal) makes contact with the lock cylinder assembly when the switch is locked, grounding the breaker through the Electrolock case and cable. When the switch is unlocked, the plunger makes contact with the contact cup or contactor mounted on back of lock cylinder assembly which is insulated from it.

TROUBLE SHOOTING:—Use a lamp and test point to check circuits through switch. Disconnect wire on terminal on side of case, block open breaker contacts with an insulator, place on test lamp lead on primary terminal inside distributor housing, place the second test point on terminal on side of Electrolock. Lamp should light with switch turned 'on' and should go out with switch turned 'off'. Leave one test point on terminal inside distributor housing, place second test point on lock case. Lamp should light with switch turned 'off' and should go out when switch is turned 'on' (unlocked). If lamp remains lighted, Electrolock is grounded or condenser is grounded. Disconnect condenser and repeat test.

REMOVAL:—Free lock at instrument panel, disconnect wire, unscrew ferrule (cable connector) on side of distributor, pull entire unit out from lock end (cable passes through junction box on engine side of dash).

If tests indicate that Electrolock is defective, take out small screw on side of case, unlock switch, withdraw lock cylinder assembly. This will allow switch contacts to be inspected.

(A)—No armored cable used (coil lead not protected). (B)—Cable Length 45½". (C)—Cable Length 37⅞". (D)—Cable Length 4-1/16". (E)—Cable Length 6⅝".
(F)—Mahogany Finish. (G)—Gunmetal Gray Finish. (H)—Burl Tan Finish. (J)—Silver Beige Finish.

NOTE—Mitchellocks are designed to be connected to the ignition coil by armored cable (except 'A' types without cable). See preceding section for complete data on Electrolocks also manufactured by Mitchell Specialty Company which are connected to distributor by armored cable.

TYPES 16-B, 16-S, 17-A, 17-S.

DESCRIPTION:—Mitchellock ignition switches incorporate a change in design from the Electrolock types (previous section) in that the primary lead from the switch to the coil is armored and the breaker lead from the coil is not taken through the switch but is connected directly to the distributor (see wiring illustrations). The Types 17-A and 17-S do not have this armored cable. The location of the terminals on the lock case differs with the various types (see illustration). Mitchellocks designed for use with Startix automatic starting switch have two 'On' positions, one for use in timing with ignition connected but Startix inoperative, and the second position with both ignition and Startix operative. This second position is the regular operating position of the switch. Details on each type switch are given on the car data sheet ('On' positions may be left and right or both to the right of the 'Off' position).

SERVICING:—To Disassemble Mitchellocks—Disconnect all leads and remove lock from mounting on dash. Remove stakings at rear of lock case which retain lock case cover. Remove all terminal screws and bushings. Pull lock case cover and contact base assembly out of lock case. Rotary contact assembly and adapter may then be remove. See special directions below for removal of each type lock cylinder from lock case.

To Assemble Mitchellocks:—Insert adapter in lock case making certain that tongue and pin on end of lock cylinder engage groove and slot on end of adapter. Insert rotary contact assembly and see that tongue and small pin on end of adapter enter groove and pin hole in end of rotor. Install contact base assembly, insert terminal screws (with bushings in place) through holes in lock case and screw firmly in place in terminal lugs on contact base assembly. See that ground strip on contact base assembly makes good contact with lock case, install lock case cover making certain that groove in cover engages projection within case, stake case securely.

Briggs & Stratton Lock Cylinders on Types 16-B, 16-S. To service these lock cylinders, first remove lock from mounting, disconnect ammeter lead and turn key to extreme right hand position, insert a 1/16 inch diameter pin as far as possible in hole in side of lock case, pull lightly on key until lock cylinder can be withdrawn.

Yale & Towne Lock Cylinders on Types 16-S, 17-S. These lock cylinders are removed for servicing in the same manner as the Briggs & Stratton lock cylinders used on the Types 16-B, 16-S. Follow directions in paragraph above.

Hurd Lock Cylinders on Type 16-S#5174. To service these lock cylinders, first remove lock from mounting, disconnect ammeter lead, turn key to extreme right hand position, press down on retaining pin (which projects into the small hole located at the top of the threaded front end of the lock case) with a small pointed tool until lock cylinder can be withdrawn.

Independent Lock Cylinders on Type 16-S—#5172, 17-A—#5159. To service these lock cylinders, disconnect ammeter lead, turn key to extreme right hand position, withdraw key, insert special 'extracting key', press key in as far as possible until lock cylinder can be withdrawn. These special 'extracting keys' will be sold only to authorized service stations and the number of the lock for which they are to be used must be specified (see list below).

TROUBLE SHOOTING:—Test circuits through the switch, using a lamp and test points, for each switch position to determine if switch is operating correctly. If switch appears to be defective, disassemble as directed above and examine. It should be remembered that Startix terminal is connected to feed terminal only with the switch key in the 'running' position and is not connected with the switch in the 'timing' position.

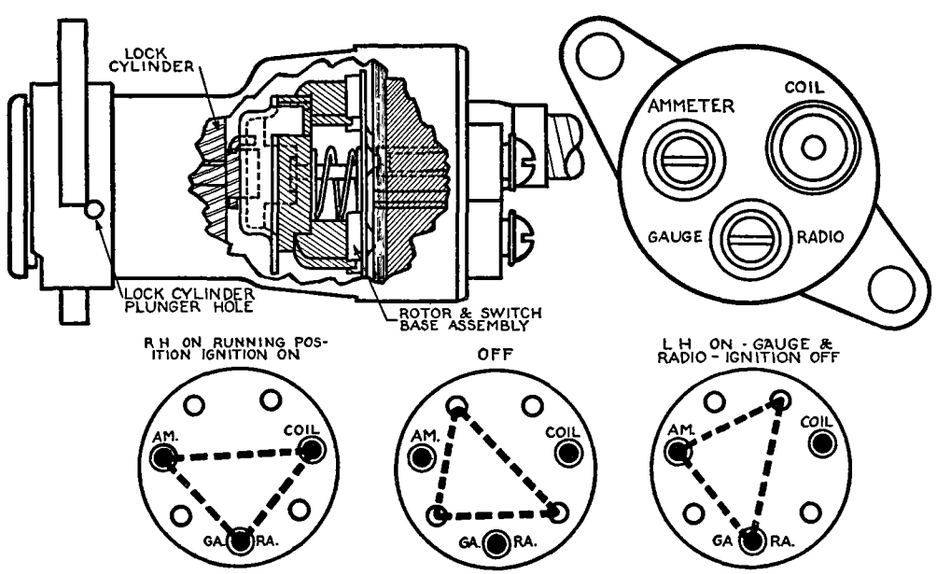
TYPES 24-B, 24-R, 24-S

NOTE:—Mitchellocks differ from 'Electrolock' types also manufactured by the Mitchell Specialty Company in that the switch is designed to be connected to the ignition coil by armored cable (rather than to the distributor as on Electrolocks), so that the coil lead is protected (rather than the breaker lead from the coil to the distributor). When Mitchellocks are used, the breaker lead is run directly from the coil to the distributor terminal and is not taken through the switch. Switch types numbered from 1 to 15 are Electrolocks, types above 15 are Mitchellocks.

DESCRIPTION:—Similar in design to previous type Mitchellocks except that terminals located on lock case cover (see illustration). Furnished in three types as follows:

'B' Type (24-B)—Has extra terminal for gasoline gauge or other accessory connection. Accessory terminal live only with switch 'on'.

'R' Type (24-R)—Same as above but switch has two 'on' positions; one for regular running with ignition on, and a second position with accessory terminal live but ignition off. This position may be used for gasoline gauge reading with engine not running or for radio control with car parked.



'S' Type (24-S)—Has additional terminal for Startix or other automatic starting device connection. Switch has two 'on' positions; one for regular running with Startix operative, and a second position with ignition on but Startix inoperative. This position used when checking timing or whenever automatic cranking not desired.

SERVICING:—To disassemble Mitchellock—With switch removed from dash and all leads disconnected, remove stakings on lock case retaining lock case cover, pull cover and entire rotor and switch base assembly out of case. Replace rotor and switch base assembly as a unit. This unit (Part No. 6420) normally stocked with sufficient excess current wire length so that wire can be cut to desired length for any installation.

To Assemble Mitchellock—See that prong on lock cylinder enters slot in face of adapter on forward end of rotor and switch base assembly, and that ridge in lock case registers with slot on side of switch base, push assembly into lock case, replace cover, stake securely.

Lock Cylinder:—To remove ignition lock, turn key to extreme right hand position (B & S locks only), insert 1/16" diameter pin in hole in side of lock case directly behind head, depress lock cylinder spring retainer, pull lock cylinder out.

TROUBLE SHOOTING:—Test circuits through switch with lamp and test points. See description above for terminals which should be 'live' with switch key in each position. If switch circuits are completed correctly and ignition still unsatisfactory, remove ignition coil base (cable connection) by taking out three screws. This will expose coil terminal in base. Check circuit through switch and coil lead to this terminal. If circuit tests OK. disconnect coil, test coil and replace if necessary. If tests indicate switch defective, disassemble as directed in Servicing below.

CIRCUITS THROUGH SWITCH SHOWN BY DOTTED LINES

NOTE:—These generators offered as special equipment on car models when fitted with Radio or when car used for special service such as City or State police, taxicab, truck, or school bus service, etc. In addition the manufacturers offer special extra-capacity generators which may be installed on practically any car model as follows:

AUTO-LITE MODELS

Generator Model.	Armature No.	Regulator.

" "	Neg.	5599
1106401 (Class A—Ford, Mercury)	Pos.	5865

NOTE—Delco-Remy generators are classified as follows:
Class A—Two brush generator with vibrating voltage and current regulation.
Class B—Third brush control generator with vibrating voltage regulation.
Class C—Third brush control generator with non-vibrating voltage control
Class PA—Same as Class A, but for passenger car use only.
Grounded Terminal—Correct type regulator must be used depending upon which terminal of battery is grounded and care must be taken not to reverse generator polarity when generator and regulator are connected. To avoid polarity reversal, disconnect regulator field lead ('F' terminal) first and connect this lead last after all other leads have been connected.

POLARIZING NOTE:—Whenever generator disconnected, polarize generator by connecting regulator "BAT" and "GEN" terminals momentarily after all leads connected and generator re-installed on car.

AUTO-LITE EXTRA CAPACITY GENERATORS

MODELS GBJ-4201, GBJ-4202, GBJ-4204, GBJ-4205, GBJ-4601

TYPE:—Third brush control type. Models GBJ-4201, 4202 are not regularly equipped with a regulator. When Type TC-4100 Current Regulator or Type TC-4200 Current Regulator and Cutout Relay are found installed on these generators refer to special article on these regulators for complete data. Models GBJ-4204, 4205, 4601 are regularly equipped with a Type TC-4302A Current Regulator and Cutout Relay. See special article on this type regulator for complete data. All generators are air-cooled by a suction fan built in the generator drive pulley or mounted independently on the drive end of the generator.

INSTALLATION:—Model GBJ-4601 is provided with mounting lugs at each end for conventional pivot-mounting with fan belt drive. When this model is installed on the Ford V8 (Police Service), the fan must be removed from the regular generator and installed on special drive pulley (Part No. SP-166) furnished with the generator. Model GBJ-4205 is designed for cradle mounting.

PERFORMANCE & ADJUSTMENT:— Charging Rate Adjustment. Regulator should be shorted out by connecting jumper wire between 'F' terminal on generator or fuse cup on side of regulator case and ground while adjustment is being made. Take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate. Third brush held in position by friction. Remove jumper wire after completing adjustment.
Cuts In—6.75-7.5 volts with charging current not to exceed 5 amperes.
Contacts Open—8.45-8.95 volts at 70°F.

Performance Data.

Cold — Regulator Contacts Closed — Hot					
Amperes	Volts	R. P. M.	Amperes	Volts	R. P. M.
0	6.4	650	0	6.4	680
4	6.7	780	4	6.75	840
8	6.9	900	8	7.0	980
12	7.2	1020	12	7.3	1175
16	7.45	1160	16	7.6	1460
20	7.7	1360	21	8.0	2400
25	8.0	2200			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24 ozs. (min.) 36 ozs. (max.) each.
Field Current—4.18-4.62 amperes at 6.0 volts.
Field Fuse—5 ampere capacity. In knurled cup on side of regulator.
Motoring Current—4.94-5.46 amperes at 6.0 volts.

RELAY-REGULATOR:—Model TC-4302-A. This unit consists of a Cutout Relay and Current Regulator with carbon field resistance and field fuse in a single case. See separate articles for complete data on these units.

Cutout Relay.

Cuts In—6.5-7.25 volts with charging current not to exceed 5 amperes.
Cuts Out—.5-2.5 ampere discharge current with open circuit battery voltage of 6.3-6.8 volts after charging current of 15 amperes has passed through windings.
Contact Gap—.015-.045".
Air Gap—.015" plus .015" or minus .005" with contacts Closed.

Regulator.

Contacts Open—8.25-8.75 volts at 70° F.
Contacts Close—1.2-1.4 volts below opening point at same temperature.
Contact Gap—.005" minimum. **Air Gap**—.045" with contacts closed.

AUTO-LITE OPTIONAL GENERATORS
MODELS GAR-4605, GAR-4609-4, GAR-4609-A-4

TYPE:—Third brush control in conjunction with a Current Regulator (two-rate charging control). All specifications and adjustments are the same as given above for the Model GAR-4601 Extra-Capacity Generator except as noted below:

Performance Data—Model GAR-4605

Cold—Regulator Contacts Closed—Hot					
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	750	0	6.5	840
4	6.75	900	4	6.85	980
8	7.1	1025	8	7.25	1160
12	7.4	1200	12	7.6	1400
16	7.7	1380	16	8.0	1720
20	8.1	1675	21	8.5	2680
24.8	8.5	2400			

Performance Data—Models GAR-4609-4, 4609-A-4

Cold — Regulator Contacts Closed — Hot					
Amperes	Volts	R. P. M.	Amperes	Volts	R. P. M.
0	6.4	720	0	6.4	760
4	6.85	840	4	6.9	920
8	7.25	980	8	7.4	1080
12	7.7	1120	12	7.85	1280
16	8.1	1300	16	8.3	1560
20	8.5	1540	20	8.8	2000
25	9.0	2400	22	9.0	2600

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24 ozs. (mimimum—old brushes), 36 ozs. maximum—new brushes).
Field Current—3.75-4.15 amperes at 6.0 volts.
Field Fuse—7½ ampere (GAR-4605), 5 ampere (GAR-4609-4, 4609-A-4) located in knurled cup on side of regulator case.
Motoring Current—4.75-5.25 amperes at 6.0 volts (½ ampere additional if relay and regulator in circuit).

RELAY REGULATOR:—GAR-4605. Cutout Relay Model CB-4021S. Current Regulator Model TC-4101A. These are separate units and are both mounted on generator field frame. See separate articles for complete data on each unit. Specifications are given below:

Cutout Relay

Cuts In—6.4 volts, 750 R.P.M., 6.3 M.P.H. Voltage limits, 6.75-7.5 volts.
Cuts Out—.5-2.5 ampere discharge current.
Contact Gap—.025-.035". **Air Gap**—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.26-8.67 volts at 70° F.
Contacts Close—6.46-6.86 volts at 70° F.
Contact Gap—005" minimum. **Air Gap**—.030" with contacts closed.

RELAY REGULATOR:—GAR—4609-4, 4609-A-4. Model TC-4302-A. Consists of Cutout Relay and Current Regulator in a single case. All specifications and adjustments same as when used on Model GBJ-4601 Extra-Capacity Generator above.

DELCO-REMY EXTRA-CAPACITY GENERATORS
AERO-VOLT MODEL 935-L

TYPE:—Third brush control in conjunction with a Voltage Control Relay (step-voltage, non-vibrating) providing a two-rate charging control. See article on Voltage Control Relays for complete data. Generator is air-cooled by suction fan built in generator drive pulley.

INSTALLATION:—Generator provided with mounting lugs for conventional pivot-mounting with fan belt drive.

PERFORMANCE & ADJUSTMENT:—Charging Rate Adjustment—Regulator must be shorted out by connecting jumper wire between 'F' terminal on generator or control unit and ground while adjustment is being made. Take off commutator cover band, loosen lockscrew on commutator end plate, shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate, tighten lockscrew. Performance figures below are maximum rated capacity and must not be exceeded.

Performance Data.

	Amperes	Volts	R. P. M.
Cold	20-23	8.5-8.8	2800
Hot	16-20	8.1-8.5	3100

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ozs. (main brushes), 16-20 ozs. (third brush).
Field Current—2.3-2.6 amperes at 6.0 volts.
Field Fuse—6 ampere capacity (in control unit).

CONTROL UNIT:—Model 5554. This unit consists of a Cutout Relay and a Voltage Control Relay with a field resistance unit and field fuse in a single case. See separate articles for complete data on these units. Cutout Relay has special set of ground contacts above the armature. These contacts (GRD terminal) are used only for control of starter control units, signal lights, etc.

Cutout Relay.

Cuts In—6.4-6.8 volts.
Cuts Out—0-3 ampere discharge current at 6.3 volts.
Contact Gap—.020". **Air Gap**—.015" with contacts closed.

Voltage Control Relay

Contacts Open—8.35-8.65 volts (70°F), 7.8-8.15 volts (180°F).
Contacts Close—7.3-7.7 volts (70°F), 6.6-7.05 volts (180°F).
Contact Gap—.010". **Air Gap & Armature Travel**—.035".
Contact Spring Tension—.7-.9 ounces.

DELCO-REMY EXTRA-CAPACITY GENERATORS
AERO-VOLT MODEL 936-N

TYPE:—Third brush control in conjunction with Vibrating Voltage Regulator regulation. Voltage Regulator is new type with special coil winding controlled by ignition switch (IGN terminal connection). See separate article for complete data. Generator is air-cooled by suction fan built-in generator drive pulley.

INSTALLATION:—Generator is provided with mounting lugs for conventional pivot-mounting with fan belt drive.

PERFORMANCE & ADJUSTMENT:—Third brush on these types is fixed and is not designed to regulate charging rate (this brush is used to limit maximum output at high speeds). Charging rate is adjusted by changing voltage regulator armature spring tension. Increase spring tension to increase charging rate, or decrease spring tension to decrease charging rate. See separate article on Vibrating Voltage Regulators for complete directions for making this adjustment. Maximum rated capacity for generator as given below must not be exceeded.

Performance Data.

	Amperes	Volts	R.P.M.
Cold	23-27	8.8-9.0	3000
Hot	18-23	8.2-8.7	3200

These performance figures are correct with ammeter connected in charging line at 'BAT' terminal with 'F' terminal grounded. This type generator must not be operated on open-circuit.

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ozs. (main brushes), 16-20 ozs. (third brush).
Field Current—2.3-2.6 amperes at 6.0 volts.

CONTROL UNIT:—Model 5591, 5592. Unit consists of a Cutout Relay and a Vibrating Voltage Regulator with field resistance unit in a single case mounted on the dash. The case must be grounded and a ground lead may be found from the case to a ground screw on the generator frame. Cutout Relay has special ground contacts mounted above the armature (GRD terminal) which are used for starter solenoid control, signal light control etc.
NOTE—Model 5591 regulator used with positive (+) battery ground, and Model 5592 with negative (—) battery ground.

Cutout Relay.

Cuts In—6.9-7.6 volts.
Cuts Out—0.3 ampere discharge current at 6.3 volts.
Contact Gap—.020". **Air Gap**—.020" with contacts closed.

Voltage Regulator.

Setting—Generator voltage should be 7.55-7 85 volts (70°) and 7.45-7.55 volts (150°F) operating at 2800-3000 R. P. M. charging a battery at not less than 8 amperes. Generator must not be operated on open-circuit. See separate article for complete adjustment instructions for this vibrating Voltage Regulator.
Contact Gap—.020". **Contact Spring Tension**—2.7-3.5 ounces.
Air Gap—.063" between armature and core (armature down so that fibre bumper just touches stop). .010" between fibre bumper and stop with armature up.

DELCO-REMY EXTRA-CAPACITY GENERATORS

930-A, B, D; 934-F; 954-A, B; 961-N; 973-M; 1102657; 1102659; 1105528; 1106401

TYPE:—Two brush, shunt wound type. Used with vibrating type voltage regulator and current regulator. See article on this type regulator for complete data. Generator is air-cooled by suction fan built in drive pulley.

INSTALLATION:—Model 954-A provided with mounting lugs for conventional pivot mounting with fan belt drive. Models 930-A and 954-B are special Ford types with mounting bracket on drive end similar to bracket on regular Ford generator so that generator may be installed after regular generator is removed without any modification of the mounting on the engine.

PERFORMANCE AND ADJUSTMENT:—No third brush is used and no provision is made for regulation on the generator. Charging rate is determined by setting of voltage regulator (up to rated capacity of generator) and maximum output is controlled by setting of current regulator. See adjustment instructions under Control unit below. Performance figures given below are maximum rated capacity of generator and must not be exceeded.

Performance Data—930-A, D

	Amperes	Volts	R.P.M.
Cold	26	8.1-8.3	1450

Performance Data—930-B

Cold	22	8.0	1100

Performance Data—934-F, 1105528

Cold	26	8.1-8.3	1325

Performance Data—954-A, B

Cold	22	8.0	1600

Performance Data—961-N

Cold	25	8.0	1650

Performance Data—973-M

Cold	26-28	8.0	1500

Performance Data—1102657, 1102659—See Note

Cold	30	8.0	1800

Performance Data—1106401

Cold	30	8.0	960

1102657, 1102659 Note—Output of 30 amperes at 1800 R.P.M. Maximum output dependent upon Current Regulator Setting.
Rotation—Clockwise (930-B), counter-clockwise (others) at commutator end.
Field Current—1.7-2.0 amperes at 6 volts (934-F, 1105528, 1106401), 2.3-2.6 (954-A, B), 2.0-2.2 (961-N), 1.7-1.85 (973-M), 1.76-1.88 (1102657, 1102659), 1.8-2.3 amperes (all others).

CONTROL UNIT:—5587, 5596, (954-A, B); 5597, 5599 (930-A, B, D; 934-F; 973-M); 5810 (930-A); 5831, 5832 (961-N); 5865 (1106401); 5871 (1102659); 5872 (1102657). Consists of Cutout Relay, Vibrating Voltage and Vibrating Current Regulator in single case usually mounted on dash. The case must be grounded and a lead is **usually run from the control unit terminal 'GRD' to a ground screw on the** generator field frame or to the engine block. See separate article for complete data on these units.
NOTE—Models 5596, 5597, 5810, 5831, 5865, and 5871 used when positive terminal of battery is grounded, Models 5587, 5599, 5832, 5872 when negative terminal grounded.

Cutout Relay

Cuts In—6.9-7.6 volts.
Cuts Out—3 ampere maximum discharge current.
Contact Gap—.020". **Air Gap**—.020" with contacts closed.

Voltage Regulator

Setting:—Generator voltage should be 7.05-7.35 volts (70°F), 7.00-7.10 volts 150° F. Regulator is over-compensated for temperature and must be checked at these temperatures. Generator must not be operated on open-circuit when making these tests.

Adjustment:—Disconnect lead on 'IGN' terminal on regulator case, connect jumper between 'IGN' and 'BAT' terminals, connect test ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground, Operate generator at 2800-3000 R.P.M., adjust charging rate to 8-10 amperes, adjust regulator by bending spring hanger at lower end of armature spring slightly until performance is shown above, restore original connections.
NOTE—Do not operate generator on open-circuit at any time or at excessive speed with current regulator shorted out. Voltage Regulator readings should be taken with cover on unit and setting should be checked by decreasing speed until cutout relay contacts open and then increasing speed to original point.
Contact Gap—.020". **Contact Spring Tension**—3.5 ounces.
Air Gap—.057" (5587), .063" (others) between armature and core with armature held down so that fibre bumper just touches stop. .010" between fibre bumper and stop with armature up.

Current Regulator.

Setting:—Must not exceed rated capacity of generator on which unit is installed (see generator performance above). Settings for each type regulator as follows:

Control Unit	Generator	Setting
5587, 5596	954-A, B	20-22 amperes
5597, 5599	930-A, B; 934-F; 973-M; 1105528	26-28 amperes
5810	930-A	24-26 amperes
5831, 5832	961-N	26-28 amperes
5865	1106401	29-31 amperes
5871	1102659	32-34 amperes
5872	1102657	32-34 amperes

Adjustment:—Make connections as above (voltage regulator test) except that lead at 'IGN' terminal should be disconnected to eliminate voltage regulator action. Operate generator. Adjust regulator by bending spring hanger at lower end of armature spring until performance is as shown above.
NOTE—Generator voltage must not be allowed to exceed 8.5 volts with voltage regulator shorted out.
Contact Gap—.020". **Contact Spring Tension**—3.5 ounces.
Air Gap—.075" between armature and core with armature down until fibre bumper just touches stop. .010" between fibre bumper and stop with armature up.

DELCO-REMY OPTIONAL GENERATORS

MODELS 929-A,B, 931-M,N,R,S,V,Z, 935-H,J,R,U, 936-A,E,G,L,M, 956-L, 967-N

TYPE:—These generators are all third brush control type in conjunction with a Voltage Control Relay (step-voltage, non-vibrating type). All specifications and adjustments are exactly the same as given for the Extra-Capacity Generator Model 935-L above except as noted below:

Performance Data—Models 929-A, B

	Amperes	Volts	R. P. M.
Cold	23-26	8.8-9.1	2200
Hot	17-20	8.1-8.5	2400

Performance Data—Models 931-N, R, V, Z

Cold	22-24	8.6-9.0	1300
Hot	13.5-16.5	7.7-8.1	1600-1800

Performance Data—Models 931-M, S

Cold	23-26	8.8-9.1	2300
Hot	17-20	8.1-8.5	2500

Performance Data—Model 956-L

Cold	23-26	8.8-9.2	2500
Hot	18-21	8.2-8.5	2800

Performance Data—Model 967-N

Cold	17-20	8.2-8.5	1900
Hot	13-15	7.7-8.0	1900

Field Current—1.8-2.3 amperes on Models 929-A, B. 1.5-1.8 amperes on Models 931-M, S. 3.5-4.0 amperes on Models 931-N, R, V, Z. 2.1-2.5 amperes on Model 956-L. 1.75-2.25 amperes on Model 967-N. All field readings at 6.0 volts.

Brush Spring Tension—14-18 ozs. (all brushes) on Model 956-L.

CONTROL UNITS:—All data on Cutout Relay and Voltage Control Relay used with these generators is the same as given for the Model 5554 used with the Extra-Capacity Generator Model 935-L except as noted below:

Model 5590 (936-G generator):—On this model the Cutout Relay contact gap should be .018-.025" and the air gap .018-.022". Voltage readings for the Voltage Control Relay (hot) should be made at 150°F. instead of 180°F.

Model 5585 (936-A, 936-L):—On this model voltage readings for the Voltage Control Relay (hot) should be made at 150°F instead of 180°F.

Model 5025554 (931-N, 931-S). This is a North East vibrating type voltage regulator. Cutout Relay is located in regulator case. Specifications are as follows:

Cutout Relay

Cuts In—6.5-6.75 volts. **Cuts Out**—3 ampere maximum discharge current.
Contact Gap—.012-.020".
Air Gap—.027-.030" between armature and core with contacts closed.

Voltage Regulator

Setting—Spring tension should be adjusted to hold generator open-circuit voltage at 7.5 volts when generator is operated at 2200-2300 R.P.M.
Contact Gap—.017-.020". **Air Gap**—.010-.015".

DELCO-REMY OPTIONAL GENERATORS

MODELS 933F, G, H, J, L; 934-C, D, F, G, H, K, L, M, N, R, S, T

TYPE:—These are shunt-wound generators (two brush type, no third brush used) with current and Voltage regulation by individual vibrating Current and Voltage Regulator units in the Control Unit. Generators are air-cooled by a suction fan built in the generator drive pulley.

PERFORMANCE & ADJUSTMENT:—Charging rate is controlled by Voltage regulator and will depend upon battery voltage and lamp load. Current regulator limits charging rate at maximum point so that generator output will be constant for all speeds above the peak or point where output is controlled by the current regulator. Current Regulator is normally set to control output at maximum rated capacity of generator as given in table below and this setting must not be exceeded. Charging rate below this point is controlled by Voltage Regulator. See regulator setting below.

Performance Data—Model 933-F

	Amperes	Volts	R.P.M.
Cold	19.5-22.5	6-7	4000

Performance Data—Models 933-G, H, J, L

Cold	22	8.0	1200

Performance Data—934, C, H, K, M, S

Cold	28	8.0	1400

Performance Data—Models 934-D, G, L, N, R, T

Cold	17	14.5-14.75	1250

Performance Data—934-F

Cold	26	8.1-8.3	1325

Rotation—Clockwise (934-C, D), counter-clockwise (all others) at commutator end.

Brush Spring Tension—22-26 ounces (all brushes).

Field Current—1.7-2.0 amperes at 6.0 volts (all 6 volt generators), 1.25-1.45 amperes at 12.0 volts (all 12 volt generators).

CONTROL UNIT:—**Model 5587 (933-F, G, H, J, L), 5597, 5599 (934-F).** Units consist of a Cutout Relay, Voltage Regulator, Current Regulator, and field resistance mounted in a single case on the dash. The case must be grounded and a ground lead will be found leading from the control unit terminal 'GRD' to a ground screw on the generator field frame. Cutout relay has extra set of ground contacts mounted on the armature (R terminal). These contacts are used for starter solenoid control etc. See separate article for complete data on these units.

Cutout Relay

Cuts In—6.9-7.6 volts.
Cuts Out—3.0 ampere maximum discharge current.
Contact Gap—.020". **Air Gap**—.020" with contacts closed.

Voltage Regulator

Setting:—Generator voltage should be 7.05-7.35 volts (70°F), 7.00-7.10 volts (150°F) operating at 2800-3000 R. P. M. and charging a battery at 8-10 amperes. Do not operate generator on open circuit. Voltage regulator is adjusted by changing armature spring tension. See article on Vibrating Voltage and Current Regulators for complete adjustment instructions.
Contact Gap—.020". **Contact Spring Tension**—3.5 ounces.
Air Gap—The Air Gap should be .063" between armature and core with armature held down so that fibre bumper just touches stop. .010" between fibre bumper and stop with armature up.

Current Regulator

Setting—Check setting with ammeter connected in charging line at 'BAT' terminal. Disconnect lead on 'IGN' terminal to eliminate voltage regulator action (generator voltage must not be allowed to exceed 8.5 volts with voltage regulator out of action). Adjusted by changing armature spring tension. See article on Vibrating Voltage and Current Regulators for complete adjustment directions. Setting should be as follows:

Control Unit	Generator	Setting
5587	933-F, G, H, J, L	20-22 amperes
5597, 5599	934-F	26-28 amperes

Contact Gap—.020". **Contact Spring Tension**—3.5 ounces.
Air Gap—.075" between armature and core with armature down so that fibre bumper just touches stop. .010" between fibre bumper and stop with armature up.

Models 5598, 5801 (934-D, G, L, N, R, T). These are 12 volt units. All specifications and adjustments same as for 6 volt units given above. Settings are as follows:

Cutout Relay

Cuts In—13-14 volts **Cuts Out**—3.0 ampere maximum discharge current.

Voltage Regulator

Setting—Generator voltage should be 14.3-14.9 volts (70°F), 14.2-14.4 volts (150°F).

Current Regulator

Setting—15-17 amperes maximum.

DELCO-REMY OPTIONAL GENERATORS
MODEL 936-J

TYPE:—Third brush control in conjunction with vibrating Voltage Regulator. All specifications and adjustments for this generator are the same as given for the Extra-Capacity Generator Model 936-N above.

CONTROL UNIT:—**Model 5588.** All specifications and adjustments same as for Model 5592 listed under Model 936-N generator above.

NOTE:—This type Regulator used on the following car models:

Car Model	Year	Regulator	Generator
Essex-Terraplane KT, KU	(1933)	TC-4102A	GBK-4602
Hudson LL, LT, LTS	(1933)	TC-4102A	GBK-4602
Hupmobile 427, 527-T	(34-35)	TC-4102A	GAR-4606
Terraplane K, KU	(1934)	TC-4102A	GBK-4602

DESCRIPTION:—The Two-Charge Regulator consists of a relay which cuts in a fixed resistance unit in series with the generator field when the generator voltage reaches the maximum for which the unit is set and cuts out this resistance when the generator voltage falls to the minimum for the which the unit is set. As generator voltage on third-brush control type generators rises as the battery becomes charged, the regulator provides a higher charging rate for a discharged battery and reduces the charging rate as the battery becomes charged. The resistor is a fixed unit and is merely cut in or out of the field circuit as the regulator contacts open and close. This provides two definite charging rates, the high rate being secured with the resistor shorted out of the field circuit (regulator contacts closed), and the lower rate with the resistor in series with the field coils (regulator contacts open).

OPERATION:—When the generator voltage reaches the maximum for which the unit is set, the current flow through the shunt winding of the regulator opens the regulator contacts cutting the resistance in the field circuit (resistor unit is connected across the contacts and is short-circuited when the contacts are closed). The anti-flutter winding (second coil winding) also comes into action when the contacts open. The contacts remain open until the generator voltage falls to the minimum for which the unit is set and then close, shorting out the resistance so that the higher charging rate is resumed. A bi-metal spring support extension on the armature compensates the regulator for temperature variations.

PERFORMANCE AND ADJUSTMENT:—Regulator should perform in accordance with this table:

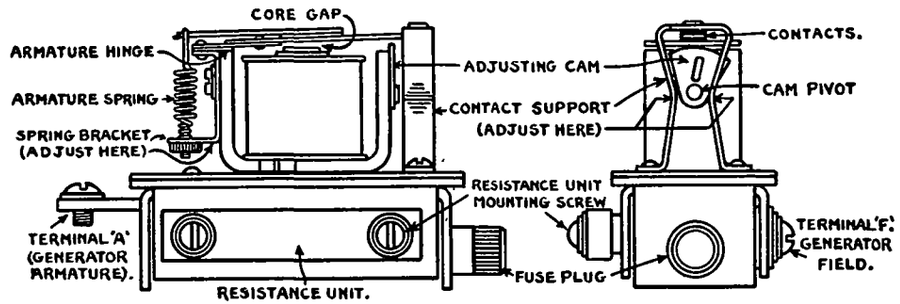
Models TC-4101-A, TC-4103-A, TC-4201-A, TC-4202-A.

Contact Opening Voltage	Temperature	Contact Closing Voltage
8.38-8.82	50°F.	6.58-6.98
8.32-8.75	60	6.52-6.92
8.26-8.67	70	6.46-6.86
8.20-8.60	80	6.40-6.80
8.13-8.54	90	6.34-6.76
8.07-8.50	100	6.29-6.71
8.02-8.44	110	6.24-6.67

Model TC-4102A

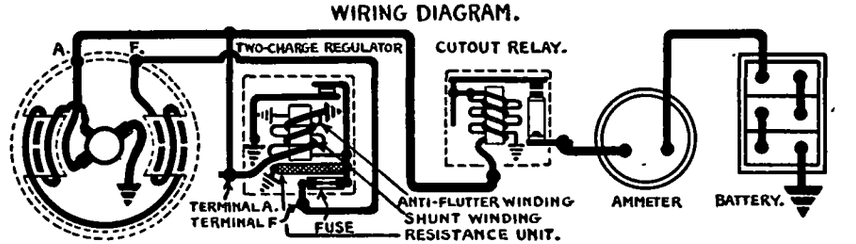
Contact Opening Voltage	Temperature	Contact Closing Voltage
7.98-8.42	50°F.	6.58-6.98
7.92-8.35	60	6.52-6.92
7.86-8.27	70	6.46-6.86
7.80-8.20	80	6.40-6.80
7.73-8.15	90	6.34-6.76
7.67-8.10	100	6.29-6.71
7.61-8.05	110	6.24-6.67

NOTE:—All models are regularly equipped with Part No. TC-51 resistance unit of 1.85-2.10 ohms.



Regulators should be carefully tested (with full allowance being made for air temperature) before adjustments are made. See test procedure below. The manufacturers recommends that units which test defective or out of adjustment be replaced rather than adjusted or repaired in the field. Adjustment instructions are as follows:

(1) **Contact point opening (from high to low charging rate).** Adjust armature spring tension by bending the lower spring bracket (see illustration). Do not unsolder nut, any necessary adjustment can be made by bending the spring bracket. Be careful not to distort the bronze armature hinge. Distortion of hinge will cause unsatisfactory regulator operation. Check performance after adjusting.



(2) **Contact point closing (from low to high charging rate).** Adjust brass cam, which acts as armature stop and controls contact gap (see illustration). After completing adjustment, apply a small amount of air-drying varnish to cam to prevent it slipping in service. Check performance after adjusting.

TESTING:—On the car. Connect a variable resistance in charging line to control generator voltage. Test voltmeter should read and be accurate to within .1 volt. Before test is made, car should stand in room with uniform temperature for at least one hour. Check air temperature when test is made, by thermometer placed about one inch from regulator. Regulator cover must be in place while testing. Regulator should perform in accordance with figures given in Performance Section above.

Bench Testing. Regulator should preferably be tested on bench. Connect voltmeter between terminal 'A' on regulator and ground. Ground one terminal of a 12 volt battery. Connect the other battery terminal to one side of a variable resistance and ground the other resistance terminal. Connect the sliding contact of the resistance to the 'A' regulator terminal. Connect a 32 cp. 6 volt lamp between the 'F' regulator terminal and a center tap on the battery (supplying 6 volts). Regulator action can now be checked by varying battery voltage by means of the variable resistance. Observe all temperature precautions noted in paragraph above. Resistance unit for this test should be 12 volts, 48-50 ohm type.

WIRING DIAGRAM.

SPECIFICATIONS:—Contact Gap—.005" minimum. See contact point closing adjustment above.

Core Gap:—.030" plus or minus .001" with contacts closed. Adjusted by expanding or contracting upper contact support bridge. If core gap is greater than specified, the temperature compensation feature is increased. If core gap is less than specified, the contacts tend to open at lower voltages with extreme temperatures and performance will not be as noted in performance table.

Resistance Unit:—Resistance units are furnished in following standard sizes:

Resistance	Marking	Part No.
1.85-2.10 ohms	1.85	TC-51
.90-1.1 "	1	TC-51A
2.75-2.95 "	2.85	TC-51B

Coils—Shunt winding should test 43-48 ohms (between generator 'A' terminal and ground). Anti-flutter winding should test 36-44 ohms (between 'F' terminal and ground with contacts open and resistance unit disconnected). All tests should be made at 75°F.

NOTE:—When regulator is mounted on car in any other location than on generator field frame, the armature should be vertical (viewed along length). Excessive vibration should be avoided. Regulator is grounded through mounting and a good ground should be provided (remove paint and grease from under mounting lugs).

SERIES TC-4300 TWO-CHARGE (CURRENT) REGULATOR

DESCRIPTION:—This type unit consists of a Cutout Relay and Two-Charge Regulator or Current Regulator combined in a single case. Types used as standard or optional equipment on car models as follows:

Car Model	Regulator	Generator
Chrysler C6, CZ, C1, C3 Exp. ('35)	TC-4301-A	GAR-4608-A,B,B-5
Chrysler C7, C8, C9, C10, C11 ('36)	TC-4301-A	GAR-4608A-5,B-5
Cord 810 (1936)	TC-4302-A	GAR-4630-5
Cord 810 (1936) 812 (1937)	TC-4306-A	GBR-4603-4
De Soto SF, SG (1935)	TC-4301-A	GAR-4608-5
De Soto S1, S2 (1936)	TC-4301-A	GAR-4608A-5
Dodge DU ('35), D2 ('36)	TC-4301-A	GAR-4608-5,A-5
Hudson GH, HT, HU, HHU, (1935)	TC-4304-A	GBK-4602-1
Hudson 63, 64, 65, 66, 67 (1936)	TC-4304-A	GAR-4701-6
Hupmobile 521-O ('35), 621-N ('36)	TC-4302-A	GAR-4620-5
Hupmobile 825H (1938) Exp.	TC-4302-A	GAR-4620-5
Lincoln V-12 (1935-36-37)	TC-4302-A, 5-A	GBC-4103
Lincoln V12 (1938-39)	TC-4305-A	GBC-4103
Nash 3620, 3680 (1936)	TC-4313-A	GBR-4602-4
Packard 120 (1935)	TC-4302-A	GAR-4611-5
Packard 120B (1936)	TC-4302-A	GAR-4611A-5
Packard 120B (1936) Later cars	TC-4302-B	GBR-4601-5
Plymouth PJ Deluxe (1935)	TC-4301-A	GAR-4608-5
Plymouth P2 Deluxe (1936)	TC-4301-A	GAR-4608E-5
Studebaker 1A, 2A ('35) Radio	TC-4302-A	GAR-4609-4,A-4
Studebaker 3A, 4A ('36) Radio	TC-4302-A	GAR-4609A-4
Studebaker 5A, 6A ('37) Radio	TC-4302-A	GCM-4802A-4
Terraplane G ('35) Spec. Equip.	TC-4304-A	GBK-4601-2
Terraplane GU Deluxe ('35)	TC-4304-A	GBK-4602-1
Terraplane 61 ('36) Spec. Equip.	TC-4304-A	GAR-4702
Terraplane 62 (1936)	TC-4304-A	GAR-4701-6
Willys Truck (1938-39)	TC-4317-A	GCS-4809A-5

OPERATION:—Regulator contacts are normally closed. When the generator voltage reaches the maximum for which the unit is set, the current flow through the regulator winding creates a magnetic field of sufficient strength to open the regulator contacts. This cuts the resistor in the field circuit and reduces the charging rate to the low rate. The resistor unit is connected across the regulator contacts and is short-circuited with the contacts closed. The generator continues to charge at the low rate until the voltage drops to the minimum for which the unit is set, the contacts then close, short-circuiting the resistor and the generator again charges at the high rate. A magnetic shunt of nickel alloy is used to compensate for temperature changes and operating voltages are not uniform for all temperatures (see table below).

PERFORMANCE & ADJUSTMENT:—Regulators should perform as shown below. Regulators should be carefully tested with allowance being made for temperature before any adjustments are made. Check mechanical specifications, connect accurate voltmeter at battery terminal of unit, if necessary insert small resistance in charging circuit (approximately .25 ohms) to bring generator voltage up to regulator operating point. Cycle regulator by increasing generator speed up to point where regulator contacts just open and then decreasing speed to point where contacts just close before taking readings. All tests should be made with regulator cover in place.

Contact Opening Voltage

Models TC-4301A, 1B, 2A, 2B, 4A, 5A, TC-4306A, 7A, 8A, 9A, 11A, 12A, 13A, TC-4314A, 16A, 17A, 19A.

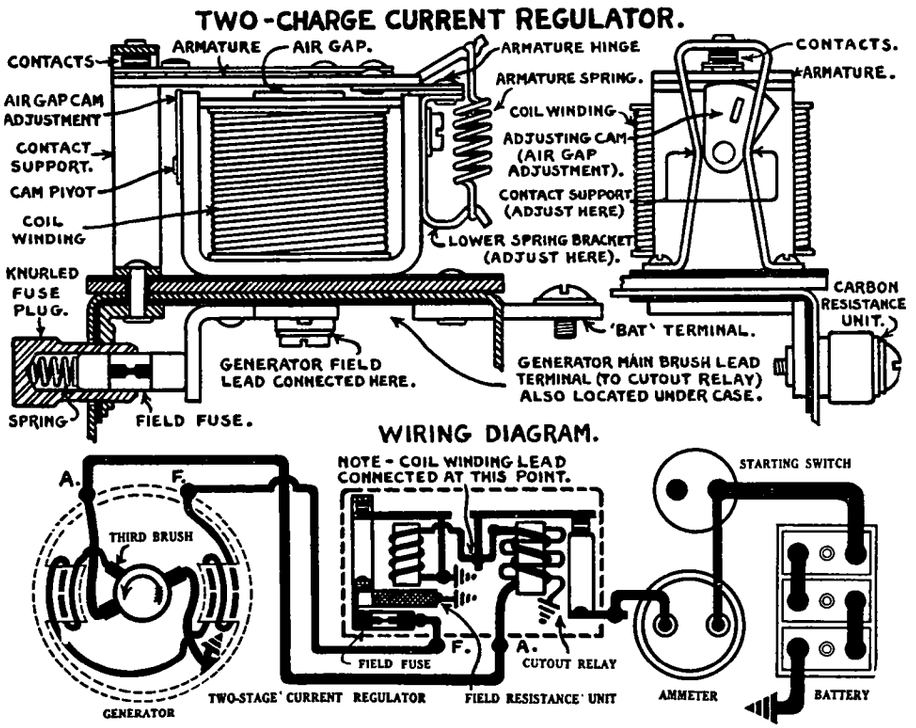
Temperature	Volts
50°F	8.40-8.90
60	8.32-8.82
70	8.25-8.75
80	8.18-8.68
90	8.10-8.60
100	8.03-8.53
110	7.96-8.46

Model TC-4304A (Hudson and Terraplane)

Temperature	Volts
50°F	8.14-8.64
60	8.07-8.57
70	8.00-8.50
80	7.93-8.43
90	7.86-8.36
100	7.79-8.29
110	7.72-8.22

Contact Closing Voltage

All 6 Volt Units—1.2-1.4 volts below opening point at same temperature.



Models TC-4303A, 3B, 3C, 10A, 15A, 18A, 21A, 22A.

Temperature	Contact Opening Voltage	Volts
50°F.		16.90-17.70
60		16.74-17.54
70		16.60-17.40
80		16.46-17.26
90		16.30-17.10
100		16.16-16.96
110		16.02-16.82

Contact Closing Voltage

All 12 Volt Units—2.4-2.8 volts below opening point at same temperature.

Testing:—On the Car. Allow car to stand in room with uniform temperature for one hour before testing. Check air temperature when test is made by placing thermometer about one inch from regulator winding. Regulator cover must be replaced when tests are run. Increase generator speed slowly and note voltmeter reading when regulator contacts open (connect small resistance in charging line if necessary in order to secure regulator action). Decrease speed, note when contacts close. Adjust as follows:

(1). Contact Opening Point (from high to low charging rate)—Adjusted by bending lower spring bracket to increase or decrease armature spring tension. Bracket should be bent down (increase spring tension) to raise operating voltage, or up (decrease spring tension) to lower operating voltage. Be careful not to distort armature hinge (armature must move freely).

(2). Contact Closing Point (from low to high Charging Rate)—Adjusted by changing position of brass cam which controls core gap with contacts open (lower armature stop). Turn cam to increase core gap to increase operating voltage, or decrease core gap to decrease operating voltage. Apply small amount of air-drying varnish after completing adjustment tc prevent cam from moving in service. Check performance after adjusting.

After adjustments have been completed, regulator should be cooled off tc room temperature and performance rechecked.

SPECIFICATIONS:—Contact Gap—.005" minimum. See contact closing adjustment above and core gap adjustment below.

Core Gap—.045" with contacts closed. Adjust by expanding or contracting upper contact support bridge to change position of upper contact. On first models with two holes punched in the nickel plate, core gap was set at .041" plus or minus .001".

Coil Resistance—To check winding, disconnect coil lead at point where it is soldered to cutout relay yoke. Coil should test 29-33 ohms at 77°F. (6 volt units), 102-112 ohms at 70-80°F. (12 volt units).

Field Resistance Units:—Resistors consist of carbon blocks mounted on side of regulator base plate. Resistor is marked with figure indicating nominal resistance in ohms as follows:

Resistor Unit Specifications

Regulator Model	Resistor Part No.	Marking
TC-4301A, 1B	TC-51G	1.4
TC-4302A, 3C, 4A, 5A, 6A, 7A, 8A, 9A	TC-51	1.85
TC-4302B, 20A	TC-51E	1.1
TC-4303A, 3B, 10A, 15A, 21A	TC-51B	2.85
TC-4311A, 12A, 13A, 14A, 16A, 17A, 18A, 19A, 22A	TC-51	1.85

NOTE—First TC-4301A regulators used TC-51E (1.1) resistor.

Field Fuse:—In knurled plug on side of regulator base plate (see illustration). When replacing fuse make certain that spring is in place in plug behind fuse to insure good fuse contact with terminal plate.

Fuse Capacity—5 ampere, No. X-842 (all regulators except TC-4314A, 15A, 20A); 7½ ampere, No. X-844 (TC-4314A, 15A, 20A).

CUTOUT RELAY

The Cutout Relay used with the Type TC-4300 series Regulators is similar in design and operation with previous types. See separate article for complete description and adjustments for Cutout Relays. Specifications are as follows:

Contact Gap—.015-.045". Adjust by bending upper armature stop.

Air Gap—.015" plus .015" or minus .005" with contacts closed. Adjust by bending lower contact support to raise or lower contact.

Contact Closing (Cut-in) Point—6.5-7.25 volts with charging current not to exceed 5 amperes.

Contact Opening (Cut-out) Point—.5-2.5 ampere discharge current (after charging current of 15 amperes has passed through winding) with open circuit battery voltage of 6.3-6.8 volts.

AUTO-LITE HORN RELAYS

OVERDRIVE & STARTER CONTROL RELAY NOTE:—For all data on Relays used with Overdrive Control Solenoids and Starter Control Solenoids, see separate articles as follows:

Overdrive Solenoid Relay—See "Warner Electric Kick-down Control" in Mechanical Equipment Section.

Starter Solenoid Relay—See "Auto-Lite Starter Controls—Solenoid Pinion Shift Type" in this section.

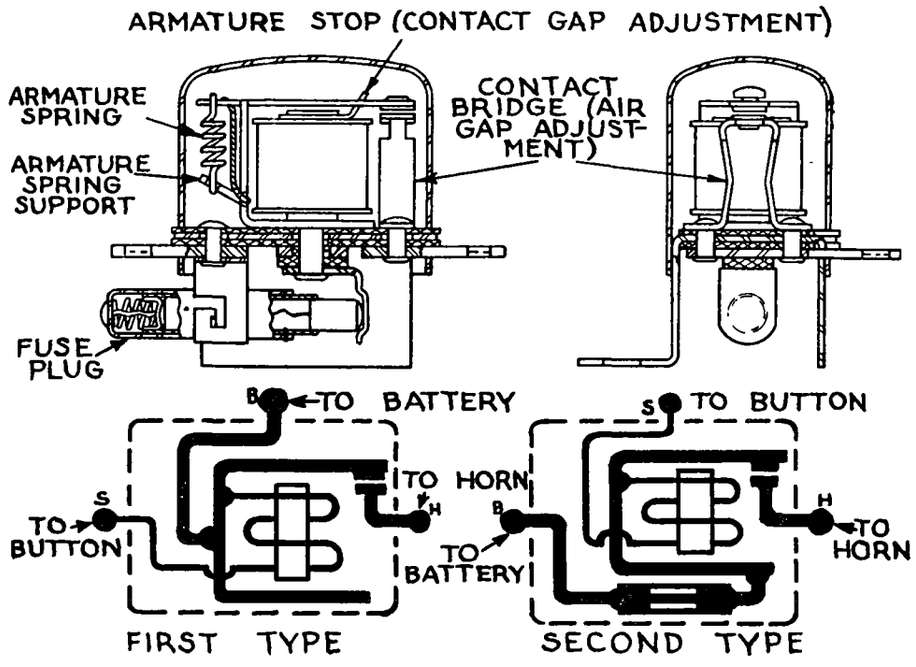
TYPE:—Series HR-4000 Horn Relays have been made in two types, without fuse (early type), with fuses in relay base (later type). Terminal locations are not the same on the two types (see illustration). These relays used on the following car models:

Car Model	Horn Relay	Horn Set
Chrysler C16 (1937)	HR-4002	HC-5103-B
Chrysler C14, C15 (1937)	HR-4002	HC-5103
Chrysler C18 (1938)	HR-4101	HC-5105
Chrysler C19, C20 (1938)	HR-4101	
Chrysler C22 (1939)	HR-4101	HH-4001, 2
Chrysler C23, C24 (1939)	HR-4101	HH-4001, 2 & HC-5107 (set)
Cord 810 (1936), 812 (1937)	HR-4002	HC-5005
De Soto S3 (1937)	HR-4002	HC-5103,B
De Soto S5 (1938)	HR-4101	HC-5105
De Soto S6 (1939)	HR-4101	HH-4001, 2
Dodge D5 (1937)	HR-4002	HC-5103,B
Dodge D8 (1938)	HR-4101	HC-5105
Dodge D11 (1939)	HR-4101	HH-4001, 2
Hupmobile 6, 822E, ('38), 922E ('39)	HR-4002	HC-5105
Hupmobile 8, 825H ('38), 925H ('39)	HR-4002	HC-5105
Plymouth P3, P4 (1937)	HR-4002	HC-5103,B
Plymouth P5, P6 (1938)	HR-4101S	HC-5105
Plymouth P7, P8 (1939)	HR-4101	HH-4001, 2

Manufacturer recommends that later type relay with fuse should be used for all new installations and to replace earlier type relay without fuse.

OPERATION:—Horn relay winding connected between feed 'B' terminal and horn button 'S' terminal so that winding energized when horn button is pressed. This attracts armature closing contacts and completing circuit to horn 'H' terminal on relay. Horn current does not pass through winding or horn button.

SPECIFICATIONS:—Contact Gap. Should be .026" with contacts open. Adjust by bending armature stop.



Air Gap. Should be .012" min., .017" max., with contacts closed. Adjust by expanding or contracting contact bridge (lower or stationary contact support).

Contact Closing Voltage. Contacts should close with terminal voltage f 3.0 volts min., 4.0 volts max. Adjust by changing armature spring tension. Bend armature spring support (lower end of spring) down to increase spring tension and raise closing voltage, or up to decrease spring tension and lower closing voltage.

Contact Opening Voltage. Contacts should open with terminal voltage of 1.5 volts minimum, 2.5 volts maximum. See adjustment directions above.

TESTING:—Connect battery and rheostat between relay 'S' terminal and ground on frame. Connect test voltmeter to same points. Use rheostat to control battery voltage and note relay performance.

FUSE:—Located in bayonet type plugs in relay base (released in same manner as lamp bulb). When replacing fuse see that spring is in place in plug behind fuse. See car model page for recommended fuse capacity.

These Regulators are used as standard or special equipment on the following car models:

Voltage-Current Regulators

Car Model	Generator	Regulator	Grounded Ter.
Chrysler C16 (1937)	GBW-4803A,C	VRB-4005A	Pos.

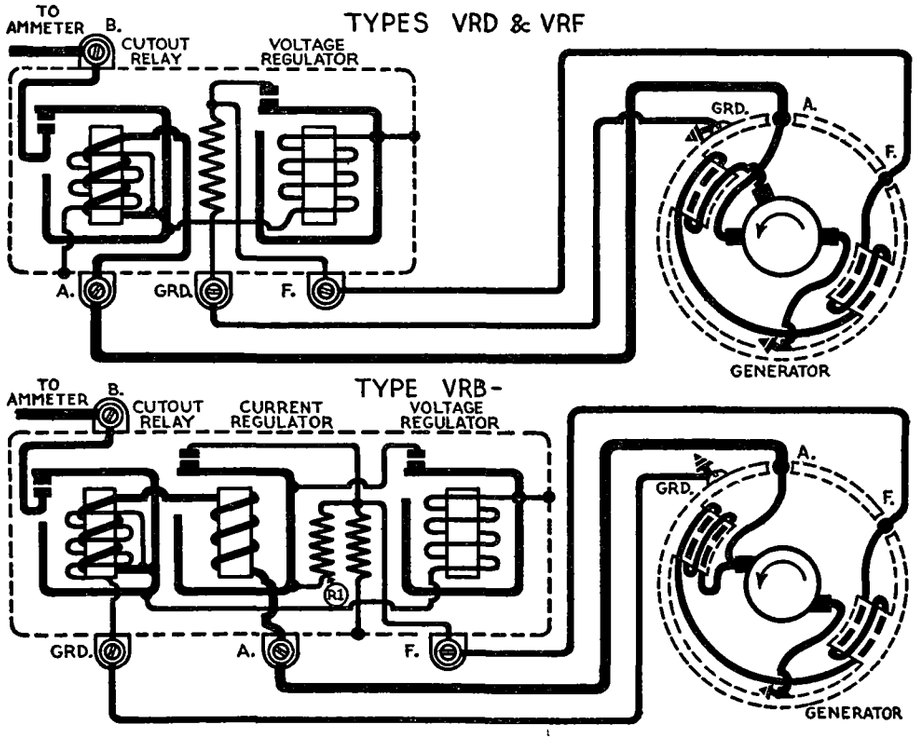
IMPORTANT CHANGES:—Voltage Setting (New Regulator Coil). Voltage Regulator coil changed beginning with Regulator Serial No. 8R-000001. This new coil requires different regulator voltage settings (new settings used also on units before 8R-000001 when this new coil installed). See Test Specifications below for settings for all models.

Regulator Resistance Units. Resistor units changed on some Voltage Regulators and second resistance unit added on some Voltage-Current Regulators. See Resistor specifications below for complete data on all types.



GROUNDED TERMINAL NOTE:—Each regulator designed to be operated with particular battery terminal grounded as noted in table above. See that battery is correctly grounded, and polarize generator when it is disconnected or removed from car (see Polarizing directions under Current Regulator Testing and Adjusting below).

TYPE:—Both the vibrating Voltage Regulators and the vibrating Current-Voltage Regulators are made in two general designs 'Small Type' and 'Large Type.' See following article on Truck & Bus Type Regulators for data on Large Type.

Model No.	Type	Voltage	Design
VRB Series	Small Type	6	Current-Voltage Regulator
VRD Series	Small Type	6	Voltage Regulator
VRE Series	Small Type	12	Current-Voltage Regulator
VRF Series	Small Type	12	Current-Voltage Regulator

DESCRIPTION & OPERATION:—Voltage Regulator. Consists of a conventional Cutout Relay and a new type Vibrating Voltage Regulator in a single case. Voltage Regulator has a single winding. When the generator voltage reaches the value for which the regulator is set, the regulator armature vibrates, opening and closing the regulator contacts, and cutting the resistance unit in and out of the field circuit. This action holds the generator voltage constant. These voltage Regulators are used only with third-brush control generators and the maximum output is controlled by the third brush in the usual manner.

Current-Voltage Regulators. Consist of the same Cutout Relay and Voltage Regulator units described above and an additional Current Regulator unit which controls the maximum generator output. These types used with two-brush shunt wound generators only. Current Regulator has a single winding connected in series so that the entire generator output goes through this winding. In operation on the car, when the generator output (entire current) reaches the value for which the regulator is set, the regulator armature vibrates, opening and closing the regulator contacts, and cutting the resistance unit in and out of the field circuit so that the output is held constant. The Current and Voltage Regulator contacts are connected in series so that the same resistance is used for both current and voltage control (when one resistance used—see Resistor data below for data on types using two resistors).

VRB, VRE NOTE

Resistor "R1" not used on units before No. 8R-000001 except on VRB-4008-A.

TESTING (ON THE CAR):—If regulator action not satisfactory, check these points first:

1. Generator Circuits. See that generator and regulator properly connected (see car wiring diagram) and that all connections are clean and tight. Examine charging line connections, check for high resistance in charging circuit. Voltage drop between generator and regulator and between regulator and battery must not exceed .1 volt when generator is charging 10 amperes. At this same charging rate, there should be no drop on voltage as measured between regulator base and battery ground post, generator frame and regulator base, and generator frame and battery ground post.

2. Generator Type & Performance. See that generator and regulator are correct types (special types designed to be used together, will not operate satisfactorily if different type generator or regulator used). Check generator performance with regulator out of circuit. Generator should produce rated output (see Performance Table on car model page). Examine commutator and brushes.

3. Battery. See that battery is in good condition and fully charged. High charging rate may be caused by overheated or discharged battery. Low charging rate may be caused by defective or sulphated battery plates. Check battery open-circuit voltage and specific gravity.

Regulator covers are sealed and Regulators are serviced on an exchange basis if seals are not broken. Performance can be checked on the car without breaking seals or removing covers as directed below. Complete bench testing and adjusting directions (requiring cover removal) are given in separate section below.

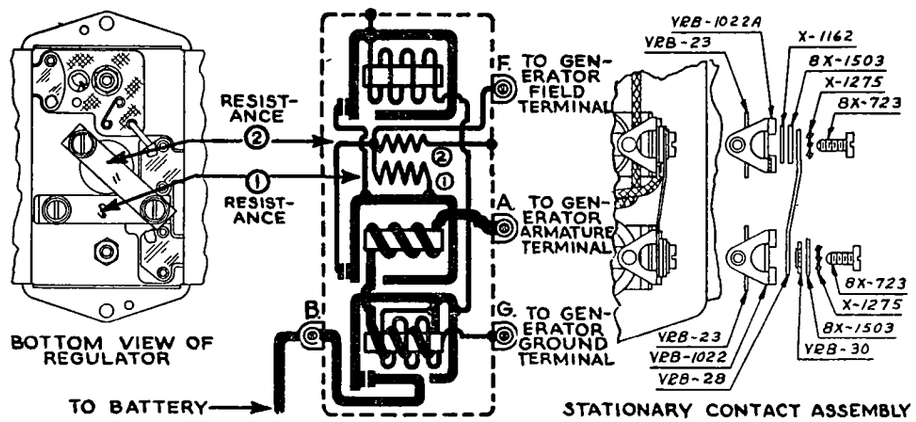
VOLTAGE REGULATOR

Voltage Regulator (All Series). Connect test ammeter (graduated to read to 1 ampere) in charging line at 'B' terminal of regulator using short heavy leads. Connect test voltmeter (graduated to read to .1 volt) between 'B' and 'GD' terminals (or between 'B' terminal and ground screw on regulator frame for VRA and VRC regulators). Make certain that car battery is fully charged (specific gravity reading of 1.275-1.280). Operate generator at speed equivalent to 30 M.P.H. for at least 15 minutes before taking meter readings. Ammeter should show reading less than maximum noted on regulator nameplate. After 15 minutes, note voltmeter reading which should agree with specifications given below. IMPORTANT NOTE—Voltage setting given for regulators "After Serial No. 8R-000001" apply also to units before this number if the new regulator coil winding (10.4-11.2 ohms) installed.

Voltage Setting

VRD-4003-A (Before 8R-000001)		All 'VRE', 'VRF' Types	
Temperature	Voltage Limits	Temperature	Voltage Limits
50°F.	7.53-7.83	50°F.	14.44-14.74
60	7.51-7.81	60	14.39-14.69
70	7.50-7.80	70	14.35-14.65
80	7.48-7.78	80	14.31-14.61
90	7.47-7.77	90	14.27-14.57
100	7.46-7.76	100	14.22-14.52

Voltage Setting—Before Serial No. 8R-000001.



VRD-4003-B (Hudson)		All other 'VRB', 'VRD' Types.	
Temperature	Voltage Limits	Temperature	Voltage Limits
50°F.	7.83-8.13	50°F.	7.53-7.83
60	7.81-8.11	60	7.51-7.81
70	7.80-8.10	70	7.50-7.80
80	7.78-8.08	80	7.48-7.78
90	7.77-8.07	90	7.47-7.77
100	7.76-8.06	100	7.46-7.76

Voltage Setting—After Serial No. 8R-000001. (or when new Voltage Regulator Coil installed).

VRD-4003-A, 3-B, 8-A, 8-B (Hudson)		All other 'VRB', 'VRD' Types.	
Temperature	Voltage Limits	Temperature	Voltage Limits
50°F.	7.48-7.78	50°F.	7.36-7.66
60	7.41-7.71	60	7.33-7.63
70	7.35-7.65	70	7.30-7.60
80	7.28-7.58	80	7.27-7.57
90	7.22-7.52	90	7.24-7.54
100	7.15-7.45	100	7.21-7.51
110	7.09-7.39	110	7.19-7.49
120	7.02-7.32	120	7.16-7.46
		130	7.13-7.43
		140	7.10-7.40

SPECIAL SETTINGS (VRD Regulators used with GCJ Generators — except Hudson). If battery is continuously overcharged, or charging rate is to high, check generator charging rate with regulator out of circuit and adjust third brush (see car model page for directions and settings on each car model), check regulator voltage with engine running at speed equivalent to 30 MPH. car speed. If voltage exceeds 7.5 volts, adjust regulator for voltage between 7.3 and 7.5 volts.

Regulator Resistor Units:—On most regulators, resistors have been changed (second resistor unit added, or resistance of single resistor changed) as follows (see illustration for location and numbering of resistor units):

Voltage-Current Regulator Resistors

Regulator Model	Before 8R-000001 "R1"	Before 8R-000001 "R2"	After 8R-000001 "R1"	After 8R-000001 "R2"

Voltage Regulator Resistors

Regulator Model	Resistor
VRD-4001A, B; 2-A, B; 3-A, B; 4-A; 6-A, B (See Note)	20
VRD-4008-A, 9-A, 10-A	20
VRD-4008-B	30
VRF-4001-A, 3-A, 4-A, 5-A, 6-A, 7-A (See Note)	30

VRD Note—Resistor TC-51L (28-32 ohms—marked 30) used on these models before Serial No. 7R-000001. Use only TC-51T (19-21 ohms—marked 20) for replacement.

VRF Note—Resistor TC-51M (57-63 ohms—marked 60) used on these models before Serial No. 9R-000001. Use only TC-51L (28-32 ohms—marked 30) for replacement.

Current Regulator (All Series). Connect test ammeter and voltmeter as directed above. Add load (turn on car lights and accessories or use a bank of headlamp bulbs connected at point between ammeter and battery) in excess of ampere rating stamped on regulator cover. Operate generator, as above, and note ammeter reading which will indicate point at which current regulator controls generator output. Ammeter reading should agree with regulator rating stamped on cover. Allowable variation is 5% (1 ampere above or below rating).

Current Setting

6 Volt Types		12 Volt Types	
Model	**Amperes**	**Model**	**Amperes**
VRB-4002A, 4A	29-31	VRE-4001A	14-16
VRB-4002C, 4C	24-26	VRE-4001B	11-13

VRB-4012A, 12A-1	27-29		
VRB-4012B-1	34-36		

ADJUSTMENT SPECIFICATIONS:—If regulator is being completely tested and adjusted on the bench (with cover removed), check specifications of all units as directed below before checking performance or changing settings.

CUTOUT RELAY

Specifications

Model	Voltage Coil Resistance	Air Gap	Contact Gap
All 'VRB' Types	35-39 ohms	.034-.038"	.015" Min.
All 'VRD' Types	35-39 ohms	.034-.038"	.015" Min.
All 'VRE' Types	111-123 ohms	.034-.038"	.015" Min.
All 'VRF' Types	111-123 ohms	.034-.038"	.015" Min.

Voltage Winding Resistance. Use ohmeter to measure resistance directly, or use accurate ammeter and voltmeter to measure current draw and voltage and calculate resistance in ohms. To check, disconnect voltage regulator lead on cutout relay frame and measure between 'A' terminal and ground.

Air Gap. Measure with contacts open at hinge end of armature core using special flat type gauge Part No. ST-281-3. Adjust by bending armature stop. Make certain that stop is in center of armature slot and that gap between armature and yoke does not exceed .002" at hinge end.

Contact Gap. Adjust by expanding or contracting stationary contact support keeping contacts exactly aligned and making certain that armature does not touch magnet yoke which will cause contacts to stick (clearance between armature and yoke with contacts closed should be .020").

VOLTAGE REGULATOR

Model	Coil Resistance	Air Gap	Contact Gap
All 'VRB' Types	10.4-11.2 ohms (see Note)	.0595-.0625"	.010-.020"
All 'VRD' Types	10.4-11.2 ohms (see Note)	.0595-.0625"	.010-.020"
All 'VRE' Types	45.8-49.6 ohms	.0595-.0625"	.010-.020"
All 'VRF' Types	45.8-49.6 ohms	.0595-.0625"	.010-.020"

NOTE—Resistance of coil used on regulators before Serial No. 8R-000001 was 12.8-14.3 ohms. Use new type coil (10.4-11.2 ohms) for replacement on all regulators. On regulators before Serial No. 8R-000001, change voltage setting to new figures (use table for regulators after No. 8R-000001) when this new coil installed.

Coil Winding Resistance. To check, disconnect voltage regulator lead on cutout relay frame and measure between this lead and ground.

Air Gap. Measure with contacts just opening at point side of armature stop pin using special pin gauge Part No. ST-281-2. To adjust, loosen screw on upper (stationary) contact bracket and use tool ST-282 to raise or lower the upper contact. Make certain that contacts are in exact alignment.

NOTE—To test gap setting (all models), connect test lamp in series with six volt battery between 'F' and 'GD' terminals. Insert low limit pin gauge depress armature (apply pressure equally at each side of contact spring, do not touch contact spring). Test lamp should go out. Repeat test using high limit pin gauge. Test lamp should remain lighted.

Armature Hinge Adjustment (Small Type). To check armature for correct 'floating' position, remove armature spiral spring, check armature position by holding regulator to the light and noting that armature floats midway between stationary contact and core stop (contacts must be open, armature must not touch stop). To adjust, bend both armature hinge support ears equal amount up or down (use square nosed pliers). Check alignment of support ears with straightedge. Re-install spiral spring, make certain that both ends of spring are down in holding grooves and that lower spring bracket is not distorted (spring must be vertical).

Contact Gap. Measure with armature held down against stop pin. If contact gap varies widely, armature stop pin is wrong length and unit should be replaced.

Contact Assembly (All Types). When installing new stationary contacts make certain that all insulating washers, lockwashers and other parts installed in correct order (see illustration for correct sequence of assembly).

CURRENT REGULATOR

Model	Air Gap	Contact Gap
All 'VRB' Types	.0595-.0625"	.010-.020"
All 'VRE' Types	.0595-.0625"	.010-.020"

Contact Gap, Spring Pressure, Air Gap. Check and adjust in same manner as directed for Voltage Regulator above. Use pin gauge Part No. ST-281-2 to measure air gap.

TESTING & ADJUSTING (ON THE BENCH):—Mount unit firmly (so there is no vibration) in same position as when mounted on car. Heat regulator before making tests by operating for 15 minutes with generator charging 10 amperes (for all units rated below 30 amperes), 20 amperes (all units rated above 30 amperes). Cover must be in place while heating unit and when making tests.

Resistor Units

Remove resistors (remove, check, and replace separately to avoid possibility of interchanging resistors when two used). Check resistance with ohmeter. Resistance value must be within limits shown in table below (figures stamped on resistor unit is nominal resistance in ohms, see table for resistance limits). See Resistor data under Voltage Regulator (above) for correct type and changes made on each regulator model.

Resistor Marking	Resistance (In Ohms)
7	6.5-7.5
11	10-12
20	19-21
30	28-32
60	57-63

CUTOUT RELAY

Connect ammeter in series in charging line between battery and regulator 'B' terminal, voltmeter between regulator 'A' terminal and ground. When checking cut-in voltage, connect single earphone (2000 ohms resistance or higher) between regulator 'A' and 'B' terminals, a click will be heard in the earphone when the contacts close.

Model	Closing Voltage	Opening Amperage
All 'VRB' & 'VRD' Types	6.4- 7.0 volts	.5-3.0 amperes
All 'VRE', 'VRF" Types	13.0-13.75 volts	.5-3.0 amperes

VRD-4008A, B Note. On Model VRD-4008A (after Serial No. 2T-000001) and all VRD-4008B regulators, Cutout Relay opening amperage should be 1.5-4.5 amperes.

Cut-in Voltage. To adjust, change armature spring tension by bending lower spring arm. Cutout Relay cut-in voltage must always be .5 volts below voltage at which voltage regulator begins to operate (contacts will not close if cut-in voltage set at higher figure).

Cut-Out Amperage. To adjust, change contact gap by raising or lowering lower (stationary) contact. See Cutout Relay Contact Gap specifications above for instructions.

Note for Rechecking Cutout Relay. When rechecking, with Cutout Relay hot (after Voltage and Current Regulators have been adjusted), if cut-in voltage and cut-out amperage are no longer correct, check armature hinge and see that it is installed with brass side up. If hinge has been installed incorrectly, replace Cutout Relay unit.

VOLTAGE REGULATOR

Connect voltmeter between regulator 'A' terminal and ground, single earphone (2000 ohms resistance or higher) between regulator 'A' and 'B' terminals. Earphone will register 'click' of regulator contact opening and closing and give accurate indication of regulator action. Operate regulator and note voltage. Voltage should be within limits shown in table for 'Testing on Car' above.

To Adjust. Increase armature spring tension (to increase voltage), decrease spring tension (to lower voltage) by bending the lower spring arm (Small Type), or turning the adjusting nut at the lower end of the spring (Large Type). If setting is changed, reheat regulator by operating generator for 15 minute period with charging rate as above and then recheck voltage.

Final 'Flash' Test. After making adjustments, replace cover, stop generator momentarily, note maximum voltage reading immediately after generator is restarted.

CURRENT REGULATOR

Connect test ammeter in series in charging line at regulator 'B' terminal. Use earphone to check regulator action (connect as directed for Voltage Regulator adjustment above). Increase generator output by connecting lamp bank or resistance across battery, note ammeter reading when current regulator operates to limit generator output. Output should be within 5% (1 ampere more or less) of rated figure stamped on regulator cover. See table for 'Testing on Car' above for each regulator model.

To Adjust. Increase armature spring tension (to increase output), or decrease armature spring tension (to decrease output) by bending the lower spring arm (Small Type) or turning adjusting nut at lower end of spring (Large Type).

Final 'Flash' Test. After making adjustments, replace cover, stop generator momentarily, note maximum current reading immediately after generator is restarted.

Polarizing Generator

Use jumper wire from starting switch battery connection to generator 'A' terminal. Do not close cutout relay contacts by hand for this purpose (excessive current will cause burnt contacts). Generator must be polarized when operated on bench and when replaced on car.

TROUBLE SHOOTING:—If regulator action is not satisfactory, check possible causes as listed below.

Cutout Relay contacts do not close. Cutout Relay shunt winding open or shorted, series coil open. 'A' terminal grounded or Cutout Relay grounded. Current Regulator series coil open.

Cutout Relay Cuts in late or at high speed. Voltage Regulator or Current Regulator contacts burnt, dirty or high resistance (if contacts burnt, check for broken or wrong type resistance unit).

Cutout Relay action erratic or intermittent. Same as above. Cutout Relay air gap wrong. Armature hinge reversed. Armature binding (armature should float without touching stop or stationary contact at room temperature with tension spring removed).

Cutout Relay Contacts Flutter. Cut-in voltage set too low. Discharge current for cut-out point too low or contacts opening with generator charging.

Generator does not charge Battery. Cutout Relay contacts dirty or burnt. 'A' terminal or cutout relay grounded. Cutout Relay air gap wrong, cut-in voltage setting too high. Voltage Regulator setting too low. Current Regulator or Cutout Relay series coil open.

No Output Control (Current Regulator Inoperative). 'F' terminal, lead to stationary contact, or stationary contact support grounded. Current Regulator frame grounded to base.

Charging Rate too low. Current Regulator air gap set wrong, current setting too low, contacts burnt, dirty or high resistance.

Charging Rate too high. Voltage Regulator setting too high, winding resistance too great. Current Regulator series coil shorted.

Voltage Regulator inoperative (No voltage control). Voltage Regulator contacts sticking, stationary contact grounded, winding open. Cutout Relay shunt coil open. 'F' terminal or lead grounded.

Voltage too high or too low. Voltage Regulator air gap set wrong, contact spring tension wrong, high resistance in winding (examine connections). Resistance units wrong type or broken. Voltage Regulator winding shorted.

Voltage drops when Voltage Regulator operates. Voltage regulator contacts sticking.

Ammeter fluctuates excessively. Slight fluctuation normal at point where voltage regulator begins to operate. If excessive, check for Voltage Regulator or Current Regulator contacts dirty, sticking, burnt or high resistance. Resistance units broken or wrong type. Voltage or Current Regulator armature hinge loose. Cutout Relay cut-out discharge current too low.

Current Discharge with Generator not running. 'B' terminal or Cutout Relay stationary contact grounded, Cutout Relay contacts sticking or air gap set wrong.

NOTE:—These "Large Type" Regulators are intended for use with generators of larger output and consist of the following types:

Regulator Model	Type	Voltage
All "VRA" Types	Current-Voltage Regulator	12 volts
All "VRC" Types	Current-Voltage Regulator	6 volts
All "VRG" Types	Current-Voltage Regulator	12 volts

GROUND TERMINAL NOTE:—Each regulator designed to be operated with particular battery terminal grounded as noted in following table. See that battery is properly grounded and polarize generator whenever it is disconnected or removed from car (see Polarizing instructions below).

Model	Grounded Terminal
VRA-4101A, 2A, 3A; VRC-4101A, 2A, 2B; VRG-4101A, 2A	Positive.
VRG-4103A	Negative.

DESCRIPTION & OPERATION:—Similar in design to "Small Type" regulators intended for passenger car equipment (see preceding article) except for additional winding on current regulator unit which is connected in series with an additional resistor unit as shown in the illustration. Adjustments and specifications for these Large Type regulators are not the same as for Small Type units and Large Type regulators should be checked and adjusted as directed below.

TESTING (ON THE CAR):—If regulator operation is not satisfactory, check the following points first:

1. **Charging Circuit.** See that generator and regulator are properly connected and that all connections are clean and tight. Check charging circuit for high resistance. Voltage drop between generator and regulator or between regulator and battery should not exceed .1 volt with generator charging at 10 amperes. There should be no voltage drop between regulator base and battery ground post, generator frame and regulator base, or between generator base and battery ground post.
2. **Generator Type & Performance.** See that generator and regulator are correct type (special types designed to be used together, will not operate satisfactorily with other units). Check generator performance with regulator out of circuit. Generator should produce rated output.
3. **Battery.** Check battery open-circuit voltage and specific gravity. See that battery in good condition and fully charged. NOTE—High charging rate may be caused by overheated, discharged, or short-circuited battery. Low charging rate may be caused by defective or sulphated battery plates, high separator resistance or extreme cold.

Regulator Seal Note—Covers are sealed. Regulator performance may be checked without breaking seals or removing covers as directed below. Complete bench testing and adjustment directions require that cover be removed.

Voltage Regulator (All Types):—Connect test ammeter in charging line at regulator "B" terminal (ammeter must read to 1 ampere and have maximum internal resistance of .01 ohm or .1 volt at 10 amperes) using short heavy leads. Connect test voltmeter between regulator "B" terminal and ground screw on regulator frame. Make certain that car battery is fully charged with specific gravity reading of 1.275-1.280. Run engine at speed equivalent to 30 M.P.H. for at least 15 minutes to bring units up to operating temperature, then note meter readings. Ammeter should indicate charging current less than maximum figure noted on regulator nameplate. Note voltmeter reading which should agree with specifications given below.

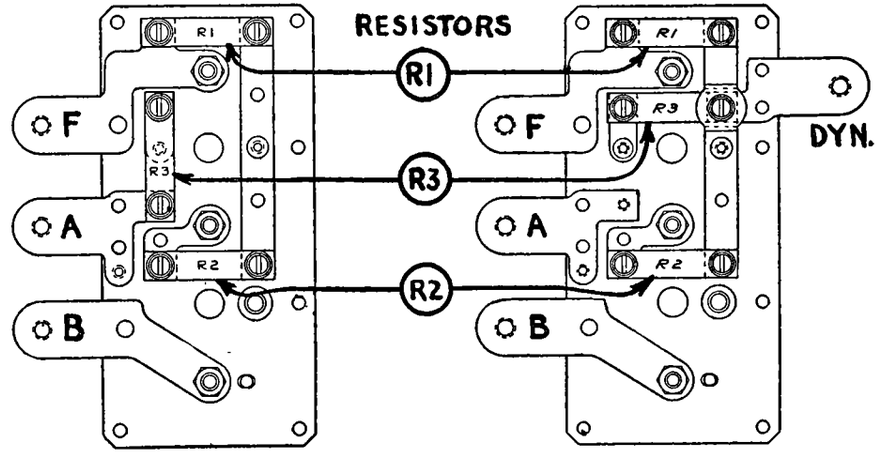
Voltage Setting

VRA-4101A, 2A; VRG-4101A		VRA-4103A, VRG-4102A, 3A	
Temperature	Volts	Temperature	Volts
50°F.	14.51	50°F.	14.31
60	14.48	60	14.28
70	14.45	70	14.25
80	14.42	80	14.22
90	14.39	90	14.19
100	14.36	100	14.16

VRC-4101A, VRC-4102A, VRC-4102B

Temperature	Volts
50°F.	7.51
60	7.48
70	7.45
80	7.42
90	7.39
100	7.36

Note—All voltage figures above are plus or minus .15 volts.



Regulator Resistor Units:—Three resistor units used on all models (see illustration for mounting of resistors on regulator base plate). To check resistor units, remove from regulator and test singly with ST-284 ohmeter. Use extreme care not to interchange resistor units make certain that resistors are of correct value as shown in table below.

Regulator Model	Resistor Markings "R1"	"R2"	"R3"
VRA-4101A, 2A, 3A	135	15	.65
VRC-4101A, 2A, 2B	80	5	.2
VRG-4101A, 2A, 3A	135	15	.65

Current Regulator (All Types):—Connect test ammeter and voltmeter as directed for voltage test above. Run engine and add load in excess of ampere rating noted on regulator nameplate (turn on lamps and accessories or connect bank of headlamp bulbs at point between generator and battery). Note ammeter reading which should agree with regulator rating stamped on cover. Allowable variation is 5% (1 ampere above or below rating) and ammeter reading should be within limits shown in table below.

Current Setting

6 Volt Types		12 Volt Types	
Model	Amperes	Model	Amperes
VRC-4101A	39-41	VRA-4101A, 3A	19-21
VRC-4102A	39-41	VRA-4102A	39-41
VRC-4102B	29-31	VRG-4101A, 2A	39-41
		VRG-4103A	19-21

ADJUSTMENT SPECIFICATIONS:—If above tests indicate that regulator is not operating properly, and units are being adjusted on the bench with the cover removed, check specifications of all units as directed below before checking performance or changing settings.

CUTOUT RELAY

Model	Voltage Coil Resistance	Air Gap	Contact Gap
All "VRA" Types	49.7 ohms	.055-.062"	.015" Min.
All "VRC" Types	15.3 ohms	.055-.062"	.015" Min.
All "VRG" Types	49.7 ohms	.055-.062"	.015" Min.

Voltage Winding Resistance. Use ohmeter to measure resistance directly or use accurate ammeter and voltmeter to measure current draw and voltage and then calculate resistance in ohms. To check, disconnect voltage coil ground lead at screw on baseplate and measure between this lead and stationary contact of cutout relay.

Air Gap. Measure with contacts open at point side of brass core pin using flat gauge No. ST-281-4. Adjust by raising or lowering stop at contact end of armature.

Contact Gap. Adjust by bending stationary contact support arms with tool ST-283 using extreme care to keep contact points in alignment and to maintain uniform gap for both sets. Check alignment with straightedge placed across tops of contact brackets.

VOLTAGE REGULATOR

Model	Coil Resistance	Air Gap	Contact Gap	Contact Spr. Pressure
All "VRA" Types	15.8 ohms	.040-.042"	.010" Min.	7-8 ozs.
All "VRC" Types	4.15 ohms	.040-.042"	.010" Min.	7-8 ozs.
All "VRG" Types	15.8 ohms	.040-.042"	.010" Min.	7-8 ozs.

Coil Winding Resistance. Disconnect both leads at screws on baseplate and measure between these leads using ST-284 ohmeter.

Air Gap. Measure with contacts just opening at point side of brass armature stop pin with gauge No. ST-281-1. To adjust, loosen screws and raise or lower armature contact stop. Make certain that contacts are in exact alignment and that contact stop screws are securely tightened.

NOTE—To test air gap setting, connect test lamp in series with a battery between regulator "A" and "F" terminals. Insert low limit pin gauge, depress armature (apply pressure equally at each side of contact spring, do not touch contact spring). Test lamp should go out. Repeat test with high limit pin gauge. Lamp should remain lighted.

Contact Gap. Measure with armature held down against stop pin, depressing armature with one finger on either side of contact spring so that no pressure applied to spring. If contact gap varies greatly, armature stop pin length is wrong and unit should be replaced. See that contact spring is straight and parallel with armature.

Contact Spring Pressure. To check, disconnect armature spring, remove armature stop, hook spring scale on contact arm at contact, note scale reading at instant contacts separate. When replacing armature stop make certain that fibre bumper block is in place.

CURRENT REGULATOR

Model	Freq. Coil Resistance	Air Gap	Contact Gap	Contact Spr. Pressure
All "VRA" Types	.018 ohms	.047-.049"	.010" Min.	7-8 ozs.
All "VRC" Types	.066 ohms	.047-.049"	.010" Min.	7-8 ozs.
All "VRG" Types	.018 ohms	.047-.049"	.010" Min.	7-8 ozs.

Frequency Winding Resistance (Large Type only). This is the second winding which is used only on Large Type regulators. To check, disconnect lead from screw on base plate at right of current regulator (contact end) and measure between this lead and current regulator frame.

Air Gap, Contact Gap, Contact Spring Pressure. Check and adjust in same manner as directed for Voltage Regulator above. Use pin gauge No. ST-281-5 to check air gap (not same as voltage regulator).

TESTING & ADJUSTING (ON THE BENCH):—Mount unit firmly in same position as when mounted on car so that there is no vibration. Heat regulator before making test by operating for 15 minutes with generator charging 10 amperes (all units rated below 30 amperes), 20 amperes (units rated above 30 amperes). CAUTION—Cover must be in place when heating regulator and when making tests.

Resistors:—Remove resistors singly (to avoid replacing in wrong position) and test with ohmeter ST-284. Resistance values must be within values shown in table below (figure stamped on resistor is nominal resistance in ohms, see separate table above for resistors used on each regulator).

Resistor Marking	Resistance in Ohms.
.2	.18-.22
.65	.6-.7
5	5-5.5
15	13.5-16.5
80	76-84
135	130-140

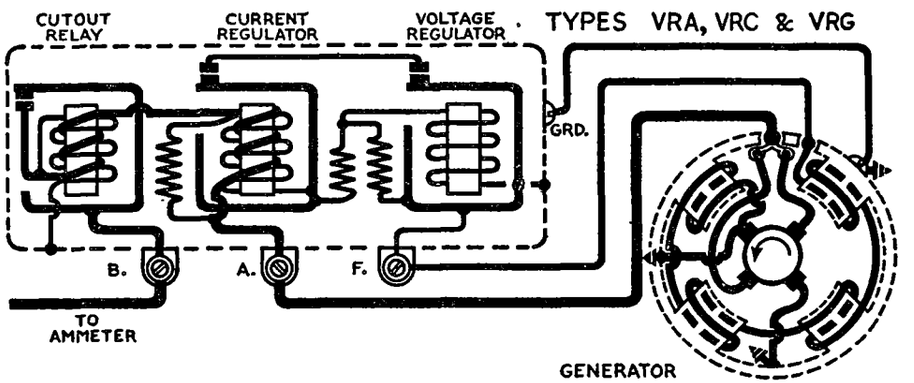
CUTOUT RELAY

Connect test ammeter in series in charging line between battery and regulator "B" terminal, voltmeter between regulator "A" terminal and ground. When checking cut-in voltage, connect single earphone (2000 ohms resistance or higher) between regulator "A" and "B" terminals. A click will be heard in the earphone when the contacts close.

Model	Closing Voltage	Opening Amperage
All "VRA", "VRG" Types	13.0-13.5	.5-4.0
All "VRC" Types	6.5-7.0	.5-4.0

Cut-in Voltage. To adjust, change armature spring tension by turning screw at lower end of spring. Cut-in voltage must always be set .5 volts below voltage at which voltage regulator begins to operate (contacts will not close if set at higher figure).

Cut-out Amperage. To adjust, change contact gap by raising or lowering lower (stationary) contact. See contact gap adjustment above.



Final Performance Test. After making adjustments, replace regulator cover and recheck performance. Make final 'flash' test after adjustments and checking have been completed.

VOLTAGE REGULATOR

Connect voltmeter between regulator "B" terminal and ground screw on regulator frame. Connect single earphone (2000 ohms resistance or higher) between regulator "F" terminal and ground. Earphone will register "click" or vibration of regulator contact opening and closing and will give accurate indication of regulator operation. Operate regulator and note voltage. Voltage should be within limits shown in table under "Testing on Car" above.

To Adjust. Increase armature spring tension (to increase voltage) or decrease spring tension (to lower voltage) by turning adjusting screw at lower end of spring.

Final Flash Test. After completing adjustments, replace regulator cover, take a "flash" voltage reading by stopping generator and then noting voltage reading immediately after restarting generator.

CURRENT REGULATOR

Connect test ammeter in charging line at regulator "B" terminal. Use earphone to check regulator action (connect as for Voltage Regulator test above). Operate generator and increase load by connecting bank of headlamp bulbs as load, or use resistance connected across battery, so that current regulator operates. Note ammeter reading which should be within 5% (1 ampere more or less) than rated capacity of regulator as shown in table above.

To Adjust. Increase armature spring tension (to increase output), decrease spring tension (to decrease output) as directed for Voltage Regulator above.

Final Flash Test. Make flash test of output after all adjustments completed and regulator cover replaced by stopping generator momentarily and then noting ammeter reading immediately after generator is restarted.

POLARIZING GENERATOR:—Generator should be polarized before being run on bench or car by connecting jumper wire from starting switch battery connection to generator "A" terminal momentarily. Do not close relay contacts by hand to accomplish this result (excessive current will burn contacts).

TROUBLE SHOOTING:—Same as for other regulator types. See Trouble Shooting table for "Small Type" regulators.

AUTO-LITE CUTOUT RELAYS

DESCRIPTION:——All Cutout Relays used as automatic switches to disconnect the generator when it is not charging the battery and thus prevent the battery discharging through the generator windings are similar in operation although individual types and makes are somewhat different in construction. See special sections below for details of design and adjustment instructions for each type.

OPERATION:—There are two coil windings, a fine winding called the shunt or voltage coil, which is connected directly from the generator terminal to ground (on 'insulated' type coil is not grounded but is connected across generator main brushes), and a heavy winding called the series or current coil, which is connected in the charging line from the generator so that the entire generator output (charging current to battery) passes through it. The series coil is in series with the cutout relay contacts so that no current flows in this coil with the contacts open. When the generator is operated at speeds below the cut-in point (with relay contacts open), there is a small current flow through the voltage or shunt winding. At the cut-in point, the magnetic field created by the shunt coil is sufficiently strong to attract the relay armature, closing the relay contacts. The generator output then flows through the series coil and the relay contacts to the battery. As long as the generator speed is high enough to produce a charging current (generator voltage greater than battery voltage), the series coil acts in conjunction with the shunt coil to keep the contacts closed.

When the generator voltage falls below that of the battery, the current flow in the series coil is reversed and the battery discharges through the generator. The magnetic field created by the series field due to this reverse current opposes that of the shunt coil, and the relay contacts open, opening the circuit between the battery and generator and preventing a further discharge of the battery.

ADJUSTMENT:—Mechanical specifications (contact gap, air gap, armature spring tension, etc.) should be checked and adjusted before the performance (cut-in and cut-out points) are checked or adjusted. See instructions for individual types below.

AUTO-LITE CB-4000 SERIES STANDARD RELAY

MECHANICAL ADJUSTMENT:—Air Gap. Close relay contacts (hold armature down), measure air gap between armature and top of coil core, using a feeler gauge. Air gap should be within limits of .010-.030". Adjust by loosening lower contact mounting screw and shifting contact bracket up or down (early types) or by expanding or contracting lower contact support so as to raise or lower contact (later types).

Contacts. Examine contact surfaces. Contacts must be flat and parallel, free from dust or oil, and not burned or pitted. If necessary, resurface contacts with a fine file or #00 sandpaper.

Contact Gap. With armature up against upper stop, check contact gap. Contact gap should be within limits of .025-.035". Adjust by bending upper stop backward or forward.

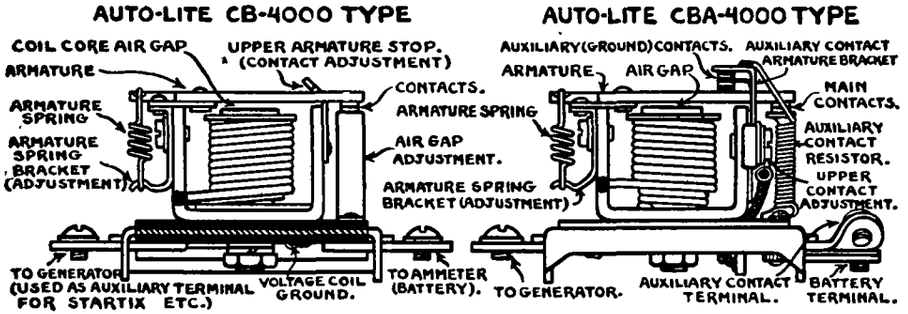
ELECTRICAL ADJUSTMENT:—Cut-in (contact closing) Point. Connect an accurate voltmeter between generator terminal of relay and ground. Operate generator and slowly increase speed until contacts close. Note voltmeter reading (there will be a slight 'kick-back' or voltage drop as contacts close). Performance should be as follows:

Model	Cut-in Voltage	Maximum Load
All 6 Volt Types	6.5 Min., 7.25 Max	5 amperes
All 12 Volt Types	13.0 Min., 14.5 Max	3 amperes

If performance is not satisfactory, adjust as follows:

To raise Cut-in Voltage. Increase air gap (see above) or increase armature spring tension by bending spring arm down (early types), or by bending lower spring bracket down (later types).

To lower Cut-in Voltage. Decrease air gap or decrease armature spring tension by bending spring arm up (early types), or by bending lower spring bracket up (later types).



Cut-out (Contact opening) Point. Connect an ammeter in the charging line at the relay. Operate generator and slowly decrease speed until contacts open. Note ammeter reading (pointer will drop to '0' when contacts open). Performance should be as follows:

Model	Minimum — Discharge Current — Maximum
All 6 Volt Types	.5 ampere — 2.5 amperes
All 12 Volt Types	.5 ampere — 2.0 amperes

NOTE—A charging current of not less than 15 amperes must pass through relay windings before cut-out test is made. If discharge current is excessive, increase armature spring tension and decrease air gap slightly.

AUTO-LITE CBA-4000 SERIES SPECIAL RELAY

This type relay has a special set of auxiliary ground contacts mounted above the armature for signal light control (auxiliary contacts are closed with main contacts open and open when main contacts close). See illustration). The auxiliary contacts were grounded directly on the first Type CBA-4001 relays. On later types (which may be identified by one terminal being copper-plated) these contacts were grounded through a 6 ohm resistor to prevent damage to the contact spring through overloading caused by accidental application of full battery voltage (signal light circuit current regulated normally by 6 volt, 3 cp. signal light in series with contacts).

MECHANICAL ADJUSTMENT:—Air Gap. Close relay contacts (hold armature down, measure air gap between armature and coil core, using a feeler gauge. Air gap should be within limits of .010-.030". Adjust by expanding or contracting lower contact support so as to raise or lower lower contact.

Contacts. Examine contact surfaces. Contacts must be flat and parallel, free from dust or oil, and not burned or pitted. Resurface contacts when necessary with a fine file or #00 sandpaper.

Contact Gap. With upper contacts closed, check lower or main contact gap. Contact gap should be within limits of .025-.035". Adjust by loosening upper contact support bracket screw (auxiliary contacts) and raising or lowering this upper contact. Check auxiliary contacts after adjusting contact gap. If these contacts do not open when main contacts close, adjust by bending auxiliary contact armature bracket (see illustration).

ELECTRICAL ADJUSTMENT:—All adjustments are the same as for the standard relay (see above). Performance should be as follows:

Cut-in (Contact Closing)

Minimum Voltage	Maximum Voltage	Maximum Load
6.75	7.5	5 amperes

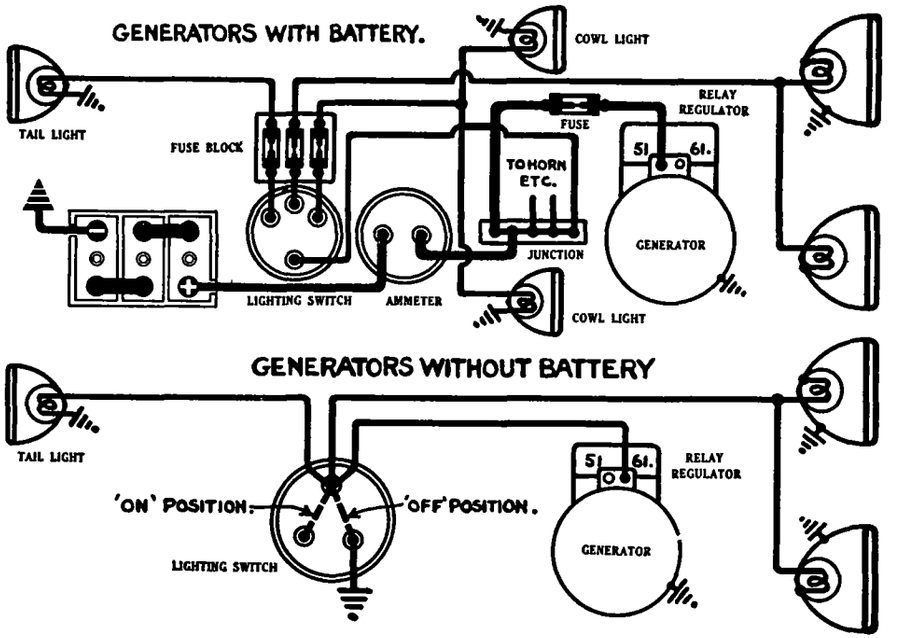
Cut-out (Contact Opening)

Minimum	Discharge Current	Maximum
.5 ampere		2.5 amperes

NOTE:—A charging current of not less than 10 amperes must pass through the relay coil windings before this cut-out test is made.

TYPES RJ75/6-900, RJA75/6-900, RJB75/6-900 (WITH AND WITHOUT BATTERY)

DESCRIPTION:—These generators have been furnished for use with battery or without battery where genrator is used for lighting only on tractors, etc. They may be changed over from one type of service to the other by following the directions given below. See separate articles for illustration of generator and regulator and complete description and adjustment of the regulator used with these generators.



TO CHANGE GENERATOR FROM USE WITHOUT BATTERY TO USE WITH BATTERY:—Remove the plug from the cable hole for terminal '51' and plug terminal '61'. Bend the pole piece stop outward until gap between pole piece and magnet core is 3-3.2 MM. or .118-.126" with pole piece against stop. This will allow relay cutout contacts to open. Check relay contact gap. With the pole piece stop in correct position, relay contact gap should be .3-.5 MM. or .012-.020". Adjust regulator as directed in article on Bosch Regulators (Generators With Battery). Follow the complete adjustment procedure—Regulating Voltage (No Load), Regulating Voltage (With Load), Cut-in Voltage, Reverse Current, and final load test. When generator is installed, make certain that negative (—) terminal of battery is grounded.

TO CHANGE GENERATOR FROM USE WITH BATTERY TO USE WITHOUT BATTERY:—Remove the plug from the cable hole for terminal '61' and plug terminal '51'. Bend the pole piece stop in so that pole piece is moved toward magnet core sufficiently to close cutout relay contacts permanently. See that a small gap remains between pole piece pin and reverse current screw with pole piece against stop so that lower regulator contacts are closed. The gap should be small enough so that the slightest movement of the pole piece toward the magnet core will open the lower regulator contacts. Connect a voltmeter between terminal '61' and ground. Operate the generator on the test bench and make the following tests.

Maximum Voltage (No Load). Slowly increase generator speed to 3600 R.P.M. Note voltmeter readings. Maximum voltage must not exceed 6.75 volts. It will be necessary to turn regulator adjusting nut about ½ turn to left or counter-clockwise to secure this setting.

Maximum Voltage (With Load). Connect a lamp load comprising 2 6v. 21cp. and 1 6v. 4 cp. lamps (34 watt total) between terminal '61' and ground (lamps in parallel). Operate generator and slowly increase speed to 3600 R.P.M. Maximum voltage should be 6.5 volts. To adjust, turn regulator adjusting nut slightly out or counter-clockwise to decrease voltage, and in or clockwise to increase voltage.

Final Load Test. After completing load test, operate generator for one-half hour at 2000 R.P.M. with this same load (34 watts). Repeat tests for maximum voltage (no load), and maximum voltage (with load). Readjust as necessary. If readjustments have been made, repeat final load test.

BOSCH REGULATOR—GENERATORS WITH BATTERY

NEW TYPE SINGLE UNIT VOLTAGE REGULATOR AND CUTOUT RELAY

DESCRIPTION:—This type unit is a combined cutout relay and voltage regulator using only one coil (see illustration). The unit is mounted on top of the generator or inside the commutator end cover. Types used on particular generators are as follows:

Voltage Regulator Type	Generator Types
SSM-11/1	RE
SSM-6/1, SSM-6/11, SSM-6/15	RJ & RJA
SSM-11/1, SSM-11/15	RJB
SSM-23/2	RJC
SSM-11/14, SSM-11/17	RK
SSM-23/10	RKC-130/6
SSM-23/44, SSM-23/5	RKC 130/12

ROTATION:—With field connections as shown in illustration (red field coil lead) connected near red arrow, generator rotation is clockwise as viewed from commutator end. To reverse direction of rotation, disconnect and exchange red and blue field coil leads. The battery used with these generators must always have the negative (—) terminal grounded. On Types RJ and RJA generators, terminal 'H' is located in place of terminal 'F' and terminal 'F' is located near regulator adjusting nut. On Types RJC and RKC generators, the leads for the field coil and field resistance are not connected to terminals 'H' and 'F' but are connected to the positive brush and to an insulated bar inside the commutator end plate. The red and blue arrows are stamped into the commutator end plate. When the red field coil lead is connected near the arrows, the generator rotation is clockwise as viewed from the drive end. To reverse the direction of rotation, disconnect and exchange the red and blue field coil leads.

OPERATION:—The illustration shows the position of the regulator with the generator not running (cutout contacts open, lower regulator contacts closed, upper regulator contacts open). In this position the generator field resistance (wound on one field pole) is short-circuited. When the generator is operated, the generator current flows through the current or 'series' winding and then through the voltage or shunt winding. When the cut-in point is reached the magnetic field created by this current flow is sufficient to attract the pole piece, closing the cut-out contacts so that the generator current flows to terminal '51' and to the battery.

As the generator voltage rises, the movement of the pole piece toward the coil core first opens the lower regulator contacts which cuts the field resistance in series with the generator field. If the voltage continues to rise, the pole piece then closes the upper regulator contacts which momentarily short-circuits the generator field. This action results in maintaining an even voltage for all generator speeds.

ADJUSTMENT:—If generator performance is not satisfactory, check the following points before removing generator from the car:

1. Generator Drive. See that generator is properly driven without belt slippage, etc.

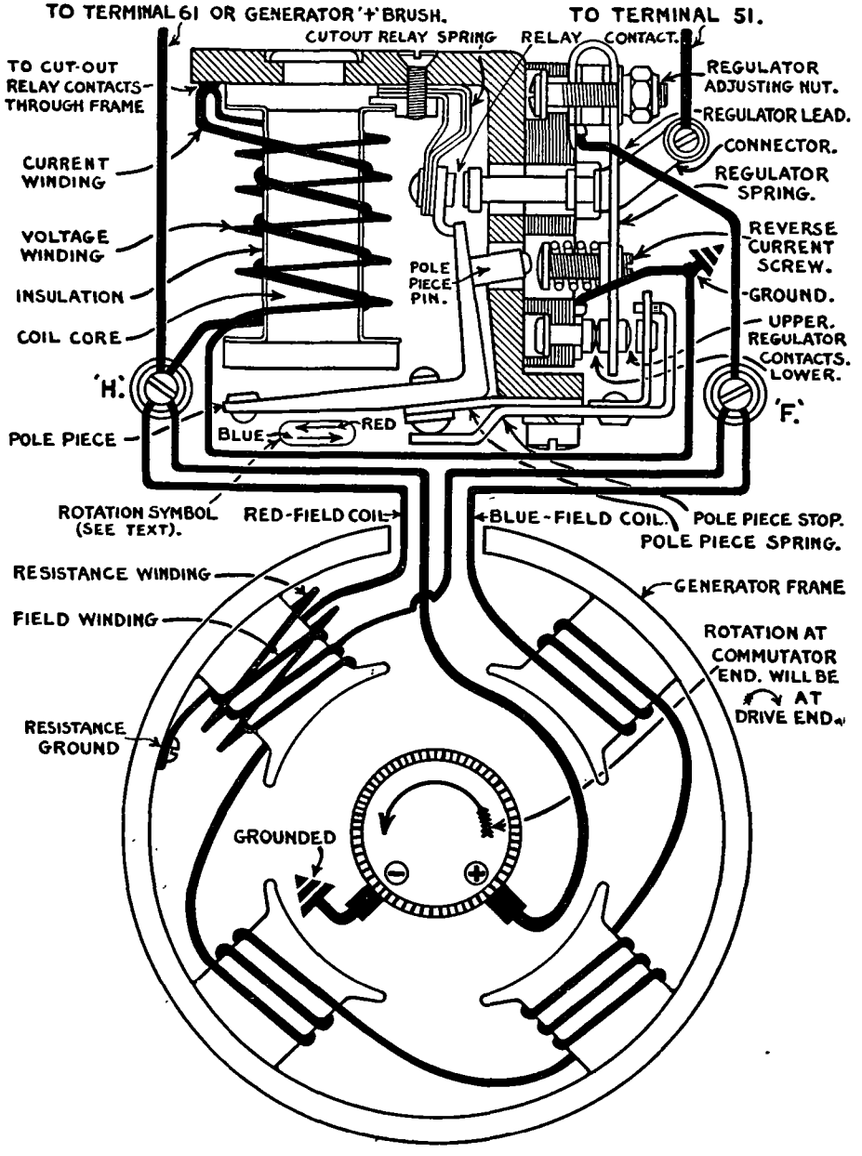
2. Wiring. Examine wiring, see that all connections are clean and tight (see illustration). Look for possible short-circuits.

3. Commutator and Brushes. See that brushes are not worn and that they are properly fitted. Examine commutator, clean if necessary.

Generator should be removed to the test bench and operated with regulator disconnected to make certain that regulator unit is at fault. To make this test, disconnect current winding lead from terminal 'H' and ground terminal 'F'. Operate the generator at speed shown in the following table and note whether voltage is within limits indicated. If voltage is not correct, examine generator for correct rotation, defective brushes, armature or field coils burnt out, or open connections.

Generator Type	Operating R.P.M.	Voltage Limits
RE	1600 R.P.M.	6-9 volts
RJ, RJA, RJB-75/6-900	850	6-9
RJC-90/6-1100	1100	6-9
RK-100/12-700	640	12-17
RK-130/12-900	750	12-17
RKC-130/6-1000	1000	6-9
RKC-130/12-825	825	12-17

If this test indicates that generator performance is satisfactory, reconnect regulator and test as follows. The entire test procedure as outlined below should be followed out before any readjustments are made. Before testing, examine relay and regulator contacts. If contacts are worn or pitted, clean and resurface contacts without disassembling. Relay contact gap should be .3 MM. (.012").



1. Regulating Voltage (No Load). Connect a voltmeter between terminal '61' and ground (if terminal 61 is plugged, connect voltmeter to stud 'H' or insulated brush. Operate the generator without load at 'nominal' speed given in table below. Note voltmeter reading. Then increase generator speed to 'maximum' and note voltmeter reading. Maximum voltage readings as recorded during this period while generator speed is increased to maximum point must be within limits given in the table and the voltage reading at maximum speed must not be more than .5 volts above or .2 volts below the voltage at nominal speed. To adjust, turn regulator adjusting nut to left (counter-clockwise) if regulating voltage is too high, or to the right (clockwise) if regulating voltage is too low. If correct regulating vontage cannot be secured with this adjustment, the regulator unit should be replaced.

Generator Type	Nominal Speed	Maximum Speed	Regulating Voltage
RE	1700 R.P.M.	5000 R.P.M.	7.3-8.5 volts
RJ, RJA, RJB	900	3500	7.3-8.5
RJC-90/6-1100	1100	4500	7.3-8.5
RK-100/12-700	700	3600	14.3-16.8
RK-130/12-900	900	3600	14.3-16.8
RKC-130/6-1000	1000	3600	7.3-8.5
RKC-130/12-825	825	4500	14.3-16.8

2. Regulating Voltage (With Load). If perforformance without load (Test 1) is satisfactory, this test can be omitted or may be made as a check on the results secured in the no-load test. Connect a voltmeter between terminal '51' and ground. Connect a lamp load of size indicated in table below between this same terminal and ground (lamps to be connected in parallel). Disconnect field lead on stud 'H', connect this lead to one terminal of an ammeter and connect the other ammeter terminal to the stud (placing ammeter in series with field to read field current). Operate generator and slowly increase speed until ammeter reading suddenly drops to about 1 ampere. This indicates that lower regulator contacts have opened and the voltmeter reading at this point is known as the 'lower regulating voltage'. Voltage readings must be within limits given in table below. To adjust, turn regulator adjusting nut to right (clockwise) if lower regulating voltage is too low, or to the left (counter-clockwise) if lower regulating voltage is too high.

As generator speed increases the upper regulator contacts finally close, short-circuiting the field winding (ammeter pointer will drop to '0'). The voltmeter reading at this point is known as the 'upper regulating voltage'. It must be within .5 volts above or .2 volts below the lower regulating voltage. If correct regulating voltage cannot be secured with this adjustment, the regulator unit should be replaced.

Generator Type	Load Watts	No. & Cp. Lamps	Lower Regulating Voltage	Maximum Speed
RE	60	4-6v.-21cp.	6.7- 7.2 volts	5000 R.P.M.
RJ, RJA, RJB	75	5-6v.-21cp.	6.7- 7.2	3600
RJC-90/6-1100	90	6-6v.-21cp.	6.7- 7.2	4500
RK-100/12-700	100	7-12v.-21cp.	12.9-14.1	3600
RK-130/12-900	130	9-12v.-21cp.	12.9-14.1	3600
RKC-130/6-1000	130	9-6v.-21cp.	6.7- 7.2	3600
RKC-130/12-825	130	9-12v.-21cp.	12.9-14.1	4500

3. Cut-in Voltage. Connect a voltmeter between terminal '61' and ground or between insulated brush and ground. Operate generator and slowly increase speed. Note voltmeter reading at instant relay contacts close (pole piece will move toward magnet core and can be easily noted). Voltmeter reading (cut-in voltage) must be within 6 and 9 volts for 6 volt generators (see tables above), or 12 and 17 volts for 12 volt generators. To adjust, bend pole piece stop (see luustration) slightly outward or away from pole piece to increase cut-in voltage, or in toward pole piece to lower cut-in voltage. On first type regulators the pole piece stop is located at the lower end of the pole piece instead of as shown. When making this adjustment, see that relay contact gap and pole piece gap (between pole piece and magnet core) does not exceed limits in table below. If correct adjustment cannot be secured wihout exceeding these contact gap and pole piece gap limits, replace regulator unit.

Relay Contact Gap Limits	.3- .5 MM. or .012-.020"
Pole Piece Gap Limits	3-3.2 MM. or .118-.126"

4. Reverse (Cut-out) Current. Depress the pole piece until the lower regulating contacts are about to open, measure distance from pole piece to relay contact spring angle (point of contact between pole piece and contact spring when contacts open). This distance must be within limits of .2-.4 MM. or .008-.016". To adjust, turn the reverse current screw in or clockwise to decrease this distance, and out or counter-clockwise to increase this distance. Then connect a voltmeter between terminal '51' and ground and an ammeter between terminal '51' and the positive (+) terminal of a battery. Ground the negative (—) terminal of the battery. Use a 6 volt battery for 6 volt generators and 12 volt battery for 12 volt generators. Battery must have sufficient capacity to show a voltage of 6.1-6.2 volts (6 volt battery), or 12.2-12.4 volts (12 volt battery) with a 6 ampere discharge. Operate the generator at a speed sufficient to charge the battery (relay contacts closed). Slowly decrease generator speed until ammeter reading drops to '0' and then shows a discharge or reverse current. Note ammeter reading when contacts open (ammeter pointer will drop to '0' at this point). Maximum reverse current as shown on ammeter must be within limits of 3-6.5 amperes. To adjust, turn reverse current screw in (clockwise) to decrease reverse current, and out or counter-clockwise to increase reverse current. Do not attempt to bend relay contact spring.

FINAL LOAD TEST (AFTER ADJUSTING):—After adjusting regulator, generator must be given a final load test to determine regulator action in service. Connect a lamp load as given in table below between terminal '51' and ground (lamps connected in parallel). Operate the generator for at least 15 minutes at speed given in table. Then allow generator to cool off to room temperature, repeat tests given above (regulating voltage without load, regulating voltage with load, cut-in voltage, reverse current), readjust as necessary. If readjustment is necessary, repeat the final load test.

Generator Type	Lamp Load Watts	Lamp Load No. & Cp. Lamps	Operating Speed
RE	60	4- 6v.-21cp.	4000 R.P.M.
RJ, RJA, RJB	75	5- 6v.-21cp.	3000
RJC-90/6-1100	90	6- 6v.-21cp.	3500
RK-100/12-700	100	7-12v.-21cp.	2500
RK-130/12-900	130	9-12v.-21cp.	3000
RKC-130/6-1000	130	9- 6v.-21cp.	3000
RKC-130/12-825	130	9-12v.-21cp.	3000

BOSCH REGULATOR—GENERATORS WITHOUT BATTERY

NEW TYPE SINGLE UNIT VOLTAGE REGULATOR AND CUTOUT RELAY AS USED ON TYPES RE, RJ, RJA, RJB GENERATORS (WITHOUT BATTERY)

DESCRIPTION:—This type regulator is the same as the type used on these generators with battery (see previous article). The generators are changed over for use without battery principally by having the pole piece stop bent so that the relay cutout contacts are permanently closed although a small gap must be normally found between the pole piece and the reverse current screw with the pole piece against the stop. See special article for complete directions for changing these generators over for use with or without battery.

ROTATION:—With field connections as shown in illustration (red field coil lead connected to terminal 'H'), generator rotation is clockwise as viewed from drive end. To reverse direction of rotation, disconnect and exchange red and blue field coil leads. On Types RJ and RJA generators, terminal 'H' is located in place of terminal 'F" and terminal 'F" is located near regulating adjusting nut.

ADJUSTMENT:—Check generator, drive, wiring, commutator, etc., as directed in article on generators with battery, before removing generator from car. If preliminary test on test bench indicates that regulator performance is unsatisfactory or that regulator is out of adjustment, make the following tests in order before readjustments are made.

1. Regulating Voltage (No Load). Connect a voltmeter between terminal '61' and ground (these generators will normally have terminal '51' plugged). Operate generator at 'nominal' speed and observe voltmeter reading. Voltage must be 6 volts or more. Then increase speed to 'maximum' speed and note voltmeter readings while speed is being increased. Voltage must be held within limits indicated. See table below for 'nominal', 'maximum' speeds and voltage limits. If generator voltage is not within limits, adjust as follows:

T Increase Voltage (maximum less than 6.6 volts)—Turn regulator adjusting nut in or clockwise to increase regulator spring tension.

T Decrease Voltage (maximum more than 7.4 volts)—Turn regulator adjusting nut out or counter-clockwise to decrease spring tension.

Generator Type	Nominal Speed	Maximum Speed	Voltage Limits
RE	1600 R.P.M.	5000 R.P.M.	6.6-7.4 volts
RJ, RJA, RJB	850	3600	6.6-7.4

2. Regulating Voltage (With Load). Connect a voltmeter between terminal '61' and ground. Connect a load comprising 2 6v. 21cp. and 1 6v. 4cp. lamps (34 watts total) between terminal '61' and ground (lamps in parallel). Operate generator and slowly increase speed to maximum as given in table below. Generator voltage must be within limits as shown. If voltage is not within these limits, adjust as follows:

To increase Voltage (maximum less than 6.4 volts)—Turn regulator adjusting nut in or clockwise to increase regulator spring tension.

To Decrease Voltage (maximum more than 6.6 volts)—Turn regulator adjusting nut out or counter-clockwise to decrease spring tension.

Generator Type	Maximum Speed	Voltage Limits
RE	5000 R.P.M.	6.4-6.6 volts
RJ, RJA, RJB	3600	6.4-6.6

NOTE:—Since the relay cutout contacts are permanently closed, it is not necessary to make a cut-in and cut-out test as on generators used with battery.

FINAL LOAD TEST (AFTER ADJUSTING):—After adjusting regulator, generator must be given a final load test to determine regulator action in service. Connect a load comprising 2 6v. 21cp. and 1 6v. 4cp. lamps (34 watts total) between terminal '61' and ground (lamps must be in parallel). Operate the generator for at least 15 minutes at the speed given in the table below. Allow generator to cool down to room temperature and check regulating voltage without load and regulating voltage with load as directed above, readjust as necessary. If any readjustment is found necessary, repeat final load test.

DELCO-REMY TWO TERMINAL CUTOUT RELAYS (NO GROUND CONTACTS)

NOTE:—For specifications on Cut-out Relays used in Control Units (Vibrating Voltage Regulators, Vibrating Voltage and Current Regulators, Voltage Control Relays) or Apparatus Boxes (except 480-Z), see separate articles on each type of equipment. Type 480-Z and Types 264-H (Cut-out Relay and Horn Relay), 264-D, F, (Cut-out and Solenoid Relays) listed below.

MECHANICAL ADJUSTMENT:—Air Gap. Close contacts by hand (hold armature down), check air gap between armature and coil core using a feeler gauge. See table below for air gap limits. Adjust by loosening armature hinge bracket support screws and shifting armature up or down (later types with 'L' shaped armature hinged at side of coil frame), or by bending armature mounting, moving armature away from or toward core (first types with armature mounted on top of coil core). On this first type relay, check also the air gap between the brass contact support and the armature at a point directly behind the contacts. This gap must be within limits of .010-.020". Adjust by bending the brass contact support.

Contact Gap. With armature up against upper stop, check contact gap. See table below for contact gap limits. Adjust by bending upper stop.

Cutout Relay Specifications and Performance
(Two and Three Terminal Types)

Type	Contact Gap	Air Gap	Cut-in Volts	Cut-out Amperes

①—Armature Spring Tension 3.5 ounces.
②—Armature Spring Tension 6.2 ounces.

ELECTRICAL ADJUSTMENT:—Cut-in (contact closing) Point. Connect an accurate voltmeter between generator terminal of relay and ground. Operate generator, slowly increase speed until contacts close. Note voltmeter reading (there will be a slight 'kick-back' or voltage drop when contacts close). See table below for voltage limits at cut-in point. Adjust as follows:

To raise Cut-in Voltage. Increase armature spring tension by bending spring post upward (later types with 'L' shaped armature), or by pulling armature stop back in notch and lifting up armature until contacts are approximately ¼" apart, then resetting armature stop and checking contact gap (first types with armature mounted on top of coil core).

To lower Cut-in Voltage. Decrease armature spring tension by bending spring post down slightly (later types), or by pressing armature down toward core (first types with armature mounted on coil core).

Cut-out (contact opening) Point:—Connect an ammeter in charging circuit at relay. Operate generator and slowly decrease speed until current reverses and contacts open. Note discharge current at instant contacts open (pointer will fall to '0'. See table below for discharge current limits. If discharge current is excessive, increase armature spring tension and decrease air gap slightly.

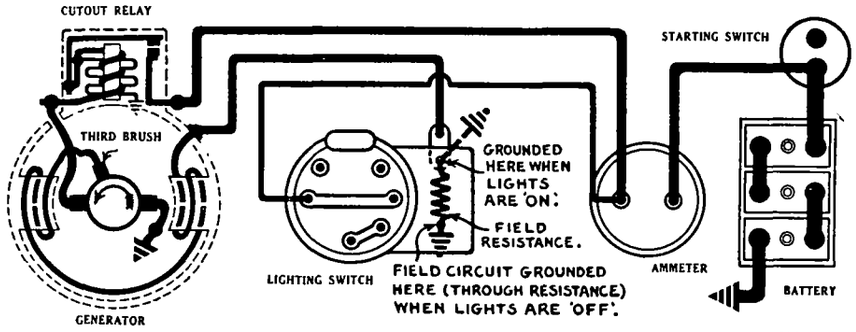
DELCO-REMY THREE TERMINAL CUTOUT RELAY (WITH GROUND CONTACTS)

These types relays have a set of auxiliary contacts mounted above the armature for signal light or starter solenoid relay control. The auxiliary contacts are closed with the main contacts open and open when the main contacts close (see illustration). The upper contact of the auxiliary contacts serves as the relay armature upper stop.

MECHANICAL ADJUSTMENT:—Air Gap. Adjustments same as for standard relay later type with 'L' shaped armature. Settings given in table above.

Contact Gap. With upper contacts closed (armature in extreme upward position) check contact gap. See table above for contact gap limits. Adjust by bending upper auxiliary contact support. See that upper contacts are closed with main contacts open, and open when main contacts close.

ELECTRICAL ADJUSTMENT:—All adjustments are the same as for the standard relay later type with 'L' shaped armature. Settings given in table above.



LIGHT SWITCH CONTROLLED FIELD RESISTANCE TYPE

NOTE:—This type Generator used on the following car models:

Car Model	Year	Generator Model
Chevrolet Master DA	1934	935-B
Chevrolet Master EA, ED	1935	935-V
Chevrolet Master FA, FD	1936	935-V
Chevrolet (All)	1937	948-R
Chevrolet Comm'l & Trucks	1938-39	948-R
Graham 90, 90-A, 110	1936	948-B
Graham 95, 116	1937	948-B
Graham, 96 (Without Radio)	1938-39	1100455
Oldsmobile F-34, L-34	1934	935-F
Oldsmobile L-34	1934	935-M

DESCRIPTION:—This type generator has a resistance unit in series with the generator field. The resistance unit is mounted on the lighting switch and is in series with the field coils with the switch turned 'off' or in the 'Park' position. When the switch is operated to turn on the headlights (principal lamp load), the resistance is shorted out, decreasing the total field resistance and increasing the generator output. Lighting switch (except on 1934 car models) has special position between 'OFF' and 'PARK' (button pulled out one notch) in which field resistance is shorted out so that the higher charging rate is available with the lamps turned off.

PERFORMANCE:—There are two distinct charging rates, the lower charging rate for day driving (lights turned off—resistance in circuit), and the higher charging rate for night driving (lights turned on—resistance shorted out). The generator used for this type installation is a conventional third brush control type, the lighting switch being used as a convenient method of switching the field resistance in or out of the field circuit. See car data sheets for performance data on particular generator models.

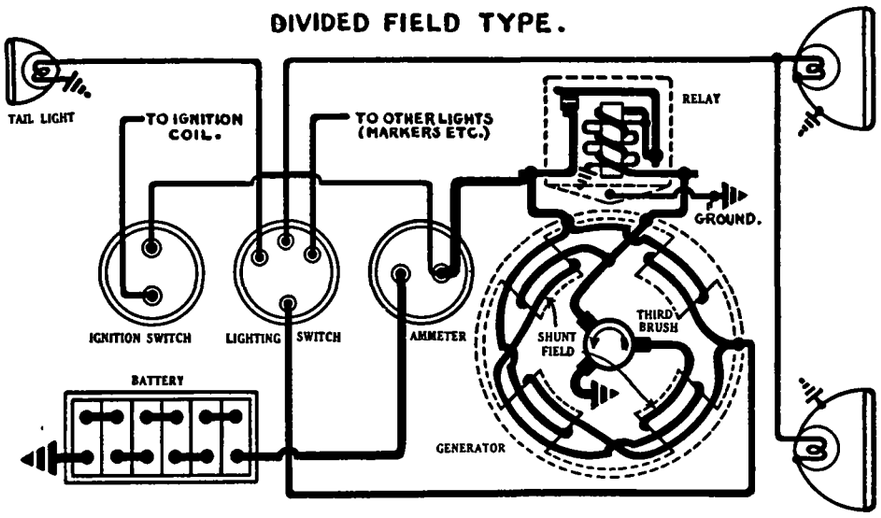
ADJUSTMENT:—Charging rate is adjusted in usual manner by shifting the third brush. Field resistance must be shorted out while adjustment is being made (ground field terminal on generator to generator field frame). Shift third brush in direction of armature rotation to increase charging rate and in opposite direction to decrease charging rate. See car data sheets for instructions and performance data on each generator model.

FIELD RESISTANCE:—All generators are regularly equipped with 1 ohm field resistance unit (on lighting switch). This is standard for average driving conditions (day and night, high and low speed). If car is operated in service with other than average driving conditions, make adjustments as noted below:

Excessive Day Use—Battery Overcharged:—Change resistance to 1½ ohm unit or reduce charging rate (third brush setting).

Excessive Night Use—Battery Undercharged:—Change resistance to ½ or ¾ ohm unit, check charging rate (do not set third brush beyond rated capacity of generator—see performance data on car data sheets for maximum setting).

Replacement resistance units are standard Delco-Remy thermostat resistance units. Parts numbers are as follows:



Resistance	Part No.
½ ohm	807180
¾ "	817911
1½ "	808767

DIVIDED FIELD TYPE

DESCRIPTION:—This type generator is a four pole unit with a conventional third brush controlled shunt field wound on two opposite field poles. A second winding on the other two field poles is connected in series with the lamp load (lamps are connected to special terminal on generator—see diagram). With all lamps off, generator operates as a regular third brush control type, all of the field excitation being supplied by the two third brush field coils, the field being of the 'consequent' or alternately excited pole type. When the lamps are turned on, the lamp current flows through the other two coils, strengthening the field and increasing the generator output.

PERFORMANCE:—Generators of this type are designed for a definite maximum lamp load and the 'lamp load' must not exceed 20 amperes (check lamp load with all lamps turned on by connecting ammeter in lamp circuit at terminal 'L'). Generators should not be operated with all load connected to ammeter terminal, since the stepped or two-stage charging rate is secured only with lamp load connected to generator terminal 'L'.

DIVIDED FIELD TYPE.

ADJUSTMENT:—Charging rate adjusted in usual manner by shifting third brush. Connect test ammeter between generator terminal and cut-out relay (do not connect ammeter to battery side of relay as ammeter will not register any current flowing to lamp circuits). Shift third brush in direction of armature rotation to increase charging rate, and in opposite direction to decrease charging rate. Charging rate should be set in accordance with operating conditions of car—performance table given below is maximum output, which must not be exceeded.

Performance Data—No Lamp Load

Generator	Cold Amperes	Cold Volts	Cold R.P.M.	Hot Amperes	Hot Volts	Hot R.P.M.
434	10-12	7.45-7.65	2000	6-8	7.05-7.35	2100
438	7.0	14.2	2100	4.6	13.7	2300
552	10-12	7.45-7.65	2000	6-8	7.05-7.35	2100
970-A	15-17	7.9-8.1	1500	11-13	7.45-7.65	1600
SM-1211	7.0	14.2	2100	4.6	13.7	2300
SM-1268	15-17	7.9-8.1	1500	11-13	7.45-7.65	1600

Allowable Lamp Load

Generator	Amperes
434, 552, 970-A, SM-1268	20
438, SM-1211	13

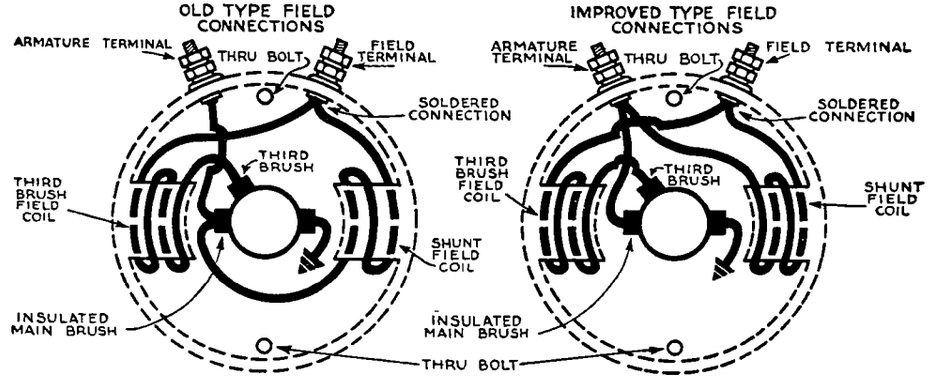
FUSE:—A 20 ampere capacity fuse is connected in the lamp circuit to protect the generator from excessive lamp load.

NOTE:—This type generator standard equipment on following car models:

Car Model	Generator	Regulator
Buick, 37-40 (1937)	918-B, 918-G	5807
Buick, 37-60, 80, 90 (1937)	918-A, 918-F	5807
Buick, 38-40 ('38), 39-40 ('39)	1101052	5807, 5858
Buick, 38-60 ('38), 39-60 ('39)	1101053	5807, 5858
Buick, 38-80, 90 ('38), 39-80, 90 ('39)	1101055	5807, 5858
Cadillac, 37-60, 65 (1937)	918-C	5817
Cadillac, 38-60, 38-60S (1938)	1101051	5817
Cadillac, 38-65 (1938)	1101054	5817
Cadillac, 39-60, 39-60S (1939)	1101056	5860
La Salle, 37-50 (1937)	918-C	5817
La Salle, 38-50 (1938)	1101051	5817
La Salle, 39-50 (1939)	1101056	5860

TYPE:—New type two-pole generator with fixed third brush and vibrating voltage regulator control. Field coils are connected separately so that left hand coil has third brush control (connected between third brush and field terminal), while right hand coil is straight shunt type (connected between main brush and field terminal). Both field coils are in regulator circuit and are controlled by the voltage regulator.
NOTE—Design of Shunt-Field Coil (right hand) has been changed so that lead location and connection points are different. See illustration and instructions below for old and new type coils. Old coils need not be discarded and will give satisfactory service if care is taken to see that leads located so that no short-circuits can result. New coils only are furnished for service.

OPERATION:—Both coils work together so that output is determined by 'balanced' characteristics of the third-brush and straight-shunt field design. Field strength of third-brush field coil drops off at high speed while that of the straight-shunt coil continues to increase so that better high speed performance is secured. This feature allows generator to be driven at greater engine-speed ratio so that improved low speed performance is secured without affecting the high speed performance. Actual charging rate on the car is determined by the voltage regulator setting.



PERFORMANCE:—See individual car model page for recommended setting for each car model. Specifications for testing as follows:
Motoring Performance—900-1000 R.P.M., 4.5-7 amperes, 6.0 volts.
Stalled or Lock Current—28-34 amperes, 5.0 volts.
Field Current (Total)—2.33-2.50 amperes, 6.0 volts.
Field Coil Testing—Specifications for each coil as follows:

Coil	Resistance (75° F.)	Field Current (at 6 volts)
Third Brush Coil	6.6-7.1 ohms	.89- .94 amperes
Shunt Coil	4.0-4.25 ohms	1.44-1.56 amperes

NEW TYPE SHUNT FIELD COIL

NOTE:—Shunt field coil (Part No. 1866409) has been redesigned so that both leads are located on top of coil and connections are made directly to the generator terminals (see illustration). Whenever old type coils are replaced by this new type follow special instructions below.

INSTALLATION:—To install new type coil, unsolder old field coil lead connection on terminal post 'F', disconnect second coil lead on insulated main brush, remove coil. Remove old armature terminal post 'A' together with lead to insulated main brush. Install new type coil with leads at top. Solder short lead of new coil to field terminal post 'F'. Arrange second lead (furnished with new terminal post attached) across top of frame, install new terminal post. See that third brush field lead connected to third brush, connect second lead on new terminal post to insulated main brush being careful to lay this lead OVER the third brush lead.

DELCO-REMY LAMP LOAD TYPE GENERATORS

CURRENT REGULATED SHUNT TYPE

DESCRIPTION:—This type generator is shunt wound, no third brush being used. An external current regulator is used to regulate the generator output. The feed wire or lead for the lamps is taken from the current regulator so that the lamp current does not flow through the entire current regulator winding (one coil only instead of both coils). This has the effect of increasing the generator output by an amount equal to one-half the lamp load when the lamps are turned on.

PERFORMANCE:—Generators of this type are designed for a definite maximum lamp load and lamp load figure in table below must not be exceeded (check lamp load with all lamps turned on by connecting ammeter in lamp circuit at terminal 'L').

Generator Model	Control Unit	Max. Lamp Load—Amperes
933-B, C	5541	11
933-D	5543	7
5030591	5545	7
961-C	5541	11

ADJUSTMENT:—Charging rate is adjusted by changing current regulator armature spring tension. Increase spring tension to increase generator output, decrease spring tension to decrease output. See article on Types 5541, 5543, 5545 Current Regulators below for complete data on adjustment, and maximum generator output.

LIGHTING THERMOSTAT:—A thermostatic arm type current limit relay (no winding) mounted in the Control Unit is used to protect the lighting circuits from overload. Thermostat contacts open with lamp load of 20 amperes wih temperature of 210°F. (air—thermostatic arm temperature 375-385°F.).

NOTE:—This type Regulator used with the 'Current Regulated-Shunt Type Generators' described above on the following car models:

Car Model	Year	Regulator	Generator
Cadillac V-8 355-D, 10, 20, 30	(1934-35)	5541	933-B
Cadillac V-12 370-D, 40	(1934-35)	5541	933-C
Cadillac V-16 452-D, 60	(1934-35)	5541	933-C
La Salle Model 350, Series 50	(1934-35)	5541	961-C

DESCRIPTION:—The Current Regulator used in these type control units is designed to control the generator output. It is used in connection with a straight shunt wound generator (see separate article on 'Lamp Control Current Regulated Shunt Type Generators') and is designed to provide a higher generator output when the car is operated with the lamps turned on. Some types are compensated for temperature variations and the output increases with abnormally low temperatures and decreases with abnormally high temperatures (see table below). All compensated types should be adjusted with the control unit warmed up to room temperature (70°F.).

OPERATION:—The entire generator output from the cutout relay is fed through the two coil windings of the Current Regulator (with lamps off). When the output reaches the maximum figure for which the unit is set, the Regulator contacts open (or vibrate), cutting the resistance unit which is connected across the contacts in series with the field current and holding the output constant. The car lamps are connected to a lead which is taken off on the battery side of the first regulator coil (see illustration) so that the lamp current does not flow through both coils (one coil instead of two) When the lamps are turned on this has the effect of reducing the magnetic field of the Regulator coils since a portion of the generator output is shunted by the second regulator coil. This increases the generator output by an amount equal to one half the lamp load and results in a more even charging rate to the battery. It is very important with this type generator that the lamp load should not exceed the maximum rating for the particular generator (see tables on car data sheets and article on shunt type lamp control generator).

PERFORMANCE:—Current Regulators used on 1934 car models should perform in accordance with the following table:

Current Regulator Setting

Regulator Type	Maximum Lamp Load	Maximum Cold Generator Ouput Lights Off	Lights On
x-5541	11 amperes	13-16 amperes	19-22 amperes
5543	7 amperes	7.5-8.5 amperes	11-13 amperes
5545	7 amperes	6.5-7.5 amperes	10-12 amperes

(x)—This type Current Regulator over-compensated for temperature and setting given above is correct with unit at room temperature (70°F). With generator hot (200°F), setting should be 9-11 amperes (lights off) and generator output with 11 ampere lamp load should be 14-16 amperes.

ADJUSTMENT:—Check mechanical specifications of Current Regulators before testing or adjusting performance. Follow procedure below:

Mechanical Adjustment:—Air Gap. Press down on armature until fiber bumper touches the stop. Hold in this position and check air gap between center of core and armature with feeler gauge. Air gap should be .057". Adjust by bending contact spring post.

Contact Gap. Hold armature down against lower stop and check contact gap. Gap should be .020". Spring tension should be 2.25 ozs. (at contacts).

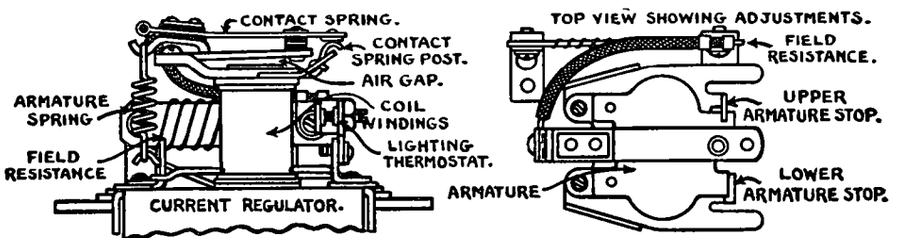
Contact Spring Gap. Release armature. With contacts closed, measure gap between the fibre bumper and contact spring stop. Correct air gap is .008". Adjust by bending upper stop.

Electrical Adjustment:—Connect accurate ammeter in charging circuit at generator terminal. Connect voltmeter between generator and battery terminals on control unit. Operate generator and note generator output. If output is not correct (see performance table above), adjust as follows:

To Increase Output. Increase armature spring tension by bending lower spring bracket down.

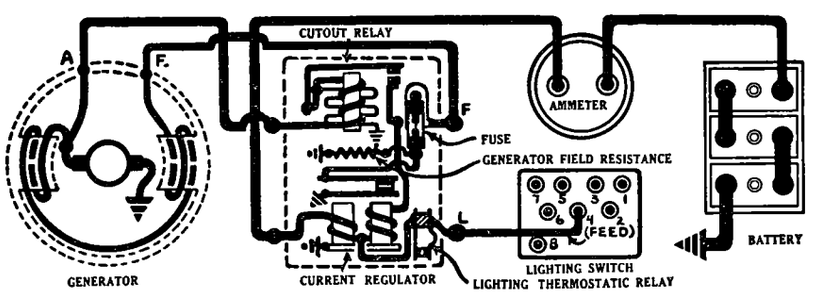
To Decrease Output. Decrease armature spring tension by bending lower spring bracket up.

Check output with cover in place on regulator and repeat adjustment until correct setting is secured.



CUTOUT RELAY:—Cutout Relay used on above regulator types similar to units used singly on other generator models except for specifications as given below. See separate article on Delco-Remy Cutout Relays for complete adjustment directions.

Cutout Relay Specifications



Cuts In—6.75-7.25 volts.

Cuts Out—0-3.0 ampere discharge current.

Contact Gap—.020". **Air Gap**—.015" (contacts closed).

WIRING DIAGRAM.

LAMP LOAD:—Lamp load should be checked by connecting an ammeter in circuit at the regulator 'L' terminal. Lamp load must not exceed maximum rating for the particular type generator.

THERMOSTAT:—A thermostatic relay (thermostatic arm type circuit breaker) mounted within the control unit case is connected in the lamp circuit to protect the regulator and generator from overloads. Thermostat contacts open with load of 20 amperes with an air temperature of 210°F. (thermostatic arm temperature will be 375-385°F.).

DESCRIPTION:—The Voltage Control Relay provides a stepped or two-rate charging control. The relay is non-vibrating and acts as an automatic switch to cut the resistance unit in or out of the field circuit, providing a high charging rate with the contacts closed (resistance short-circuited) and a lower charging rate with the contacts open (resistance in field circuit). Types used as standard or special equipment on car models as follows:

OPERATION:—The voltage control relay has only one winding (there are two coils but windings are connected in parallel). When the generator voltage reaches the maximum point for which the unit is set, the current flow through the coil winding opens the relay contacts, cutting the resistance into the field circuit. The contacts remain open (providing the lower charging rate) until the generator voltage falls to the minimum point and then close so that the higher charging rate is resumed. The resistance is connected across the relay contacts and is short-circuited with the contacts closed.

PERFORMANCE:—Voltage Control Relays are over-compensated for temperature and operating voltage will not be uniform over entire range. Tests should be made with unit cooled down to room temperature (70°F). Settings may be rechecked with generator and control unit hot (180°F). Performance should be as follows:

Performance Data

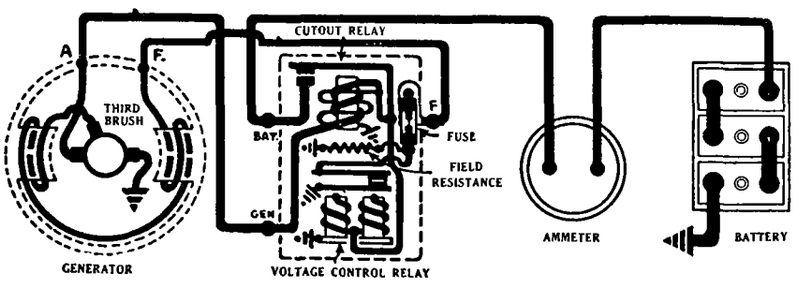
ADJUSTMENT:—Check mechanical specifications of Voltage Control Relay before testing or adjusting performance. Follow complete procedure below:



Mechanical Adjustment:—Air Gap. Hold armature down against lower stop and use feeler gauge to check gap. Use sensitive spring scale to check spring tension at contacts. See table below for specifications (spring tension given in ounces).

Armature Travel. Gauge armature travel (between lower stop and under side of armature with armature up against upper stop). Adjust by bending upper armature stop. See table below for specifications.

Contact Gap. Hold armature down against lower stop. Use feeler gauge to check gap, being careful not to disturb position of upper contact spring arm. See table below for specifications.

Electrical Adjustment:—Connect accurate voltmeter between terminal marked 'Bat' and ground. Operate generator charging a fully charged battery and cycle generator by increasing speed until voltage control relay contacts just open and then decrease speed until contacts just close. Then repeat test and note voltmeter reading at instant contacts open and close. Voltage Control Relay performance should agree with table above. If operating voltages cannot be secured even with generator charging a fully charged battery, connect a variable resistance or fixed resistance of about .25 ohms in charging circuit. Resistance must have sufficient current carrying capacity to take entire generator load (20-25 amperes). Adjustments are as follows:

Cut-in (contact opening) Voltage Adjustment. Increase armature spring tension to increase operating voltage, or decrease armature spring tension to decrease operating voltage. Adjust by bending spring lower bracket. Correct spring tension before making this adjustment is ¾ oz. measured at contacts.

Cut-out (contacts closing) Voltage Adjustment. Increase armature air gap to increase operating voltage or decrease air gap to decrease operating voltage. Adjust by bending lower armature stop. Adjustment to correct closing voltage should be very slight. If it is necessary to change air gap considerably, recheck armature travel and contact gap, then repeat test.

CHARGING RATE ADJUSTMENT:—It should be remembered that the Voltage Control Relay establishes a high and low charging rate. The actual charging rate (maximum for both 'high' and 'low' rates) is determined by the third brush setting of the generator. The third brush is adjusted in the usual manner except that the Voltage Control Relay must be shorted out by connecting a jumper wire from the generator 'F' terminal to ground while the adjustment is being made in order to prevent regulator action. See individual car data sheets for standard settings and allowable maximum settings for each generator. Data given in 'Performance Data' tables is the maximum rating for the particular generator and must not be exceeded. Be sure to remove the jumper wire after the adjustment is completed.

WIRING:—Terminals are as shown except where Cut-out Relay ground contacts are used for starter solenoid control, when an extra 'GRD' terminal is provided. On one model the solenoid circuit is grounded through the generator third brush and the extra terminal is marked '3B'.

CUTOUT RELAY

The Cutout Relay used with these Voltage Control Relays is similar in design and operation with previous types. See separate article for complete description and adjustments. Specifications are as follows:

DELCO-REMY HORN RELAYS

DELCO-REMY HORN AND SOLENOID RELAYS

DESCRIPTION:—These types are similar in design and construction to the Cut-out Relays without ground contacts as described above except that only one coil winding is used and this is connected between the terminals (Solenoid Relays) or one end is brought out to a terminal and the other end connected to the main circuit within the relay case (Horn Relays). See car wiring diagrams where these units are used. In some instances Solenoid Relays or Horn Relays are combined with Cut-out Relays in a single case or the Solenoid Relay is built in the starter solenoid switch case (see special article on Starter Control Solenoid Switches).

ADJUSTMENT:—Adjustments are made in the same manner as for Cut-out Relays. Specifications are given in the table below.

Solenoid Relays

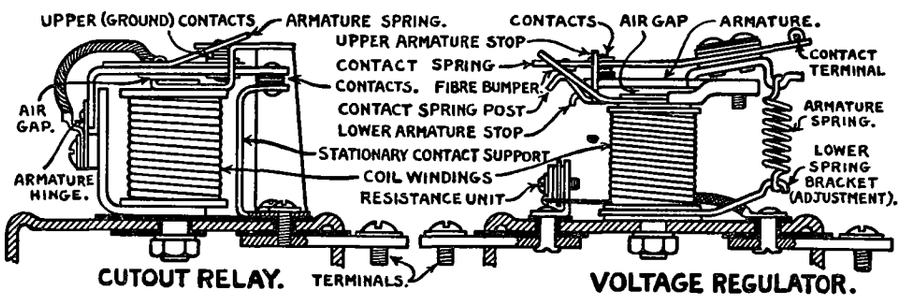
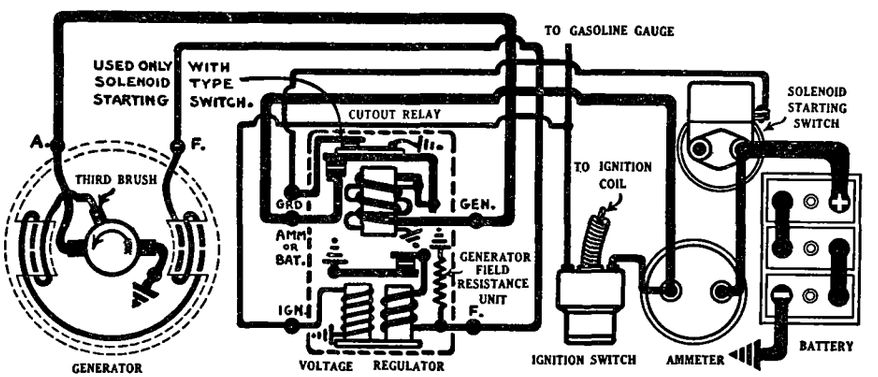
DESCRIPTION:—These units are composed of a new type Vibrating Voltage Regulator and a Cutout Relay in a single case. Unlike previous units, the voltage regulator is not designed to control generator voltage on open circuit and generator should be operated only when charging a battery. The control unit cover is sealed in place and unauthorized breaking of the seals (necessary to service either Cutout Relay or Voltage Regulator) voids the warranty on the unit. See Trouble Shooting Section below for tests which can be made without breaking the seals or removing the cover to determine whether unit is defective. These units are used as standard or special equipment on car models as listed above. Battery ground terminal must be positive (Pos.) or negative (Neg.) as indicated in table. This is important.



NOTE—To avoid changing generator polarity, disconnect lead on 'F' terminal of regulator **First** and connect this lead **Last.** To insure correct polarity, connect 'GEN' and 'BAT' terminals on regulator together momentarily after all leads have been connected but before engine is started.

Generators used with this type control unit have a 'fixed' or non-adjustable third brush. No regulation of the charging rate is possible except by changing voltage regulator setting.



OPERATION:—Two windings are used on the regulator unit. The shunt or fine winding is connected at point near the battery (battery side of Cutout Relay) and is controlled by the ignition switch to prevent the battery discharging through the winding when the car is not being operated. Regulator is thus actuated by battery voltage (line voltage at a point near the battery) rather than by generator voltage (voltage directly across main brushes). The series or heavy winding is connected in series with the generator field and regulator contacts so that a current flows through this winding only when the regulator contacts are closed. In operation the current flow through both windings creates a magnetic field which attracts the regulator armature and opens the contacts when the battery voltage reaches the maximum for which the unit is set. When the contacts open, the current flow through the series coil is interrupted and the resistance unit is cut in the field circuit (resistance is connected across the contacts and is short-circuited with the contacts closed). This reduces the field strength and the generator voltage so that the regulator contacts again close. The opening and closing of the contacts is extremely rapid (vibrating action) and the generator voltage is held reasonably constant.

The generator will charge a discharged battery at the maximum rate and will be controlled by the fixed third brush (generator voltage depends upon battery voltage—both will come up as battery becomes charged). As the battery voltage comes up on charge, the voltage regulator will tend to hold generator voltage constant; charging rate tapering off to 'finish' rate.

The regulator is over-compensated for temperature variations by means of a bi-metal armature hinge. For this reason all tests should be made with regulator at room temperature (70°F) and rechecked when hot (150°F).

WIRING DIAGRAM.

TROUBLE SHOOTING:—If generator performance is not satisfactory, check in accordance with following table to determine whether Voltage Regulator or Cutout Relay is defective (not necessary to remove control unit cover to make these tests). Control unit is separately mounted and must be well grounded. See that a good ground exists through the base of the control unit or connect a separate ground lead from one of the mounting screws to a ground on the engine block.

1. Generator Not Charging. Operate engine at speed equivalent to 25 M.P.H. and ground 'F' terminal on control unit. If generator charges, regulator is defective. If generator does not charge, ground 'F' terminal on generator. If generator charges, the lead connecting the 'F' terminals is broken or open-circuited and should be replaced. If generator does not charge, disconnect the lead on the 'GEN' terminal of the control unit and flash to ground on engine block. If a spark is noted, the regulator or cutout relay is defective. If no spark is noted, examine this lead (connecting 'A' terminal on generator and 'GEN' terminal on control unit) before disassembling and examining generator.

2. Charging Rate Too High or Too Low. This may be caused by incorrect setting or defective operation of the Voltage Regulator. To check voltage of regulator, connect a variable resistance in the charging line between 'BAT' terminal of control unit and ammeter (in charging line). Dis-

connect lead on 'IGN' terminal of control unit and connect jumper wire from this terminal to 'BAT' terminal. Connect accurate test voltmeter between 'IGN' terminal and ground. Take readings with control unit at room temperature (70°F) and hot (150°F). To test, operate engine at speed of approximately 25 M.P.H. or generator speed of 2000-3000 R.P.M. until regulator reaches proper temperature, decrease speed until cutout relay contacts open, then increase speed to 2000-3000 R.P.M., holding charging current at 8-10 amperes and note reading. See table under Adjustment Section below for correct voltages. If voltages are correct, high charging rate may be caused by a shorted battery or a low charging rate may be caused by loose connections or a badly sulphated battery.

Oxidized Regulator Contacts—To check with regulator on the car, disconnect lead on 'IGN' terminal of regulator, connect ammeter in charging line at 'BAT' terminal. Operate engine at low speed so that charging current indicated on ammeter is 4-5 amperes. Maintain constant engine speed, ground 'F' terminal on regulator, note ammeter reading (wait until pointer remains steady after first momentary surge). If ammeter reading is 2 amperes or more greater than with 'F' terminal not grounded, contact point oxidization is excessive. To check with regulator on bench, see that commutator and brushes in good condition, then check generator speed at which cutout relay contacts close with 'F' terminal grounded and not grounded. Closing point with 'F' terminal grounded is normally slightly lower than when terminal not grounded. If difference is 100 R.P.M. or more, contacts are oxidized and should be cleaned.

NOTE—Radio by-pass condensers must not be installed on field or 'F' terminals of generator or regulator as these will cause oxidation of contacts. Condensers should be removed and contacts examined and resurfaced.

SERVICING:—If above tests indicate that Voltage Regulator or Cutout Relay are defective or that settings are incorrect, the entire control unit should be returned for service. All adjustments outlined below require breaking of the seals (voiding the warranty) and removing of the control unit cover.

CUTOUT RELAY ADJUSTMENT:—When the Cutout Relay has a set of auxiliary contacts mounted above the armature for starter solenoid relay circuit control or generator charge indicator control, these contacts should be closed with the main contacts open, and should open when the main contacts close. All other adjustments listed below.

Air Gap—Hold contacts closed and measure gap between armature and coil core with a feeler gauge. Air gap should be .020". Adjust by loosening two screws in armature hinge bracket and moving armature up or down.

Contact Gap—Measure gap with armature up against stop or with upper contacts closed (when used). Contact Gap should be .020". To adjust, bend upper armature stop backward or forward, or bend support arm carrying upper auxiliary contact (stop not used on this type).

Cut-in Voltage. Connect test ammeter in charging line at regulator 'BAT' or 'AMM' terminal, voltmeter between regulator 'GEN' terminal and ground. With regulator connected (lead attached to 'IGN' terminal), operate generator and slowly increase speed. Note voltmeter reading at instant relay contacts close. See table below for correct figure for each model. To adjust, change flat armature spring tension by bending spring post. Increase spring tension to increase closing voltage, decrease tension to lower voltage.

Cut-out Amperage. Connect test ammeter in charging line at regulator 'BAT' terminal. Operate generator, increase speed until cutout relay contacts close, then slowly decrease speed and note discharge (reverse) current at point where contacts open.

Cutout Relay Performance Data

Type	Cut-in Volts	Cut-out Amperes
5557, 88, 91, 92	6.9-7.6	0-4.0
5600	6.9-7.6	0-4.0
5802	12.8-14.2	0-4.0
5803, 7, 8	6.9-7.6	0-4.0
5812, 14, 15, 17	6.9-7.6	0-4.0
5820, 22, 27, 35	6.9-7.6	0-4.0
5843	12.4-13.6①	0-4.0
5844	6.2-6.9①	0-4.0
5862, 70	6.2-6.8	0-4.0
5866	12.4-13.6	0-4.0

①—Compensated for temperature. This setting correct both Cold and Hot.

Torrid Climate Setting—To correct overcharged battery condition where regular atmospheric temperatures are 95° to 100° F. and above, adjust Cutout Relay to close at 6.8-7.2 volts cold.

VOLTAGE REGULATOR ADJUSTMENT:—Check and adjust mechanical specifications listed below before changing voltage setting.

Contact Gap—Examine contacts and resurface by dressing lightly with a fine, flat contact file if oxidized to such an extent that generator performance is affected (this may be caused by excessive sparking due to low spring tension, poor alignment of contacts, etc.). Contact metal on small contact is extremely thin and filing should be held to a minimum. See that contacts are aligned and that contact surfaces are square. Check tension of the upper contact mounting spring. Spring tension should be 3.5 ozs. when contacts just open (measure by means of a spring scale hooked under contact spring). Adjust by bending contact spring slightly. Check contact gap with armature held down. Gap should be .020". Adjust by bending lower armature stop up or down. Check clearance between fibre bumper and stop with armature up. Clearance should be .010". Adjust by bending upper armature stop.

Air Gap—Check air gap between armature and coil core with contacts closed so that fibre bumper just touches the contact spring stop. Air gap should be .063". To adjust, bend contact spring stop. See Voltage Setting section below.

VOLTAGE REGULATOR SETTING:—***Using Variable Resistance (AVR Set)***—Resistance unit should be approximately .25 ohms. Connect resistance and test ammeter in charging line at 'BAT' terminal on regulator, disconnect lead at 'IGN' terminal, connect jumper between 'IGN' and 'BAT' terminals, connect voltmeter between 'IGN' terminal and ground. Operate generator at rated maximum output RPM., adjust resistance for output of 8-10 amperes. When regulator reaches proper temperature, 'cycle' regulator by decreasing speed until cutout relay contacts just open, then increase speed to original figure and note voltmeter reading with regulator operating. If performance cold (70° F.) and hot (150° F.) is not correct, adjust regulator as directed below.

Fixed Resistance Method. Use ¾ ohm (6 volt), 1½ ohm (12 volt) resistance capable of carrying 10 amperes (Nichrome wire preferred, do not use other wire). Disconnect leads on 'BAT' and 'IGN' regulator terminals, connect fixed resistance between 'BAT' terminal and ground on engine block, connect jumper between 'BAT' and 'IGN' terminals, connect voltmeter between 'IGN' terminal and ground. Operate engine, increase speed to R.P.M. at which maximum rated output is reached (see car model page for performance on each generator model), note voltmeter reading. If regulator action not satisfactory, adjust as directed below, then cycle regulator and recheck performance.

Voltage Setting. Regulator voltage setting is adjusted by bending armature spring lower bracket up or down to decrease or increase the spring tension. Only a slight change in the position of the bracket should be required. Increase spring tension (bend bracket down) to increase regulator voltage, or decrease spring tension (bend bracket up) to decrease regulator voltage. If spring tension must be decreased to a point where the spring is free with the contacts closed, change upper contact spring tension slightly (do not exceed limits as given above or change gap). If correct regulator voltages cannot be secured cold and hot by adjusting the armature spring tension, the regulator air gap may be changed slightly as follows: Increase air gap to increase cold setting, or decrease air gap to decrease cold setting with respect to hot setting.

Voltage Regulator Setting

Type	Cold Voltage (70°F)	Hot Voltage (150°F)
5557, 88, 91, 92	7.5-7.9	7.4-7.6
5600	7.25-7.65	7.2-7.4
5802	14.2-15.0	14.1-14.5
5803	7.25-7.65	7.2-7.4
5807, 8, 12, 14, 17	7.5-7.9	7.4-7.6
5815	6.95-7.45	6.95-7.15
5820, 22	7.25-7.65	7.2-7.4
5827, 35	7.5-7.9	7.4-7.6
5843	14.2-15.0	14.1-14.5
5844	7.25-7.65	7.2-7.4
5862, 70	7.3-7.6	7.25-7.35
5866	14.2-15.0	14.1-14.5

Torrid Climate Setting—To correct overcharged battery condition where regular atmospheric temperatures are 95° to 100° F. and above, set Voltage Regulator to operate at 6.8-6.9 volts hot.

These vibrating Voltage Regulators standard or optional equipment on the following car models:

Vibrating Voltage Regulators

Car Model	Generator	Regulator	Grounded Ter.
Buick 39-40, 60, 80, 90 (1939)	1101052,3,5	5858**	Neg.

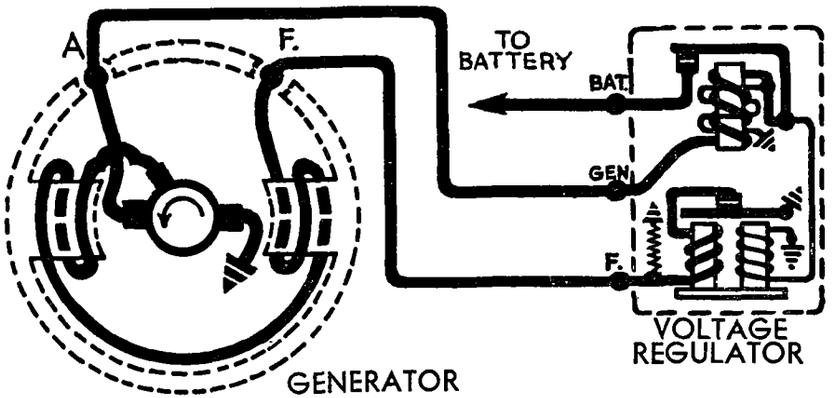
Pontiac 6 & 8 (1939)	1100003	5858**	Neg.

**New type Regulator without 'IGN' Terminal.

REGULATORS WITHOUT 'IGN' TERMINAL

CHECKING:—High Charging Rate with Fully Charged Battery—To locate cause of trouble, connect ammeter in charging line at 'BAT' terminal of regulator, run engine at medium speed, disconnect generator field lead at regulator 'F' terminal. If charging current drops to '0' (no ammeter reading), regulator is out of adjustment, field circuit in regulator is grounded so that field current does not pass through resistance and contacts, or shunt winding of voltage regulator is open-circuited. If charging current does not drop to '0' (ammeter continues to register charging current), field circuit is grounded directly (at some point in field lead, or within generator). To check lead, disconnect at generator 'F' terminal. If generator continues to charge, ground is at terminal or within generator.



Low Charging Rate (or no output) with Discharged Battery—Check all wiring between generator and regulator, and between regulator and battery. Connect ammeter in charging line at regulator 'BAT' terminal. Start engine and increase speed slowly until charging current of 4-5 amperes is indicated on ammeter, hold engine speed steady at this point, ground regulator 'F' terminal. If charging rate increases by 2 amperes or more, regulator contacts are dirty or oxidized (see Servicing data below for contact resurfacing). If no increase noted, or if contacts are in good condition, increase engine speed slowly and note if generator produces rated output (see car model 'T&E' pages for generator performance tables). If generator performance is satisfactory, regulator is defective, out of adjustment, or voltage setting is too low (see Adjustment below). If generator output is less than capacity, check third brush setting and overhaul generator. If generator does not charge at all, leave 'F' terminal grounded, disconnect lead on regulator 'GEN' terminal and flash to ground. If spark occurs, trouble is in Cutout Relay which should be checked for dirty contacts, open shunt winding, grounded series winding or grounded frame. If no spark secured, repeat this check at generator 'GEN' terminal (to make certain that this lead is not grounded or open-circuited), and overhaul generator.

CAUTION—Do not operate generator more than momentarily with lead disconnected from 'GEN' terminal (not designed to be operated on open-circuit).

SERVICING:—When servicing and adjusting regulators, always check contacts (resurface if necessary as directed below), contact gap, contact spring tension, air gap before making adjustments to change performance.

Contact Point Resurfacing—If flat contact has a pit or cavity, use a special spoon shaped 'riffler' file to clean out the cavity and remove all oxidized material, then finish cleaning contact with a flat fine-cut contact file. Use file lightly on smaller rounded contact (contact metal is very thin). Use extreme care not to bend contact spring (file each contact separately) and keep all grease off contact surfaces. Do not use sandpaper or emery cloth on these contacts.

IMPORTANT SERVICE CAUTION—Badly burn or fused contacts, burnt resistor unit and regulator winding are caused by open-circuit operation, high resistance in charging circuit or radio condenser connected to field terminal. Check car wiring and correct trouble before replacing regulator.

TESTING & ADJUSTMENT:—Test and adjust each unit in order as follows:

CUTOUT RELAY

Air Gap—Hold contacts closed, check gap between armature and coil core with a feeler gauge. Should be .020". Adjust by loosening two screws on armature hinge bracket and move armature up or down.

Contact Gap—Check with feeler gauge with armature up against upper stop. Should be .020". To adjust, bend upper armature stop (or upper contact support on types with auxiliary ground contacts on armature—make certain that these auxiliary contacts open when main contacts close).

Cut-in Voltage & Cut-out Current—Connect ammeter in charging line at regulator 'BAT' terminal (disconnect lead at this terminal, connect lead to one ammeter terminal, connect other ammeter terminal at 'BAT' terminal). Connect voltmeter between regulator 'GEN' terminal and ground on regulator case. Start engine and slowly increase speed. Note voltage at which relay contacts close. Should be 6.3-6.9 volts (cold or hot—see note below). Then decrease speed slowly and note ammeter reading at instant contacts open. Should be 0-4.0 amperes. Adjust as follows:

Cut-in Voltage Adjustment—Bend spring post (at outer end of armature spring) up to increase cut-in voltage (increase spring tension), down to decrease cut-in voltage (decrease spring tension).

Torrid Climate Setting—To correct overcharged battery condition where regular atmospheric temperates are 95° to 100° F. and above, adjust Cutout Relay to close at 6.4-6.6 volts hot or cold.

Cut-out Current Adjustment—Adjust by changing armature spring tension and air gap slightly. Air gap limits are .018-.022".

CAUTION—On all regulators without 'IGN' terminal, relay voltage must be set below regulator voltage or relay will not close until high generator speed is reached which will result in discharged battery and burned relay contacts. Set voltage to exact figures given above. Low setting will cause vibrating and burning of relay contacts. Relays used on these regulators are compensated and performance will be same cold and hot (can be checked regardless of temperature). This is not true of regulators with 'IGN' terminal.

VOLTAGE REGULATOR

Check regulator for broken, burned, loose or unsoldered leads, and defective resistor unit. Check contacts and resurface if dirty or oxidized (see Servicing directions above—replace armature assembly if contacts are pitted or have been filed excessively).

Air Gap—Move armature down by hand until fibre bumper just touches stop, check air gap between armature and center of core with feeler gauge. Should be .063". Adjust by bending contact spring post. Check clearance between fibre bumper with armature up. Should be .010". Adjust by bending upper stop.

Contact Gap & Spring Tension—Hold armature down against lower armature stop and check gap with feeler gauge. Should be .020". Adjust by bending lower armature stop. Check contact spring tension with spring scale hooked between fibre bumper and contact point as near point as possible, note scale reading at instant contacts open. Should be 3½ ozs. minimum. Adjust by bending the flat contact spring (carrying upper contact) as near as possible to point where it is attached to the frame.

Voltage Setting (Using Variable Resistance or AVR Set)—Connect variable resistance (approximately .25 ohms required) and ammeter in series in charging line at regulator 'BAT' terminal, connect voltmeter between 'BAT' terminal and ground on regulator case. Run engine at speed at which generator maximum output normally secured (2800-3000 R.P.M.), adjust resistance so that charging rate is 8-10 amperes (if charging rate less than 8 amperes, turn on lights while making this check), operate generator until regulator reaches operating temperature of 150°F. (very hot when felt by hand). Note voltmeter reading. Should be 7.4-7.6 volts at this temperature (7.5-7.9 volts at 70°F.—Cold). To adjust, remove regulator cover, change regulator armature spring tension slightly by bending spring hanger (at lower end of spring) down to raise regulator voltage (increase spring tension), or up to lower regulator voltage (decrease spring tension). Replace regulator cover and repeat test. CAUTION—Cover must always be in place when tests are made.

Torrid Climate Setting—To correct overcharged battery condition where regular atmospheric temperatures are 95° to 100° F. and above, set Voltage Regulator to operate at 6.8-6.9 volts hot.

Fixed Resistance Method—Disconnect lead at 'BAT' terminal of regulator (leave this lead off while making test), connect 3/4 ohm fixed resistance between 'BAT' terminal and ground (see Resistance Note below), connect voltmeter between 'BAT' terminal and ground. Operate engine at speed at which generator normally produces maximum output until regulator reaches operating temperature of 150°F (very hot when felt by hand). Note voltmeter reading. Should be 7.4-7.6 volts at this temperature (7.5-7.9 volts at 70°F—Cold). Adjust in same manner as directed for AVR setting method above.

RESISTANCE NOTE—Resistance unit must be capable of carrying 10 amperes and must have same resistance cold and hot. It is extremely important that correct resistance unit value be used when using this method of checking regulator setting. Use 3/4 ohm resistance for all 6 volt regulators, 1½ ohm resistance for 12 volt units.

GENERATOR OUTPUT (THIRD BRUSH CONTROL).

Checking—Connect 1/4 ohm variable resistance and ammeter in series in charging line at regulator 'BAT' terminal, connect voltmeter between 'GEN' terminal and ground. Operate generator at speed for which maximum output figure given in generator performance tables (see car model 'T&E' pages for each model), adjust variable resistance until voltage is correct—this is extremely important. Note ammeter reading.

Adjustment—On generators with adjustable third brush, adjust brush for correct output. On types with fixed third brush, no adjustment is possible and generator must be overhauled if rated output cannot be secured.

These regulators standard or optional equipment on following car models:

Car Model.	Generator.	Regulator.	Grounded Ter.

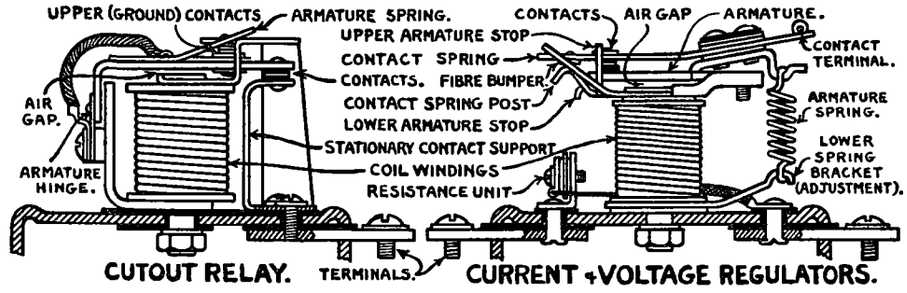
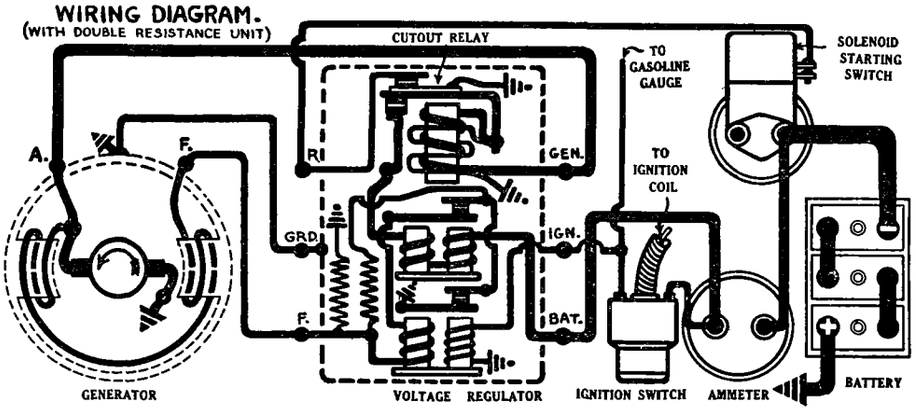
DESCRIPTION:—These units are composed of a vibrating type Voltage Regulator of a new design, a vibrating type Current Regulator, and a Cutout Relay in a single case. The Voltage Regulator is not designed to control generator voltage on open circuit and the generator should be operated only when charging a battery. The Control Unit cover is sealed in place and unauthorized breaking of the seal (necessary to service any of the units) voids the warranty on the unit. See Trouble Shooting Section below for tests to determine whether the unit is defective without removing cover. These models are standard or special equipment on car models listed below. Battery ground terminal must be positive (Pos.) or negative (Neg.) as indicated in table. This is important.

NOTE—To avoid changing generator polarity, always disconnect lead on 'F' terminal of regulator **First** and connect this lead **Last.** To insure correct polarity, connect 'GEN' and 'BAT' terminals on regulator together momentarily after all leads have been connected but before engine is started.



Generators used with this type Control Unit are shunt wound, two-pole, two-brush machines (no third brush being used). No regulation of generator charging rate is possible except by changing setting of Current Regulator (maximum output) or Voltage Regulator (maximum voltage).



OPERATION:—Voltage Regulator. Operation of this type voltage regulator is same as Vibrating Voltage Regulator when used alone (see preceding article) except that resistance unit has been increased to 30 ohms.

Current Regulator. The two coils of the Current Regulator are connected in series in the charging line between the cutout relay and the 'BAT' terminal of the control unit so that the entire generator output flows through these coils when the cutout relay contacts are closed. When the current flow reaches the maximum for which the unit is set, the current regulator contacts vibrate, cutting the resistance units in and out of the field circuit (both resistance units are in parallel in the field circuit so that total resistance is less than the single resistance which is cut into the field circuit by the opening of the voltage regulator contacts). Generator output is held reasonably constant at maximum point until speed is reduced or load decreased.

TROUBLE SHOOTING:—If generator performance is not satisfactory, check in accordance with the following table to determine whether Voltage Regulator or Current Regulator is defective (not necessary to remove control unit cover to make these tests). Control Unit is separately mounted and must be well grounded. A separate ground lead is run from the 'GRD' terminal on the control unit for this purpose. Examine this lead and ground.

1. Generator Not Charging. Operate engine at speed above cut-in point (do not operate engine at high speed as tests eliminate regulating action and damage may result to generator). Ground 'F' terminal on control unit. If generator charges, regulator is defective. If generator does not charge, ground 'F' terminal on generator. If generator charges, the lead connecting the 'F' terminals on the generator and the control unit is broken or open-circuited and should be replaced. If generator does not charge, disconnect lead at 'GEN' terminal of control unit and flash this lead to ground with 'F' terminal still grounded. If a spark is noted, the regulator or cutout relay is defective. If no spark is noted, examine this lead (connecting 'A' terminal on generator and 'GEN' terminal on control unit) before disassembling and examining generator.

2. Generator Charging Rate Too High or Too Low. This may be caused by incorrect setting or defective operation of either the Voltage Regulator or Current Regulator. To check Voltage Regulator setting, connect a variable resistance in the charging line between the 'BAT' terminal on the control unit and the ammeter and adjust to hold charging current at 8-10 amperes (approximately .25 ohm max.). Disconnect lead to 'IGN' terminal of control unit and connect a jumper wire between this terminal and the 'BAT' terminal. Connect accurate test voltmeter between 'IGN' terminal

and ground. Take readings with control unit at room temperature (70°F) and hot (150°F). To test, operate engine at speed above cut-in point, decrease speed until cutout relay contacts open, then increase speed to 2000-3000 R.P.M., holding charging current at 8-10 amperes and note voltmeter reading. See table under Adjustment Section for correct voltages.

To check Current Regulator setting, turn on lights and other accessories so that current load exceeds Current Regulator setting (see table below), disconnect lead on 'IGN' terminal of control unit (this cuts out the Voltage Regulator action), connect accurate test ammeter in charging line at control unit terminal 'BAT'. Operate engine and slowly increase speed until generator output remains constant. This figure will be the point for which the current regulator is set and should normally be the maximum rated output of the generator (see table under Adjustment Section for standard current regulator settings). If the generator output increases beyond the maximum point which represents the rated output for the particular generator, do not continue to increase engine speed as this indicates that current regulator is not operating and damage may result to the generator.

Oxidized Voltage or Current Regulator Contacts—To check with regulator on car, disconnect lead on 'IGN' terminal of regulator, connect ammeter in charging line at 'BAT' terminal. Operate engine at low speed so that charging current indicated on ammeter is 4-5 amperes, ground 'F' terminal on regulator and note ammeter reading (wait until pointer steadies after first momentary surge). If ammeter reading is 2 amperes or more greater than with 'F' terminal not grounded, contact point oxidation is excessive. To check with regulator on bench, see that commutator and brushes are in good condition, then check generator speed at which cutout relay contacts close with 'F' terminal grounded and not grounded. Closing point with 'F' terminal grounded is normally slightly lower than with terminal not grounded. If difference is 100 R.P.M. or more, contacts are oxidized and should be corrected.

NOTE—Radio by-pass condensers must not be installed on field or 'F' terminals of generator or regulator as these will cause oxidation of contacts. Condensers should be removed and contacts examined and resurfaced.

SERVICING:—If above tests indicate that Voltage Regulator, Current Regulator, or Cutout Relay are defective or that settings are incorrect, the entire control unit should be returned for service, which is handled on an exchange basis. All adjustments outlined below require the breaking of the seals (voiding the warranty) and removing the control unit cover.

CUTOUT RELAY ADJUSTMENT:—If cutout relay has a set of auxiliary contacts above the armature (for starter solenoid relay circuit control, etc.), these contacts should be closed with main contacts open and should open when main contacts close. All other adjustments listed below.

Cutout Relay Performance Data

Type	Cut-in Volts	Cut-out Amperes
5559, 87, 96, 97, 99	6.9-7.6	0-4.0
5598, 5801	12.8-14.4	0-4.0
5806	12.3-13.7	0-4.0

5854	6.9-7.6	0-4.0
5855	6.4-7.1	0-4.0
5856	12.3-13.7	0-4.0
5861, 67	6.9-7.6	0-4.0
5865①	6.3-6.9	0-4.0
5865②	6.9-7.6	0-4.0
5871, 72	6.3-6.9	0-4.0
5873①	6.3-6.9	0-4.0
5873②	6.9-7.6	0-4.0
5874, 75	6.9-7.6	0-4.0
5877, 78	6.3-6.9	0-4.0
5885	6.3-6.8	0-4.0

①—No IGN terminal. ②—With IGN terminal.

Torrid Climate Setting—To correct overcharged battery condition where regular atmospheric temperatures are 95° to 100° F. and above, adjust Cutout Relay to close at 6.8-7.2 volts cold (with IGN terminal), 6.4-6.6 volts hot or cold (without IGN terminal).

Air Gap—Hold armature down (contacts closed) and measure air gap between armature and coil core with a feeler gauge. Air gap should be .020". Adjust by loosening two screws on hinge bracket and shifting armature up or down.

Contact Gap—Measure gap with armature up and auxiliary contacts closed. Gap should be .020". Adjust by bending support arm carrying upper auxiliary contact.

Cut-in Voltage. Connect test ammeter in charging line at regulator 'BAT' or 'AMM' terminal, voltmeter between regulator 'GEN' terminal and ground. With regulator connected (lead attached to 'IGN' terminal), operate generator and slowly increase speed. Note voltmeter reading at instant relay contacts close. See table below for correct figure for each model. To adjust, change flat armature spring tension by bending spring post. Increase spring tension to increase closing voltage, decrease tension to lower voltage.

Cut-out Amperage. Connect test ammeter in charging line at regulator 'BAT' terminal. Operate generator, increase speed until cutout relay contacts close, then slowly decrease speed and note discharge (reverse) current at point where contacts open.

VOLTAGE & CURRENT REGULATOR ADJUSTMENTS:—Check and adjust mechanical specifications listed below before changing voltage or current settings. Adjustments for both Voltage and Current Regulator are the same except as noted.

Contact Gap—Examine contacts and resurface by dressing lightly with a fine, flat contact file if oxidized to such an extent that generator performance is affected (this may be caused by excessive sparking due to low contact spring tension, misalignment of contacts, etc.). Contact metal on small contact is extremely thin and filing should be held to a minimum. See that contacts are aligned and that surfaces are square. Check tension of upper contact mounting spring. Tension should be 3½ oz. min. when contacts just open (measure by means of a spring scale hooked under contact spring). Adjust by bending contact spring slightly. Check contact gap with armature held down. Gap should be .020". Adjust by bending lower armature stop. Clearance between fibre bumper and stop with armature up should be .010". Adjust by bending upper armature stop.

Air Gap—Check air gap between armature and coil core with contacts closed so that fibre bumper just touches the contact spring stop. Air gap should be .063" (all Voltage Regulators), .075" (all Current Regulators). Adjust by bending contact spring stop.

VOLTAGE REGULATOR SETTING:—Using Variable Resistance (AVR Set)—Resistance unit should be aprpoximately .25 ohms. Connect resistance and test ammeter in charging line at 'BAT' terminal on regulator, disconnect lead on 'IGN' terminal, connect jumper between 'IGN' and 'BAT' terminals, connect voltmeter between 'IGN' terminal and ground. Operate generator at rated maximum output RPM., adjust resistance for output of 8-10 amperes. When regulator reaches proper temperature, 'cycle' regulator by decreasing speed until contacts just open, then increase speed to original figure and note voltmeter reading with regulator operating. If performance cold (70°F) and hot (150° F) is not correct adjust regulator as directed below.

Fixed Resistance Method. Use ¾ ohm (6 volt), 1½ ohm (12 volt) resistance capable of carrying 10 amperes (Nichrome wire preferred, do not use other wire). Disconnect leads on 'BAT' and 'IGN' regulator terminals, connect fixed resistance between 'BAT' terminal and ground on engine block, connect jumper between 'BAT' and 'IGN' terminals, connect voltmeter between 'IGN' terminal and ground. Operate engine, increase speed to R.P.M. at which maximum rated output is reached (see car model page for performance on each generator model), note voltmeter reading. If regulator action not satisfactory, adjust as directed below, then cycle regulator and recheck performance.

Voltage Setting—Adjust by bending armature spring lower bracket up or down to decrease or increase the spring tension. Only a slight change in the position of the bracket should be required. Increase spring tension (bend bracket down) to increase regulator voltage or decrease spring tension (bend bracket up) to decrease regulator voltage. If spring tension must be decreased to a point where the spring is free with the contacts closed, change upper contact spring tension slightly (do not exceed limits as given above). Cover must be on and regulator checked cold (70° F.) and hot (150°F). If tested on the bench, control unit should be placed in same position as on the car (horizontal or vertical). If correct regulator voltages cannot be secured both cold and hot by adjusting armature spring tension, the regulator air gap may be changed slightly as follows: Increase gap to increase cold setting, or decrease gap to decrease cold setting, with respect to hot setting.

Voltage Regulator Setting

Type	Cold Voltage (70°F)	Hot Voltage (150°F)
5559	7.5-7.95	7.4-7.6
5587, 96, 97, 99	7.0-7.4	6.95-7.15
5598, 5801, 6	14.2-15.0	14.1-14.5
5809, 10	7.0-7.4	6.95-7.15
5811	7.5-7.9	7.4-7.6
5813, 18	7.5-7.95	7.4-7.6
5819, 28	7.0-7.4	6.95-7.15
5823, 25, 26, 29, 36, 37	14.2-15.0	14.1-14.5
5840, 41, 42, 46	14.2-15.0	14.1-14.5
5847, 48, 52, 53, 54	7.0-7.4	6.95-7.15
5855	7.5-7.95	7.4-7.6
5856	14.2-15.0	14.1-14.5
5861, 67	7.5-7.9	7.4-7.6
5865	7.0-7.4	6.95-7.15
5871, 72, 73, 74, 75, 77, 78	7.0-7.4	6.95-7.15
5885	7.0-7.4	6.95-7.15

Torrid Climate Setting—To correct overcharged battery condition where regular atmospheric temperatures are 95° to 100° F. and above, set Voltage Regulator to operate at 6.8-6.9 volts hot.

CURRENT REGULATOR SETTING:—Connect ammeter in charging line at 'BAT' terminal on regulator, disconnect lead on 'IGN' terminal (to eliminate regulator action), turn on lights. Operate engine and increase speed until output remains constant, note ammeter reading. If current regulator performance not satisfactory, adjust as directed below.

Current Setting—Adjust by bending armature spring lower bracket up or down to decrease or increase the spring tension. Only a slight change in position of the bracket should be required. Increase spring tension (bend bracket down) to increase maximum output, or decrease spring tension (bend bracket up) to decrease maximum output. Settings are given in table below. Current Regulator must never be set at higher figure than the rated capacity of the generator on which it is being used.

Current Regulator Setting

Type	Maximum Amperes	Type	Maximum Amperes
5559	20-23	5846	11.5-13.5
5587, 96	20-22	5847, 48	34-36
5597, 99	26-28	5852, 53	34-36
5598, 5801, 6	16-18	5854	29-31
5809, 10	24-26	5855	13
5811	28-30	5856	14-16
5813, 18	24-26	5861, 67	28-30
5819	26-28	5865①	28-30
5823	16-18	5865②	29-31
5825	11.5-13.5	5871, 72	32-34
5826	19-21	5873①	28-30
5828, 31, 32	26-28	5873②	29-31
5829	7-9	5874	29-31
5836, 37	24-26	5875	32-34
5840	12-14	5877, 78	28-30
5841, 42	24-28	5885	38-40

①—No IGN terminal. ②—With IGN terminal.

NOTE—Type 5559 regulator rated at 20-22 amperes, but when used with 933-M generator on 1937 Cadillac V12 or V16, setting is 26 amperes.

Delco-Remy Regulators or 'Apparatus Boxes' are made in two types: a two-element (Cutout Relay and Voltage Regulator) type used in conjunction with third brush control generators, and a three-element (Cutout Relay, Current Regulator, and Voltage Regulator) type used with shunt wound generators. Both types of units are checked and adjusted in exactly the same manner and no distinction is made between them in the following discussion except that the material on the Current Regulator applies only to the three-element Apparatus Box. The maximum output of the third brush controlled generator used with the two-element Apparatus Box is regulated by the third brush setting (see paragraph on Third Brush Setting). First check following points:

1. **Connections.** See that all connections are clean and tight and that generator and Apparatus Box are correctly wired up (see diagram).
2. **Commutator and Brushes.** Clean commutator and examine brushes. If commutator is rough or worn down to the mica it should be turned down in a lathe (taking a very fine cut) and the mica then undercut to a depth of 1/32 inch. Brushes must seat over at least 75% of the bearing surface and should be sanded in if necessary.
3. **Generator Voltage.** Check generator voltage by operating generator with a voltmeter connected between the "Armature" terminal of the genrator and ground. Generator voltage should build up properly (see table below for performance data). If generator does not build up, check for shorted or grounded armature or field coils.
4. **Apparatus Box Ground.** Apparatus Box must be well grounded. A ground screw is provided on each end of the Apparatus Box and, if Apparatus Box is not grounded through the frame by being firmly mounted on a clean metal surface on the car, a ground wire should be provided between one of these screws and the car frame or generator frame.

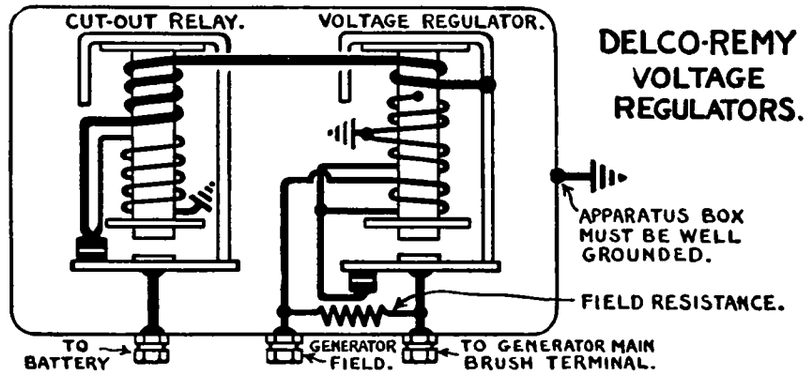
MECHANICAL ADJUSTMENTS

CUTOUT RELAY:—Air Gap. Air gap between armature and coil core should be .057". To check the air gap, hold armature down (contacts closed) and measure gap between underside of armature and coil core with a feeler gauge. Adjust by loosening the 3 screws on the lower contact bracket and shifting the position of the stationary contacts (the lower contact bracket mounting screw holes are slotted to permit this adjustment).

Contact Gap. The Contact gap must be .020 inch. Check gap with a feeler gauge. Adjust by bending the armature stop above the armature (between the upper contact fingers).

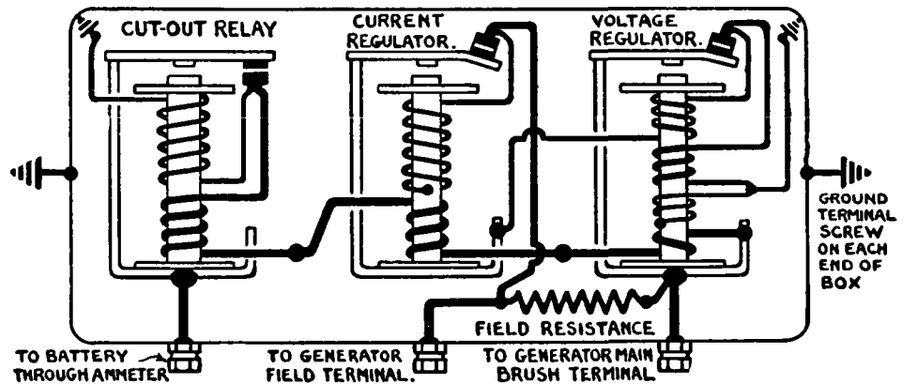
CURRENT REGULATOR AND VOLTAGE REGULATOR:—Contact Gap. Contact gap should be .015 inch. To check the contact gap, hold armature down against coil core and measure gap with a feeler gauge. Adjust gap by loosening lock nut on stationary contact stud (upper contact) and turning down stud. Tighten locknut after making adjustment.

ELECTRICAL ADJUSTMENTS



CUTOUT RELAY:—Cut-in Point. Connect negative (—) terminal of test voltmeter to "Armature" terminal on the generator and ground positive (+) terminal of voltmeter to Apparatus Box case. Short out Voltage Regulator by connecting one end of a short jumper to the upper contact support on the regulator and connect the other end of the jumper to the armature on which the lower contact is mounted. Operate generator and slowly increase generator speed until relay contacts close. Note voltmeter reading at instant contacts close (there will be a slight 'kick-back' of the voltmeter pointer when the contacts close and this can be used to check the closing point). Contacts should close with a generator voltage of 7.0 volts (6 volt units), 13.5 volts (12 volt units), 26.0 volts (24 volt units), 35.0 volts (32 volt units except 5611), 33.0 volts (5611 only). To adjust closing point, change relay armature spring tension by loosening lockscrew on lower spring bracket and turning eccentric adjusting screw. Increase the spring tension to raise the cut-in voltage and decrease the spring tension to lower the cut-in voltage. Tighten lockscrew and repeat test.

Cut-out Point. Connect a test ammeter in the battery line (disconnect the lead on the 'Ammeter' terminal of the Apparatus Box and connect this lead to one terminal of the test ammeter and connect the other ammeter terminal to the 'Ammeter' terminal on the Apparatus Box). Operate the generator at a speed above the cut-in point so that generator is charging the battery and slowly decrease the speed until the relay contacts open. Note ammeter reading. Contacts should open with 0-3 ampere discharge.



CURRENT REGULATOR (Three-element Apparatus Boxes only):—Disconnect lead on 'Ammeter' terminal of Apparatus Box and connect to positive (+) terminal of test ammeter. Connect negative (—) terminal of test ammeter to 'Ammeter' terminal on Apparatus Box. The Voltage Regulator must be shorted out (see Cut-out Relay adjustment). Operate th generator and increase the speed to the maximum for the particular generator (see table below, Special Note, and Individual Car Data Sheets). Turn on enough lamp load to cause Current Regulator to begin operation. Note ammeter reading. If generator output as indicated by ammeter reading does not correspond with rated setting for the Apparatus Box, the Current Reulator setting must be changed. To adjust Current Regulator, loosen lock screw on lower spring bracket and turn eccentric adjusting screw to right or clockwise to decrease, or to left or counter-clockwise to increase the output. Tighten lockscrew and repeat test. NOTE—Current regulator setting must not be changed until after regulator contact gap has been checked.

THIRD BRUSH SETTING (Two-element Apparatus Boxes only):—To check third brush setting on generators used with a two-element Apparatus Box, first connect test ammeter in charging line and short out Voltage Regulator as directed in paragraph above on Current Regulator. Then operate generator at speed indicated in table below and change third brush setting until generator output corresponds with maximum rated capacity for the particular machine being tested (see table and individual car data sheets). Shift the third brush in the direction of armature rotation to increase the charging rate and in the opposite direction to decrease the charging rate.

TWO ELEMENT APPARATUS BOX.

THREE ELEMENT APPARATUS BOX.

VOLTAGE REGULATOR:—Voltage Regulator should be checked and adjusted on open circuit. Disconnect the battery lead at the 'Ammeter' terminal on the Apparatus Box. Connect the negative (—) terminal of the test voltmeter to the 'Ammeter' terminal on the Apparatus Box and ground the positive (+) lead of the voltmeter to the Apparatus Box case. Operate the generator at the speed shown on the table below and note the voltmeter reading after regulator has reached operating temperature. If not within limits shown in table below, check contact gap before setting changed. Loosen the lock screw on the armature spring lower mounting bracket plate and turn the eccentric adjusting screw to change the spring tension. Increase the spring tension to increase the open circuit voltage and decrease the spring tension to decrease the voltage. Tighten the lock screw and check adjustment by varying speed throughout operating range.

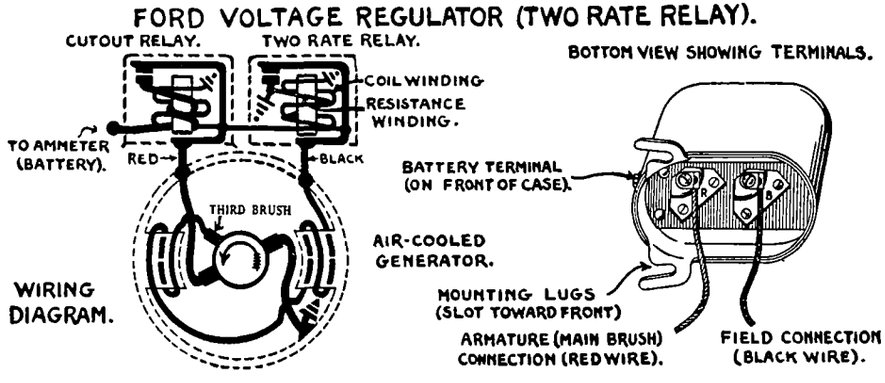
FORD REGULATOR

TWO-RATE RELAY TYPES

NOTE:—These regulators used as standard or special equipment on the following models:

Models.	Regulator.	Generator.
Ford V8 (1934-36)	40-10505, A	40-10000-B
Ford V8 All Models (1937)	68-10505	78-10000-HA, HB
Lincoln Zephyr H (1936)	68-10505	68-10000-HA, HB
Lincoln Zephyr HB (1937)	68-10505	78-10000



DESCRIPTION:—The Voltage Regulator or Two Rate Relay is combined with the Cutout Relay in a case on the generator field frame. The regulator consists of a fixed resistance unit which is cut in or out of the generator field circuit by the action of the regulator contacts (resistance is connected across the contacts and is short-circuited with the contacts closed). Resistance is wound on a form over the regulator coil winding. This coil winding (shunt coil) is connected in parallel with the shunt winding of the cutout relay. Regulator is compensated for temperature variations by having one contact mounted on a thermal support.

OPERATION:—The regulator contacts are normally closed (resistance short-circuited) when the generator is not operating. The generator will charge the battery at the high rate until the generator voltage reaches 8.5 volts. At this point the current flow through the regulator coil winding will cause the regulator contacts to open, cutting the resistance in the field circuit, and reducing the charging rate to approximately 20% of the high rate. The contacts remain open, and the generator charges at the low rate until the generator speed decreases sufficiently so that the cutout relay contacts open. The regulator contacts then close so that generator will again charge at the high rate when the generator speed is increased sufficiently to close the cut-out relay contacts. This action provides two charging rates, a high rate with discharged battery or for a short interval after the generator begins to charge (regulator contacts closed), and a lower rate after the battery is charged (regulator contacts open).

The regulator also acts as a safeguard against high voltage due to resistance in charging circuit, high internal resistance in battery, or other causes, since these factors all cause the generator voltage to rise and the regulator will operate when the generator voltage reaches 8.5 volts even when the battery is not fully charged (generator voltage normally rises as battery voltage comes up on charge).

ADJUSTMENTS:—No provision made for adjustments. Replace units which do not operate satisfactorily.

FORD VOLTAGE REGULATOR (TWO RATE RELAY).

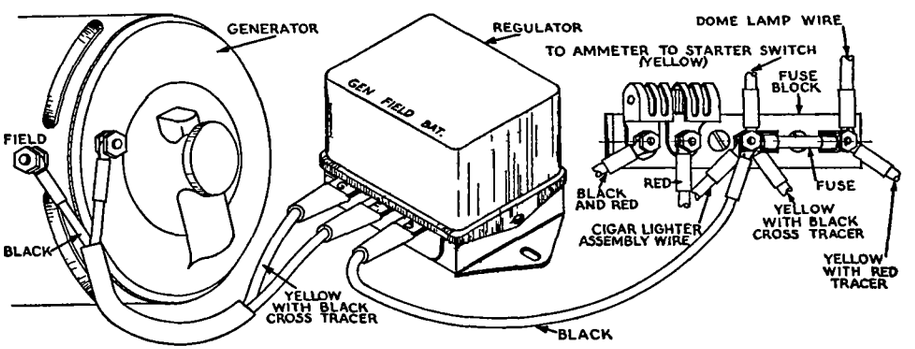
①—Superseded by 91-A-10505-A.

TYPE:—Regulator consists of a vibrating type combination voltage-current regulator and a cutout relay in a single case designed to be mounted on the dash and used in conjunction with a two-brush shunt wound generator (see illustration).

OPERATION:—Voltage Regulation. Regulator voltage winding is connected across the generator main brushes. When the generator voltage reaches the value for which the regulator is set, regulator contacts vibrate (cutting the resistance in and out of the field circuit) so that the voltage is held constant (winding actually connected in two sections, one of which is short-circuited by the contacts when they are closed but is energized when the contacts open—see illustration).

Current Regulation. Current coil on regulator is connected in series in charging circuit so that the entire generator output flows through this winding. When the current reaches the maximum for which the regulator is set, the regulator contacts vibrate and the output is held from exceeding this figure.

REGULATOR TESTING:—Voltage Regulation. Connect voltmeter between regulator 'B' terminal and ground. Start engine and operate at 900 R.P.M. minimum (set hand throttle control to hold engine at this speed while test being made). Disconnect battery ground connection—generator will then operate with only voltmeter and ignition system in circuit so that voltage will rise until regulator comes into action. Regulator should limit voltage to 7.6 volts at 70° F. If voltage exceeds this figure, regulator should be replaced. If voltage is 7.0-7.6 volts, regulation action is satisfactory. If voltage below 7.0 volts and battery is not maintained in fully charged condition on car, regulator should be replaced.



Current Regulation. Connect ammeter in charging line at 'B' terminal on regulator. Use 'BRS' test set attachment or rheostat and voltmeter connected across battery terminals (do not disconnect battery cables) and apply load until battery voltage drops to 5.75 volts. Start engine and increase speed until current regulator limits generator output. Note ammeter reading. Regulator should limit output to 23 amperes (Generator Models 81-A-10000-E, 82-A-10000-E, 81-T-10000-B) 30 amperes (Generator Models 81-A-10000-D, 82-A-10000-D, 81-T-10000-A, 91-A-10000).

REGULATOR ADJUSTMENT:—No adjustments can be made (regulator cover riveted in place). Replace defective units.

INSTALLING NEW GENERATORS & REGULATORS:—Disconnect battery ground strap. Disconnect yellow wire with black tracer (old generator lead) from fuse block, draw this two-wire cable (contains also black wire not used with three-brush generator) back through rubber grommet in dash. Mount regulator securely on dash on bosses provided (near bottom on first cars, on inclined surface to left of center on later cars—avoids interference with oil-bath air cleaner and the oil filter when installed). Connect regulator ground lead to the dash (scrape paint from dash and tighten ground lead screw securely for good ground connection). Insert special black wire through the dash grommet, connect one end to fuse block, opposite end to regulator 'B' terminal. Disconnect wire on old generator, replace with new generator (do not install belt). Connect wires in two-wire cable to regulator as follows: Yellow-with-black tracer wire to regulator 'G' terminal, Black wire to 'F' terminal. Connect battery ground strap, touch yellow-with-black tracer wire to 'G' terminal on generator commutator endplate. No spark should be evident and generator should not motor or show other reaction (see Note below). If O.K., connect this wire permanently, connect black wire to other (field) terminal on generator. Install fan belt. With a fully charged battery, generator output may be as low as 6-7 amperes with ignition load only, or as high as 30-35 amperes with low battery and maximum load.

NOTE—If spark noticed or generator motors when yellow-with-black tracer wire flashed to generator 'G' terminal, replace regulator. Use extreme care not to interchange the generator leads (transposing these two wires will cause destruction of the regulator).

Ground Note—Early type regulators grounded through base of regulator. Later types mounted on rubber cushions and grounded to dash through a separate ground lead.

Voltage Regulator and Cutout Relay adjustments on both the two-element Control Unit (designed for use with third brush control generators) and the three-element Control Unit (for use with shunt wound generators) are made in exactly the same manner. No distinction is made between these two types in the following discussion except that the material on the Load Limit Controller (Current Regulator) applies only to the three-element Control Unit. Generator output on third brush control types using the two-element control unit is controlled by the setting of the third brush. The elements of the Control Unit should be checked in the order shown and the mechanical adjustments of each element must be checked in the order shown and the mechanical adjustments of each element must be checked before any attempt is made to check or adjust the electrical settings.

The Control Unit should be mounted in a vertical position and all connections between the battery, Control Unit, and generator should be clean and tight. Special test hook-ups for test ammeter and voltmeter are given for each test.

VOLTAGE REGULATOR:—Mechanical Adjustment. All gaps should be measured with the armature held down so that the stop pin is against the coil yoke.

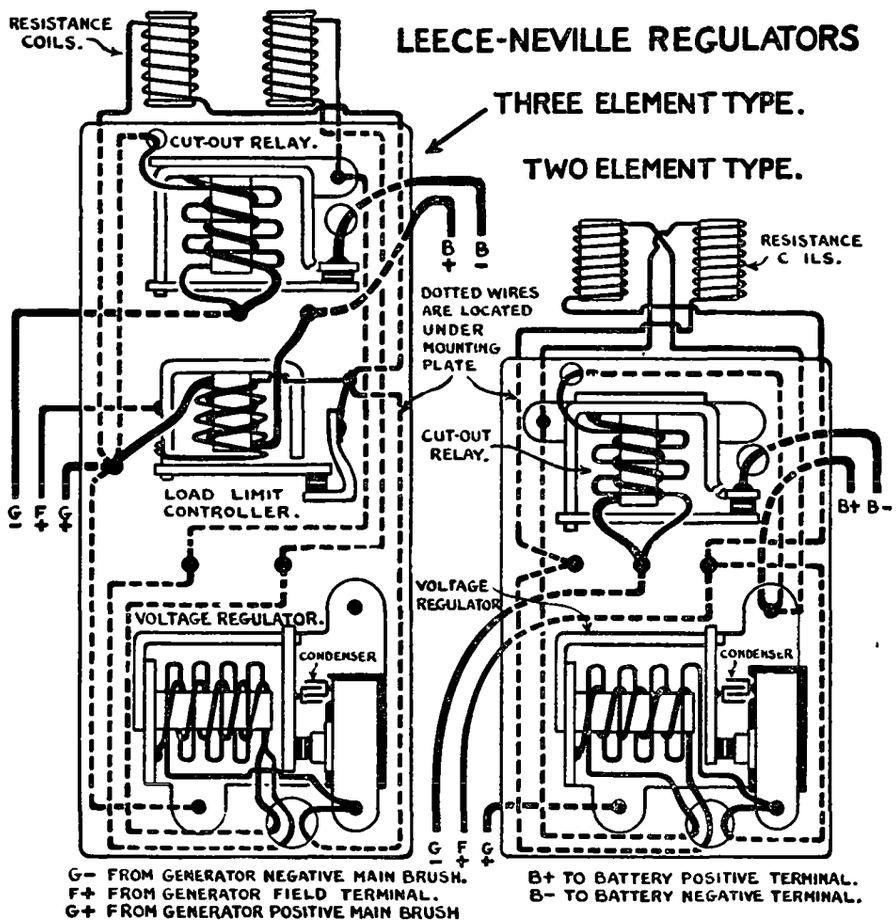
Contacts. Examine Regulator Contacts. If necessary clean contacts by drawing 'crocus' cloth between them while holding contacts closed. Blow out all dust and draw a piece of clean, smooth paper between contacts while holding them closed. See that contact surfaces are square and parallel so that a good contact is established between them.

Hinge Gap. IMPORTANT. Check hinge gap between magnet frame or yoke and hinge (under armature) at hinge end of Voltage Regulator by means of a feeler gauge. If hinge gap is not between .008-.015 inch, adjust by loosening bracket screw on end of coil yoke and shifting hinge bracket up or down. Tighten bracket screw after making adjustment.

Contact Point Gap. Contact gap should be .020-.025 inch. Check with feeler gauge. Adjust by bending armature stop (upper contact support).

Core Gap. Core gap between armature and coil core should be .021-.026 inch. Check with feeler gauge.

Electrical Adjustment:—Open Circuit Setting. Disconnect battery lead from 'B' terminal on Control Unit. Connect test voltmeter from this terminal to ground. Clean Load Limit Controller contacts and close contacts by wedging a small piece of some non-conductor, such as a matchstick, below the armature. This wedge should be left in place to prevent Load Limit Controller operating while Voltage Regulator and Cutout Relay are being tested or adjusted. Operate generator for 15 minutes at R.P.M. in table below in order to bring Regulator up to operating temperature. Note voltmeter reading at the end of this period. If open-circuit voltage corresponds with figure given in table, the adjustment is correct. If voltage is not correct, adjust Regulator by turning Regulator adjusting nut above hinge bracket until exact voltage reading is secured. Tap Regulator armature several times at a point back of the armature stop to check Regulator operation. If voltage is held within range given in the table the setting is satisfactory. See that the loop end of the armature spring is in the grooves of the spring bracket and that the adjusting nut locking clip is in place so that the adjustment cannot change in service.



If the open circuit voltage varies widely for no apparent reason or if a correct setting cannot be secured, locate trouble from following table:

High Voltage. Check following points:—
1. Large resistance coil (upper coil in case) open circuited or disconnected.
2. Connections on terminals 'G+' and 'F+' reversed.
3. Lead to 'G—' terminal open circuited or disconnected.
4. Regulator point condenser shorted.
5. Regulator contact gap incorrect.
6. Regulator coil defective.

No voltage or very low voltage. Check following points:
1. Generator field fuse open. Check fuse and fuse clips.
2. Leads to 'G—' and 'F+' terminals shorted.
3. Leads to 'G+' or 'F+' terminals open circuited or disconnected.
4. Regulator coil defective.
5. Poor contact at Regulator contact points. Clean and adjust contacts.

Voltage varies widely for no apparent reason.
1. Small resistance coil (lower coil in case) open circuited or disconnected.
2. Regulator coil defective.
3. Poor contact at Regulator contact points. Clean and adjust contacts.
4. Regulator armature binding. See that armature moves freely and check hinge gap.

Arcing at Regulator Contacts.
1. Condenser disconnected or defective.
2. Poor contact at Regulator contact points. Clean and adjust contacts.
3. Regulator coil defective.
4. Small resistance coil (lower coil in case) open circuited or disconnected.
5. Open circuit voltage set too high.

CUTOUT RELAY:—Mechanical Adjustments. All gaps should be measured with the armature held down with the stop pin against the coil yoke. Do not guess at gap dimensions. Use a feeler gauge. This is important.
Contacts. Examine relay contacts. Clean contacts by drawing 'crocus' cloth

between them while contacts are held closed. Blow out all dust and finish by drawing a piece of smooth,clean paper between contacts while they are held closed. See that contact surfaces are square and parallel and that a good contact is established between them.

Hinge Gap. IMPORTANT. Check hinge gap between magnet frame or yoke and hinge under armature by means of a feeler gauge. If hinge gap is not within .008-.015 inch, adjust by loosening bracket screw on end of coil yoke and shifting hinge bracket up or down until correct gap is secured. Tighten bracket screw after making adjustment.

Contact Point Gap. Contact point gap should be .028-.032 inch. Check with a feeler gauge. Adjust by bending armature stop (directly above armature at contact end of relay).
Core Gap. Core gap between armature and coil core should be .020-.025 inch with relay contacts closed.

Electrical Adjustments:—To Set Cut-in Point. This test is made on open circuit with battery lead disconnected from 'B—' terminal on Control Unit. If desired a small (3 cp.) test lamp may be connected between this terminal and ground to determine the point at which the contacts close (the lamp will light up when the contacts close). Connect the test voltmeter between terminals 'G+' and 'G—' on the Control Unit. Operate the generator and slowly increase speed until relay contacts close. Note voltmeter reading at instant test lamp lights.

Relay cut-in point can also be checked by operating generator at a speed above the cut-in point and momentarily opening Voltage Regulator contacts by pressing on the regulator armature at a point directly behind the armature stop. The opening of the contacts in this manner will cause the generator voltage to drop to a very low figure and if the pressure on the regulator is released very slowly, the generator voltage will build up slowly enough so that the cut-in voltage (when the relay contacts close and the test lamp lights) can be noted on the voltmeter. This test requires less time than the slowing down and increasing of the generator speed and should be used when successive tests are being made. If voltmeter reading corresponds with the figure in the table below, the relay setting is satisfactory. If the cut-in voltage is not correct, turn the adjusting nut at the top of the hinge bracket to the right or clockwise to increase the cut-in voltage and to the left or counter-clockwise to decrease the cut-in voltage. Repeat the test after each adjustment until the exact setting is secured. After the cut-in point has been set, the cut-out point or discharge current necessary to open the relay contacts must be checked. See that the loop ends of the armature spring are in the grooves of the spring bracket and that the adjusting nut locking clip is in place so that the adjustment cannot change in service.

To Check Cut-out Point. Connect battery lead to one terminal of test ammeter and connect other ammeter terminal to 'B—' terminal on Control Unit. This is a closed circuit check. Operate the generator at a speed above the cut-in point with the generator charging the battery and slowly decrease the generator speed until the relay contacts open. Note ammeter reading at the instant the contacts open. This discharge current must be within the range shown in the table above. If the discharge current is not correct, disconnect the battery and recheck the cut-in point as directed above.

If repeated adjustments fail to secure the correct setting, check trouble from following table:

If either Cut-in point or Cut-out point cannot be correctly set.
1. Cut-out relay windings defective.
2. Voltage Regulator winding defective.
3. Generator voltag low.
4. Poor contact at relay contacts. Clean and adjust cut-out relay contacts.
5. Generator to Control Unit wires disconnected or incorrectly connected.

If Cut-out Point is not correct.
1. Battery disconnected or connections defective (loose terminals).
2. Battery defective. Check battery and electrolyte level.
3. Battery connections reversed, causing relay contacts to vibrate.

LOAD LIMIT CONTROLLER:—The Load Limit Controller is designed to limit the generator output to the maximum rated capacity of the system. For this reason a low charging rate as indicated on the instrument panel ammeter means that the car battery is fully charged and should never be taken to mean that the Load Limit Controller should be adjusted. The Load Limit Controller should be checked on closed circuit with the generator charging the battery.

Mechanical Adjustment:—These are made in exactly the same manner as on the Voltage Regulator (the construction of the two units is similar). All settings are the same except that the core gap on the Load Limit Controller should be .020-.025 inch.

Electrical Adjustment:—Connect battery lead to one terminal of the test ammeter and connect the other ammeter terminal to the 'B—' terminal on the Control Unit. This is a closed circuit test with the generator charging the battery. Remove the wedge from the Load Limit Controller armature (see Voltage Regulator paragraph) so that Load Limit Controller can function. Operate the generator at R.P.M. shown in table below. Close Voltage Regulator contacts momentarily by pressing up on regulator armature. This will cause voltage to rise and charging rate to increase if Load Limit Controller is not correctly set. Note ammeter reading with Voltage Regulator contacts held closed. If ammeter reading is within range shown in table below, the Load Limit Controller setting is satisfactory. If reading is outside this range, turn the adjusting nut above the hinge bracket to the right or clockwise to increase the generator output and to the left or counter-clockwise to decrease the output until the correct setting is secured. The upper figure in the table is the maximum allowable output for the particular generator and must never be exceeded. See that the loop ends of the armature spring are in the grooves of the spring bracket and that the adjusting nut locking clip is in place so that the adjustment cannot change in service.

If it is not possible to secure a correct setting of the Load Limit Controller, check the following points:
1. Load Limit Controller winding defective.
2. Load Limit Controller incorrectly adjusted. See Mechanical adjustments and check condition of contacts, contact gap, and hinge gap.
3. Generator voltage too low. See Voltage Regulator paragraph.

THIRD BRUSH SETTING:—On all third brush control generators equipped with a two-element Control Unit, the generator maximum output is controlled by the third brush setting. To check third brush setting, connect battery lead to one terminal of the test ammeter and connect the other ammeter terminal to the 'B——' terminal on the Control Unit. Operate the generator at the R.P.M. shown on the Load Limit Controller adjustment table. Close Voltage Regulator contacts momentarily by pressing on Voltage Regulator armature. This will cause voltage to rise and generator charging current will increase if third brush is not correctly set. Note ammeter reading with Voltage Regulator contacts closed. If ammeter reading is within range shown in output column of Load Limit Controller Table, the third brush setting is correct. If reading is not correct, shift third brush in direction of armature rotation to increase output or against rotation to decrease output until exact setting is secured. The figure in the table is the maximum allowable output for the particular generator and must never be exceeded.

GENERATOR AND REGULATOR SPECIFICATIONS

x- Indicates third brush control generator using two-element Control Unit.

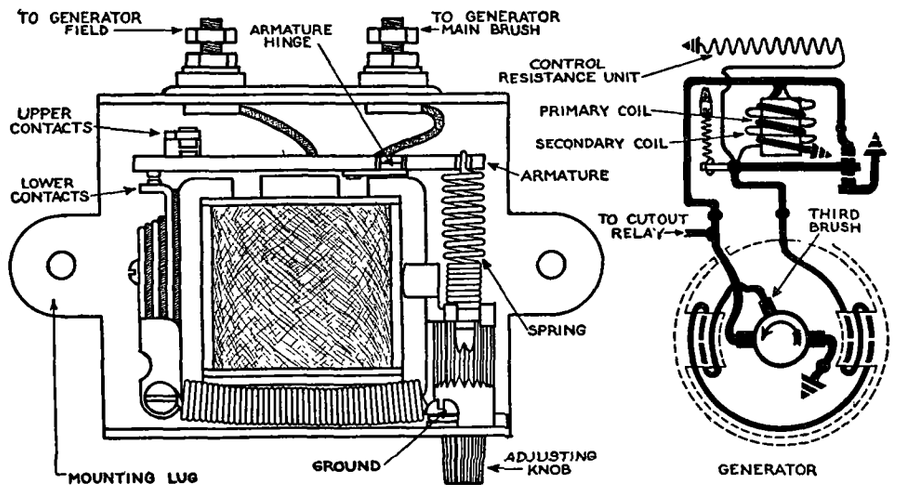
NOTE:—This unit is a vibrating type voltage regulator designed for universal application and may be installed on any 6-8 volt generator (where field current does not exceed 5 amperes) to provide voltage regulation. No cutout relay is included and the original cutout relay installed on the generator is used.

DESCRIPTION:—Regulator consists of a vibrating armature with two movable contacts, one of which contacts upper stationary contact (armature not operating or vibrating on upper contacts), and the other contacts the lower stationary contact (armature vibrating in lower position). Armature is controlled by a spring at the hinge end (spring tension controlled by adjustment knob) and is operated by a two-coil winding. Primary winding of coil is connected directly across the generator main brushes (from main brush lead to ground). Secondary winding is connected between main brush lead and armature contacts so that winding is alternately connected across main brushes (upper contacts closed), in series with resistance unit (both contacts open), or its shorted out (lower contacts closed). Resistance unit consists of a fixed resistance coil mounted on the regulator base plate and connected between the armature and ground. Field lead is also conected to the armature so that field circuit is completed to ground with the resistance shorted out (upper contacts closed) or through the resistance coil (both contacts open or when lower contacts closed).

OPERATION:—Upper contacts are closed with generator voltage below point for which regulator is set so that resistance is shorted out and charging rate is at maximum. As generator voltage increases when battery comes up on charge, current flow through coil windings increases to point where armature is attracted, opening upper contacts, and setting up a vibrating action (Operation on Upper Contacts—see explanation below). When battery is fully charged or at high speeds, armature is attracted toward coil more strongly and vibrating action is set up on lower contacts (Operation on Lower Contacts—see explanation below.) Operation on lower contacts provides maximum regulation and will hold charging rate down to 6 ampere finish rate (see Regulator setting above).

Operation on Upper Contacts—When current flow through primary and secondary coil windings is sufficient to attract armature and open the upper contacts and regulator comes into action, the opening of the contacts cuts the resistance into the field circuit, weakening the field and reducing the generator voltage so that the contacts again close. The cycle is then repeated and the armature vibrates between the open and closed positions cutting the resistance in and out of the field circuit. In addition, when the contacts open, the field voltage (both field lead and secondary coil lead are attached to armature) is superimposed on the secondary coil as a counter or 'bucking' voltage to the main brush voltage across the coil. This voltage differential sets up a steady vibratory 'beat' and increases the frequency of armature vibration. This regulating action maintains generator voltage at a practically constant figure throughout the normal speed range. The dwell or period during which contacts are closed depends on armature spring tension (adjustment knob setting) and will be shorter (lower generator voltage) with less spring tension, and longer (higher generator voltage) with greater spring tension.

Operation on Lower Contacts—When lower contacts close, resistance is connected across generator main brushes as well as in series with the field. This acts as an additional load on the generator to prevent overvoltage in addition to cutting down the field strength. When the contacts open (generator voltage drops due to regulating action above) resistance is in series with secondary and differential voltage action is the same as in operation on upper contacts.



INSTALLATION:—Regulator case provided with mounting lugs for preferred mounting on generator field frame. Lugs can be bent flat for dash or other mounting. Regulator grounded through case and surface under mounting lugs must be cleaned to provide good ground contact (generator mounting) or separate ground wire may be run from mounting lug screw to engine (dash or other insulated mounting). Connect 'G' terminal on regulator case to main brush lead at terminal on generator field frame or at generator terminal of cutout relay—never connect to battery terminal of cutout relay. Connect 'F' terminal on regulator to field terminal on generator field frame, remove ground connection at this terminal (terminal will be grounded if no regulator used previously). If no field terminal provided, make field connection as noted

Generator Field Connection—If field lead grounded internally and not brought out through field frame, drill frame and mount insulated terminal stud or install insulated bushing so that lead can be brought out (drilling hole in commutator cover band not recommended). Locate ground connection in generator, disconnect grounded field lead, connect this lead to terminal stud or splice on section of insulated wire and bring wire out through insulated bushing. Test field for grounds (third brush should be insulated from commutator while making this test), remove any grounds which may be found (field grounds will cause arcing and burning of regulator lower contacts). Install soldered terminals on all leads, see that terminal nuts are tight.

INSTALLATION ADJUSTMENTS:—These adjustments must be made with battery fully charged (1.260 or higher) and generator warm. Battery must be in good condition with all cells equal. Operate generator for 15 minutes at maximum output speed charging battery. Then adjust as follows:

Cutout Relay—Must be set for cut-in voltage of 6.5-7.0 volts for operation with regulator. This may be under standard setting (see separate articles on Cutout Relays). To check cut-in point, disconnect charging line at battery terminal of cutout relay, connect 6-8 volt, 3 cp. lamp between this terminal and ground, connect test voltmeter between generator terminal of cutout relay and ground. Operate generator, increase speed slowly, note voltmeter reading at instant test lamp lights. Adjust cutout relay so that voltmeter reading at this cut-in point is 6.5-7.0 volts. Do not increase generator speed above the cut-in point with the battery line disconnected.

Generator Third Brush Setting—Connect test ammeter in charging line at battery terminal of cutout relay. Disconnect lead on 'G' terminal of regulator to cut out regulator action—do not connect jumper between 'F' terminal and ground. Operate generator at speed for maximum output, set third brush so that ammeter reading corresponds with rated capacity of generator (see car model page for third brush adjusting directions and generator rated capacity). Connect lead to regulator "G" terminal. Charging rate should drop indicating regulator is operating (charging rate will increase with discharged battery).

Regulator Setting—With ammeter connected in charging line at battery terminal of cutout relay, battery fully charged (1.260 reading or higher), generator warm, operate generator at speed at which maximum output secured, turn regulator adjustment knob to right or left as required until ammeter indicates 6 ampere charging current. This is average taper charge requirement

REGULATOR ADJUSTMENT:—Regulator adjustment knob on side of case controls armature spring tension and is the only adjustment provided. Six ampere finish charging rate (setting section above) may be varied slightly (1-2 amperes above or below this point) for special operating conditions or seasonal requirements. Turn adjustment knob to right or clockwise (increase spring tension) for higher charging rate, and to left or counter-clockwise (decrease spring tension) for lower charging rate. Adjustment must be made with fully charged battery only (with discharged battery, charging rate will approach third brush setting or maximum generator rated output).

SERVICING:—No service operations necessary other than to clean contacts when this is required. Clean contacts by drawing crocus cloth between them while holding the contacts closed with light pressure. Blow out all cleaning dust.

TROUBLE SHOOTING:—Slight fluttering of dash ammeter pointer may occur when regulator action changes over from vibrating on upper contacts to vibrating on lower contacts. If ammeter flutters excessively or at other times, check generator commutator for roughness or eccentricity, check brush fit in holders and seat on commutator, check generator drive belt adjustment. See that all connections in charging circuit are clean and tight. Check ammeter.

If regulator lower contacts arc or burn (most evident with fully charged battery) check entire field circuit for grounds.

DESCRIPTION:—Voltage regulator and cutout relay adjustments on two-element Control Unit (for use with third brush control generators) and the three-element Control Units (for use with shunt wound generators) are made in exactly the same manner. No distinction is made in the following discussion between these two types except that the material on the Current Regulator Unit applies only to the three-element Control Unit. The special two-unit combined Current-Voltage Control Unit requires a special setting (see note under Voltage Regulator Unit).

Old and new model numbers for these type regulators or control units are as follows:

Old Model No.	New Model No.	Type of Equipment
3912-B	240936	Voltage & Current Regulator
3916-A	295025	Voltage Regulator
3917	5003917	Voltage Regulator
3919-A	238102	Voltage Regulator
14502	5014502	Voltage Regulator
14502-A	284432	Voltage Regulator
14502-B	284370	Voltage Regulator
——	5030658	Voltage Regulator
——	5030692	Voltage Regulator
(x) 3922	——	Combined Voltage-Current Regulator
(x) 3924-A	5003924	Combined Voltage-Current Regulator

(x)—See special section in article following for data on these types.

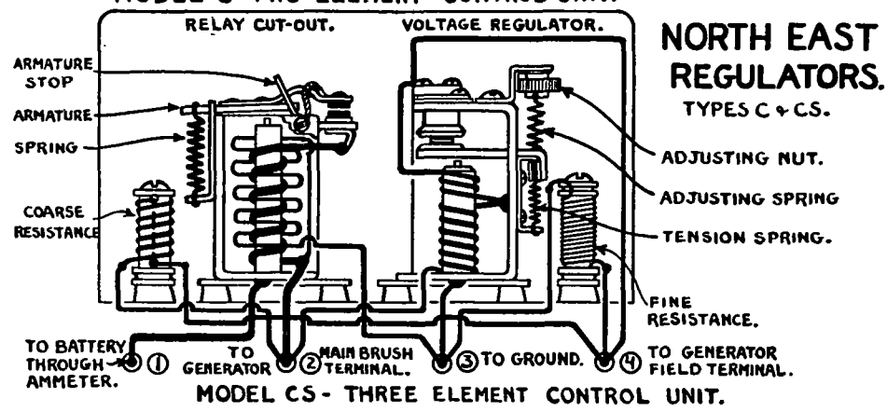
Since the generator charging rate with voltage regulation depends upon the condition of the battery, the instrument panel ammeter does not indicate that generator performance is unsatisfactory or that adjusment is necessary. In general, the operation of the regulator unit should be checked whenever the generator is serviced or repaired. The generator should be checked whenever the regulator is set or the setting is changed. The exact procedure in checking and setting individual regulators will be found on the following pages. This procedure should be carefully and exactly followed. Preliminary procedure is as follows:

Generator. Check condition of generator commutator and brushes. Clean commutator and reseat brushes if necessary. Examine generator connections. See that all connections are clean and tight, see that generator is correctly hooked up. Check field fuse.

Regulator. Mount regulator in operating position (same position as on car). Use accurate voltmeter and ammeter to check settings—see illustrations and specific directions for hookup of instruments for each test. Make settings in following order:

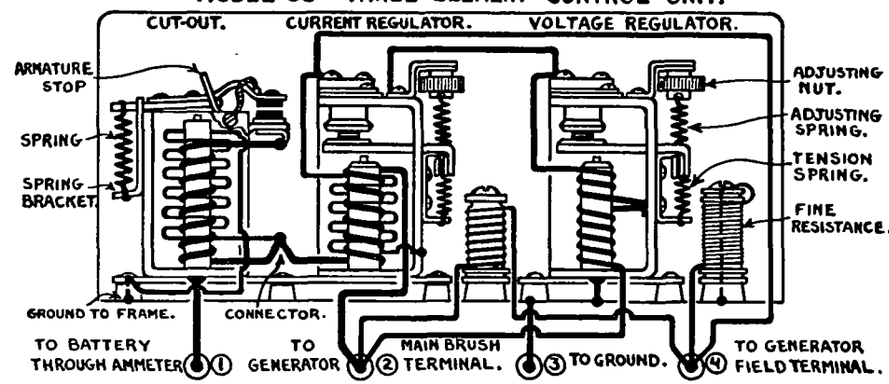
1. **Cut-out Relay.** Mechanical Adjustments—Check condition of contacts and resurface if necessary, set contact gap; check and set core gap; check and set hinge gap. Electrical Adjustments—Check and set cut-in point; check and set cut-out point.
2. **Voltage Regulator.** Mechanical Adjustments—Check condition of contacts and resurface and align if necessary, set contact gap; check and set core gap (on North East units check length and clearance of core pin); check and set hinge gap; check sideplay of armature. Electrical Adjustments—Operate generator and set regulator to maintain correct open circuit voltage.
3. **Current Regulator.** Mechanical Adjustments—Check and set contact gap, check and set core gap (on North East units check length and clearance of core pin), check and set hinge gap, check sideplay of armature. Electrical Adjustment—Operate generator with full load and set regulator to maintain rated capacity of generator. On two-element control units with third brush current control, this setting is made by shifting the third brush to secure correct output.

MECHANICAL ADJUSTMENTS



CUT-OUT RELAY:—Contacts. Check contacts by slipping off tension spring and removing armature (it will not be necessary to disconnect pigtails). If necessary resurface contacts with a fine flat contact file or No. 00 sandpaper. In re-installing armature see that pigtails do not bind under stop lug and that stationary contact is perfectly flat and armature contact slightly rounded. Align contacts by bending armature support lugs. On double contact type of relay see that contacts open and close simultaneously. Adjust by bending armature contact supporting fingers.

Armature Side Play. Side play of armature at contacts should be 1/64-1/32 inch to prevent binding. Adjust by bending armature support lugs Tension spring must be unhooked before making this adjustment.



Core Gap Clearance. Double Contact Type—Air gap between coil core stop pin and armature should be .040-.045 inch. Check with feeler gauge and set by bending stop lug above armature up or down. Stop pin height above core should be .025 inch (minimum) to .040 inch (maximum). Pin should be replaced if less than .025 inch or filed down if more than .040 inch in height. Single Contact Type—Air gap should be .015 inch. Adjust by bending stop lug.

Contact Gap. Single and Double Contact Type—Contact gap should be .025 inch. On single contact type adjust by bending lower (stationary) contact bracket. On Double Contact Type adjust by bending upper (armature) contact support fingers. The gap must be kept exactly the same on both sets to insure their opening and closing simultaneously.

MODEL C-TWO ELEMENT CONTROL UNIT.

MODEL CS - THREE ELEMENT CONTROL UNIT.

VOLTAGE REGULATOR:—Contacts. On 6 and 12 volt systems with positive battery terminal grounded, stationary contact is of metal and armature contact of carbon. On systems with negative battery terminal grounded, both contacts are made of carbon. Contacts should be surfaced on a piece of No. 00 sandpaper laid on a flat surface and all dust brushed off with a fine brush. Contacts should never be touched with the fingers as greasy finger marks will interfere with correct operation. Align contacts after reassembly by shifting armature bracket after slacking off bracket screws (hinged armature type) or by bending support lugs on armature bracket (first type). Do not bend or twist armature bracket or hinge. On first type, see that sideplay of armature at contacts is 1/32-1/64 inch to prevent armature binding.

Regulator Type	Contact Assemblies Upper Contact	Lower Contact
240936	Tungsten	Carbon
295025	Silver	Carbon
5003917	Carbon	Carbon
238102	Silver	Carbon

Core Gap Clearance. Check clearance between armature and magnet frame to see that armature has full movement without touching frame. Clean out all dirt. Check length of pin in coil core. If under .025 inch, pin should be replaced. If over .040 inch, pin should be filed down. Air gap between pin and armature should be .003-.005 inch with contacts closed. Check with a feeler gauge.

Contact Gap. Check contact gap by inserting feeler gauge between coil core pin and under side of armature with contacts closed. Gap should be .003-.005 inch. To set gap, loosen lock screw on stationary contact mounting bracket on top of magnet frame and turn stationary contact locking nut to raise or lower stationary contact. See that contact surfaces are square and parallel. To align contacts, loosen locking nut with locking screw tight, which will release ball-and-socket joint in contact thimble, press armature up firmly to close contacts and tighten locking nut.

CURRENT REGULATOR:—Same as for Voltage Regulator (above).

ELECTRICAL ADJUSTMENTS

CUT-OUT RELAY:—Cut-out Relay action may be checked on open or closed circuit. In each case the voltage regulator should be shorted out by connecting a short jumper between terminals 3 and 4 on the Control Unit. The generator should never be operated at excessive speeds with the voltage regulator out of the circuit as damage may result. For closed circuit operation all lights must be turned off.

Open Circuit Setting. Connect voltmeter between terminals 2 and 3 on Control Unit. Connect a test lamp (3 cp.) between terminals 1 and 3. Disconnect battery lead on terminal 1. Operate generator and gradually increase speed until test lamp lights, indicating that relay contacts have closed. Note voltmeter reading. Decrease generator speed until test lamp goes out, indicating that contacts have opened. Note voltmeter reading. These tests should be repeated several times. Correct settings for cut-in and cut-out points are as follows:

Type of Equipment	Contacts Close Volts	Contacts Open Volts	Amperes
All 6 Volt Relays	7.0-7.25	5.75-6.0	0-3 (discharge)
All 12 Volt Relays	13.25	11.0-11.50	0-2 (discharge)

To set Cut-in Point:—Change armature spring tension by bending lower spring bracket down (away from armature) to raise cut-in voltage. Bend spring bracket up (toward armature) to lower cut-in voltage. Check adjustment by repeating test until correct setting is secured.

Closed Circuit Setting. Disconnect generator lead on terminal 2 of Control Unit and connect this lead to one terminal of the test ammeter. Connect the other ammeter terminal to terminal 2 on he Control Unit. Connect voltmeter between terminals 2 and 3 on the Control Unit. Operate generator and gradually increase speed until kick-back of voltmeter pointer indicates that contacts have closed. Voltmeter readings and method of adjusting are the same as for open circuit testing as given above.

To check cut-out point of Relay, gradually decrease generator speed and note discharge current indicated on test ammeter. Contacts should open with discharge current of less than 3 amperes. If discharge current is greater than 3 amperes, increase air gap between coil core and armature as directed under mechanical adjustments above. If contacts open with the generator still charging, decrease the air gap. After changing air gap, check the cut-in point again and adjust if necessary.

Relay should be checked again after Voltage Regulator has been set and any necessary adjustments made to secure Relay performance in accord with data given above. As a final test, check cut-in and cut-out points several times by increasing and decreasing generator speeds and noting voltmeter readings.

VOLTAGE REGULATOR:—Before Voltage Regulator is adjusted, generator should be tested to make certain that it is operating satisfactorily and will produce the full rated output. To make this test, short out Voltage Regulator by connecting a short jumper between terminals 3 and 4 on the Control Unit and connect an accurate voltmeter between terminals 2 and 3. Operate generator at moderate speeds and note output (on straight shunt generators current will continue to rise with an increase of speed and generator should never be operated at speeds higher than the rated R.P.M. for maximum output). If generator produces rated output (see table below), remove jumper between terminals 3 and 4 and proceed with adjustment

Open-circuit Setting. Take off battery lead on terminal 1 of Control Unit and operate generator on open circuit. Bring generator speed up to rated R.P.M. for maximum output. If regulator does not control voltage within two volts of correct figure (see table), turn adjusting nut to center of stud, adjust tension spring by bending spring toward armature to raise voltage or away from armature to lower voltage until setting is within 2 volts of correct figure. Operate generator for 15 or 20 minutes to allow regulator winding to reach operating temperature and check voltmeter reading at end of this period. If Voltage Regulator does not control voltage within 2 volts of correct figure, bend tension spring until approximate setting is secured. Then turn adjusting nut at upper end of adjusting spring to right (to increase operating voltage) or to the left (to lower operating voltage) until exact setting is secured. If it is necessary to turn the adjusting nut near the end of the stud to secure the correct setting, the nut should be turned back to the center of the stud and another preliminary adjustment made by bending the tension spring. After each adjustment the speed of the generator should be decreased and the generator then brought up to the rated R.P.M. figure again in order to overcome the effect of the residual magnetism of the regulator. Correct settings are given in the following table:

Type of Equipment	Open Circuit Voltage Setting
All 6 Volt Regulators	7.5 volts
All 12 Volt Regulators	14.5 volts

Check final setting by varying generator speed throughout operating range and checking voltmeter readings carefully.

Closed Circuit Check. After setting of Voltage Regulator has been completed on open circuit, the operation of the Voltage Regulator should be checked on closed circuit. Connect a variable resistance (carbon pile rheostat) between battery lead and terminal 1 on Control Unit. Connect test ammeter between terminal 2 and generator lead. Connect voltmeter between terminals 2 and 3 on Control Unit. Operate generator at correct speed to produce maximum output. Reduce resistance to minimum (screw up carbon pile) and note ammeter reading. Charging rate should be between finish rate and maximum charging rate of generator. Increase resistance (decrease pressure on carbon pile) until voltmeter reading indicates that Voltage Regulator is operating (voltmeter reading will correspond with setting of Voltage Regulator). Ammeter should indicate 'finish rate' or approximately 1-3 amperes. If generator output is higher than this figure the Voltage Regulator open circuit operation should be rechecked.

CURRENT REGULATOR:—The separate Current Regulator should be checked and adjusted on closed circuit. Connect the test ammeter between generator lead and terminal 2 on Control Unit. Short out Voltage Regulator by connecting a short jumper across Regulator contacts from upper contact support to regulator frame (do not connect terminals 3 and 4 on Control Unit as this would also short out the Current Regulator). Operate generator and increase speed gradually to rated R.P.M. for maximum output. Close Current Regulator contacts momentarily by hand and note whether generator output increases. Then release contacts and note at what point Regulator controls generator output. Regulator should be set in accordance with rated output figure for each generator. Standard settings for 12-volt generators are as follows:

Generator Rated Capacity	Current Regulator Setting
300 Watts	24 amperes
400 Watts	31 amperes
500 Watts	38 amperes
600 Watts	45 amperes
800 Watts	60 Amperes

The Current Regulator is adjusted in the same manner as the Voltage Regulator. Approximate settings are made by bending the tension spring and a final adjustment is secured by turning the adjusting nut at the upper end of the adjusting spring. The setting should be checked by operating the generator at various speeds throughout the entire range.

FINAL CHECK:—After all adjustments have been made on Control Unit, allow Unit to cool off and recheck Cut-out Relay cut-in point. If voltage Regulator operates before Cut-out Relay contacts close (which will prevent generator from charging until Control Unit warms up) the Voltage Regulator setting should be raised slightly but not more than .25 volts.

A final operating test should be made with the Control Unit cover in place and with the Control Unit mounted on the car.

TWO-ELEMENT COMBINED CURRENT-VOLTAGE CONTROL UNIT TYPES: 3922, 3924-A:—Adjustments are made in exactly the same manner as directed for Voltage Regulators (above) but the open circuit voltage should be set at 17.00 volts to compensate for the action of the current coil. In checking the operation of the Control Unit on closed circuit, the variable resistance should be set to hold the voltage at 13 volts and the charging rate noted (ammeter reading should be 17-19 amperes). The resistance should then be adjusted to hold the voltage at 14 volts and the ammeter reading again noted. The generator output should show a drop of approximately 3 amperes or a charging rate of 14-16 amperes. If necessary the Voltage Regulator setting should be readjusted slightly to secure this result.

NORTH EAST CONTROL UNITS

USED ON GENERATORS OF 150 WATT CAPACITY OR LESS

The types which will be found in service are as follows:

Model Number	Voltage	Type of Equipment
5025067	6 volts	Voltage Regulator
5025554	6 volts	Voltage Regulator
5028271	12 volts	Voltage Regulator
5028280	6 volts	Voltage Regulator
5029044	6 volts	Current Regulator
5029314	6 volts	Voltage Regulator
5030060	6 volts	Voltage Regulator
5030885	6 volts	Voltage Regulator

DESCRIPTION:—These units consist of vibrating type voltage or current regulators combined with cutout relays in a single case. Voltage regulators are designed to hold generator voltage constant at the point for which the unit is set and provide a tapered charging rate as the battery voltage comes up on charge. Current regulators are designed to limit the maximum generator output to the amperage for which the unit is set. They are used only on two-brush shunt wound generators and should not be installed on third brush control type.

ADJUSTMENT:—Cutout relay should be adjusted before voltage regulator or current regulator adjustments are made. In each case all mechanical adjustments, such as air gap, contact gap, and contact spring tension should be made before the electrical setting is checked or adjusted. Adjustments are listed in order below.

CUTOUT RELAY:—**Contact Gap**—Check with feeler gauge. Should be .012-.020". Adjust by bending upper stop.

Air Gap—Check air gap at two points. Should be .027-.030" at point near contacts and .018-.020" at point near spring. Armature should be up (contacts open) in each case.

Electrical Setting—Cut-in Point. Contacts should close with generator voltage of 6.5-6.75 volts (6 volt units), or 13.0-13.5 volts (12 volt units). Adjusted by changing armature spring tension. Increase spring tension to increase cut-in voltage, or decrease spring tension to decrease cut-in voltage.

Cut-out Point—Contacts should open with discharge current of 0-3 amperes (6 volt units), or 0-2 amperes (12 volt units).

VOLTAGE REGULATOR:—**Air Gap**—Gap between armature and core (measured at rear near spring) should be .010-.015" with armature down and contacts open. Adjust by bending contact spring stop. Gap between fibre bumper block and stop should be .005-.007" with armature up and contacts closed. Adjust by bending upper armature stop.

Contact Gap—Should be .017-.020" with armature down. Adjust by bending lower armature stop.

Contact Spring Tension—Should be 1.5-2.0 ounces. Measure at tip of top contact.

Electrical Setting—Operate generator on open circuit at speed at which maximum output is secured. Open circuit voltage should be 7.1-7.5 volts (6 volt units), 14.2-14.5 volts (12 volt units) with generator hot after being operated for 15-20 minutes. Units are compensated for temperature and cold voltage should be 7.5 volts (6 volt units), 15.0 volts (12 volt units). Adjust by bending arm holding spring which normally holds contact closed. In crease spring tension to increase regulator voltage or decrease spring tension to decrease voltage.

CURRENT REGULATOR:—Air gap, contact gap, contact spring tension specifications and adjustments are the same as given above for the Voltage Regulator.

Electrical Setting—Check setting by connecting ammeter in battery lead at regulator. Output should be 11.5 amperes normally or 14.5 amperes maximum. Adjust by bending arm holding spring which normally holds contacts closed. Increase spring tension to increase current setting or decrease spring tension to decrease current setting.

NOTE:—North-East Generator model numbers have recently been changed. Old and new model numbers for Lamp Load Generators are as follows:

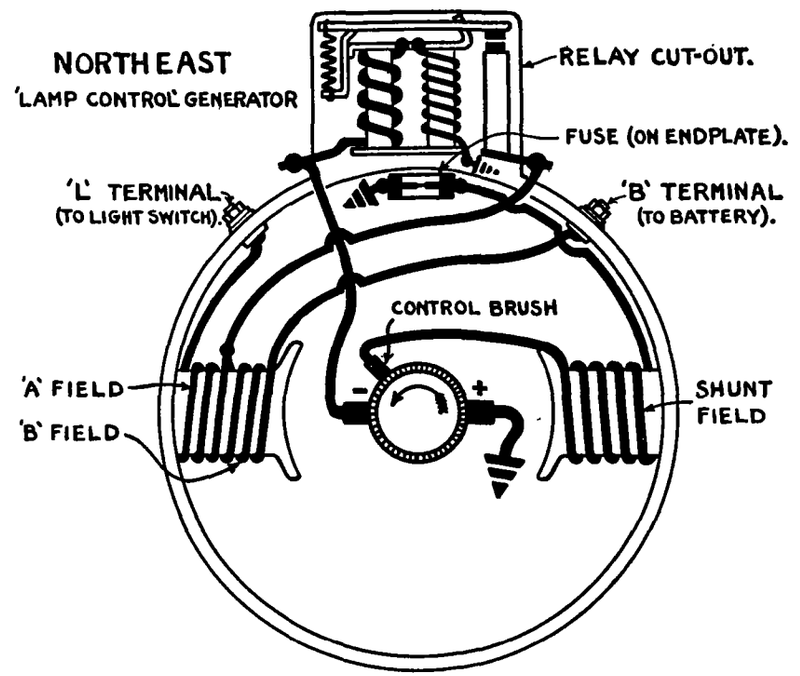
Old Model Number	New Model Number
LAB-6564-A	5006564
LAB-6620	5006620
LAB-6624	5006624
———	5004486

DESCRIPTION:—This type generator, although it resembles the ordinary generator in construction (except that there are two terminals 'L' and 'B' on the field frame), operates differently than the regular third brush shunt field control types. The regular shunt field connected between the third brush and the grounded main brush through a field fuse mounted on the end plate is wound on one field pole. The other pole carries a divided series field ('A' and 'B' on the diagram). Both sections of this field are inoperative at speeds below the relay cut-in point when the lamps are turned off. When the lamps are turned on, the lighting current from the battery goes through both sections of the series field, which strengthens the magnetic field and causes the generator to cut in at a lower speed. The 'A' section of the series field continues to strengthen the magnetic field as long as the lights are turned on and is inoperative at all speeds when the lights are turned off. The 'B' section of the series field acts to strengthen the magnetic field when the lights are turned on until the relay cut-out contacts close and the generator takes care of the lamp load when it opposes or bucks the shunt field. This 'B' section also bucks the shunt field at all speeds above the cut-in point with the lights turned off. This tends to hold the charging rate down with the lights turned off and automatically increases the generator output when the lights are being used.

ADJUSTMENT:—Generator output can be adjusted in the usual manner by shifting the third brush. The third brush adjusting screw is located on the commutator end plate. Turn the adjustment screw to the right or in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate.

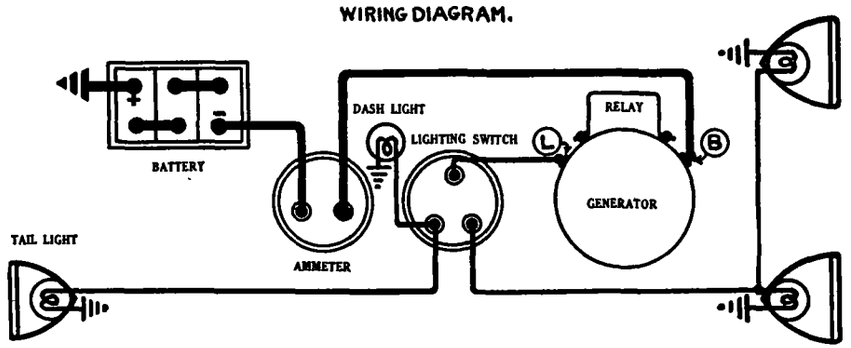
PERFORMANCE:—With standard car setting, the generator performance is as follows with all lamps turned off:

Generator Data—Maximum Hot Output—Lamps Off



Model	Amperes	Volts	R.P.M.
5006564	7.7	8.0	1930
5006620	8.2	7.35	1800
5006624	9.0	7.3	2600
5004486	9.0	7.3	2600

LAMP LOAD:—These generators are designed for a definite maximum lamp load as shown in table below. This figure must not be exceeded and lamps must be connected as shown in wiring diagram (lamps should not be connected at the ammeter terminal as in conventional practise).



Generator Model	Maximum Lamp Load (Amperes)
5006564	7
5006620	7
5006624	8
5004486	8

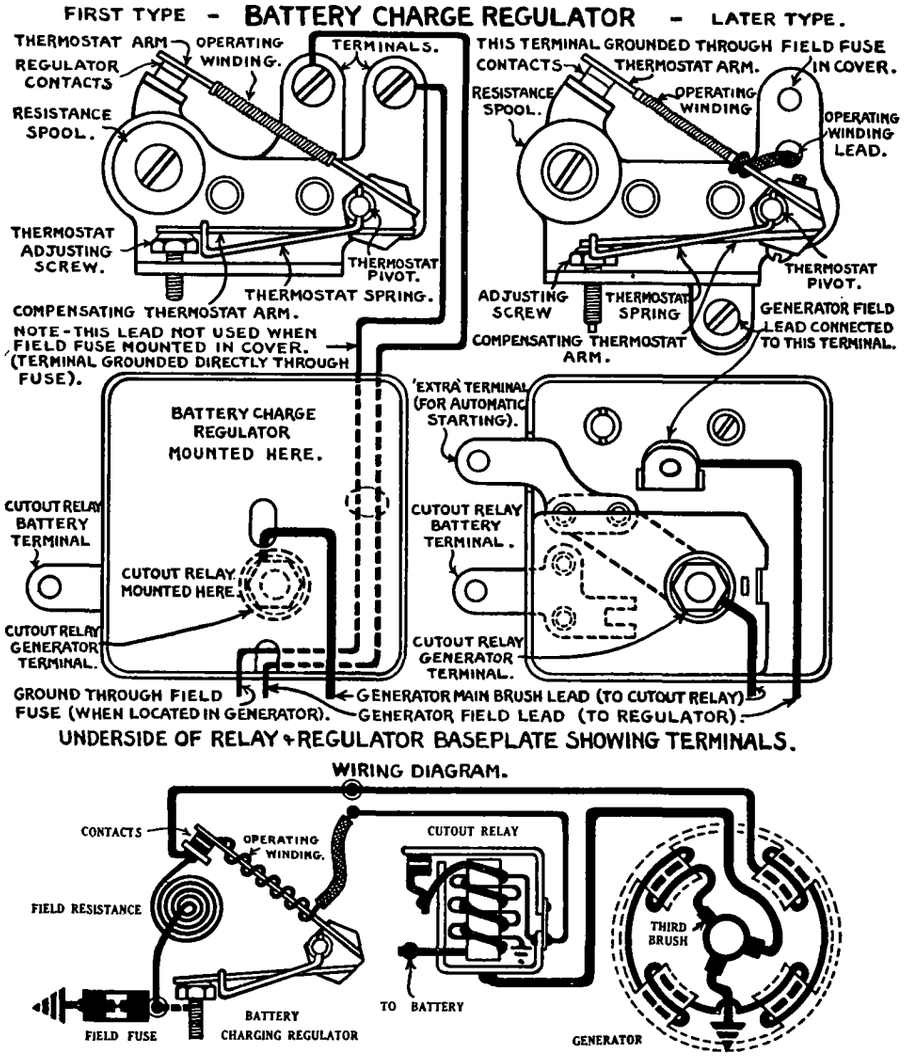
RELAY CUTOUT:—Type 20220. Relay is mounted on the generator field frame. One terminal is connected to the negative main brush and the other relay terminal is connected to the series field lead. Note that the relay is not connected to the battery as is the usual practice. The battery is connected to the 'B' terminal on the field frame. Relay contacts close when the generator voltage reaches 7.0-7.25 volts and open with a discharge current of 0-3 amperes when the generator voltage drops to 5.75-6.0 volts. Relay contact gap is .012-.020". Air gap is .027-.030" with contacts closed.

FUSES:—The shunt field is grounded through a 10 ampere fuse mounted in a plug on the commutator end plate. No other size fuse should be used for replacement.

WIRING DIAGRAM.

OWEN-DYNETO BATTERY CHARGE REGULATOR

DESCRIPTION:—The Owen-Dyneto Battery Charge Regulator consists of an electrically operated thermostatic regulator and a relay cut-out mounted in a single case which is designed to be mounted on top of the generator. It is standard equipment on certain models of Owen-Dyneto generators and can be installed on generators of other manufacture by making minor alterations in the relay mounting and wiring hookup. The regulator permits a relatively high charging rate without danger of damaging the battery and automatically varies the charging rate to cover different driving conditions by permitting the high charging rate over short periods of time or for short trips and automatically cutting down the rate after the regulator thermostat heats up which will occur on long trips or after the generator has nearly completed the battery charge.



OPERATION:—The regulator consists of two thermostat arms mounted on a pivot. The upper arm carries the regulator contacts and has a fine resistance unit wound on it. This resistance is connected directly between the generator relay terminal in the base of the unit and ground and is thus connected directly across the main brushes of the generator. The lower thermostat arm is a compensating unit and carries no winding. It is designed to compensate the regulator for temperature changes. The spring which normally keeps the regulator contacts closed engages the lower thermostat arm. The two upper terminals of the regulator should be connected to the field as marked in the illustration. The field resistance is wound on a spool on the regulator frame and is connected between the two regulator terminals and across the contacts. It is thus connected in series with the generator field winding but is short circuited by the regular contacts when the contacts are closed.

In operation with the regulator contacts closed the generator operates as a straight third brush shunt machine charging the battery at the rate determined by the third brush setting. Current likewise flows through the winding on the upper thermostat arm. When the generator voltage reaches 8 volts (cold) or 7.5 volts (hot) this winding heats up causing the arm to flex and open the contacts which inserts the resistance in the field circuit. This reduces the charging rate to the finish rate of the battery.

ADJUSTMENT:—The regulator is set at the factory and should not require adjustment. However, if adjustment is necessary, connect a voltmeter between the battery terminal of the generator and ground and operate the generator for several minutes to allow the thermostat winding to heat. The regulator cover must be in place or the air blast of the fan will prevent the proper functioning of the thermostat. Then turn the adjusting screw under the lower thermostat arm clockwise to increase the operating voltage and counter-clockwise to decrease the voltage. The regulator should operate at 8.0 volts cold or 7.5 volts hot.

NOTE:—A carbon button or disc type resistance was used on the earlier types. The amount of resistance could be varied by increasing or decreasing the pressure of the brass disc on the carbon button. This type resistance has been discontinued and all regulators are fitted with a wire-wound type of resistance unit.

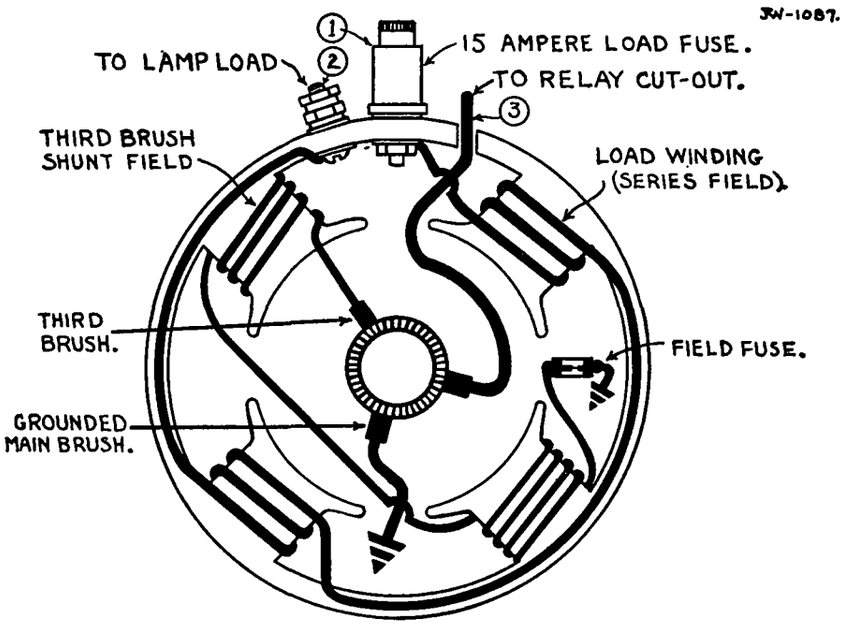
INSTALLATION:—The regulator can be installed on practically any generator after removing the old relay cutout and modifying the old relay mounting to take the regulator mounting screws. Then connect the old relay lead from the generator main brush to the terminal in the base of the regulator unit. Disconnect the generator shunt field ground and bring this lead out of the generator, drilling a hole through the commutator cover band to take the wire. Connect this lead to the regulator field terminal. The other regulator terminal should be grounded through the fuse mounted in the regulator cover. On Owen-Dyneto generators or generators with the field grounded through a fuse mounted on the generator frame, the field should be disconnected from the fuse terminal and brought out to the regulator and a second lead should be brought out from the fuse terminal to the regulator ground terminal.

TYPES CD-836, CD-839, CD-846

DESCRIPTION:—The Owen-Dyneto Lamp Control Generator is designed to deliver a set amount of current to the battery regardless of the load on the generator. It will charge the battery at pratically the same rate whether the car lamps are burning or not. It is a compound wound machine with two shunt coils wound on opposite poles and connected between the third brush and ground through a five ampere field fuse. There are two main brushes, one being grounded and a lead from the other being taken out to the relay cutout and then to the battery. A series field is wound on the other two field poles. This field is connected in series with the lamp load through a 15 ampere fuse mounted on the generator field frame and consists of two coils in series with each other. This field circuit is open with the lamp switch off.

OPERATION:—With the lamp switch 'Off' and lamps not burning, the generator operates as a third brush shunt wound generator with two field coils and 'consequent' poles between the field poles which are energized. When the lamp switch is turned on the lamp circuit current which is taken from the battery side of the generator relay cutout flows through the 'series' windings strengthening the field and increasing the generator output in proportion to the current drawn by the lamps. The 15 ampere fuse in the lighting circuit is designed to prevent overload and the lamp load should be so regulated as to keep the current below this figure. The ignition current should never be taken through the generator and the coil lead should be connected directly to the generator side of the ammeter.

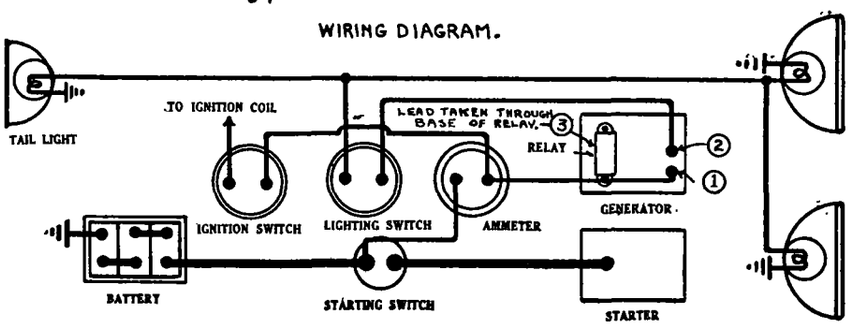
PERFORMANCE:—The generators are set at the factory to give the following performance:



Generator Data

Load	Amperes	Volts	R.P.M.
Without Lamp Load.	0	12.4	1200
With Lamp Load.	0		900
Without Lamp Load.	7		2320
With Lamp Load.	4		1800
Without Lamp Load.	6		3200
With Lamp Load.	1		3200

The above table indicates current supplied to the battery by the generator at various speeds and under different conditions. The maximum output of the generator is 15 amperes. The normal lamp load is approximately 11 amperes.



ADJUSTMENT:—The third brush setting is adjustable. To adjust third brush, remove the commutator end cover and turn the slotted shifter shaft on the generator end plate.

RELAY:—Type 20070. Relay is mounted on the generator. Relay contacts close at 900 R.P.M. with lamp load and 1200 R.P.M. without lamp load when the generator voltage reaches 12.4 volts.

OWEN-DYNETO GENERATOR

Types CD-836, 838, 839, 846.

TYPES KB-873, KB-897, KB-878 AND KB-890

DESCRIPTION:—The Owen-Dyneto Starter-generator for outboard engines is a six pole, compound wound machine. The armature is keyed directly on the upper end of the crankshaft and serves as the engine flywheel. It revolves within the field frame which is mounted on the upper end of the crankcase. The two main brushes and a movable control brush are mounted on the brush ring which is centered on the upper end of the field frame by six small tongues. A battery charge regulator is also mounted on the brush ring. The ignition unit is mounted on the upper end of the shaft under the cover plate of the starter-generator.

OPERATION:—The starter-generator is controlled by a three position 'slide bar' type switch. The three positions of the switch are:

OFF. In this position of the switch the starter-generator is disconnected from the battery and the ignition is likewise disconnected from the battery. It is the normal position of the switch when the engine is not running.

NEUTRAL. In this position of the switch, the ignition is connected to the battery but the starter-generator is not connected. The switch should be placed on 'Neutral' when for any reason it is desired to hand-crank the engine. It may also be used for high speed operation to eliminate the drag of the generator. No damage will occur to the starter-generator windings if the engine is run with the switch in 'Neutral' as both the series and shunt windings are open. The neutral position of the switch is secured by sliding the switch bar 3/16 inch from the 'Off' position.

ON. When the switch is placed on the 'On' position the ignition is turned on and the starter-generator is connected to the battery. In addition the shunt field circuit of the generator is completed. The starter-generator then acts as a motor to spin the engine at approximately 400-450 R.P.M. The starter continues to assist the engine until the engine speed reaches 1000 R.P.M. when it begins to charge the battery. At all speeds above 1000 R.P.M. the machine will operate as a generator to charge the battery. Whenever the engine speed drops below 1000 R.P.M. the machine operates as a motor which prevents the engine from stalling at low speeds. The cut-in speed of the Types KB-873, KB-878 and KB-897 six volt starter-generators is 1000 R.P.M. as above. On the Type KB-890 starter-generator this cut-in speed is 1500 R.P.M. The Type KB-890 is a twelve volt machine.

The generator output is controlled by an Owen-Dyneto 'Battery Charge Regulator' operating in conjunction with the third brush shunt field control. The control brush or 'third brush' can be shifted on the brush ring to change the generator output. The control brush should be shifted in the direction of armature rotation to increase the charging rate and in the opposite direction to decrease the charging rate. The Battery Charge Regulator is fully covered on a separate page. See Generators.

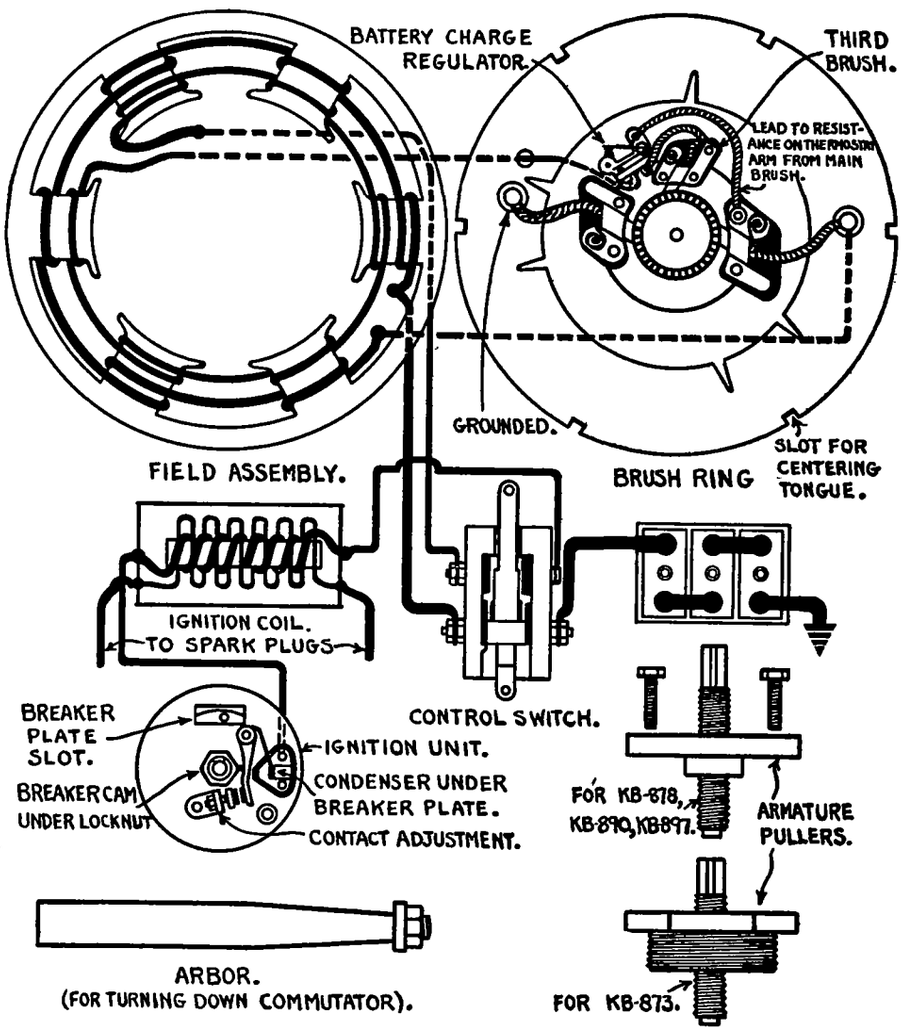
Generator Performance Data

Types KB-873, 878, 897

Amperes	Volts	R.P.M.
0	6.3	1000
16	7.6	2500
13	7.4	4500

Type KB-890

Amperes	Volts	R.P.M.
0	13	1500-1600
9	14	3500
8	14	4500



Starter Performance Data

Types KB-873, 878, 897

Torque	R.P.M.	Volts	Amperes
4 lb. ft.	400	6	65
27 "	Lock	5.5	290

Type KB-890

Torque	R.P.M.	Volts	Amperes
14 lb. ft.	400	11	130
35 "	Lock	9.5	330

MOUNTING:—The starter-generator must be disassembled before it can be removed from the engine. To remove starter-generator, perform the following operations in order:

1. Remove the cover. Take out the six screws that hold the cover in place on the field frame (Types KB-878, 890) or loosen the clamping screw (Types KB-873, 897). Raise the cover slightly and disconnect the spark advance control wire from the ignition mounting plate and the ignition coil lead from the breaker assembly. Then lift the cover from place.

2. Remove the ignition unit. Mark the position of the breaker plate on the armature (so that it may be reassembled in the same position without disturbing timing). Insert a screwdriver through the opening of the breaker plate and take out the six screws mounting the ignition unit on the end of the armature shaft. The ignition unit may then be lifted off.

3. Remove the hand cranking pulley (Types KB-873, 897, used on Johnson engines only). On the Type KB-873 the pulley is mounted on a split sleeve which screws into the armature hub and is held in place by a taper plug in the armature hub. The taper plug is locked in place by a nut on the stud which projects up through the pulley from the plug. To remove this type pulley, loosen the nut on the stud in the center of the pulley and tap stud down to loosen the taper plug. The pulley can then be unscrewed. The split sleeve has a right hand thread. On the Type KB-897 the pulley is mounted on a stud which is mounted on the end of the armature shaft by six screws. To remove pulley, take off the nut and cam on the stud bolt and lift pulley from place.

4. Remove the Brush Ring assembly. Take out the three screws which mount the brush ring on the field frame. Remove the two terminal stud nuts on the main brush leads and disconnect the shunt field coil lead at the regulator. The brush ring can then be lifted off.

5. Remove the Armature. The armature can be withdrawn after the nut which holds it in place on the crankshaft has been taken off. Several special armature pullers have been developed by the Owen-Dyneto Corporation for this purpose.

6. Remove the Field Frame Assembly. The field frame is mounted on the crankcase by four machine screws. These screws are accessible after the machine has been disassembled as directed above.

NOTE:—Since the armature is designed to be mounted on the crankshaft there is no armature shaft. If the armature is to be mounted in a lathe to turn down the commutator a special arbor must be used. This can be secured from the Owen-Dyneto Corporation.

IGNITION

OPERATION:—The ignition unit is of standard automotive design with a single lobe cam mounted on the crankshaft revolving at engine speed. The coil for two cylinder ignition is of the two spark type with both ends of the secondary brought out to high tension terminals which are connected to the spark plugs. Both cylinders fire simultaneously once in each revolution of the crankshaft. On four sylinder engines a double coil is used with two primaries and two secondaries which terminate in four high tension terminals. One coil fires the two upper cylinders and the other coil fires the two lower cylinders. Two breakers are used, each breaker controlling one coil. Both breakers are mounted on the breaker plate and operate on the same cam. The condensers for the breakers are mounted under the breaker plate.

TIMING THE ENGINE:—To set the ignition timing, turn the engine over until the pistons reach top dead center (the extreme outer end of the stroke). Fully retard the spark advance. Loosen the locking nut on the upper end of the breaker shaft and carefully locate the cam so that contacts are beginning to open. Tighten the locking nut and connect the coil secondary leads to the spark plugs. With the spark advanced the contacts will be wide open at top dead center. Breaker contact gap should be .022-.025 inch. Set contact gap by loosening lock nut on stationary contact mounting stud and turning up stud. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone.

②—VRD-4008B used on first cars.

PRODUCTION CHANGE NOTE:—VRB & VRD Regulators—When these types used on early 1940 cars, refer to Auto-Lite Regulator article in 1939 Supplement in Electrical Equipment Section of manual for specifications.

GROUND TERMINAL NOTE:—Each type regulator designed for use with particular battery terminal grounded as noted in table above. When installing regulator, see that correct battery terminal grounded and repolarize generator (after all connections made) as follows:

Polarizing Generator—Connect jumper wire momentarily from starting switch battery connection to generator 'A' terminal (after all connections have been made). This momentary surge of current through generator windings will polarize generator for correct operation.

TYPE:—These regulators similar to previous 'VRB' and 'VRD' types except as follows:

Cutout Relay—New type armature with contact mounted on spring so that armature seals against yoke after contacts close. Designed to produce wiping action of contacts.

Armature Springs (all units)—Two different type springs used. Springs on Cutout Relay and Current Regulator units have 12¾ coils while spring on Voltage Regulator unit has 14½ coils. CAUTION—Springs must not be interchanged. Make certain that correct spring used on each unit.

VRP Current Regulator Windings—Two windings used (see illustration).

CHECKING & ADJUSTMENT:—Check each unit as directed below. See that correct armature spring installed (see note above), check resistors for correct value and location, and check and adjust all gaps before making adjustments to change regulator performance. After making adjustments, always make final 'flash' test (see instructions below) and polarize generator when generator and regulator replaced on car (see Ground Terminal Note above).

CUTOUT RELAY

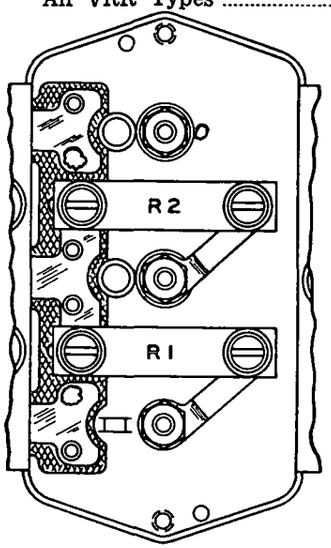
Model	Voltage Winding Resistance	Contact Gap	Air Gap
All 'VRP' Types	29.8-33.0 ohms	.015" Min.	.034-.038"
All 'VRR' Types	29.8-33.0 ohms	.015" Min.	.034-.038"

Winding Resistance—Use ohmeter (ST-384) to measure resistance directly, measure from regulator 'A' terminal to ground with voltage regulator lead disconnected from cutout relay yoke.

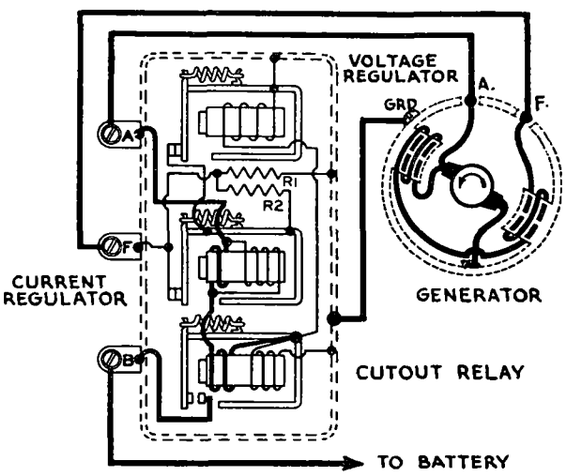
Air Gap—Use flat gauge (ST-281-3) to measure between magnet core and armature at point as close to armature hinge as possible with contacts open. Adjust by bending armature stop making certain that stop does not rub against side of armature. NOTE—Armature 'seals' against yoke after contacts close

Contact Gap—Check with feeler gauge. Gap must not be less than .015" but may exceed this figure in service. With correct adjustment, contacts will close and armature will then 'seal' against yoke. CAUTION—If contact gap too large, contacts will not close before armature seals against yoke (armature must have further travel to effect this sealing).

Model	Contacts Close	Contacts Open
All 'VRP' Types	6.4-6.6 volts	4.8-5.6 volts①
All 'VRR' Types	6.4-7.0 volts	6.0 Amperes Max.



①—Discharge current will be approximately 7-8 amperes.



Closing Voltage—Connect ammeter in charging line at regulator 'B' terminal, connect voltmeter between 'A' terminal and ground. Operate generator and increase speed slowly until contacts just close **but without sealing against yoke,** note voltmeter reading at this point (NOTE—a 2000 ohm earphone connected between 'B' terminal and ground may be used to check closing, a click will be heard as the contacts close). To adjust, use tool ST-283 and adjust armature spring tension by bending lower spring hanger. Increase spring tension to increase closing voltage, lower spring tension to decrease voltage. CAUTION—Closing voltage must always be set .5 volts less than Voltage Regulator setting (contacts will not close if closing voltage higher than regulator setting).

Opening Voltage or Amperage—Connect meters as for Closing Voltage Check (above), decrease generator speed slowly and note voltmeter (or ammeter) reading as contacts open. Adjust by changing contact gap (see above).

VOLTAGE REGULATOR

Model	Winding Resistance	Contact Gap	Air Gap
All 'VRP' Types	10.8-12.0 ohms	.012" Min.	.048-.052"
All 'VRR' Types	10.8-12.0 ohms	.012" Min.	.048-.052"

Winding Resistance—Use Ohmeter (ST-284) to measure resistance directly. Measure between lead (disconnect lead from cutout relay yoke) and ground.

Air Gap—Use pin gauge ST-281-7 and measure at point next to stop pin on contact side with contacts just opening. Test air gap by connecting test lamp and battery between 'F' terminal and ground. Insert low limit pin gauge, depress armature by hand, lamp should dim or go out. Repeat test with high limit pin gauge. Lamp should remain lighted. To adjust air gap, loosen screw holding upper contact bracket, use tool ST-282 to raise bracket (to increase gap), tap top of bracket to lower contact (to decrease gap), tighten screw. See that contact spring is straight and parallel with armature.

Contact Gap—Check gap with feeler gauge while holding armature down against stop pin (CAUTION—do not press on contact spring, press down on armature evenly on both sides of spring). Gap may vary in service, if gap variation too great stop pin is wrong length and unit should be replaced.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Voltage Setting Check—Connect ammeter in charging line at regulator 'B' terminal (ammeter must read to 1 ampere and internal resistance must not exceed .01 ohm, use short heavy leads for connections), connect voltmeter between regulator 'B' terminal and ground (meter must read to .1 volt). Make certain that car battery is fully charged with gravity reading of 1.275-1.280 (substitute fully charged battery if car battery run down). Run engine at speed equivalent to 30 MPH for at least 15 minutes with generator charging battery to bring regulator up to operating temperature. Then note voltmeter reading which should agree with table above. NOTE—Single earphone of 2000 ohm or greater resistance connected between 'F' terminal and ground is recommended in checking regulator operation.

Adjustment—Use tool ST-283 to vary armature spring tension by bending arm at lower end of spring. Increase spring tension to increase voltage, decrease tension to decrease voltage. Replace cover and recheck performance.

CURRENT REGULATOR

NOTE—Data below applies to 'VRP' types only with separate Current Regulator. Disregard this data for 'VRR' Regulators used with third brush generators.

Model	Contact Gap	Air Gap
All 'VRP' Types	.012" Min.	.034-.038"

Air Gap—Use pin gauge ST-281-6 to check gap, tool ST-282 to adjust gap. Check and adjust in same manner as Voltage Regulator (see above).

Contact Gap—Check in same manner as Voltage Regulator (above).

Model	Current Setting	Max. Amperes
VRP-4001A, 2A, 3A, 4A, 5A, 8B		34-36
VRP-4001B, 4C, 5B, 6E, 7A		31-33
VRP-4001C, 2B, 4D, 5D, 6C, 9B		27-29
VRP-4001D, 4B, 6A, 6AP, 9A		29-31
VRP-4001E, 5C, 6B		24-26
VRP-4004E, 6F, 7B, 8A, 9C		39-41
VRP-4006D, 9D		19-21

Current Setting Check—Connect test meters and heat regulator as directed for Voltage Regulator Check (above). Then connect load in excess of rated capacity of regulator at point between regulator and battery (use bank of headlamp bulbs, or turn on all lights and accessories). Note ammeter reading with Current Regulator operating. Generator output must be within 5% of rated capacity stamped on regulator cover as shown in table above.

Adjustment—Same as Voltage Regulator (above). Use ST-283 tool.

FINAL 'FLASH' TEST:—After adjusting Cutout Relay, Voltage Regulator, or Current Regulator, final flash test should be made after regulator cover replaced, by operating generator and noting regulator performance immediately.

REGULATOR RESISTORS:—One resistance unit used on 'VRR' regulators, two used on 'VRP' models (see VRP illustration for resistor locations). Resistors should be checked for correct resistance by testing with ohmeter (ST-284). CAUTION—Remove one resistor at a time to avoid interchanging units. Use extreme care to replace resistors in exact original location.

Voltage-Current Regulator Resistors

Model	Mark — R1 — Ohms		Mark — R2 — Ohms	
VRP-4001A, 2A, 3A, 4A, 5A, 8B	38	36-40	7	6.5-7.5

VRR-4001A, 2A	30	28-32
VRR-4001B, 2B, 3A, 4A, 5A	20	19-21

TROUBLE SHOOTING:—Same as for previous VRB and VRD types. See Auto-Lite Regulator article in Electrical Equipment Section of manual (or 1938 Supplement) for data.

1940 FORD REGULATOR

Std. Equipment On:	Regulator	Generator
Ford '60' & '85' Pass. Cars & Comm'l. ('40)	**01A-10505A**	**01A-10000**
Ford Trucks, All except C-O-E (1940)	**01A-10505A**	**01A-10000**
Ford Trucks, Cab-over-Engine Models ('40)	**01A-10505A**	**81T-10000A, B**
Lincoln-Zephyr, 06H (1940)	**01A-10505A3**	**01A-10000**
Mercury, Model 09A (1940)	**01A-10505A**	**01A-10000**

These Regulators same design as used on 1939 cars with 2-brush generators.

SERVICE NOTE:—Regulator covers are sealed and should not be removed. No adjustments are possible and units which are defective as determined by tests given below should be replaced.

Bench Test Caution—Ford Generator and Regulator circuits and wiring not same as units used on other cars and these units must always be tested together. Do not operate generator or regulator with regulator or generator of other make on test sets.

REGULATOR TESTING:—Make all tests exactly as given below.

CUTOUT RELAY

Contact Closing Voltage—Use 15 voltmeter connected across relay contacts (connect one lead to regulator 'B' terminal, other lead to regulator 'G' terminal). With contacts open, voltmeter will read full battery voltage. Operate engine and slowly increase speed until contacts close (voltmeter will drop to zero and then reverse). Engine speed should be 400 RPM. (01A-10000 Gen.), 550 RPM. (81T-10000A), 350 RPM. (81T-10000B).

Contact Resistance—With voltmeter connections as above, turn on headlamps and increase engine speed so that charging rate is maximum. Voltmeter reading should not exceed ¼ volt (voltage drop across relay contacts). If voltmeter reads above ½ volt, contacts are burnt and cutout relay should be replaced. NOTE—This reading will be in reverse from closing voltage test above and voltmeter leads should be exchanged so that pointer will move in proper direction on scale.

Contact Opening Reverse Current—Connect ammeter in charging line at regulator 'B' terminal. Operate generator and increase speed until contacts close. Then slowly decrease speed and note reverse reading at instant contacts open. Current varies with temperature and must not exceed following maximum figures (replace regulator if current is excessive): 5.5 amperes—60°, 4.7—80°, 4.0—100°, 3.5—120°, 2.8—140°, 2.2—160°, 1.7—180°.

VOLTAGE & CURRENT REGULATOR

IMPORTANT NOTE—Regulator should be tested with resistance of ¾ ohm (two 32 cp. headlamp bulbs) in generator circuit instead of battery to eliminate differences caused by battery being more or less charged. Regulator temperature should be carefully gauged with thermometer in contact with regulator case (performance varies with temperature).

Voltage Setting Test—See Note below for Ford Test Set connections. If test set not used, disconnect lead at regulator 'B' terminal, connect two 32 cp. headlamp bulbs in series between this terminal and ground (so generator output flows through both bulbs in series), connect voltmeter between 'B' terminal and ground. Operate generator at speed of 900 engine RPM. and note voltmeter reading. If voltage is within range given in table below, regulator is OK. If voltage is below minimum or above maximum figure, replace regulator.

Ford Test Set Connections—Disconnect high and low beam headlamp wires under hood, connect negative test set high tension lead to headlamp side of these wires. Ground positive low tension lead to engine, plug in 15 voltmeter, connect both negative low tension lead and positive interrupter lead to regulator 'B' terminal (disconnect regular lead from this terminal). If headlamp bulbs do not light up, close interrupter contacts. Test regulator as directed above and note readings on test set 'B' scale. Replace regulator if readings not within minimum-maximum figures in table below.

Ford Test Set 'B' Scale		Voltage Setting	Equivalent Volts	
Maximum	Minimum	Temperature	Maximum	Minimum
51	48	60°	7.65	7.20
50	47¼	80°	7.50	7.0875
49½	46¾	100°	7.425	7.0125
49	46¼	120°	7.35	6.9375
48¾	45¾	140°	7.3125	6.8625
48¼	45½	160°	7.2375	6.825
48¼	45½	180°	7.2375	6.825

Current Setting Test—Use 'BRS' test set attachment to discharge battery until voltage drops to 5¾ volts. Connect ammeter in charging line at regulator 'B' terminal. Operate engine at speed at which maximum output produced (see car model 'T&E' pages for generator data) and note ammeter reading. If output exceeds following maximum, regulator should be replaced: 32 amperes (01A-10000 Generator), 28 amperes (81T-10000A Generator), 20 amperes (81T-10000B Generator).

SERVICING:—No adjustment possible. Replace defective regulators.

These regulators standard or optional euqipment on following car models:

①—Accessory Equipment.

IMPORTANT SERVICE NOTE:—For High Charging Rate and High Voltage complaints, always check generator for grounded field coils or grounded leads before changing regulator settings. To check, disconnect lead from regulator 'F' terminal with generator operating. If output drops off, trouble is in regulator. If output does not drop off, trouble is in generator and generator should be inspected for grounded field coils or leads.

Open Circuit Caution—Generator must never be operated on open circuit which will damage Generator or Regulator and cause burnt generator windings or regulator windings, burnt field resistance, or fused contacts. If these conditions found in service, check wiring circuits for open circuits or high resistance and correct before re-installing generator or regulator.

Regulator Seals—Regulator covers are sealed to indicate they are adjusted to original factory specifications. Warranty is void if unit is damaged by improper servicing (adjustments may be made by competent operators).

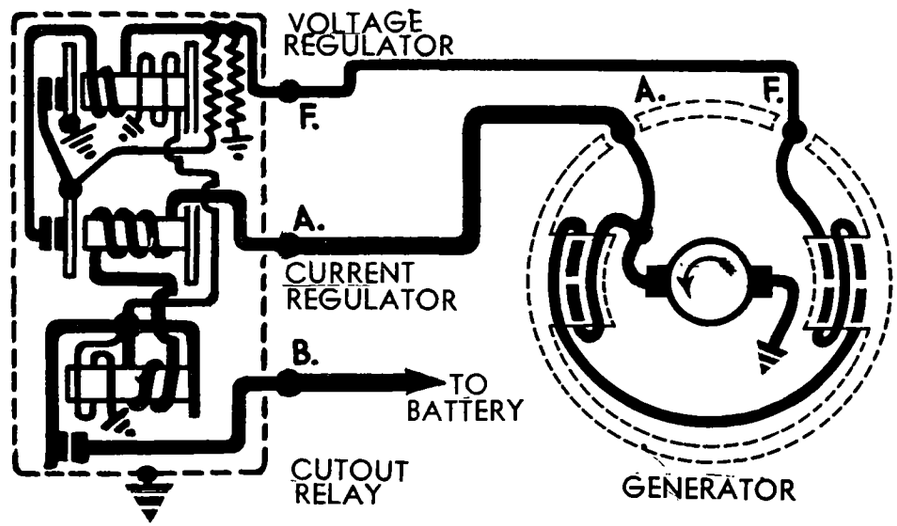
GROUND TERMINAL NOTE:—Each regulator designed to be used on cars with a particular battery terminal grounded as shown in table above. When installing regulator, make certain that correct battery terminal is grounded and always repolarize generator whenever generator or regulator has been disconnected. Reversed polarity will cause Cutout Relay contacts to vibrate and burn.

Polarizing Generator—After generator and regulator connected, connect jumper lead between regulator 'BAT' and 'GEN' terminals momentarily. This will allow momentary flow of current through generator windings and cause generator to assume correct polarity for operation on car.

IMPORTANT PRODUCTION CHANGE:—Voltage Regulator Armature Springs—First units fitted with one light spring and one heavy spring, later units have two springs of equal weight (same as Current Regulator). When adjusting regulator, light spring (or one spring only if both alike) should normally be adjusted. Heavy spring (or other spring if both alike) should only be adjusted if satisfactory performance cannot be secured otherwise (see Adjustment directions below).

TYPE:—These new "Single Core Regulators" differ in design from previous Regulators Without IGN Terminal as follows:

Windings—All windings for each unit (Cutout Relay, Voltage Regulator, Current Regulator) are wound on a single core.



Cutout Relay—Has double contacts. Both sets of contacts must be set so as to open and close together.

Regulator Armature Springs—Two armature springs used (both springs same weight on Current Regulator, one light and one heavy spring on Voltage Regulator). Adjustments normally made on one spring only (light spring on Voltage Regulator). Special directions required for adjustment of both springs (required when unit badly out of adjustment or new springs installed).

Regulator Contacts—Lower movable contact mounted directly on upper surface of armature (spring type mounting not used).

CHECKING REGULATOR & GENERATOR PERFORMANCE:—To quickly locate trouble on the car, make the following tests before removing the generator or regulator for further testing and adjustment on the bench. Check battery condition with hydrometer, note whether battery low (discharged) or high (fully charged), operate engine and note charging rate as follows:

Fully Charged Battery & Low Charging Rate—This indicates that Voltage Regulator is operating normally. To check Current Regulator operation, connect test ammeter in charging line at regulator 'BAT' terminal, use starter motor to crank engine for about 15 seconds (disconnect high tension lead to prevent engine starting) to bring battery down, then run engine at medium speed, turn on all lights and accessories to start Current Regulator operating and not ammeter reading which should agree with current regulator setting (see table below). As soon as generator replaces current used in starting, charging rate should taper off to original low rate.

Fully Charged Battery & High Charging Rate—Check battery temperature (charging rate will be higher with hot battery). If charging rate excessive, operate generator at medium speed with ammeter in charging line at regulator 'BAT' terminal and note ammeter reading as follows: Disconnect lead from regulator 'F' terminal. This opens field circuit and generator output should drop off (indicating that trouble is in regulator). If output does not drop off, disconnect this lead at generator 'F' terminal. If this causes output to drop off, this lead is grounded in harness and should be replaced. If output does not drop off, check generator for grounded field leads or windings. If trouble is located in regulator, reconnect field lead at regulator 'F' terminal, remove regulator cover, depress voltage regulator armature so as to open regulator contacts manually. If output drops off, regulator has not been functioning correctly and should be adjusted. If output does not drop off, check field circuit within regulator for shorts or grounds, see that all insulators in place and that both voltage and current regulator contact support bushings and insulators are properly installed (see Servicing data below).

Discharged Battery & Low Charging Rate or No Output—Check entire charging circuit for loose connections, damaged or broken wires, and short-circuits. If entire charging circuit in good condition and no high resistance in circuit, ground regulator 'F' terminal and operate generator, increase speed slowly and note generator output (CAUTION—Do not operate generator at excessive speed —generator is operated with no regulation when 'F' terminal is grounded and output may cause generator to burn out if speed increased excessively). If output increases with speed, regulator is defective and should be checked for incorrect setting or dirty or burnt contacts. If output does not increase beyond a few amperes, check generator for grounded or open field coils, dirty or burnt commutator, defective armature or brushes. If no output is noted, quickly disconnect lead from regulator 'GEN' terminal and flash this lead to ground. If no spark is noted, generator is defective. If spark occurs, check Cutout Relay

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

for contacts not closing (burnt contacts, open shunt winding, high voltage setting, or grounds).

CAUTION—Do not operate generator more than momentarily with lead disconnected from regulator 'GEN' terminal. This is open-circuit operation and will cause damage to generator or regulator if continued more than momentarily.

ADJUSTMENT:—Check all specifications for each unit first and adjust each unit as follows:

CUTOUT RELAY

Model	Cut-in Setting Volts (Hot)	Cut-out Setting Disch. Amperes	Contact Gap	Air Gap
1118201 to 8	6.2-6.7	0-4.0	.020"	.020"
1118209, 10	12.4-13.4	0-4.0	.020"	.020"
1118211, 12, 13	6.2-6.7	0-4.0	.020"	.020"
1118214	12.4-13.4	0-4.0	.020"	.020"
1118215, 16	6.2-6.7	0-4.0	.020"	.020"
1118217 to 20	12.4-13.4	0-4.0	.020"	.020"
1118221, 22, 23	6.2-6.7	0-4.0	.020"	.020"
1118224	6.3-6.9	0-4.0	.020"	.020"
1118225	12.4-13.4	0-4.0	.020"	.020"
1118226	6.2-6.7	0-4.0	.020"	.020"
1118227, 28	12.4-13.4	0-4.0	.020"	.020"
1118229 to 34	6.2-6.7	0-4.0	.020"	.020"
1118235	12.4-13.4	0-4.0	.020"	.020"
1118236, 37, 38	6.2-6.7	0-4.0	.020"	.020"

Cut-in Setting Note—Should be checked with unit HOT (at operating temperature).

Contact Gap—Adjust by bending upper armature stop (see Air Gap adjustment). Both contacts must have same gap so as to open and close together.

Air Gap—Check with armature pressed down so contacts just close. If both sets of contacts do not close simultaneously, bend spring fingers until they do. To adjust air gap, loosen two screws on hinge bracket at back of relay, raise or lower armature and hinge assembly.

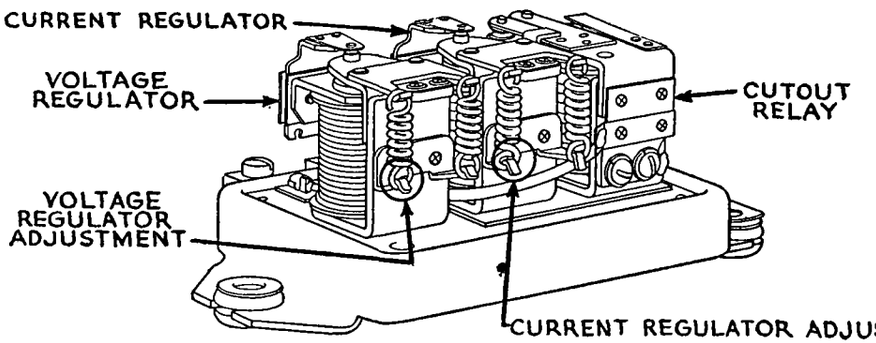
Cut-in Voltage & Cut-out Amperage—To check, connect ammeter in charging line at regulator 'BAT' terminal, voltmeter between 'GEN' terminal and ground. Operate generator and gradually increase speed until relay contacts close, note voltmeter reading. Decrease speed slowly and note reverse current reading on ammeter when contacts open. To adjust closing voltage, bend spring post down (to decrease voltage), up (to increase voltage).

VOLTAGE REGULATOR

Model	Voltage Setting Volts (Hot)	Model	Volts (Hot)
1118201 to 6	7.2-7.4	1118221, 22, 23	7.0-7.2
1118207, 8	7.0-7.2	1118224	7.4-7.6
1118209, 10	14.0-14.2	1118225, 27, 28	14.0-14.2
1118211, 12	7.0-7.2	1118226, 29, 30	7.0-7.2
1118213	7.2-7.4	1118231	7.2-7.4
1118214	14.0-14.2	1118232, 33, 34	7.0-7.2
1118215, 16	7.0-7.2	1118235	14.0-14.2
1118217 to 20	14.0-14.2	1118236, 37, 38	7.0-7.2

Important Note—Regulator over-compensated for temperature and must be checked only when hot and with cover in place (setting higher when cold).

Checking Voltage Setting—Connect ammeter and variable resistance of 'AVR' set in charging line at regular 'BAT' terminal, or disconnect charging line and ground the 'BAT' terminal through ¾ ohm fixed resistance (6 volt units), 1½ ohm fixed resistance (12 volt units). Resistance must be capable of carrying 10 amperes and must not change in value during temperature changes. Connect voltmeter between 'BAT' terminal and ground. Operate generator and increase speed to point where rated output normally produced (see car model 'T&E' page for generator data), adjust variable resistance of 'AVR' set so that charging current is 8-10 amperes (not required if fixed resistance method used). When regulator reaches operating temperature (150° or very hot to the touch) with regulator cover in place, cycle generator by decreasing speed to point where relay contacts open, then increase speed to original figure and note voltmeter reading. Adjust regulator if voltage does not agree with figure in table above.



CAUTION—Do not change setting to correct High Voltage without first checking generator for grounded fields—see 'Important Service Note' above.

Adjustment—Bend spring hanger at lower end of **light (left spring) or one spring only (on later units where both springs alike)** down to increase tension and raise voltage setting, or up to decrease tension and lower voltage setting. If correct adjustment cannot be secured on light spring (or one spring) or if new springs are being installed, adjust second spring as follows:

Heavy Spring (or Second Spring) Adjustment—Disconnect light spring (or one spring if both alike), connect voltmeter between regulator 'GEN' terminal and ground. Open regulator contacts by hand (press down on regulator armature), operate generator and increase speed slowly until voltmeter reading is 3 volts (6 volt units), 6 volts (12 volt units). Release armature, adjust spring tension by bending lower spring hanger up or down until voltage is 4.5-5.0 volts (6 volt units), 8.5-9.0 volts (12 volt units). Connect light spring (or second spring if both alike), adjust this spring as directed above.

Air Gap—.070" (supersedes gap of .075" originally specified for these units).

Air Gap Adjustment—To check, press armature down and allow it to come back until contacts just close, measure air gap at center of core with armature in this position. To adjust, loosen two screws on upper contact support bracket, move bracket up or down being careful to keep contacts lined up.

CURRENT REGULATOR

NOTE—Data below applies only to 3 unit Regulators (with separate Current Regulator Unit). Disregard this current regulator data when adjusting 2 unit Regulators (no Current Regulator) used with third-brush generators.

Model	Current Setting Amperes	Model	Amperes
1118201, 2	32-34	1118222, 23	34-36
1118207, 8	28-30	1118224	12.5-13.5
1118209, 10	16-18	1118225	14-16
1118211, 12	38-40	1118226, 29	34-36
1118214	24-26	1118230	26-28
1118215, 16	22-24	1118232	34-36
1118217	19-21	1118233, 34	24-26
1118218	7-9	1118235	9-11
1118219	24-26	1118236	26-28
1118220	12-13	1118237, 38	38-40
1118221	26-28		

Important Note—On units with steel armature spring hinges, regulators are over-compensated for temperature and must be checked only when hot (have higher setting when cold). Units with bronze armature spring hinges operate at same value both cold and hot.

Checking Current Setting—Remove regulator cover and connect short jumper from voltage regulator frame to upper contact support bracket (this will short out voltage regulator while current regulator being checked). Connect ammeter in charging circuit at regulator 'BAT' terminal. Turn on lights, radio and other accessories (to provide load which will bring current regulator into operation), operate generator and increase speed until output remains stationary. With regulator at operating temperature (150° or very hot to the touch) and cover in place, ammeter reading should agree with setting given above.

CAUTION—Do not change setting to correct High Charging Rate without checking generator first for grounded fields—See "Important Service Note" above.

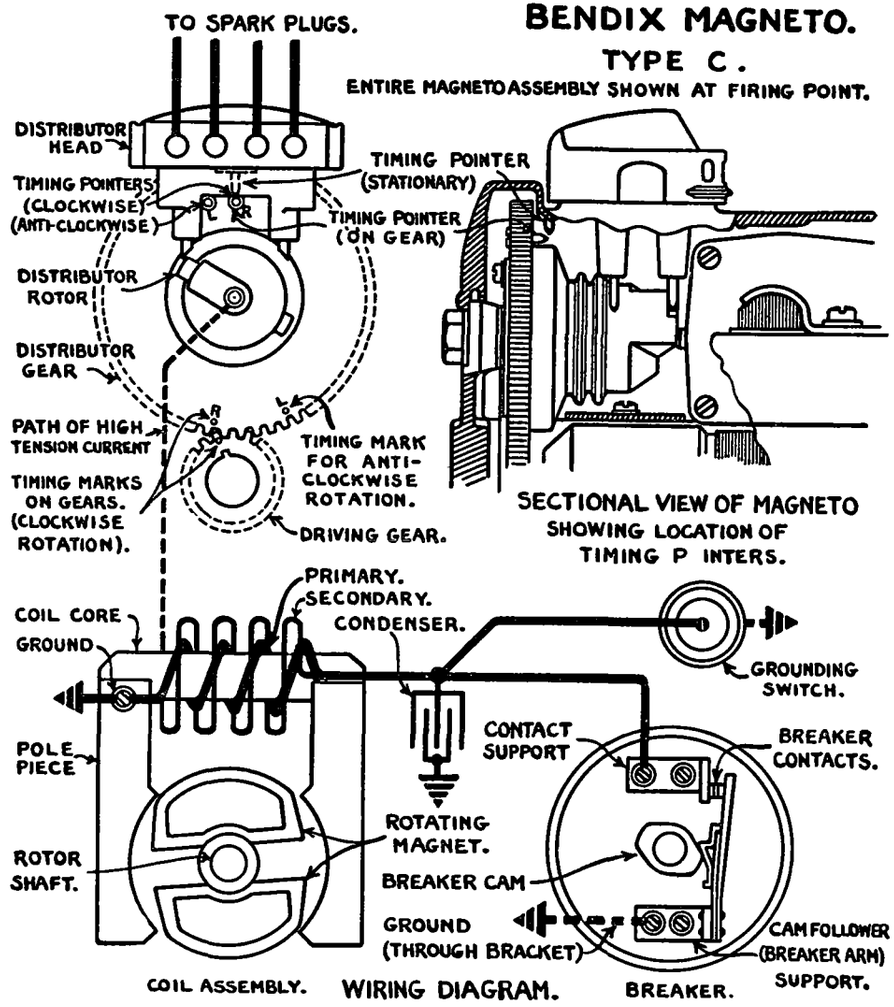
Adjustment—Bend spring hanger at lower end of **one spring only** down to increase tension and increase current setting, up to decrease tension and decrease current setting. If adjustment cannot be secured on one spring, or new springs are installed, proceed as follows:

Spring Adjustment—With one spring disconnected, operate generator at medium speed, adjust hanger at lower end of spring until output is regulated at approximately half rated output (17 amperes on 1118201,2). Then connect second spring and adjust this spring as directed above (do not touch first spring when making this final adjustment).

Air Gap—.075" (supersedes gap of .080" originally specified for these units).

Air Gap Adjustment—Same as for Voltage Regulator (above).

DESCRIPTION:—These magnetos are manufactured by the Scintilla Magneto Company and embody the rotating magnet and stationary coil and breaker as found in Scintilla Magnetos. They are designed for automotive, marine and stationary engine installation. Magnetos are completely enclosed for protection in service (ventilation is provided for by wire gauze covered ventilating windows) and housings can be removed for inspection and adjustment without special tools. Magnet shaft and distributor rotor are mounted on ball bearings which are packed with grease at overhaul periods and require no lubrication in service. Breaker contacts are easily adjusted with a screwdriver and entire breaker assembly is quickly removable by releasing a spring catch. All connections are made by means of bronze leaf springs.



INSTALLING MAGNETO:—Adjustment of Timing Range Scale. Spark advance range of magneto must be set for the particular engine on which magneto is installed. Advance range is adjustable up to 45° for rotation in either direction by means of the Timing Range Scale mounted on the back of the breaker housing (see illustration 3). When the figure '45°' in the center of the scale is opposite the arrow on the housing, the magneto is set for 45° maximum advance with rotation in either direction. To set advance range, loosen the two screws 'A' on the scale and shift the scale itself to the correct position. On magnetos for clockwise rotation (drive end) shift the scale to the left over the range marked 'L' to decrease the spark advance range (each division on the scale is 15°). On magnetos for counter-clockwise rotation (drive end), shift the scale to the right over the 'R' portion of the dial to decrease the timing range. Timing range must be set in accordance with engine manufacturers' specifications. On magnetos driven at 1½ times engine speed the setting as indicated on the Timing Range Scale should be 1½ times the desired range as measured on the engine crankshaft.

TIMING:—Timing Magneto to Engine—when crankshaft setting for full advance is known. Turn engine to correct firing position for No. 1 piston with spark advanced. Advance magneto spark control lever, take off distributor head, disengage impulse coupling when used. Turn magneto drive shaft until timing pointer on face of large distributor gear lines up with timing pointer inside magneto main cover (at top of magneto—see illustration). Couple magneto to engine (see paragraph on adjustable drive member).

When Advance Firing Point is Not Marked. Set Timing Range Scale to correspond with the specified maximum advance for the engine (where magneto is driven at 1½ times crankshaft speed, Timing Range Scale setting must be 1½ times specified advance). Turn engine to top dead center firing position for piston No. 1. Retard magneto spark advance lever and time magneto to engine by turning magneto drive shaft until breaker contacts begin to open (slightly after position when timing pointer on large distributor gear lines up with timing pointer on magneto frame).

Fixed Spark Ignition when Advance Point is not Marked. Set Timing Range Scale to amount of fixed spark advance before top dead center desired. Time magneto to engine with spark advance lever retarded and piston No. 1 at top dead center as directed in paragraph above. After timing has been completed, remove contact breaker from magneto, reset Timing Range Scale at '0' for correct rotation, replace breaker on magneto. This will provide Fixed Spark Ignition with the setting at the correct point before top dead center.

Adjustable Drive Member. An adjustable drive member is designed to be mounted on the engine drive shaft. This drives the magneto through two dogs on its outer face which engage with a flexible fabric center disc which in turn engages two dogs on the magneto coupling member. The adjustable drive member should be set when the magneto is timed to the engine initially. The drive member consists of an inner hub keyed to the drive shaft with worm teeth on its outer circumference. These teeth engage with the adjusting screw in the outer or dog plate member. The screw also clamps the entire drive member together after the setting has been made. With the magneto shaft turned to the firing position and the engine crank-

shaft turned to firiing position for piston No. 1, center the central disc of the coupling on the magneto shaft coupling member, then with the cotter removed and castellated nut on the adjusting screw loosened, turn the adjusting screw in until it has turned the dogs on the drive coupling into position so that they are centered on the slots of the central disc. When adjustment has been completed clamp the dog plate securely in position by tightening the castellated nut on the adjustment screw and replacing the cotter pin. In making the adjustment the screw should always be turned clockwise or in, as reversing the direction will only back the screw out of the dog plate.

Impulse Couplings. Heavy duty Bendix Impulse Couplings have been developed for installation on these magnetos. As usually installed, the couplings are automatic; that is, the impulse coupling automatically engages whenever the engine is cranked and is automatically disengaged at the throw-out speed. Impulse couplings may be manually engaged and disengaged with engine running or stopped by means of buttons on top of the coupling. The center button marked 'ON' should be depressed to engage the coupling. The other button marked 'OFF' should be pressed to disengage the coupling. The 'ON' button should not be pressed with the magneto operating at high speeds. Impulse couplings must always be disengaged when the magneto is being timed to the engine. Impulse couplings are lubricated when installed and require no attention in service. The felt washer between the coupling housing and dust cover is saturated with graphite grease and should be given a drop of oil occasionally.

SERVICING:—Inspection of Contacts. At intervals of 500 hours or 10,000 miles of operation, remove breaker cover and see that lubricating felt attached to cam follower is saturated with oil. This felt oils the breaker cam surface and should be given one or two drops of medium oil if necessary. Check contact setting by cranking engine to firing position of piston No. 1, advance magneto spark control lever, see that timing pointer on large distributor gear lines up with pointer on housing main cover, check contacts, which should begin to open at this point. If contacts are not opening, loosen two mounting screws on contact support block, shift block to one side or the other until contacts begin to open. There is a slot in the breaker housing on each side of the support block which serves as a purchase point for the screwdriver in shifting the support. A very slight movement should be sufficient to adjust contacts. Tighten mounting screws after completing adjustment. It is not usually necessary to check contact gap but this should be approximately .018" maximum.

Alignment of Breaker Contacts. Movable contact can be adjusted vertically and horizontally to properly align contact with stationary contact. Horizontal adjustment is made by inserting a shim of correct thickness under the cam follower support. This is necessary only when new contacts are installed and should be done by a Scintilla Service Station. Vertical adjustment of the cam follower is made by shifting the cam follower support slightly. The hole in the support for the mounting screw '2' is slightly elongated, permitting this adjustment. To adjust, loosen the two mounting screws slightly, move the contact support up or down, as necessary, to align contacts, tighten mounting screws, recheck alignment.

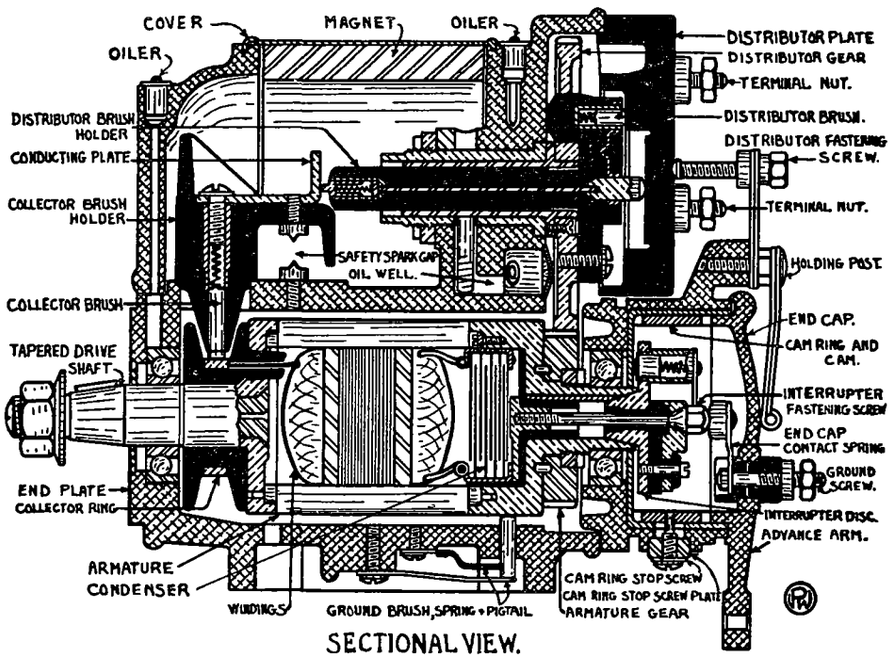
LUBRICATION:—At intervals of 1,500 hours, or 30,000 miles of operation, the magneto should be disassembled and inspected for wear. The ball bearings of the rotating magnet or drive shaft should be washed with gasoline and repacked with No. 44 Keystone grease or equivalent. Grease should also be applied to teeth of the distributor gear.

At 3,000 hour or 60,00 mile intervals the large distributor gear and distributor should be removed and disassembled, the bearings washed in gasoline and repacked with grease.

DESCRIPTION:—Bosch Magneto, Type AT, is of the high tension armature type. A single magnet is mounted over the armature and end plates completely enclose all working parts. Magneto can be equipped with Type IC-200 automatic impulse coupling or Type EC impulse coupling which is entirely enclosed in a water and dust-proof housing. Type G automatic advance governor can also be fitted to Type AT magneto. The Type AT-4 should be driven at crankshaft speed on four cylinder, four cycle engines and the Type AT-6 should be driven at one and one half times engine speed on six cylinder four cycles engines. Magneto must be driven in direction indicated on frame.

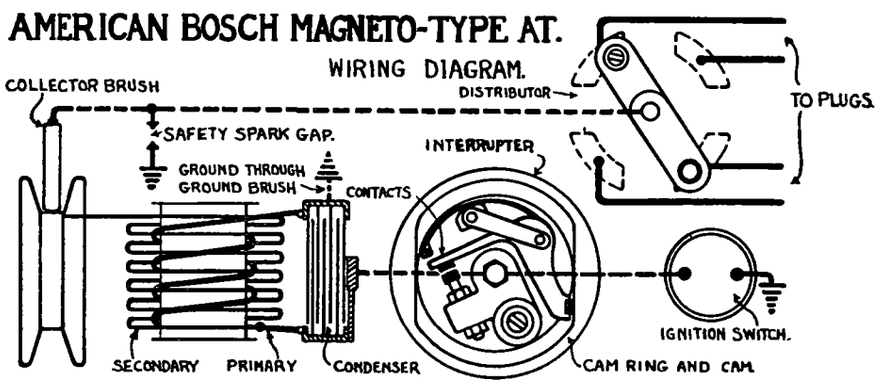
OILING:—Put one or two drops of light machine oil in the oiler at each end of the magneto every 500 miles. Do not oil interrupter.

BREAKER:—Breaker contacts separate .4 millimeter or 1/64 inch with interrupter arm on highest point of cam. Breaker contacts and mounting are fixed on end of armature shaft and rotate while cam and cam ring are stationary. To set contact gap, turn armature shaft until fiber bumper is on highest point of cam. Then loosen lock nut on stationary contact stud and turn contact until proper gap is secured. Tighten the lock nut. Contacts are made of platinum. Resurface contacts with worn No. 00 sandpaper or with a fine flat jeweler's file. Do not use emery cloth.



TIMING:—Crank engine until crankshaft reaches proper position for piston in No. 1 cylinder with manual advance lever fully retarded. See manufacturers' specifications as given on specific car data sheets in the National Manual. Fully retard magneto advance arm and turn magneto in direction of rotation until contacts begin to separate when the fiber bumper of the interrupter arm reaches the steel segment in the cam ring. Make certain that magneto is firmly bolted to base mounting and couple drive shaft to engine without disturbing either crankshaft or magneto armature shaft. Remove distributor cover and note position of distributor brush. Connect the segment directly over the brush to the spark plug in cylinder No. 1 and connect remaining plugs in proper firing order around the distributor plate in a direction opposite to rotation of the interrupter.

When manufacturers' specifications are not available, the engine may be timed to fire with piston on top dead center entering power stroke with full retard. Crank engine over until piston No. 1 enters compression stroke (the upstroke with both valves closed). Then continue to crank engine slowly noting dead center on flywheel or checking piston travel with a wire inserted in spark plug port until the piston reaches top dead center. Then connect magneto as directed above.



Timing Magneto with Impulse Coupling:—Turn magneto in direction of rotation until coupling is released from arrester plate. This point will be after proper firing position since impulse coupling will spin magneto over firing position. Then turn magneto backward in direction opposite to rotation until the breaker contacts open and begin to close as fiber bumper passes off steel segment in cam ring. This is the correct firing position and the magneto can then be coupled to the engine.

SPARK PLUG GAPS:—Spark plug gaps must be set at .020 or 1/50 inch. It is important that the gap be set at this figure. If spark plug gap is too wide engine will miss at low speeds and will be difficult to start. A safety spark gap is located above the armature. If spark jumps safety gap frequently check magneto and spark plugs to locate trouble.

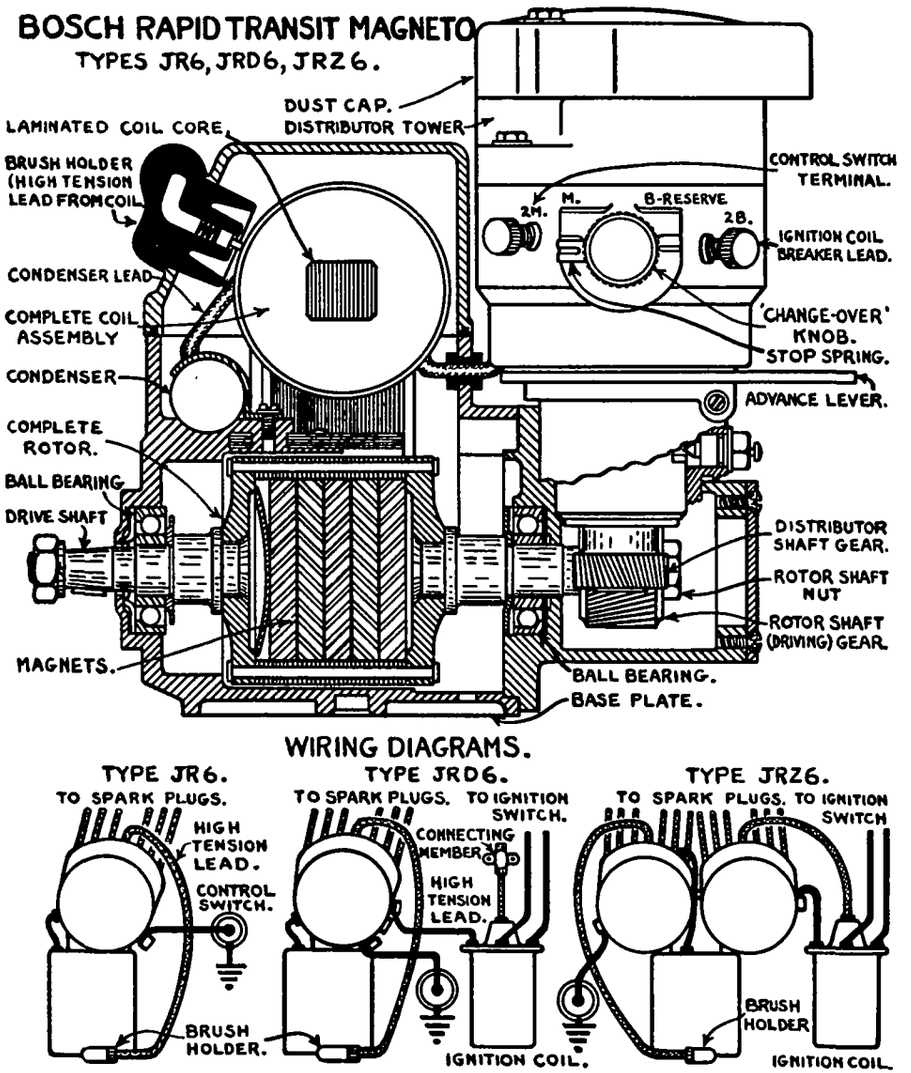
TROUBLE SHOOTING:—Engine Misses on One Cylinder:—Check spark plugs for correct gap. Check spark plug in missing cylinder for short circuit due to fouling or cracked insulator. Check for chafed or burnt insulation on cable. Check distributor plate for dirty distributor track or segment.

SECTIONAL VIEW.

Irregular Firing on All Cylinders:—Check interrupter contacts and set gap. Resurface contacts if necessary. Tighten fastening screw in center of interrupter plate. Check ground brush under armature in base plate. Check collector brush and collector ring. Check distributor plate and wipe out with a clean rag moistened with gasoline if dirty or gummed with oil.

DESCRIPTION:—These magnetos are of the rotating field magnet, stationary coil and breaker type. The magnet assembly, consisting of five cobalt steel plate magnets, forms the rotor which is mounted on ball bearings. The stationary armature or coil assembly is mounted directly above the rotor on the upper ends of the laminated pole pieces so that the magnetic field is completed through the laminated coil core. The direction of the magnetic field is changed twice for each revolution of the rotor shaft so that the magneto produces two sparks per revolution and must be driven at 1½ times crankshaft speed on a six cylinder engine.

The breaker assembly and distributor are mounted in a tower at one end of the magneto and the vertical distributor shaft is driven by spiral gears from the rotor shaft. The primary lead from the coil to the breaker runs through the frame or housing on the distributor end of the magneto and into the distributor cup directly above the timing lever. The coil high tension current is taken from the coil through a brush in the brush holder on the drive end of the magneto and then through a flexible lead to the central tower of the distributor cap. A special waterproof cover is mounted on top of the distributor cap and all high tension cables emerge from under the lower edge of this cover. When the magneto is furnished with automatic spark advance the advance mechanism (centrifugal weight governor type) is mounted on the lower section of the distributor drive shaft in the distributor tower. These magnetos are built in three distinct types.



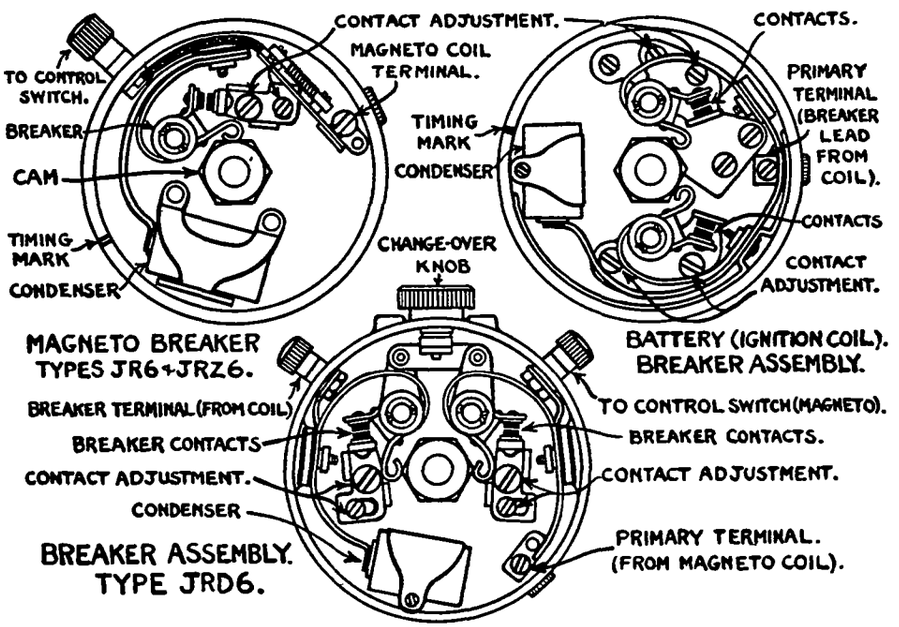
Type JR-6—Single Spark Plug Magneto Ignition. This type has a single interrupter or breaker assembly and is furnished with manual spark control.

Type JRD-6—Dual Magneto or Battery Ignition. This type has two distinct interrupter assemblies with a simple changeover device so that the second set of contacts can be used as a reserve or emergency set with an ignition coil to provide an emergency battery ignition system. Magneto and battery ignition can be used alternately but not at the same time. Magneto is fitted with automatic spark advance.

Type JRZ-6—Twin Ignition. This magneto has two distributor towers and two distinct distributor and breaker assemblies. Both distributor shafts are driven by the spiral gear on the rotor shaft. One distributor tower (right hand facing distributor end) is used for magneto ignition and fires one set of spark plugs on the engine. This distributor is similar in design to that used on the JR-6 and has a single set of contacts. The battery ignition distributor (let hand facing distributor end) has two sets of breaker contacts and in conjunction with an ignition coil fires the second set of spark plugs on the engine. This type magneto is fitted with manual spark advance.

TIMING MAGNETO TO ENGINE:—Magnetos must always be timed to the engine with spark control levers advanced and the advanced firing point for the particular engine must be determined. With the engine crankshaft turned to this advanced firing point for piston No. 1, and with the magneto distributor cap removed (take out two screws and lift off cap), turn the magneto shaft until the rotor segment or electrode is directly opposite the red line on the upper edge of the distributor cup. See that spark advance levers are in the advanced position (on the JRZ-6 the lever is on the end of the drive shaft and is returned to the advanced position by a spring behind the drive gear on the rotor shaft). Continue to turn the magneto drive shaft carefully in the direction of rotation until the breaker contacts begin to open (do not use paper strips to check contact opening, if this method is used employ thin steel strips not over .03MM. or .001 inch in thickness.) Couple the magneto to the engine, being careful not to disturb relative position of magneto drive shaft and crankshaft.

In timing the Type JRD-6 magneto, the magneto breaker contact must be used and the change-over knob must be in position to allow the breaker arm of this set of contacts to be in contact with the cam (see paragraph below). On the Type JRZ-6 magneto, the distributor cap on the magneto distributor (right hand distributor viewed from distributor end) should be



removed and these contacts used to time the magneto to the engine. The battery contacts will be correctly timed to the engine if the battery distributor has not been removed or the timing screws (the copper plated screws on the breaker plate) disturbed.

SERVICING:—At intervals of 20,000 miles or 30,000 kilometers, the distributor caps should be removed and the breaker contacts inspected. If necessary the contacts should be resurfaced with a fine, flat contact file and the breaker gap adjusted. Breaker contact gap should be set at .3MM. or .012 inch (minimum)—.4MM. or .0157 inch (maximum). to adjust contacts, loosen lock screw on stationary contact mounting plate and turn eccentric adjusting screw until gap is within above limits with breaker arm on the lobe of the breaker cam (use a feeler gauge to insure accuracy). The battery breaker contacts on the Type JRZ-6 should also be inspected, resurfaced, and adjusted if necessary. In adjusting these contacts none of the copper plated screws on the breaker plate should be loosened as this will affect the ignition setting. On the Type JRD-6, the change-over knob must be in position for magneto ignition when the magneto contacts are checked and adjusted. The battery contacts will need adjustment only if battery ignition has been used extensively. In this case turn the change-over knob 180° counter-clockwise from the position marked 'M' to the position marked 'B-Spare' before the battery contacts are checked and adjusted.

LUBRICATION:—The ball bearings on both the rotor shaft and distributor shaft are packed with a heat-resisting grease which should not require renewal between overhaul periods. Whenever the magneto is disassembled for inspection or overhaul the bearings should be cleaned and repacked with this special grease (melting point 175°C.). The drive gear case is filled with 'ambroleum' which should not require any attention.

WIRING:—See illustrations for complete wiring diagrams of each magneto type. The terminal on the side of the distributor marked '2M' on each type should be connected to the magneto short-circuiting switch. The other side of the switch is grounded. Whenever work is being done on the car wiring or circuits are being tested, the magneto ground wire should be disconnected at the '2M' terminal in order to avoid any possibility of current flowing through the magneto windings and demagnetizing the magnets.

CHANGE-OVER ON TYPE JRD-6:—See wiring diagram for details of complete installation of the Type JRD-6 magneto, ignition coil and change-over coupling. The magneto is designed to operate ordinarily as a simple magneto ignition installation controlled by the short-circuiting or ground switch. If it is desired to use battery ignition for any reason, the change-over knob on the side of the distributor should be turned 180° counter-clockwise from the 'M' point to the 'B-Spare' position. The spring on the pointer will snap into place at each position. The screw plug on the high tension lead at the brush holder on top of the magneto case should then be unscrewed and the lead pulled out of the brush holder. This lead should then be inserted in the open end of the coupling or connecting member to which the coil high tension lead is connected. There is a needle point at the base of the socket which enters the end of the cable, insuring a good contact. The cable plug should then be screwed in firmly so that the cable is gripped and cannot be withdrawn. This completes the change-over and the engine can be operated on battery ignition by turning on the ignition coil switch. In order to operate the engine on magneto ignition again it will only be necessary to return the high tension lead to the brush holder on the magneto (the connection is made in the same manner as on the coupling, and rotate the change-over knob clockwise to the 'M' position.

The change-over knob controls the breaker contacts through a cam action and lifts the breaker arm not being used free of the breaker cam so that the contacts remain open. The timing of the engine is not affected by this action so that it is not necessary to retime the magneto when it is changed over from magneto to battery ignition. However the magneto contacts can only be checked and adjusted when the change-over knob is in position 'M' and the knob must be turned to position 'B-Spare' before the battery contacts are adjusted.

DESCRIPTION:—The Robert Bosch Magneto Types FF4A and FF6A are of the armature type with all moving parts entirely enclosed. They are furnished with cylindrical base for cradle mounting or with flat base with locating pins for bracket mounting. Magneto should be driven only in direction shown by arrow on collector ring brush holder.

ADVANCE:—Type FF4A has 40° manual advance range. This is equal to 40° measured on flywheel since magneto must be driven at crankshaft speed. Type FF6A has 60° manual advance range equal to 40° on the flywheel since the magneto must be driven at 1½ times crankshaft speed. An automatic advance device may be fitted to all FF4A and FF6A magnetos giving an automatic advance range of 30°. This may be used in conjunction with the manual advance or the manual advance mechanism may be locked by inserting a set screw screwed in the endplate so that it fills the notch in the interrupter housing. The interrupter must first be turned to the fully advanced position. The manual advance arm may be set in any desired position to facilitate connecting of advance control rod. The advance arm ring is held in position by friction against the interrupter housing. To set arm, loosen set screw in side of arm and turn to desired position. Then tighten the set screw.

BREAKER:—Breaker is mounted on end of armature shaft and rotates with armature. Contacts separate 1/64 inch with bumper of contact arm on cam. Clean contacts with a soft brush and gasoline. Contacts may be trued up with a fine flat contact file or on a medium hard oilstone. To replace contacts, remove hexagonal headed screw and remove breaker. Replace in correct position.

OILING:—The armature shaft is mounted on ball bearings packed with heavy grease. The breaker arm pivot pin is oiled by wick oiler saturated with oil. This is sufficient for a running period of 35,000-50,000 miles and need be renewed only when the magneto is disassembled for servicing. Every 4500 miles remove the oil plug in the top of the magneto at rear of distributor housing and fill oil hole with heavy machine oil. It may be necessary to warm the oil but it is essential to use heavy oil so that it will not get in the distributor or breaker housing.

TIMING:—To check magneto for correct position of armature when contacts open. Remove the distributor plate. There are two circular windows in the large gear marked 'R' and 'L'. Fully advance manual control arm and turn magneto shaft in direction of rotation until red line on stationary pole piece is visible through proper window. Use 'R' window in timing clockwise magnetos and 'L' window in timing counter-clockwise drive magnetos. Slowly turn the shaft until the red mark on the end of the armature lines up with the red mark on the pole piece. If magneto is correctly assembled the breaker contacts will just begin to separate at this point.

To time magneto to engine. Crank engine until crankshaft reaches proper firing position of No. 1 cylinder with manual advance lever fully retarded. See manufacturer's specifications as given on specific car data sheets in the National Manual. Then fully retard manual advance arm and turn magneto shaft in direction of rotation until red line on pole piece appears through proper window in distributor gear. Continue to turn the shaft until breaker contacts begin to separate. Couple the magneto to the engine being careful not to disturb the relative position of the magneto and crankshaft. Connect the segment opposite the carbon brush in the distributor head to the spark plug in cylinder No. 1. Connect the remaining terminals to the spark plugs following the proper firing order of the engine.

IMPULSE COUPLING:—Both the FF4A and FF6A magnetos can be fitted with impulse couplings to furnish a very hot spark at low speeds to start the engine. To time engines where impulse couplings are used, it will be necessary to turn the magneto in the opposite direction from that in which the magneto is driven (as given by arrow on collector brush holder). If this is not done the impulse coupling will spin the armature over the timing position so rapidly that it will be impossible to set magneto.

SPARK INTENSIFIER:—A spark intensifier or auxiliary spark gap can be fitted to the magneto. This is provided with a switch on the dash and inserts a second spark gap in the secondary circuit when the plugs are fouled. To install spark intensifier it is necessary to remove collector brush holder and install special unit with two terminals for cables to the switch. If it is desired to operate magneto equipped for spark intensifier without this device, it will be necessary to connect a short piece of high tension cable between the two terminals on the side of the collector brush holder.

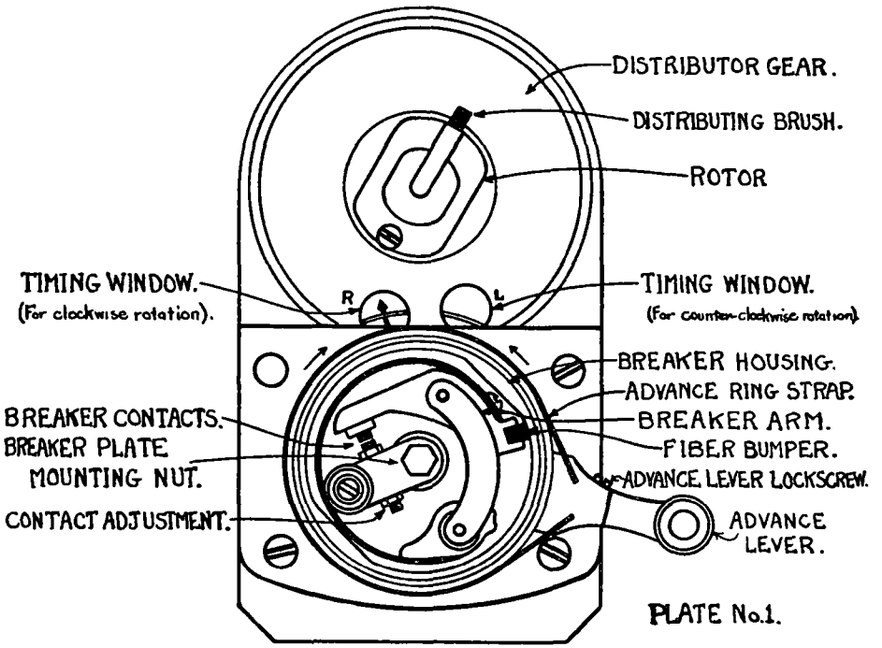


PLATE No.1.

ROBERT BOSCH MAGNETO - MODELS FF4A-FF6A.

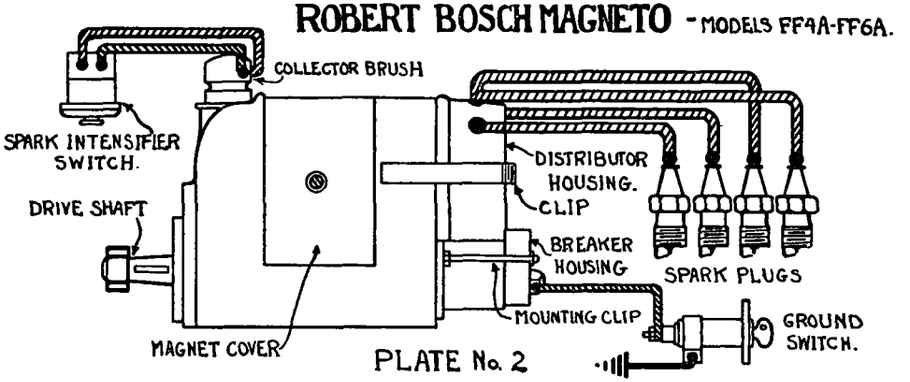

PLATE No. 2

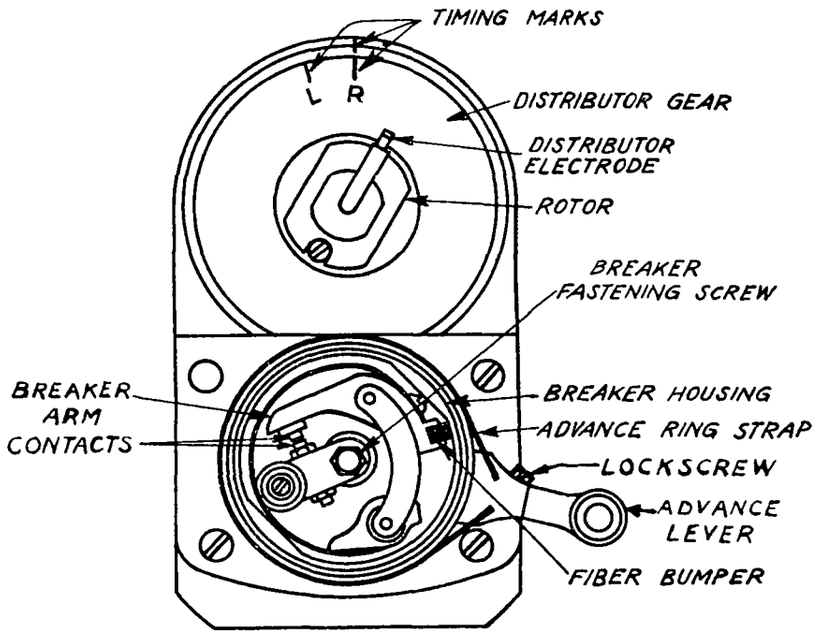
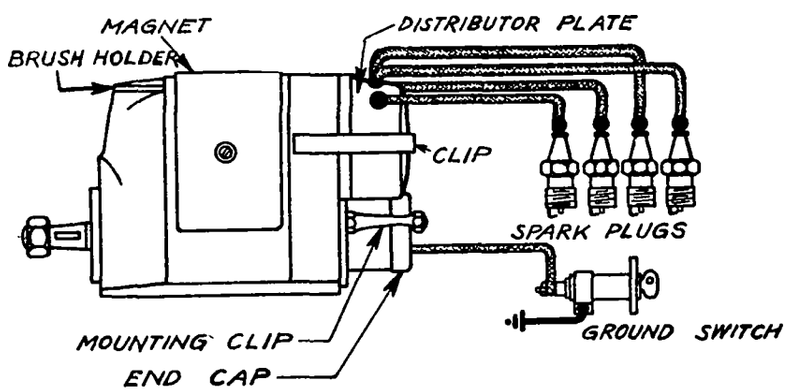
DESCRIPTION:—The Robert Bosch Magneto Types FR4B and FR62 are powerful magnetos of the armature type with all moving parts entirely enclosed. They are furnished with flat base and tapped holes for bracket mounting. Magneto should be driven only in direction shown by arrow on top of magneto frame.

ADVANCE:—Type FR4B has 30° manual advance range. This is equal to 30° measured on the flywheel since magneto must be driven at crankshaft speed. Type FR6C has 45° manual advance range equal to 30° on the flywheel since the magneto must be driven at 1½ times crankshaft speed. The manual advance mechanism may be locked by inserting a set screw screwed in the breaker housing so that the latter is held in advance position. The manual advance arm may be set in any desired position to facilitate connecting of advance control rod. The advance arm ring is held in position by friction against the interrupter housing. To set arm, loosen set screw in side of arm and turn to desired position. Then tighten the set screw.



BREAKER:—Breaker is mounted on end of armature shaft and rotates with armature. Contacts separate 1/64 inch with bumper of contact arm on cam. Clean contacts with a soft brush and gasoline. Contacts may be trued up with a fine flat contact file or on a medium hard oilstone. To replace contacts, take out breaker fastening screw and remove breaker. Replace in correct position, with key properly engaging the corresponding keyway.



OILING:—The armature shaft is mounted on ball bearings packed with heavy grease. The breaker arm pivot pin is oiled by wick oiler saturated with oil. This is sufficient for a running period of 35,000-50,000 miles and need be renewed only when the magneto is disassembled for servicing. Every 4500 miles fill oil cup in the top of the magneto with light machine oil, preferably Robert Bosch non-freezing oil US-506.

TIMING:—**To Check Magneto for Correct Position of Armature When Contacts open.** Remove the distributor plate. There are two lines in the large gear marked 'R' and 'L'. Fully advance manual control arm and turn magneto shaft in direction of rotation until proper line on gear is opposite timing mark on magneto frame. Use 'R' mark in timing clockwise magnetos and 'L' mark in timing counter-clockwise drive magnetos. If magneto is correctly assembled the breaker contacts will just begin to separate at this point.

To Time Magneto to Engine. Crank engine until crankshaft reaches proper firing position of No. 1 cylinder with manual advance lever fully retarded. See manufacturer's specifications as given on specific car data sheets in the National Manual. Then fully retard manual advance arm and turn magneto shaft in direction of rotation until proper mark ('R' for clockwise, 'L' for anti-clockwise rotation) is opposite timing mark on magneto frame. Continue to turn the shaft until breaker contacts begin to separate. Couple the magneto to the engine being careful not to disturb the relative position of the magneto and crankshaft. Connect the distributor head segment opposite the distributor electrode to the spark plug in cylinder No. 1. Connect the remaining terminals to the spark plugs following the proper firing order of the engine.

IMPULSE COUPLING:—Both the FR4B and FR6C magnetos can be fitted with impulse couplings to furnish a very hot spark at low speeds to start the engine. To time engines where impulse couplings are used, it will be necessary to turn the magneto in the opposite direction from that in which the magneto is driven (as given by arrow on top of magneto frame). If this is not done the impulse coupling will prevent the proper setting of the magneto.

APPLICATION NOTE:—These magneto types designed for the following service:

Magneto Model	No. of Cylinders	Max. Engine Bore	Max. Magneto RPM.
MJA4A, MJA4B (See Note)	4	All except HC	4500
MJA6A, MJA6B (See Note)	6	All except HC	4500
MJB4A	4	Up to 4½"	4500
MJB6A	6	Up to 4½"	4500

NOTE:—MJA4A and MJA6A magnetos are similar to MJA4B and MJA6B except that an improved timing mechanism and cam lubrication system and an additional anchoring washer which prevents accidental removal of the timing gear and rotor are used on the "B" types.

Models MJB4A, MJB6A. These models are intermediate type and are smaller than "MJA" models. They are similar in design to MJA4B and MJA6B except that distributor gear shaft is mounted on a plain bushing instead of the double-row ball bearing used on the "MJA" models.

H.C. Engines. Special "Heavy Duty" MJA4B and MJA6B magnetos are furnished for use on engine with unusually high compression ratios.

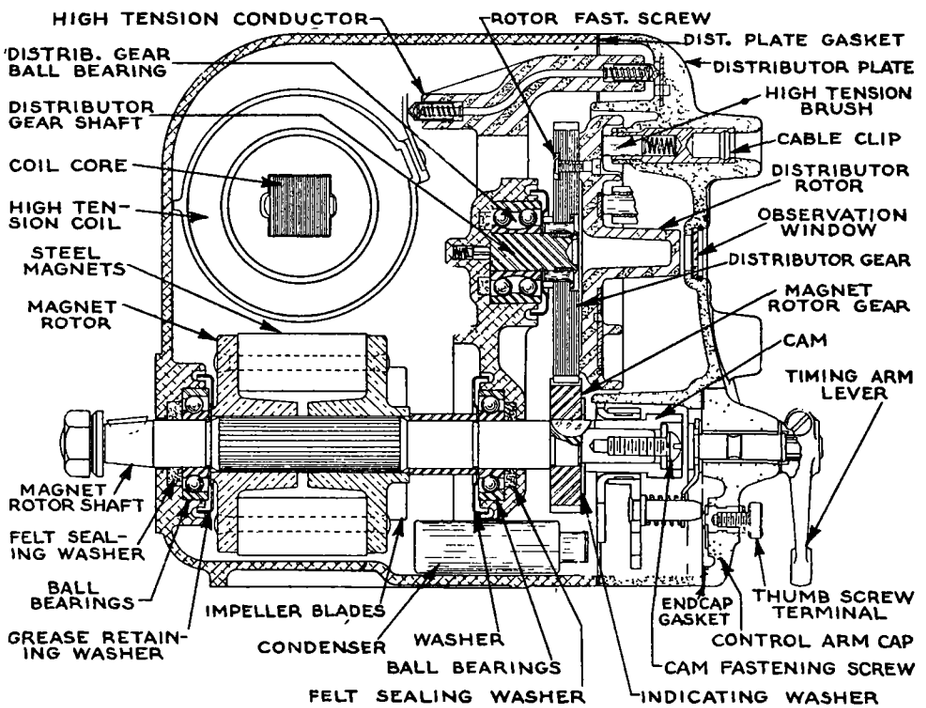
DESCRIPTION:—These magnetos are of the Inductor Type with stationary coil mounted on a laminated core directly above the rotating magnets. Magnets are permanently assembled on a steel rotor shaft which is mounted on ball bearings in the magneto housing. Housing is a single piece aluminum die-casting with laminated pole pieces cast in. Screened ventilator openings are provided in each side of the housing and the fan action of the rotor insures proper cooling. Breaker mechanism is mounted on end of housing with stationary breaker arm and rotating cam mounted on rotor shaft. Distributor gear and distributor are mounted on ball bearings (MJA4A, 4B, 6A, 6B), plain bushing (MJB4A, 6A) in the housing at the end of the coil and the high tension current is conducted to the distributor by brushes and conductors cast in the distributor plate (see illustration). High tension terminals on distributor plate are provided with individual brushes which contact the track on the distributor.

TIMING:—Turn engine over to firing position for #1 piston with retarded or advanced spark (usually indicated by flywheel mark "IGN", "SP.#1" etc.—see engine manufacturers recommendation). Then turn magneto to correct firing position for #1 cylinder as directed below for each type. NOTE—Timing window provided on distributor plate for each magneto so that distributor plate need not be removed to observe distributor gear markings.

Fixed Ignition Magneto without Impulse Coupling. Remove control arm cap (breaker housing cover), turn magneto shaft in direction of regular rotation until breaker contacts just begin to open. Couple magneto to engine being careful not to disturb relative positions of magneto shaft and engine crankshaft. Connect distributor terminal which is in line with arrow on distributor visible through timing window on distributor plate to spark plug in cylinder #1, connect remaining spark plugs in accordance with firing order of engine.

Fixed Ignition Magneto with Impulse Coupling. Remove control arm cap (breaker housing cover), rotate impulse coupling in direction opposite to regular rotation until contacts open and then close, then rotate coupling in direction of regular rotation until contacts just begin to open (this procedure necessary to prevent impulse coupling spinning magneto past firing point). Couple magneto to engine being careful not to disturb positions of magneto and engine. Connect spark plugs as directed in paragraph above.

Variable Ignition Magneto without Impulse Coupling. Set timing arm of magneto in full retard position (rotate arm in direction of magneto rotation as indicated by arrow on nameplate), or full advance position (rotate arm in direction opposite to magneto rotation) depending on whether engine manufacturer recommends that engine be timed with retarded or advanced spark. Remove control arm cap (breaker housing cover), turn magneto shaft in direction of rotation until breaker contacts just begin to open, couple magneto to engine being careful not to disturb relative positions of magneto shaft and engine crankshaft. Connect distributor terminal which is in line with arrow on distributor visible through timing window on distributor plate to spark plug in cylinder #1, connect remaining spark plugs in accordance with firing order of engine.



Variable Ignition Magneto With Impulse Coupling. Set timing arm in full retard position (rotate arm in direction of magneto rotation as indicated by arrow on nameplate) or full advance position (rotate arm in direction opposite to magneto rotation) depending on whether engine manufacturer recommends timing engine with retarded or advanced spark. Remove control arm cap (breaker housing cover), rotate impulse coupling in direction opposite to regular rotation until contacts open and then close, then rotate coupling in direction of regular rotation until contacts just begin to open (this procedure necessary to prevent impulse coupling spinning magneto past the timing point). Couple magneto to engine being careful not to disturb position of magneto shaft and crankshaft. Connect spark plugs as directed in paragraph above.

Rotor Position when Contacts Open. See "Edge Distance Setting" under Adjustment below for directions for checking and adjusting rotor position when contacts open.

BREAKER CONTACTS:—Contact Gap. Should be .014-.016" (.35-.40 MM.).

Contact Gap Adjustment. Loosen lockscrew on stationary contact mounting bracket and turn eccentric adjusting screw (in slotted hole). Tighten lockscrew securely after making adjustment.

Contact Servicing. See that contacts are free from oil or grease and properly aligned so that full surfaces of both contacts meet squarely. Contacts are tungsten and may be filed flat or cleaned on a stone. NOTE—Manufacturer recommends tool SA-69526 (file and stone) for this purpose. Always replace stationary contact and breaker arm and contact assembly as a unit.

LUBRICATION:—All MJA Models. Magnet rotor ball bearings and distributor gear ball bearings are packed with U.S. 505 high temperature grease and require repacking at intervals of 12 months or longer. Cam Lubricator is packed with Mobile No. 3 lubricant and requires replenishing only when magneto is being serviced.

All MJB Models. Place few drops of engine oil in distributor shaft oil hole (on distributor shaft boss in housing back of distributor gear) once each year. Rotor ball bearings are packed with U.S. 505 high temperature grease and require repacking at intervals of 12 months or longer. Cam lubricator packed with Mobile No. 3 lubricant which should be replenished when magneto is serviced.

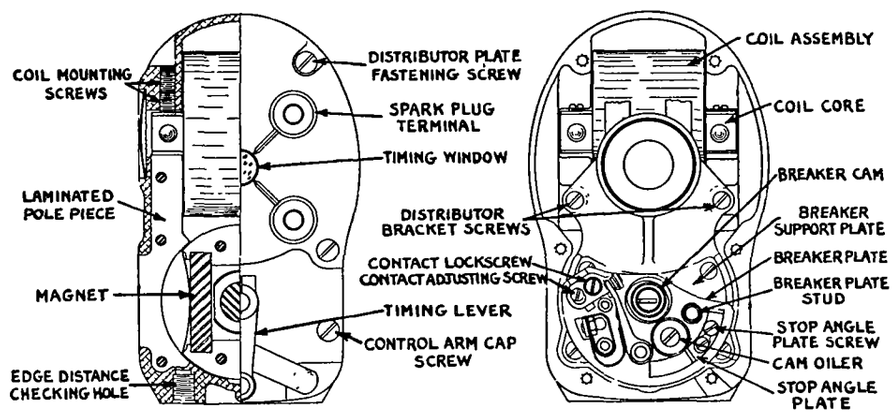
CHANGING MAGNETO ROTATION:—To change magneto for rotation in opposite direction, disassemble magneto, replace necessary parts, and make adjustments when reassembling as directed below. NOTE—If Impulse Coupling is used, this must be changed over for opposite rotation or replaced with unit for new rotation when magneto is changed.

Disassembly. Take out attaching screws and remove complete distributor plate assembly. Remove breaker plate stopscrew, spring, and plain washer (fixed ignition types only). Remove breaker plate assembly. Remove breaker cam fastening screw, retaining washer, lockwasher, and breaker arm. Take out attaching screws and remove stop angle plate and breaker support plate. Remove indicating washer (on rotor shaft in front of drive gear) and distributor gear assembly (these parts must be removed together).

New Parts. Correct Stop Angle Plate must be installed for each rotation and type of service as follows:

Type of Service	Stop Angle Plate Clockwise Rotation	Counter-clockwise Rotation
Fixed Spark Ignition	PL-528	PL-527
20° Timing Range	PL-526	PL-529
35° Timing Range	PL-525 (Unchanged)	PL-525

Reassembly. Turn rotor shaft until woodruff key in shaft is on top and in line with hole in distributor gear bracket. Line up indicating mark on indicating washer with line marked "A" on distributor gear rotor segment (for counter-clockwise rotation), line marked "C" (for clockwise rotation). Make certain that spacer is on distributor gear shaft, install indicating washer and distributor gear together, keeping indicator lines together and making certain that indicating washer slot engages woodruff key on rotor shaft. Install breaker support plate and stop angle plate (see table above for correct stop angle plate). Install breaker cam on rotor shaft with notch in cam marked "A" (for counter-clockwise rotation), "C" (for clockwise rotation) engaging woodruff key on rotor shaft. Install cam fastening screw, lockwasher, and retaining washer. Replace breaker plate assembly. Check Edge Distance (See "Edge Distance Setting" under Adjustment below) and contact gap. Replace distributor plate, change type designation and direction arrow on nameplate (this is important to prevent confusion in timing).



ADJUSTMENT:—Edge Distance Setting. To check, remove setscrew in edge distance checking hole in magneto base, fully advance timing lever, turn rotor shaft in direction of rotation until breaker contacts are just beginning to open, check clearance between edge of rotor and side of housing which should be 3 MM. (plus or minus .5 MM.). Use 3 MM. edge distance gauge (Tool #415) to make this check. To adjust, insert 3 MM. edge distance gauge through checking hole in magneto base, turn rotor shaft in direction of rotation until it is against the gauge, loosen stop plate screw on breaker plate and adjust plate so that breaker contacts are just opening with timing lever in full advance position.

SERVICING:—Recharging Magnets. Magnets can be recharged by placing entire magneto in charger by using special jaws SE-524 in conjunction with magnetizer service tool EF-1161 or EF-1180. Turn rotor shaft so that keyway in shaft is toward the left (facing drive end of magneto).

Rotor Bearing Replacement. Ball bearings are three-piece type, Part No. BB-60226 and must be replaced as an assembly (do not install single parts). To replace bearings, remove complete rotor assembly from housing, remove ball cages from inner races on rotor shaft, use special tool #2922 and jaws HY-41 to pull inner races from shaft. Use tool #61 to remove outer ball races from housing and distributor gear bracket. Press new outer races in housing and distributor gear bracket in an arbor press making certain that paper packing strip IS-400 and paper washer IS-399 are used. Press inner races on rotor shaft with grease retaining washer between race and rotor. Pack bearings with US-505 high temperature grease before installing rotor in magneto.

Distributor Gear Ball Bearing (MJA Models). Ball bearing is one-piece double row type, Part No. BB-1001. To replace bearing, remove distributor gear bracket from housing, remove ball bearing with tool #452. Install new bearing in arbor press making certain that paper packing strip IS-387 is used. Pack bearing cage with US-505 high temperature grease before installing assembly in housing.

Distributor Gear Bushing (MJB Models). Bearing consists of a bushing pressed in the distributor gear bracket. To replace bushing, remove distributor gear bracket from housing, remove old bushing by using punch and pilot in an arbor press. Press new bushing in place in arbor press.

APPLICATION NOTE:—These magneto types designed for the following service:

Magneto Model	No. of Cylinders	Max. Engine Bore	Max. Magneto RPM.
MJC1A (See Note)	1	3½"	4500
MJC4A	4	3½"	4500
MJC6A	6	3½"	4500

NOTE:—Model MJC1A. This model is intended for use on one cylinder engines and consists of a MJC4A magneto without the distributor mechanism. Distributor cover plate has a single high tension terminal which has a contact on its inner end bearing against the coil contact strip. This model is not timed in same manner as MJC4A and MJC6A models and special directions are given below.

DESCRIPTION:—MJC magnetos are of the Inductor Type and are smaller in size than corresponding MJA and MJB models. They are similar in design to the MJA and MJB models (see preceding article) except for different breaker plate and distributor mechanism (see illustration).

TIMING (MJC1A):—Note. Timing will be simplified if indicator card is used. This card is designed to be placed on the rotor shaft and has a lug which engages the shaft keyway so that the arrow on the card lines up with a mark on the housing when the magneto is in firing position.

Timing Engine—Turn engine crankshaft until piston is in firing position for retarded or advanced spark (usually indicated on flywheel by mark "IGN", "SPK" etc.—see engine manufacturers recommendations). Then turn magneto to firing position (see directions below for each type), couple magneto to engine being careful not to disturb relative position of magneto shaft and crankshaft, connect high tension terminal on distributor plate to spark plug.

Fixed Ignition (without Impulse Coupling) using Indicator Card. Install indicator card on magneto driveshaft so that rotation arrow on card points in same direction as arrow on magneto housing and lug on card engages keyway in shaft. Turn magneto in direction of rotation until arrow on card lines up with mark on housing directly above shaft. Couple magneto to engine.

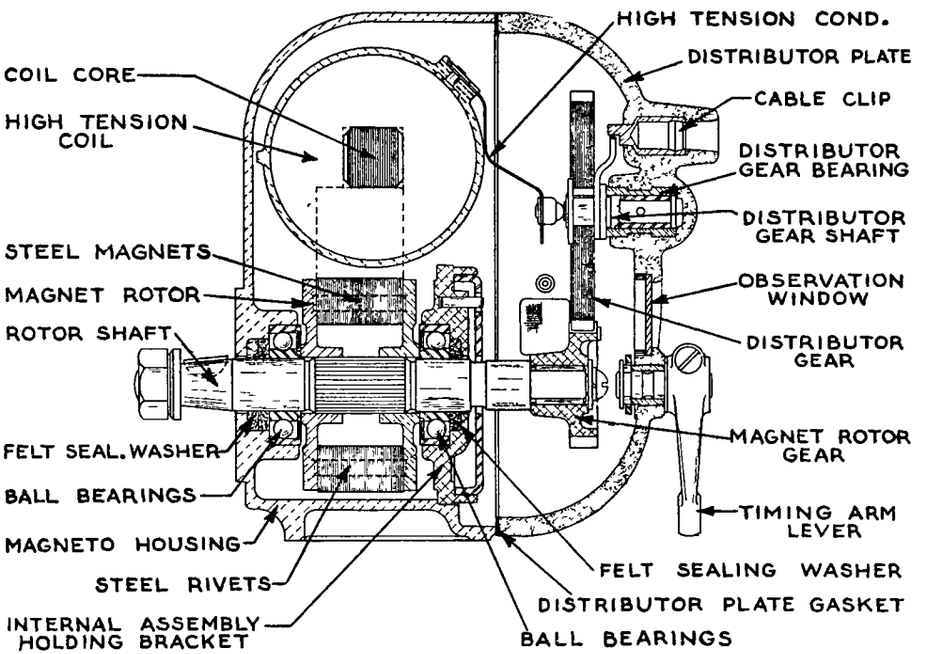
Fixed Ignition (without Impulse Coupling) not using Indicator Card. Remove distributor plate, rotate magneto shaft in direction of rotation until breaker contacts just begin to open. Replace distributor plate, couple magneto to engine.

Fixed Ignition (with Impulse Coupling). Rotate impulse coupling in reverse direction from regular rotation until red mark on impulse member lines up with arrow on arrester plate (first magnetos), or mark on housing directly above shaft (later magnetos). Couple magneto to engine in this position.

Variable Ignition (without Impulse Coupling) using Indicator Card. Place timing arm in full retard position (rotate arm in direction of rotation) or full advance position (rotate arm against direction of rotation) depending on whether flywheel mark is for retard or advance timing. Install indicator card on shaft and time in same manner as for Fixed Ignition (using Indicator Card) above.

Variable Ignition (without Impulse Coupling) not using Indicator Card. Set timing arm as directed in paragraph above, remove distributor plate, rotate magneto shaft in direction of rotation until breaker contacts just begin to open. Replace distributor plate and couple magneto to engine.

Variable Ignition (with Impulse Coupling). Set timing arm in full advance position (move lever to limit of travel in direction opposite to regular rotation of magneto). Turn impulse coupling in direction opposite to regular rotation until red mark on impulse member lines up with arrow on arrester plate (first magnetos), or mark on housing directly above shaft (later magnetos).



TIMING (MJC4A, MJC6A):—Note. Distributor gear is mounted on distributor plate and removal of distributor plate will disturb gear mesh. Distributor gear must be properly meshed with rotor gear or "timed" when distributor plate is replaced as follows:

Distributor Plate Installation & Distributor Gear Timing. Turn engine over to firing position of #1 piston (see timing directions below). Take out base mounting screws and remove magneto from engine, being careful not to disturb position of engine drive coupling. Rotate magneto rotor shaft in opposite direction from regular rotation until marked tooth on rotor gear points straight up toward coil. Install distributor gear in distributor plate and turn gear until dot on gear points down and is centered in observation window on distributor plate. See that gasket is in place on magneto housing, install distributor plate on housing so that mark on distributor gear is lined up with marked tooth on rotor gear. Use extreme care to engage dowel pins on magneto frame in holes in distributor plate without forcing plate in position, tighten four mounting screws carefully. Rotate rotor shaft in direction opposite to regular rotation until arrow on distributor gear is visible in observation window. Install magneto on engine and install coupling, being careful not to change relative positions of rotor shaft and crankshaft. Magneto will be timed to engine and upper right hand high tension terminal should be connected to the spark plug in cylinder #1 (on MJC6A magnetos for counter-clockwise rotation, connect upper left hand terminal to #1 spark plug). Connect remaining spark plugs in accordance with firing order of engine.

CAUTION—On all magnetos with variable timing range, holes in "U" shaped timing lever within distributor plate must be properly engaged with studs on breaker assembly when distributor plate is installed. If timing lever not properly engaged, lever will contact distributor gear in extreme end positions and will cause stripping of distributor gear teeth. Check timing lever engagement by moving lever through entire range and turning rotor shaft by hand at the same time to determine if lever is striking distributor gear teeth.

Timing Engine—Turn engine crankshaft until piston #1 reaches firing position for retarded or advanced spark (usually indicated on flywheel by mark "IGN", "SPK.#1"etc.—see engine manufacturers recommendations). Then turn magneto to firing position (see special directions below), couple magneto to engine, being careful not to disturb relative position of rotor shaft and crankshaft. Connect upper right hand terminal on distributor plate to #1 spark plug (except on MJC6A counter-clockwise magnetos on which upper left hand terminal should be connected to #1 spark plug), connect remaining spark plugs in accordance with firing order of engine.

All Magnetos where Engine Coupling not disturbed. With magneto off engine, rotate rotor shaft in direction opposite to regular rotation until arrow on distributor gear is visible in observation window on distributor plate. Mount magneto on engine an connect engine coupling, being careful not to disturb position of rotor shaft.

Magnetos with Impulse Coupling when Engine Coupling disturbed. If adjustable driving member of magneto coupling on engine shaft has been disturbed, make certain that crankshaft turned to firing position of #1 cylinder, loosen keyed hub nut of adjustable driving member so that coupling flange may be freely moved. Remove distributor plate on magneto, mount magneto loosely on engine with fibre driving disc in place between driving member and impulse coupling. Rotate magneto rotor shaft in direction opposite to regular rotation until breaker contacts open and then close, then rotate rotor shaft in regular direction of rotation until contacts just begin to open. Securely fasten engine drive member in this position by tightening keyed hub nut, being careful not to move rotor shaft. Remove magneto from engine, install distributor plate (see directions on "Distributor Plate Installation and Distributor Gear Timing"

above) and see that timing lever is properly engaged on breaker plate studs (variable timing type magnetos). Install magneto on engine and engage coupling, making certain that rotor shaft is turned so that arrow on distributor gear is visible in observation window on distributor plate.

Rotor Position when Contacts Open. See "Edge Distance Setting" under Adjustment below for directions on checking and adjusting rotor for correct position when contacts open.

BREAKER CONTACTS:—Contact Gap. Should be .014-.016" (.35-.40 MM.).

Contact Gap Adjustment. Loosen lockscrew on stationary contact mounting bracket, shift bracket by turning eccentric adjusting screw (this eccentric screw not used on MJC1A). Tighten lockscrew securely.

Contact Servicing. See that contacts are free from oil and grease and are properly aligned so that full surfaces of both contacts meet squarely. Contacts are tungsten and may be filed or cleaned with a stone. NOTE—Manufacturer recommends tool SA-69526 (file and stone) for this purpose. Always replace stationary contact and breaker arm and contact assembly as a unit. Coat breaker arm fibre bumper block lightly with US505 grease.

LUBRICATION:—Rotor shaft ball bearings are packed with US-505 high temperature grease and require repacking at intervals of 12 months or longer. Distributor gear shaft is hollow and should be filled with US-505 grease (grease is fed out through small hole in shaft to bearing). Cam lubricator is packed with US-505 grease and needs replenishing only when magneto is serviced. NOTE—Cam oiler on MJC1A should be packed with heavy oil or Mobile No. 3 lubricant.

CHANGING MAGNETO ROTATION (MJC1A):—Take out attaching screws and remove distributor plate. On Fixed Ignition Types, loosen breaker assembly fastening screws, shift breaker assembly counter-clockwise (for counter-clockwise rotation), clockwise (for clockwise rotation) until stop pin is at opposite (trailing) end of slot in breaker plate, retighten breaker assembly fastening screws. On Variable Ignition Types (20° Timing Range), take out attaching screws, remove breaker plate assembly and replace with correct unit for desired rotation (IN-529 for counter-clockwise, IN-5210 for clockwise rotation), retighten attaching screws. Check and adjust Edge Distance (see "Edge Distance Setting" under Adjustment below), change direction arrow and type designation on magneto nameplate.

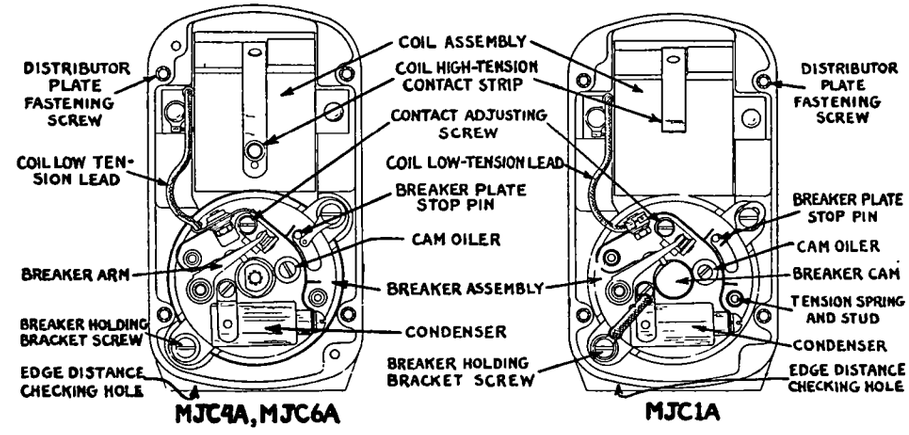
Impulse Coupling Note. If magneto fitted with impulse coupling, this must be changed over for opposite rotation or replaced with unit for new rotation when magneto rotation is changed.

CHANGING MAGNETO ROTATION (MJC4A, MJC6A):—To change magneto for rotation in opposite direction, disassemble, replace necessary parts, and make adjustments when reassembling as directed below. NOTE—If Impulse Coupling used, this must be changed over for opposite rotation or replaced with unit for new rotation when magneto rotation is changed.

Disassembly. Take out attaching screws, remove distributor plate and distributor gear assembly. Remove rotor shaft gear fastening screw, plain washer and lockwasher, remove gear with tool #425. Take out breaker assembly holding bracket fastening screw, plain washer and lockwasher, remove breaker assembly holding bracket and breaker assembly. Withdraw rotor assembly from housing.

New Parts. Correct Rotor Assembly, Rotor Shaft Gear, and Breaker Assembly (20° Timing Range Variable Ignition Types only) must be installed for each rotation as listed below. NOTE—On Fixed Ignition types, same Breaker Assembly is used for rotation in both directions, breaker assembly need be changed only on Variable Ignition Types.

Magneto Parts	Clockwise Rotation	Counter-clockwise Rotation
Rotor Assembly①	RT-5216	RT-5215
Rotor Gear①	GE-5213	GE-5216
Breaker Assembly②	IN-528	IN-527



①—All Magnetos (Fixed Ignition & 20° Range Variable Ignition Types).
②—20° Range Variable Ignition Types only (unchanged for Fixed Ignition)

Reassembly. Install correct rotor assembly (see list above), breaker assembly holding bracket, breaker assembly (on Variable Ignition models, install correct breaker assembly as noted in list above), tighten breaker assembly fastening screws securely. On Fixed Ignition Types only, rotate breaker assembly counter-clockwise (for counter-clockwise rotation), clockwise (for clockwise rotation) as far as possible so that stop pin is at trailing end of breaker plate slot before tightening fastening screws. Install rotor shaft gear (see list above for correct type), plain washer, lockwasher, tighten fastening screw securely. Check and adjust edge distance (see "Edge Distance Setting" under Adjustment below), check contact gap. Change type designation and direction arrow on nameplate (necessary to prevent confusion when timing magneto). Install distributor gear and distributor plate (see "Distributor Plate Installation and Distributor Gear Timing" under Timing above).

ADJUSTMENT:—Edge Distance Setting. To check, remove setscrew (MJC4A, MJC6A), felt plug (MJC1A) in edge distance checking hole in magneto base, fully advance timing lever (Variable Ignition Types), turn rotor shaft in direction of rotation until breaker contacts just begin to open (remove distributor plate to check contact opening), check clearance between edge of rotor and side of housing which should be 3 MM. (plus or minus .5 MM.). Use 3 MM. edge distance gauge (Tool #415) to make this check. To adjust, insert the 3 MM. edge distance gauge through hole in base plate, turn rotor in regular direction of rotation until it is against the gauge, adjust breaker assembly holding bracket so that contacts are just opening. Replace setscrew or felt plug to seal checking hole in base plate. NOTE—See "Distributor Plate Installation and Distributor Gear Timing" under Timing (above) for distributor plate installation on MJC4A, MJC6A.

SERVICING:—Recharging Magnets. Magnets can be charged by placing entire magneto in charger by using special jaws SE-524 in conjunction with magnetizer service tool EF-1161 or EF-1180. Turn rotor shaft so that keyways in shaft is toward left (facing drive end of magneto).

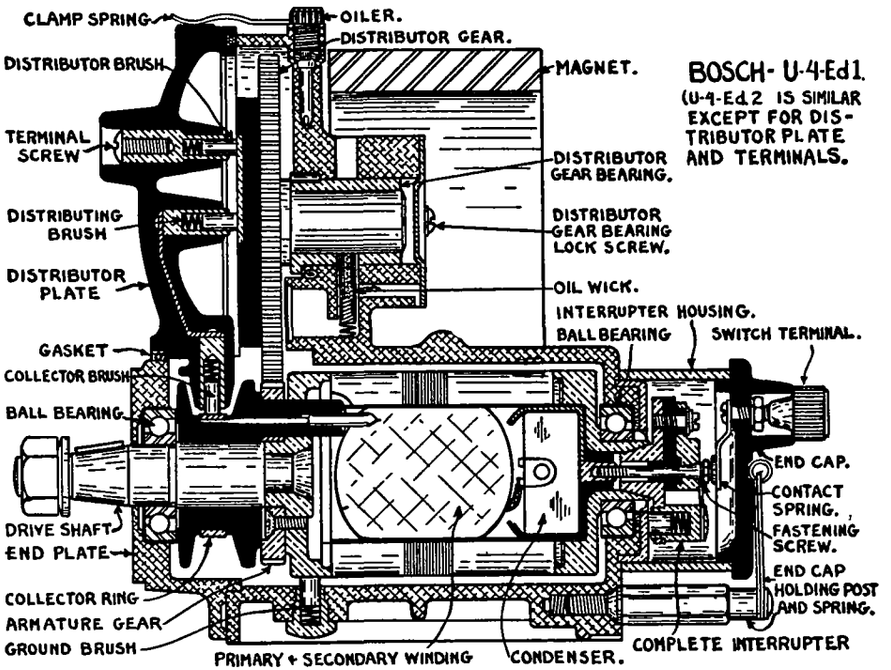
Rotor Bearing Replacement (All MJC Models). Same bearings used on other MJ magnetos. See preceding article on MJA, MJB Magnetos for complete bearing installation instructions.

DESCRIPTION:—This magneto is of the high tension, rotating armature type and has been developed for high speed, heavy duty engines and also for heavy duty, slow speed work. For this latter type engine, an Ed. 4 impulse coupling may be installed. The U-4, Ed. 1 type is equipped with screw terminals while the U-4, Ed. 2 has sleeve terminals. In all other respects the two types are identical.

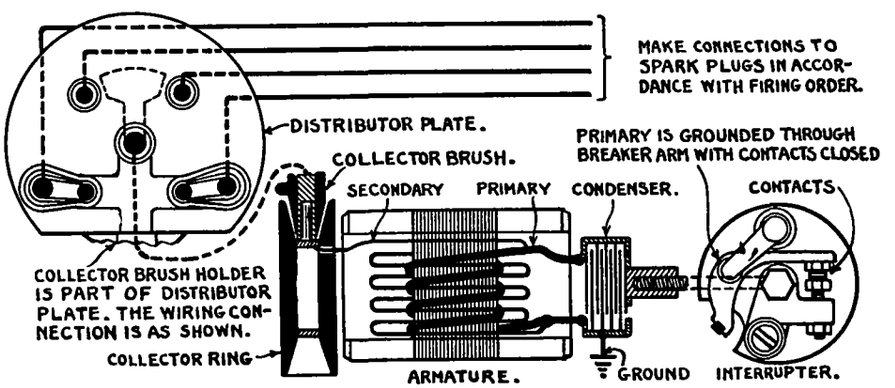
ROTATION:—Magnetos are furnished for both clockwise and counter-clockwise rotation (viewed from the drive end). The direction of rotation of a particular magneto is indicated by an arrow stamped on the lower part of the shaft end plate. In order to change the direction of rotation it will be necessary to replace the interrupter assembly with the unit designed for the opposite rotation and to change the position of the distributor disc on the distributor gear. The distributing segment is mounted in a hard rubber block which is held on the face of the distributor gear by two screws. Holes are provided for two separate positions. For clockwise rotation the disc must be mounted so that one screw is in the hole marked 'C' on the gear. For counter-clockwise rotation the screw must be inserted in the hole marked 'A'.

BREAKER:—The breaker or interrupter is mounted on the end of the armature shaft. The contact assembly and interrupter arm rotate with the armature while the cam ring and cam segments are stationary. The spark is advanced or retarded by rotating the cam ring. Interrupter contacts are made of platinum. They should separate .4 millimeter or approximately 1/64 inch with the interrupter arm on the high point of the cam segment. Set contact gap by loosening lock screw and turning up stationary contact mounting stud. Resurface contacts when necessary with worn No. 00 sandpaper or a fine flat contact file. Do not use emery cloth.

TIMING:—Crank engine over until piston No. 1 reaches firing position with spark fully retarded. (See manufacturer's specifications.) Mount magneto on engine and turn armature until contacts begin to separate with the spark lever fully retarded. Couple magneto to engine, being careful not to change position of crankshaft or magneto shaft.



The magneto is fitted with a spark advance range of 25-35 degrees. It can be used with fixed ignition if desired. The distributor gear and armature gear are marked and must be correctly assembled to insure correct position of the distributor segment when the contacts open. One tooth of the armature gear is beveled. This should be meshed with the distributor gear tooth marked by a punch mark.



OILING:—The armature shaft is carried on ball bearings which are packed in grease and require no oil. The distributor gear shaft is carried on a plain bushing and is fitted with an oil hole at the top of the magneto. Put 2 or 3 drops of light machine oil in this oiler every 500 miles of operation.

SPARK PLUGS:—Spark plug gaps should be correctly set. This will depend on the type of engine used and in general should be .020-.025 inch. A safety spark gap consisting of a pointed screw extending through the shaft end plate to within a short distance of the collector ring is provided. This will protect the windings if the plug gaps are too wide or if cables become disconnected. The current should not be allowed to jump across the safety gap for any length of time and the ignition system should be checked whenever this occurs.

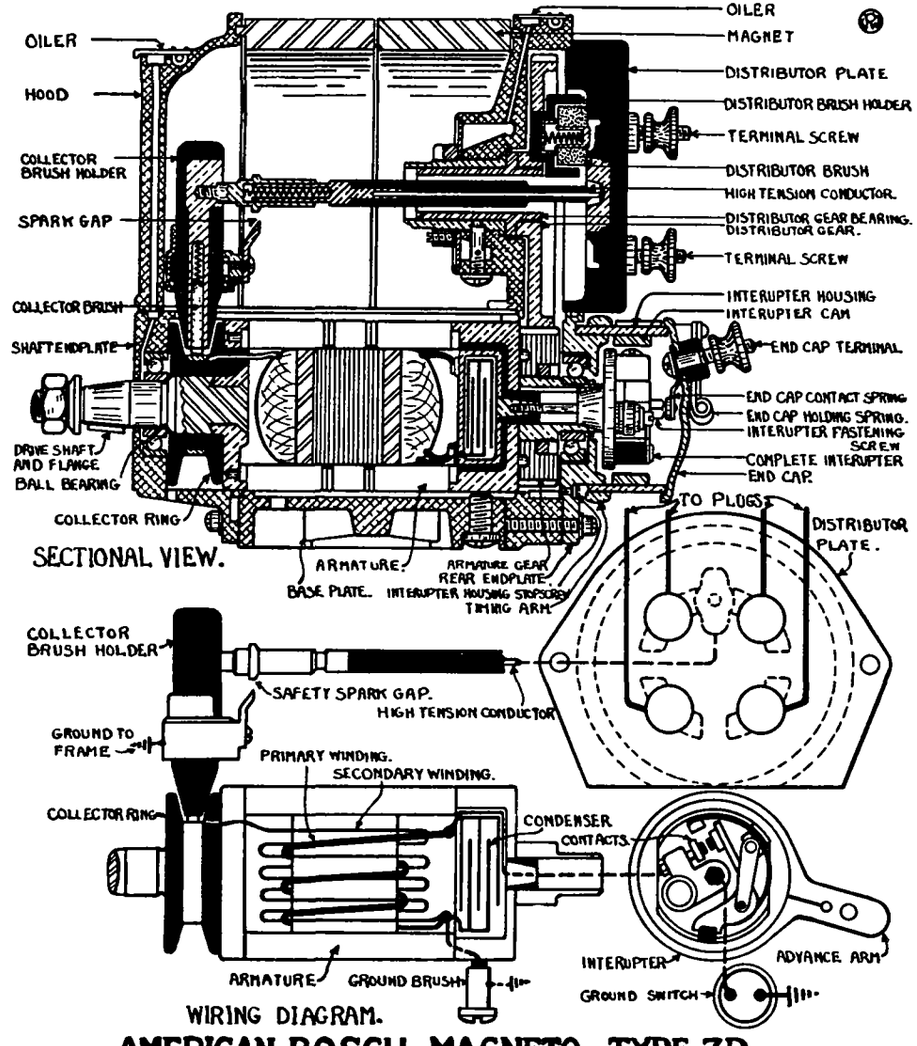
SERVICING:—The magneto is very simple in design and can be disassembled without difficulty. Disassemble in the following order: (1) Remove ground brush from under plug in base plate. (2) Swing spring on holding post to one side, remove end cap, remove interrupter housing. Then remove interrupter assembly using special Tool No. 339 to first take out interrupter fastening srcew. (3) Press the holding screws to one side and remove distributor plate. Be careful not to damage collector brush which is carried on the lower end of the plate. (4) Carefully pull the distributor gear and armature assembly out together.

In reassembling the magneto be careful to properly mesh the gears (see Timing). Make certain that the oil wick does not interfere with the distributor gear shaft. If the gears are replaced it will be necessary to see that they are properly meshed. The gear mesh is adjustable by turning the distributor gear bushing slightly. This bushing is slightly eccentric and turning it will raise or lower the distributor gear. It is held in place by the distributor gear bearing lock plate which engages in the slot in the end of the bearing. The lock plate is slotted for two mounting screws to retain the bearing position.

DESCRIPTION:—The Bosch Magneto Type ZR is of the high tension armature type. Two magnets are mounted above the armature and the end plates completely enclose all working parts. A safety spark gap is located above the armature under the magnets. The Type ZR magneto can be used with a Bosch Duplex Vibrating ignition coil to provide dual battery and magneto ignition. The Type ZR-4 magneto should be driven at crankshaft speed on four cylinder four cycle engines. The Type ZR-6 magneto must be driven at one and one half crankshaft speed on six cylinder four cycle engines. The direction in which magneto should be driven is stamped on the frame.

OILING:—Put 2 or 3 drops of light machine oil in the oiler at each end of the magneto every 500 miles of operation. Do not oil the interrupter. Examine interrupter occasionally and wipe off all oil and dirt.

BREAKER:—Breaker or interrupter contacts separate .4 millimeter or 1/64 inch with interrupter arm on highest point of cam. At this point the fiber bumper of the interrupter arm will be in the center of the steel segment of the cam ring. Set contact gap by turning armature shaft until fiber bumper is on highest point of cam. Then loosen lock nut on stationary contact stud and turn contact until proper gap is secured. Tighten the lock nut. Contacts are made of platinum. Resurface contacts with worn No. 00 sandpaper or with a fine flat jeweler's file. Do not use emery cloth.



TIMING:—Crank engine until crankshaft reaches proper position for piston in No. 1 cylinder with manual advance lever fully retarded. See manufacturers' specifications as given on specific car data sheets in the National Manual. Fully retard magneto advance arm and turn magneto in direction of rotation until contacts begin to separate when the fiber bumper of the interrupter arm reaches the steel segment in the cam ring. Make certain that magneto is firmly bolted to base mounting and couple drive shaft to engine without disturbing either crankshaft or magneto armature shaft. Remove distributor cover and note position of distributor brush. Connect the segment directly over the brush to the spark plug in cylinder No. 1 and connect remaining plugs in proper firing order around the distributor plate in a direction opposite to rotation of the interrupter.

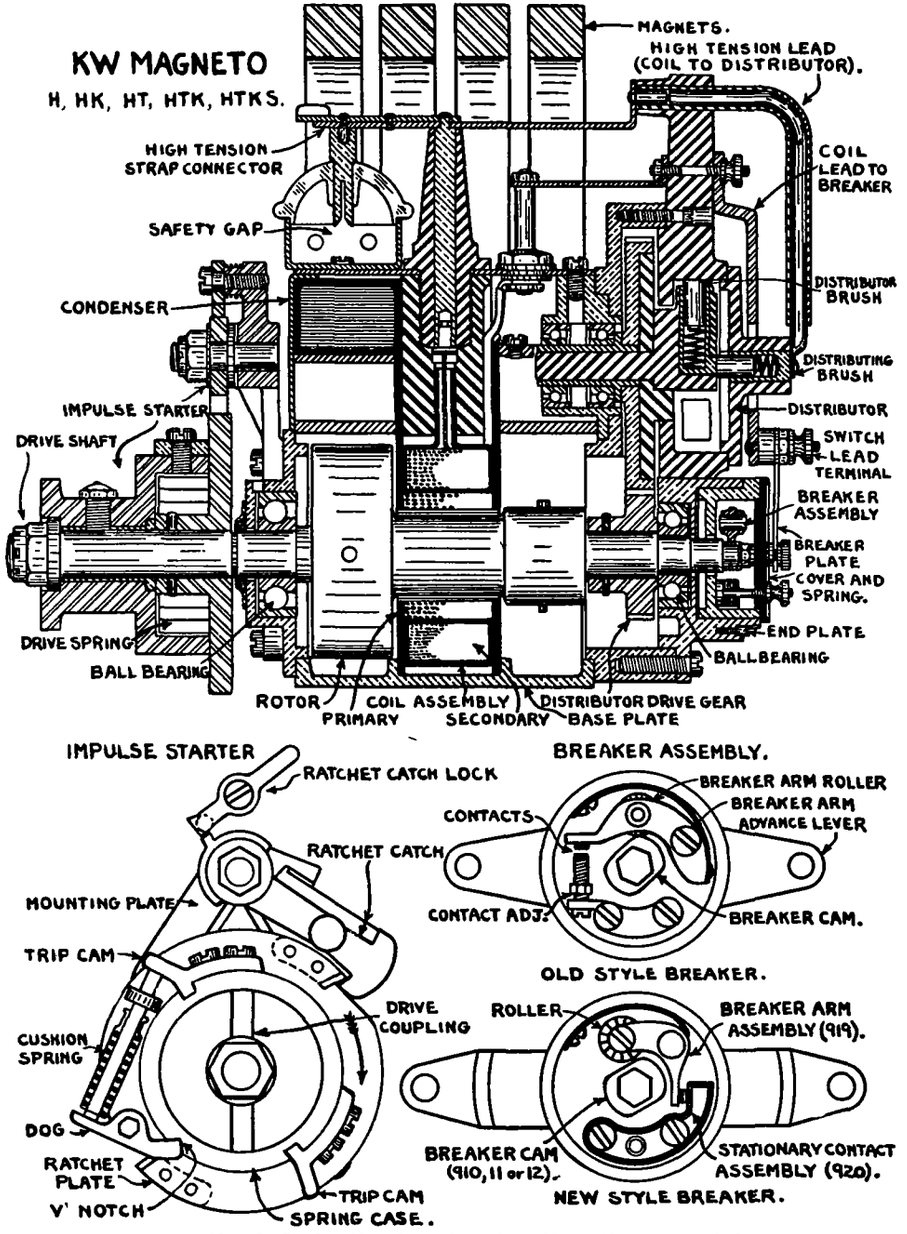
When manufacturers' specifications are not available, the engine may be timed to fire with piston on top dead center entering power stroke with full retard. Crank engine over until piston No. 1 enters compression stroke (the upstroke with both valves closed). Then continue to crank engine slowly noting dead center on flywheel or checking piston travel with a wire inserted in spark plug port until the piston reaches top dead center. Then connect magneto as directed above.

Timing Magneto with Impulse Coupling:—Turn magneto in direction of rotation until coupling is released from arrester plate. This point will be after proper firing position since impulse coupling will spin magneto over firing position. Then turn magneto backward in direction opposite to rotation until the breaker contacts open and begin to close as fiber bumper passes off steel segment in cam ring. This is the correct firing position and the magneto can then be coupled to the engine.

SPARK PLUG GAPS:—Spark plug gaps must be set at .020 or 1/50 inch. It is important that the gap be set at this figure. If spark plug gap is too wide engine will miss at low speeds and will be difficult to start. A safety spark gap is located above the armature. If spark jumps safety gap frequently check magneto and spark plugs to locate trouble.

TROUBLE SHOOTING:—Engine Misses on One Cylinder:—Check spark plugs for correct gap. Check spark plug in missing cylinder for short circuit due to fouling or cracked insulator. Check for chafed or burnt insulation on cable. Check distributor plate for dirty distributor track or segment.

AMERICAN BOSCH MAGNETO - TYPE ZR.



Irregular Firing on All Cylinders:—Check interrupter contacts and set gap. Resurface contacts if necessary. Tighten fastening screw in center of interrupter plate. Check ground brush under armature in base plate. Check collector brush and collector ring. Check distributor plate and wipe out with a clean rag moistened with gasoline if dirty or gummed with oil.

DESCRIPTION:—These magnetos are designed for large, heavy duty stationary engines. They are of standard KW design and are of the inductor type with stationary magnets and coil and rotating inductors. There are two inductors set at right angles and mounted on the ends of the rotating shaft. The coil is wound concentrically around the shaft between the two inductors. The magnetic field is completed from the magnet pole piece through the inductor and the shaft which forms the coil core to the other inductor and through it to the opposite magnet pole piece. The rotation of the inductors breaks the magnetic field and then reverses it, causing an interruption and reversal of the magnetic flux. This generates a current in the coil primary which is interrupted when the primary circuit is broken by the opening of the interrupter contacts. This generates a high tension current in the secondary which is distributed to the spark plugs through a conventional distributor mounted on the breaker end of the magneto. These magnetos are designed for 2, 3, 4 and 6 cylinder engines. The Type H has four permanent magnets and is designed for use on engines operating at speeds above 300 R.P.M. When fitted with an Impulse Starter it is known as Type HK. The Type HT has five permanent magnets and should be used on engines operating at speeds under 300 R.P.M. as it produces a hot spark at speeds as low as 30 R.P.M. An Impulse Starter can be fitted in which case the magneto is known as Type HTK. The Type HTKS is designed for exceptionally heavy duty single cylinder engines. It is fitted with an Impulse Starter and the interrupter cam is driven at one half inductor shaft speed. This means that the magneto must be driven at twice engine speed on two cycle engines.

ROTATION:—The magneto as supplied by the manufacturer is designed for rotation in the direction indicated by the arrow on the bearing cap on the drive end or on the Impulse Starter. The magneto can be set so that it can be driven in the opposite direction but no provision is made to change rotation of Impulse Starters. If it is desired to change the rotation on a magneto equipped with an Impulse Starter, it will be necessary to remove the Impulse Starter and replace it with a similar unit designed for opposite rotation. To change the direction of rotation, remove the interrupter housing cover and take off the interrupter cam on the end of the shaft. The cam is stamped 'L' for left hand or counter-clockwise rotation on one side, and 'R' for right hand or clockwise rotation on the reverse side. Replace the cam with the letter indicating the desired rotation facing out. Then remove distributor block which will expose the moulded distributor and segment. Remove the three screws and replace in the other three holes in the distributor gear. This completes the operation.

MOUNTING:—Magnetos are fitted with a brass base and may be mounted directly on the magneto bracket on the crankcase. Base mounting screws should not enter the holes in the magneto base plate more than ⅜ inch or they will break through and strike the rotor. If desired the magneto can be mounted at an angle. If a mounting strap is used this must be of brass or non-magnetic material.

BREAKER:—The breaker or interrupter assembly is mounted on the end of the magneto frame. The cam is mounted on the rotor shaft and revolves while the contacts and interrupter lever are stationary. Contacts should separate 1/64 inch. On the old style breakers with roller located in center of breaker arm, adjust contacts by loosening lock nut on stationary contact mounting stud and turning up stud until gap is correct with breaker arm roller on the high point of the cam. This type breaker is no longer used and is not furnished for service. The new style Parts 920 (stationary contact assembly) and 919 (breaker arm assembly) should be used. The old steel cam cannot be used with the new assembly and the cam should be replaced with a new unit of similar design. These are Parts Nos. 910 (one point cam), 911 (two point cam), 912 (four point cam). To install the new type breaker, remove breaker housing from magneto and completely disassemble all parts. Then

file or scrape the hole in the housing to allow the new style cam to pass freely. Install the stationary contact assembly (920) carefully insulating it at all points from the housing. A new composition insulator to be placed

under the block is furnished and the rubber bushings should be slipped over the two mounting screws and the fibre washers placed under the screw heads. The contacts spring plunger and spring must be in place before the block is mounted. These parts fit the new block without change. Then install breaker arm assembly. The spring must be properly hooked on the breaker arm and the other end fastened to the housing by the mounting screw. The breaker arm pivot screw should be tightened just enough so that arm moves freely and the lock washer and lock nut on the back of the housing should be tightened. Remove the old cam from the rotor shaft and replace with new cam. Check to see that the proper letter on the face of the cam points outward (see Rotation). To set contact opening, loosen screw in eccentric roller at end of breaker arm and rotate roller slightly until the correct gap is secured with the roller on the high point of the cam. The gap should be 1/64 inch. Then tighten screw to hold adjustment.

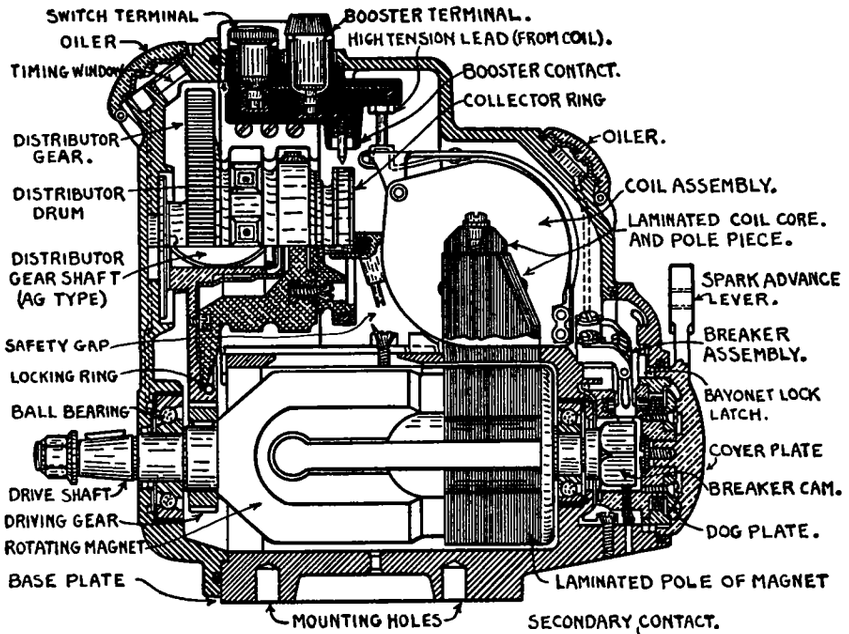
TIMING:—The firing position of the engine will depend largely on the speed at which it operates and the type of the engine. Manufacturer's specifications should be followed whenever available. In general the engine should be cranked over until piston No. 1 reaches top dead center entering power stroke. Then turn magneto shaft until the distributor brush is on the lower left hand segment and the breaker contacts are beginning to open as the breaker arm roller reaches the leading edge of the high point of the breaker cam. The spark control lever should be advanced one half or in a horizontal position if the engine operates at speeds below 700 R.P.M., or fully retarded (by being moved as far as possible in the direction of rotation) for engines running at higher speeds. This will allow low speed engines to be started with the spark retarded past top dead center if necessary. Then couple the magneto shaft to the engine without disturbing the relative positions of the magneto or the engine crankshaft. Sonnect the terminal at the left of the distributor block to the spark plug in cylinder No. 1 and connect the remaining spark plugs in accordance with the firing order of the engine.

Timing Magnetos with Impulse Starters:—The Models HK and HTK Magnetos equipped with Impulse Starters can be timed to the engine exactly as directed above if the ratchet catch is locked out of engagement in the ratchet by the ratchet catch lock. This will render the Impulse Starter inoperative and the shaft can be turned as though the coupling were rigid. It is possible to time the magneto by using the Impulse Starter without reference to the contacts. Turn the magneto shaft until the distributor is opposite No. 1 segment. Then turn the starter case or coupling member until the cam on the case is under the center of the roller on the ratchet case. This is the position at which the Impulse Starter would ordinarily be tripped. Then turn the engine over until piston No. 1 is slightly past top dead center entering power stroke and couple the magneto to the engine.

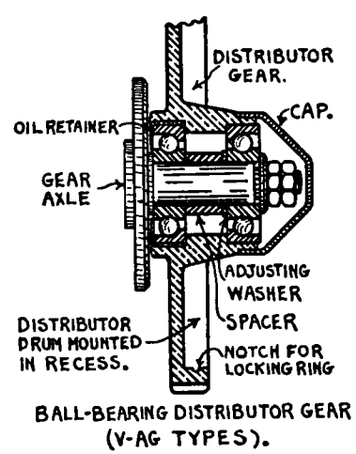
Timing Model HTKS:—See that Impulse Starter is out of engagement with ratchet catch locked by ratchet catch lock. Turn engine over until piston reaches top dead center entering power stroke (on two cycle engines it is only necessary to set piston at top dead center since every stroke is a power stroke). Place spark control lever in a horizontal position which is midway between full advance and full retard. Turn magneto shaft until breaker contacts are beginning to open. Couple the magneto to the engine in this position. This will provide 15 degrees advance before top dead center and 15 degrees retard after top dead center, since the timing range of the lever is 30 degrees.

SPARK PLUGS:—Spark plug gaps should be 1/64 or approximately .016 inch.

OILING:—The oiler at the top of the distributor block oils both the distributor shaft and rotor breaker end bearing. The oiler at the opposite end oils the drive end rotor bearing. Put a few drops of light oil in each of the oilers every month. Examine the breaker housing and see that breaker contacts are clean and free from oil.

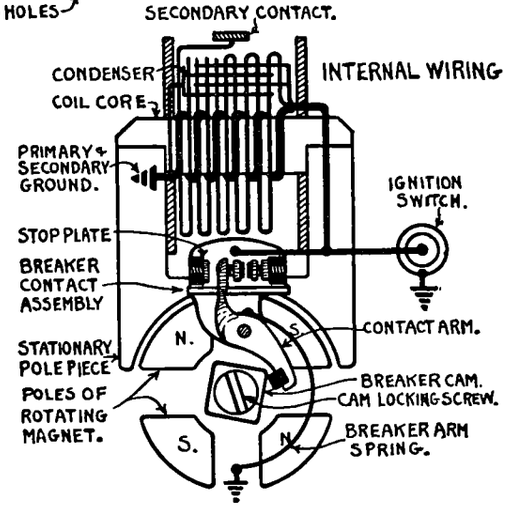


IMPULSE STARTER:—The Impulse Starter designed for these models is of the manually operated semi-enclosed type. See illustration. The magneto shaft is coupled to the ratchet plate by means of a nut on the end of the shaft. This nut is visible in the center of the coupling. The magneto half of the coupling rotates on the magneto shaft and is fastened to it only through a driving spring. When the ratchet catch lock is released, the ratchet catch drops down and engages the slot in the edge of the ratchet plate. This prevents the ratchet plate and magneto shaft from turning and as the coupling is rotated in cranking the engine, the spring inside the starter case or coupling is compressed. When the engine reaches firing position the cam on the outside of the case trips the ratchet catch and the spring rotates the ratchet plate and magneto shaft at high speeds, producing a hot spark. The ratchet catch then drops down and engages the next point on the ratchet plate and the operation is repeated. This continues until the speed of the magneto is sufficient to throw the ratchet catch out with sufficient force to cause it to be locked out by the ratchet catch lock. The magneto is then driven exactly as though connected by a solid coupling. It is necessary to release the ratchet catch whenever the engine is cranked.



Servicing Impulse Starter:—The only service operation likely to be necessary will be to replace the Impulse Starter driving spring. To replace spring, perform the following operations in order: First, remove the cushion spring assembly and dog on ratchet without disurbing the flattened stud which acts as a guide for the cushion spring sleeve. Take off the dog and the two trip cams on the spring case. Then take off nut on magneto shaft (in center of coupling) and pull starter spring case off shaft. Assemble the new spring on the ratchet plate and place the inner end of the spring in the notch on the ratchet plate sleeve on the shaft. The spring must be put in place so that when compressed it will tend to drive the magneto shaft in the direction of rotation. Place the outer end of the spring in the notch in the starter spring case. There are two notches, one to the left and one to the right of the 'V' notch on the outside of the case in which the dog engages. On clockwise magnetos the spring should be inserted in the notch at the left of the 'V' notch and for counter-clockwise rotation the spring should be inserted in the notch at the right of the 'V' notch. In each case the spring end is inserted in the notch furthest from the 'V' notch against the direction of rotation. It will not be possible to seat the spring end in the notch until the spring is wound up one turn by turning the spring case. Seat the spring end and then push the spring case in place. Put on the shaft nut to hold the spring case in place. Then trip the ratchet catch and wind up the spring slightly more than one turn. Mount the cam which has just passed the flat stud on the ratchet which holds the cushion spring. Replace the cushion spring assembly and the other cam and the Impulse Starter is ready for operation.

TYPES AG-8-D, AG-9-D, AG-12-D



DESCRIPTION:—These models are Aircraft Magnetos. They are similar to other Scintilla Magnetos in being of the inductor type with rotating magnets and stationary coil. The rotating magnet has four poles and revolves within two laminated field poles. The coil is wound on a laminated core which is mounted directly on the upper ends of the pole pieces so that the magnetic field of the permanent magnets is completed through the coil core. The magnetic flux through the coil is reversed every time one of the poles of the magnet passes the pole piece, or four times in each revolution of the magnets. The magneto thus produces four sparks per revolution of the drive shaft. The interrupter cam is mounted on the end of the magnet shaft. The contacts and interrupter assembly are rigidly mounted on the breaker cage. The stationary contact is mounted on an insulated bracket at the top of the breaker cage. A bayonet lock and flat spiral bayonet lock spring are assembled on the breaker cage to hold the breaker assembly in the fully advanced position except when the magneto is retarded for starting by means of the timing lever. The advance lever is assembled in the end cover and is held in place by a central screw which is screwed in the end boss of the end cover. There are two dogs on the advance lever which engage in holes in the dog plate on the breaker cage assembly and permit a number of positions of the advance lever. A distributor drum is mounted directly above the rotating magnet and is driven by a distributor gear at one-half magnet speed. The high tension current is led from the coil through a carbon brush to the distributor drum terminals from which it is distributed to the spark plugs. The magneto is equipped for a 'booster' starting system. See paragraph on 'Booster'.

ROTATION:—The direction of rotation in which the magneto is designed to be driven is indicated by the arrow in the small disk on the frame at the distributor end of the magneto. The direction of rotation can be changed although this requires an almost complete disassembly of the magneto and the adjustment of the various parts. To change rotation, disassemble the magneto and pull the breaker cam. There are two keyways on the shaft marked 'D' for clockwise rotation and 'G' for counter-clockwise rotation. Place the woodruff key in the proper keyway, replace cam and pull cam fastening screw up tight. Then remove distributor cylinder and large distributor gear. The small dog screw in the face of the gear should be inserted in the hole marked 'D' for clockwise rotation and in the hole marked by 'G within a circle' for counter-clockwise rotation. The hole marked 'G without a circle' is only used for counter-clockwise rotation when no booster connection is fitted. Replace distributor gear and distributor cylinder. Take off the collector ring for booster current. There are two holes on the collector ring marked 'D' for clockwise rotation and 'G' for counter-clockwise rotation. The fastening screw should be inserted in the proper hole and this should line up with the line on the face of the distributor cylinder. Then remove cover and advance lever essembly. Unscrew dog plate fastening screws on breaker cage and remove dog plate. Carefully lift off bayonet lock latch and spring from breaker cage. Remove bayonet lock spring, turn spring over and replace. Remove breaker lever axle and breaker lever. Then take out stationary contact screw and fibre stop and interchange. Reverse breaker lever and replace so that contacts match up. Screw the breaker lever axle in and lock threaded end to breaker cage. Replace bayonet lock latch and spring and check to see that both ends of the spring are secured. Replace dog plate and dog plate screws, locking the screw heads to the dog plate. Mesh large distributor gear tooth marked 'D' with marked tooth of small gear for clockwise rotation and fasten end plate in place on housing. Replace contact assembly and rotate magnet until the number 'T' on the distributor gear appears in the opening for the timing window in the end plate and the contacts are just beginning to open. Replace the timing window so that the white line is directly above the mark on the distributor gear opposite the figure 'T' for clockwise rotation. This completes the change in rotation although it will be necessary to mark the end plate with new timing marks to correspond to the timing marks on the distributor gear; change the rotation indicating arrow to indicate the new rotation and to change the number discs to indicate the new order of cable connections (these will not be the same). This entire operation is so intricate and requires so much care to insure the proper assembly of all units that the Scintilla Magneto Company recommends that the magneto be returned to the factory whenever it is necessary for the rotation to be changed. It should be attempted only as an emergency measure.

BALL-BEARING DISTRIBUTOR GEAR (V-AG TYPES).

BREAKER:—The breaker assembly is stationary while the breaker cam revolves

with the magnet shaft. Contacts separate .012 inch. Set contact gap by loosening lock nut on stationary contact mounting stud and turning up stud until correct gap is secured with breaker lever on the high point of the cam. Resurface contacts when necessary with a fine flat contact file. The clearance between the breaker lever and the fibre stop on the contact support directly behind the contact end of the breaker lever must be not less than .002 inch with the contacts fully open. If necessary the fibre stop can be filed to secure this clearance although if this is done care must be used to see that the breaker lever bears against the entire face of the stop when the breaker lever is pressed back against it.

OILING:—There is an oiler with a hinged cover at each end of the magneto. The oiler at the drive end has two holes. Put 30 to 40 drops of oil in the drive end oilers when oil should appear at the overflow hole about one inch below the oil hole cover. One of these oil holes oils the drive end bearing while the other oils the distributor shaft on the AG models. This second oil hole is not used on the V-AG models with ball bearing distributor shaft. The oiler at the breaker end oils the other magnet shaft ball bearing. This oiler should be given 3 to 5 drops of oil. Any excess is to be avoided as it will work out in the breaker case. The wick at the bottom of the breaker cage should be saturated with heavy oil. The oiling should be done every 10 hours of operation.

TIMING:—The magneto should be mounted on the engine bracket with base cap screws which extend into the holes in the magneto base plate 7/16 to ½ inch. This is very important. Locating dowel pins are also used. These should be a snug fit in the magneto base. With magneto on base and magneto half of drive coupling locked in place, crank engine over until firing position of piston No. 1 with spark fully advanced is reached. The manufacturer's specifications must be followed. Then carefully turn magneto shaft in the direction of rotation until No. 1 can be seen in the timing window. The line opposite the 'I' mark should coincide with the mark on the timing window when the contacts are just opening. If no timing window is used, remove the distributor gear cover and line up the supplementary marks on the distributor gear and the end plate. Couple the magneto to the engine in this position and connect the terminal marked No. 1 to the spark plug in No. 1 cylinder. The remaining magneto terminals should be connected in numerical order to the spark plugs in accordance with the firing order of the engine.

SPARK PLUGS:—The spark plug gap will depend entirely on the type of engine on which the magneto is used. The manufacturer's specifications should be followed. The magneto is fitted with a safety gap in which the spark jumps from an extension of the high tension brush assembly to a ground screw on the frame. This gap is set at ⅜-½ inch.

BOOSTER STARTING:—The magnetos of this series are equipped for use with booster current to assist in starting. This consists of an extra terminal on the top of the frame marked 'H' to which a supplementary high tension current source is connected. This will normally be a small hand magneto which is turned over at speed by the operator during the cranking operation. This booster current jumps from the terminal screw to the booster collector ring on the end of the distributor drum from which it is led to auxiliary terminals on the distributor drum directly behind the regular terminals. From these terminals the spark jumps to the cable electrodes and is distributed to the spark plugs. Due to the position of the terminals on the drum the booster current will lag behind one cylinder so that when the timing mark for cylinder No. 1 is visible in the timing window the booster current will be distributed to No. 12 cylinder.

TYPES V-AG-8-D, V-AG-9-D, V-AG-12-D

The V-AG Magnetos differ from the AG series only in the mounting of the distributor gear.

On the AG series the distributor gear revolves on a plain bearing carried on an eccentric shaft to permit the adjustment of the distributor gear mesh. This will probably not be required unless one of the gears has been replaced. In this event the fastening screws on the shaft flange should be loosened and the shaft drifted slightly to the right (viewed from the drive end) to raise the large gear or to the left to lower the large gear. The flange mounting screws should then be tightened and locked to the outside face of the end plate.

On the V-AG series the distributor gear is carried on two plain ball bearings. The bearings are packed with grease which is retained by brass caps at each end of the assembly and require no attention between overhauls. The assembly endplay is adjusted by means of a spacer and adjusting washers between the two bearings.

SCINTILLA VERTEX MAGNETO

FORD V-8 TYPE

DESCRIPTION:—This installation consists of an eight cylinder Vertex magneto and a special aluminum adaptor or drive housing which is designed to be bolted on the timing gear cover in place of the regular ignition unit. The magneto and adaptor or drive are furnished as a unit and the ignition will be correctly timed when the unit is installed if the seal (which prevents disassembly of the unit) is not broken. Special tubes for the spark plug leads and mounting brackets are furnished.

SERVICING:—Lubrication and other servicing instructions for this model are the same as for the standard Vertex (see next page). An additianal grease cup is located on the adaptor or drive housing. This cup should also be screwed down once each 1000 miles or 50 hours of operation and refilled with light cup grease.

INSTALLATION:—The engine should be cranked to firing position for piston #1 before the old ignition unit is removed. With engine turned to this position, take off distributor caps, remove cable tubes, take out three capscrews and lift off old ignition unit. Place Vertex unit in position and fasten with the regular capscrews. Check timing by removing distributor head and noting whether mark on breaker cam lines up with mark on oil protection ring around cam. If marks are in line, seal has not been broken and ignition timing is correct. If not, ignition timing must be set as directed above. Install new cable tubes and connect spark plugs as follows:

Top Row of Outlets	To Cylinder	Lower Row of Outlets	To Cylinder
#1	#1	#5	#6
#2	#5	#6	#3
#3	#4	#7	#7
#4	#8	#8	#2

See car page for method used in numbering engine cylinders.

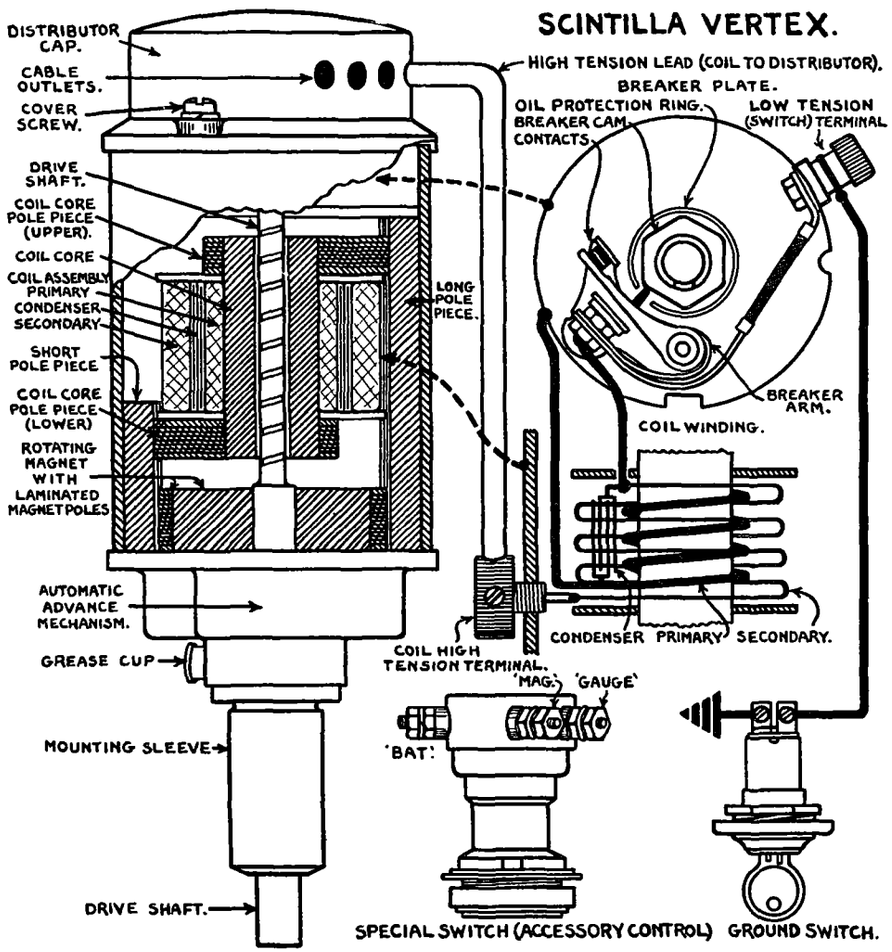
IGNITION SWITCH:—A special switch adaptor is provided which should be used to replace the insulating plate on the under side of the ignition switch (combination ignition switch and steering post lock). The regular ignition lead on the switch (red) can be used to connect the switch terminal 'V' and the low tension terminal 'P' on the Vertex. The 'M' terminal on the switch should be grounded. On cars equipped with the electric oil pressure gauge, the gauge lead should be taken off the switch and connected to the generator side of the cutout relay.

SCINTILLA VERTEX MAGNETO

DESCRIPTION:—The Vertex is an inductor type magneto (stationary coil, rotating magnet) provided with automatic spark advance and designed to replace the battery ignition systems used on car models. The entire assembly (magnet, coil, automatic advance mechanism, breaker and distributor) is contained in a cylindrical case and is fitted with a standard SAE. type mounting on the drive end. It is mounted in place of the battery distributor on the engine (see special section below on Ford type). As with other magnetos, ignition is cut off by grounding the coil primary and in most cases a special switch must be installed for this purpose.

OPERATION:—The rotating magnet with laminated poles is mounted on the vertical shaft directly above the automatic advance mechanism so that the poles of the magnet pass across the lower ends of the pole pieces. The pole pieces are alternately long (connected to upper end of coil core) and short (connected to lower end of coil core) so that the magnetic flux through the coil core is reversed as the magnet pole passes from one pole piece to the next. At the point where the magnetic flux is strongest, the breaker contacts open, interruping the primary current and inducing a high tension current in the secondary winding. The secondary current is fed to the distributor rotor by the lead on the side of the magneto case and is distributed to the correct spark plug. The distributor head (at top of unit) and breaker (directly under distributor head) are similar in design to conventional battery ignition units. The automatic advance unit uses centrifugal weights of the usual design and advances the entire mechanism (magnet, breaker cam, and rotor) in accordance with the engine speed.

INSTALLATION:—Timing of the magneto after installation will be simplified if the engine is cranked to #1 piston firing position before the battery distributor is removed. With #1 piston on compression, turn engine over until contacts just begin to open (if semi-automatic type, place spark control lever in full retard position). Remove distributor, take off drive gear or coupling, transfer to Vertex unit, allowing .003" clearance between drive gear and lower end of Vertex housing. Install Vertex on engine but do not tighten clamp bolt, rotate magneto housing until rotor is opposite #1 terminal in distributor head (#1 terminal is marked on head) and contacts begin to open. Tighten clamp bolt to hold magneto housing in this position. Connect spark plugs in accordance with firing order of engine (see car pages for firing order for each engine). Distributor head is of the side outlet type but head is marked to indicate relation between terminals and outlets.



Ignition timing can be checked with engine operating under full load by loosening clamp bolt and rotating magneto housing against direction of rotation to advance spark until engine begins to knock. Magneto should then be rotated in direction of rotation until knock is eliminated, and the clamp bolt tightened. The drive gear or coupling can be changed on the shaft to relocate the position of the distributor head outlets if desired but the position of the breaker cam on the shaft should not be changed (this is set with relation to position of magnet poles and must be maintained).

SERVICING:—Lubrication—The Vertex shaft is lubricated by a grease cup at the lower end. Grease cup should be refilled with light cup grease and turned down once each 1000 miles or 50 hours of operation. Two felt lubricators saturated with oil are located on the breaker plate under the distributor head. If oil does not show on the surface of the lubricators when they are pressed, apply one drop of medium engine oil to each felt. Keep all oil off breaker contacts.

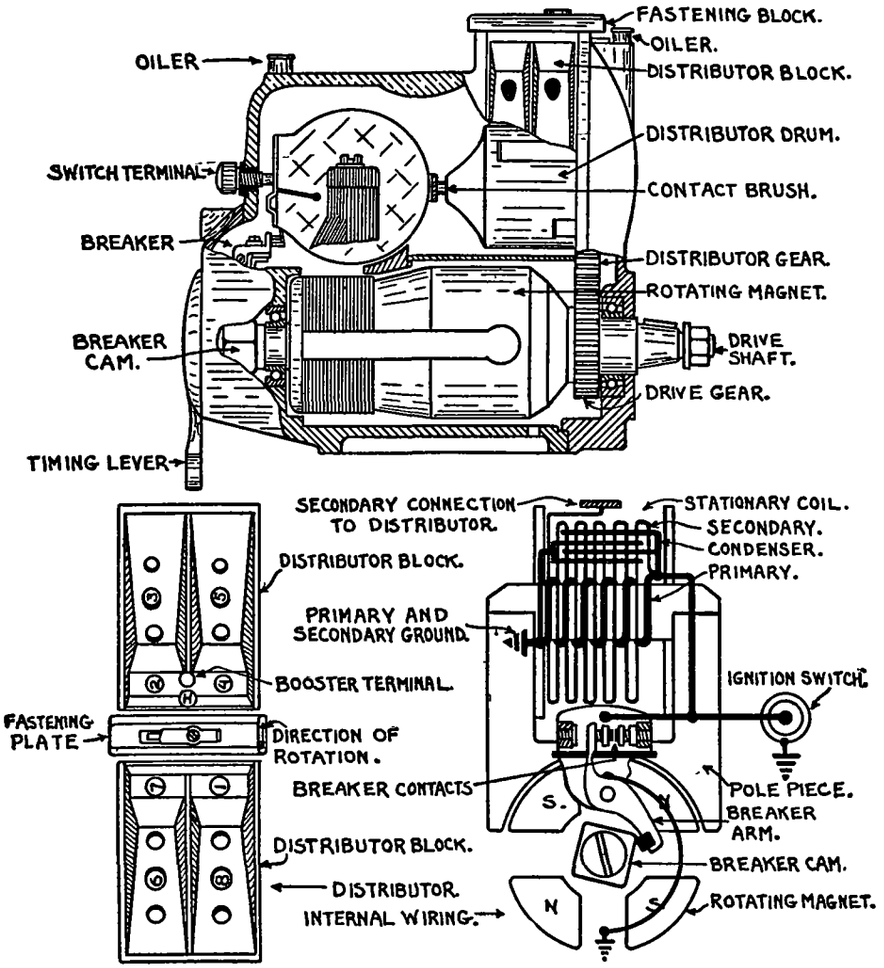
Breaker Contacts—Inspect contacts at 10,000-mile or 500-hour periods. Check gap with breaker arm on lobe of cam. Gap should be .014" or within limits of .012-.016". Adjust by loosening screw on stationary contact mounting bracket and shifting position of bracket. Tighten screw after making adjustment. Do not resurface contacts unless badly pitted.

SPECIAL SWITCHES:—The Vertex magneto is controlled by a ground switch (single circuit through switch to ground). The switch is turned 'on' by breaking the circuit through the switch, and 'off' by completing the circuit through the switch so that the breaker contacts are short-circuited and the primary winding grounded directly.

On car models fitted with ignition switch control of accessories, such as gasoline gauges, stop lights, or starter solenoid switch circuits, it will be necessary to control these in some other manner or install the special Type EV switch furnished by the Scintilla Company, which has additional 'Bat' (ammeter) and 'Gauge' terminals.

DESCRIPTION:—The Scintilla Magneto differs from conventional design in that the field magnet rotates within the pole pieces of a 'U' shaped core on which the stationary coil is wound. The coil consists of primary, condenser and secondary wound in turn on a laminated core which is held in place on the upper end of the pole pieces by two bolts. The breaker cam is mounted on one end of the rotating magnet while the breaker contacts are mounted stationary in the breaker housing at the end of the magneto. The magnet is mounted on ball bearings and carries the drive gear which meshes with the distributor gear. All connections are made by spring clips. The distributor is of the jump spark type and consists of a drum on which are mounted metal segments. These distributing segments are connected to the secondary winding through the carbon brush in the end of the distributor drum and the secondary current jumps from the segment to the cable terminal electrode in the distributor block.

INSTALLATION:—The magnetos of this series are designed for aircraft use. The type of engine on which each magneto should be used is indicated by the model number. Type MN magnetos are designed for small engines up to approximately 4 inch bore while GN magnetos are for 4 inch bore engines and larger. The number 5, 7, etc.) indicates the number of cylinders. The letter D indicates that the magneto may be fitted with a booster magneto for starting. This device consists of an extra terminal marked 'H' on the distributor block to which the booster cable should be attached. The distributor drum is fitted with an extra set of segments which are electrically connected to the distributor segments. The current from the booster magneto jumps from the booster terminal electrode to the distributor drum and is then distributed to the cylinders in the usual manner.



The magneto is designed for base mounting either by base screws or mounting band. It is held in alignment by studs in the base plate. Drive should be through a flexible coupling. The gear ratio and timing range of each type is given on the following table:

Magneto Type	Timing Range	Magneto Speed
MN- 5-D	30°	1¼ to 1
MN- 7-D	25°	⅞ to 1
MN- 8-D	25°	1 to 1
GN- 6-D	35°	1½ to 1
GN-14-D	30°	1¾ to 1
GN-16-D	30°	2 to 1
GN-18-D	30°	2¼ to 1

ROTATION:—The magneto must be driven in the direction indicated on the front end of the securing block over the distributor blocks. There is a second arrow on the top of the end plate which is visible when the securing block is off the magneto. In order to change the direction of rotation it will be necessary to change the contact breaker, distributor drum or cylinder, distributor blocks and securing cover.

BREAKER:—Breaker contacts separate .012 inch. Adjust contacts by loosening lock nut on stationary contact mounting stud and turning up stud until correct gap is secured with the breaker arm on lobe of the cam. The breaker assembly can be removed by taking out the fastening screw is the breaker end cover and removing the two fastening screws in the breaker cage securing ring. One of these screws should then be screwed in the central hole in the breaker cage which will allow the breaker assembly to be withdrawn. Resurface contacts with a fine flat contact file.

TIMING:—Turn the engine over until piston No. 1 enters compression stroke and continue cranking until the piston reaches the full advance position. Remove the distributor blocks and rotate the magneto in the proper direction until the timing marks on the rim of the large distributor gear line up with the mark on the front end plate. The contacts should be just pening at this point with the timing lever in the fully advanced position. There are two sets of these marks, one consisting of a single line and the other of two parallel lines located on the right and left sides of the end plate. Then carefully couple magneto to the engine and connect the terminal marked '1' on the distributor block to the spark plug in cylinder No. 1. The remaining terminals on the distributor blocks are numbered in order of firing. The firing order of the engine must be ascertained and the spark plugs connected in numerical order. A simple method of doing

this is to number the cylinders 1, 2, 3, etc., in accordance with the firing order and then to connect the spark plug and magneto terminal of the same number together.

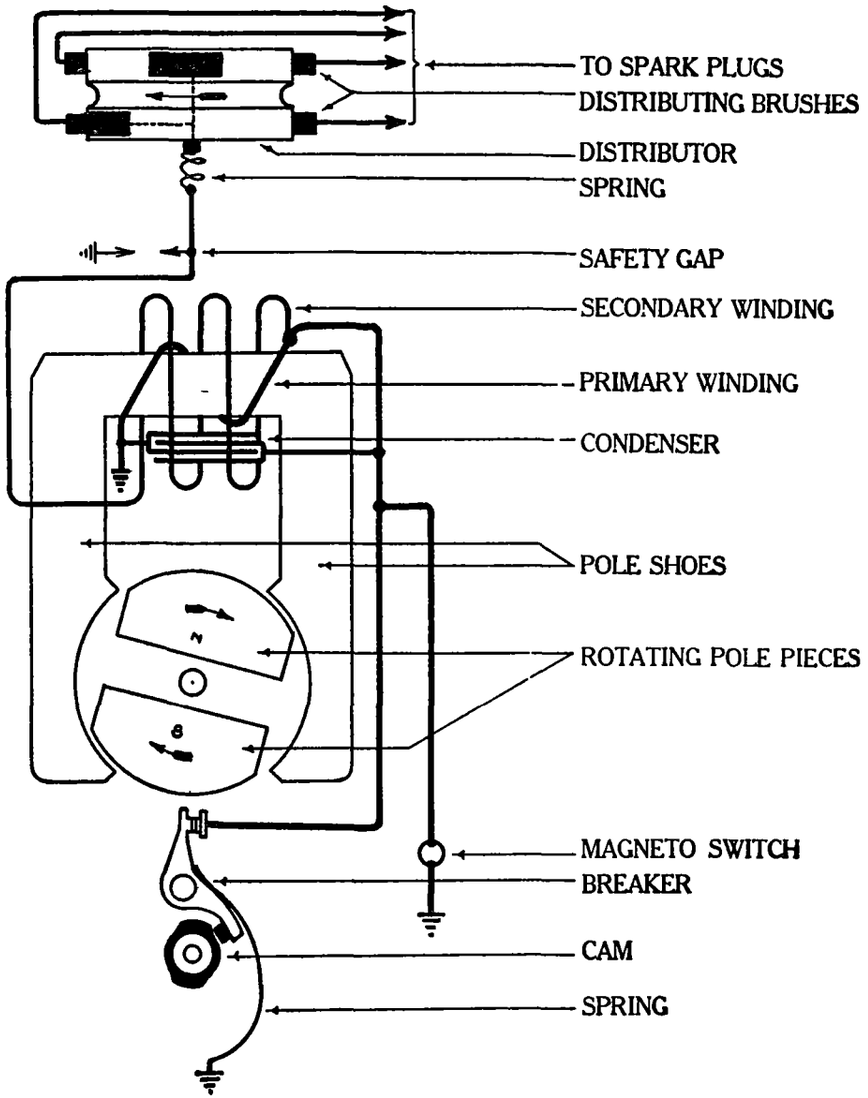
OILING:—There is an oil hole in each end plate of the magneto. The oiler at the drive end should be given 30-40 drops of medium machine oil every 600 miles (automobile) or 25 hours of flying. The oiler is fitted with an overflow drain and all excess oil drains through an outlet in the magneto base. The oiler at the breaker end of the magneto oils the breaker oil wick in addition to the main bearing and excess oil is to be avoided. Put 5 to 8 drops of oil in this oiler.

DESCRIPTION:—The Scintilla Magneto is of the inductor type with a stationary coil assembly and a rotating magnet. The magnet itself forms the drive shaft and rotates under the laminated pole pieces on which the coil core is mounted. The magnet on the two, four and six cylinder types has two poles and the magneto produces two sparks per revolution. On the eight cylinder type, a four pole magnet is used and the magneto produces four sparks per revolution. The breaker cam is mounted on the end of the drive shaft and the breaker assembly is stationary. The coil secondary is connected to the distributor drum contacts through a carbon brush mounted at the end of the drum. Distributor brushes are mounted in distributor blocks at each side of the magneto. The primary terminal is located at the top of the magneto. This should be connected to the switch which stops the engine by shortcircuiting the breaker contacts. The other side of the switch is grounded.

ROTATION.—The direction in which the magneto operates is indicated by an arrow on the magneto cover.

BREAKER.—The contact points are made of platinum-iridium and separate .013 inch. The complete breaker assembly may be removed by hand for cleaning and inspection. The contact points seldom require resurfacing, but if their condition affects the ignition, they should be resurfaced with a fine, flat jeweler's file.

OILING.—Put 5 or 6 drops of light engine oil in the two oil wells every 500 miles.



TIMING.—1st. When the maximum advance of the magneto is known:

Turn the engine over until the piston in Number 1 cylinder is in the position where the fully advanced spark should occur. Then turn the magneto shaft until Number 1 on the distributor gear wheel corresponds with the index in the timing window in the front end plate. At this moment the contact points begin to separate, provided the advance lever is set at full advance (opposite to the direction in which the magneto rotates). Contact is then made between the corresponding segment on the distributor cylinder and terminal Number 1 on the distributor carbon brush holder.

2nd. When the maximum advance of the magneto is not known:

Turn the engine over until the piston in Number 1 cylinder is on top dead center. Set the advance lever at full retard (in the same direction in which the magneto rotates), and turn the magneto shaft until Number 1 on the distributor gear wheel has passed the timing window and the contact points just begin to open. To see the breaker points, remove the contact breaker cover by releasing the two spring clamps. Tighten the coupling and fasten the magneto securely to the base. Connect terminal Number 1 to the spark plug in cyinder Number 1. Then follow the firing order of the magneto as marked on the distributor carbon brush holders, that is: 1, 2, 3, 4, 5, 6, 7, 8, and connect the cables to the spark plugs in accordance with the firing order of the engine.

SPARK PLUG GAPS.—The spark plug gaps should be .020 inch.

SCINTILLA MAGNETO

Types AM4, AG4, AM6 and AG6

Types Used on Four and Six Cylinder Engines

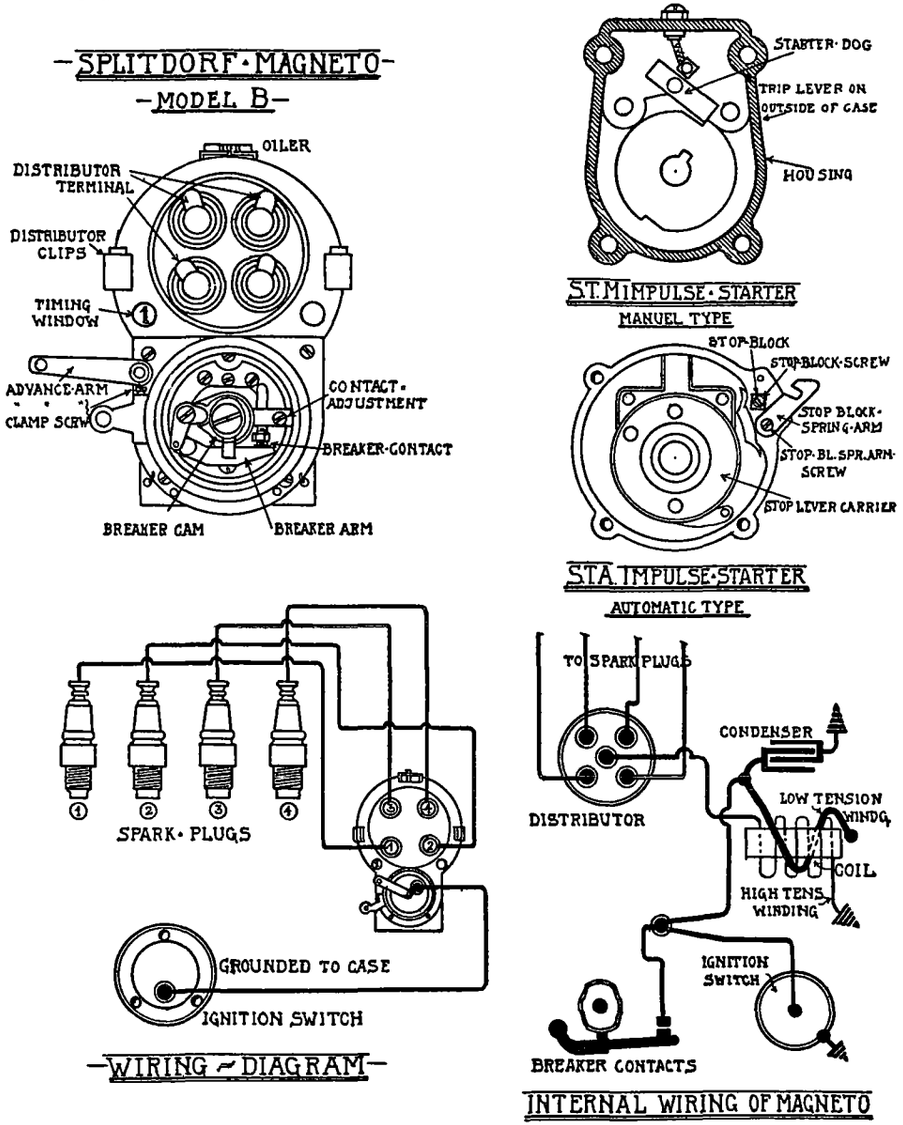
The Six Cylinder Type Uses Six Distributor Brushes Instead of Four, as Shown Here

DESCRIPTION:—The Model B Splitdorf Magneto is of the inductor type. Primary and secondary windings are mounted on a 'U' shaped core and are mounted inside the arch of the magnets. They are stationary. The condenser is mounted directly above the winding. The rotor is of die-cast aluminum mounted on a steel shaft carried on ball bearings and has on its circumference four laminated steel members which complete the magnetic field between the pole pieces. Magneto is fitted with both 20° and 30° timing slots. The advance arm may be mounted in either a right, left or vertical position. Magneto is fitted with taper shaft for standard coupling. It should be driven at crankshaft speed on a four cylinder engine and 1½ crankshaft speed on a six cylinder engine.

BREAKER:—Breaker contacts separate .020 inch with contact arm fully depressed by cam. Resurface contacts when necessary with a fine flat contact file. If breaker contacts are badly worn they should be removed and replaced. Use Splitdorf Parts Nos. 63700 and 64503 for this purpose.

TIMING:—To set magneto for correct position of rotor when contacts open. To check magneto for correct assembly, fully advance spark control lever and connect a battery in series with a buzzer between the stationary contact and the magneto frame. The buzzer will operate while the contacts are closed. Then insert a .062 inch feeler gauge in the slot on the right side for clockwise drive and left side for counter-clockwise drive of the magneto frame (viewed from drive end). Rotate drive shaft in a direction opposite to direction of rotation until the feeler gauge is just gripped by the rear rotor segment. The buzzer should stop vibrating at this point indicating that the breaker contacts have opened.

To time magneto to engine. Crank engine until piston No. 1 reaches firing position. See manufacturer's recommendations as given in car data sheets. If these are not available the engine may be timed with piston No. 1 on top dead center entering power stroke. Remove distributor block and rotate magneto shaft until the keyway points directly upward. Fully retard spark control lever and continue to rotate shaft until contacts begin to separate. At this point the distributor finger will be approaching the lower left hand segment position. Couple magneto to engine being careful not to disturb relative positions of magneto shaft and crankshaft, Replace the magneto distributor block and connect the lower left hand segment to the spark plug in cylinder No. 1. Connect the remaining terminals to the spark plugs in the other cylinders in accordance with the firing order of the engine.



OILING:—Care must be taken not to over-oil the magneto. Every 200 hours of running, put 2 or 3 drops of light engine oil in the oiler at each end of the magnet dust cover plate. At the same time remove the breaker housing cover and put a few drops of oil in the wick oiler directly above the breaker arm pivot. The distributor block may be wiped out with a clean soft cloth moistened with gasoline but it should be wiped dry before assembling the block.

IMPULSE STARTERS:—The Model B magneto may be fitted with two types of impulse starters, the STM manual enclosed type and the STA automatic enclosed type. In each case the outer cam member serves as half the coupling to the engine.

Model STM. To operate this type impulse starter the trip lever 'G' must be thrown to the left hand position (viewed from the drive end). This places the starter in operation and causes the spring to rotate the magneto armature at a high rate of speed to produce a very intense spark. This action continues until the starter dog is thrown out of engagement with sufficient force to cause it to fall over dead center. The hand lever must then be operated to place impulse starter in action again.

To time engines with magneto with Model STM impulse starter, throw starter dog out of engagement with hand lever in right position and then proceed with timing as directed in paragraph on 'Timing'.

Model STA. With this model the impulse stater operates until the magneto speed reaches 250 R.P.M. when the centrifugal action throws the stop levers out of engagement. To time engine with STA impulse starter, loosen screw in stop block

spring arm, swing aside stop block spring, loosen stop block screw and pull out stop block. Then proceed with timing as directed in paragraph on 'Timing'.

Oiling of Impulse Starters:—Impulse starters are packed with grease. This must be renewed at infrequent intervals by removing the impulse starter from the magneto.

TYPE C

DESCRIPTION:—New design inductor type magneto with stationary coil, magnet, and breaker assembly. All parts (except magnet) completely enclosed in two compartment die-cast housing and accessible by removing front cover plate. Coil mounted in top compartment behind distributor assembly and directly in front of condenser. All connections (except high tension lead to distributor) made at terminal block above coil. Rotor assembly mounted on ball bearings in lower compartment with breaker cam on one end and is a die-casting with laminated iron inserts and a steel shaft.

Specifications:—Furnished for right or left hand rotation (see change-over instructions below), 1 to 6 cylinders, Fixed spark at 10°, 20°, 30° variable spark advance, Jump Spark (standard) or Brush type distributor (optional), and with External switch, built in push-pull switch or automatic control. With automatic control, breaker contact is grounded by ground strip when breaker plate moved to full retard position. Magneto may be fitted with Type SA full automatic or Type STM manual Impulse Starter.

TIMING:—Timing Magneto to Engine (No Impulse Starter). Crank engine over to fully retarded firing position for No. 1 piston. Remove magneto distributor block, retard magneto advance lever fully (move in direction of rotation as far as possible), turn magneto shaft by hand in direction of rotation until rotor finger approaches No. 1 segment (extreme lower left for RH, extreme lower right for LH when facing distributor), stop when breaker contacts begin to open. Couple magneto to engine without disturbing position of crankshaft or magneto shaft. See that floating member of coupling is free and recheck timing.

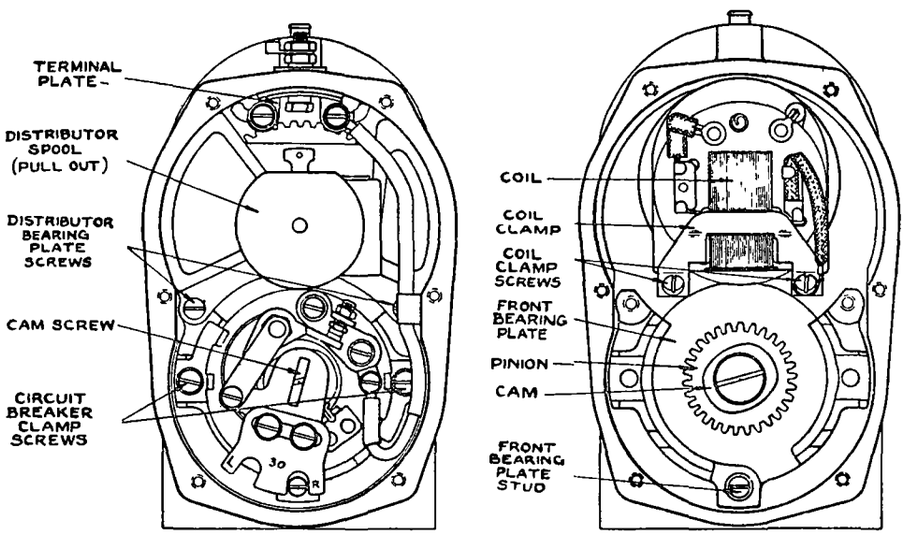
Timing (When Impulse Starter used)—Impulse Starter must be disengaged to prevent magneto being rotated past the firing position. When fitted with Type SA (automatic), remove cover screw at upper end of latch plate on impulse starter case, swing latch plate back exposing stop block hole, insert cover screw which has been removed in this hole and engage stop block, draw stop block forward, then time magneto as directed above. When fitted with Type STM, see that trip lever is in 'Out' position to prevent engagement. For other types of Impulse Starters which cannot be disengaged, turn magneto backward (opposite to direction of rotation) until approximate firing position is reached and then turn shaft forward until contacts open. This will prevent starter functioning.

Timing (Breaker Assembly & Rotor Position). See Adjustment section below to test magneto for correct rotor position when contacts open.

BREAKER CONTACTS:—Gap should be .015" (regular service), .013" (extreme high speed). To adjust, loosen locknut on stationary contact stud and turn stud. Resurface contacts when necessary with a fine contact file, crocus cloth or fine sandpaper. When platinum contacts (optional) are used, resurface only with very fine sandpaper.

LUBRICATION:—Every 500 Hours. Use No. 40 oil. Put 4-6 drops in main shaft oilers (drive end and on top of housing behind terminal), 20-25 drops, slowly, on felt in distributor shaft oiler at right of rotor, 1-2 drops on breaker arm bearing felt and in advance lever shaft oiler, 4-6 drops on breaker cam wick (do not saturate wick). If no felt used in distributor shaft oiler and breaker arm bearing oiler, use good grade soft grease with high melting point at these points. Do not over-oil.

SERVICING:—Dismantling. Remove Impulse Starter. Remove front cover plate. Pull distributor spool straight forward and out. Remove breaker assembly by disconnecting primary lead and taking out screw and bronze spring clamp at each side. Disconnect wires at terminal plate at top of magneto, disconnect hexagonal nut on top of housing, remove terminal plate. Remove distributor bearing plate and gear by disconnecting primary lead clamp at side and taking out two screws being careful not to pull on the lead wires. Take out screw on end of cam, use special Splitdorf puller and remove cam. Use pinion puller and remove pinion. Take out one stud at bottom and remove front bearing plate by tapping drive end of shaft forward. Take out key in rotor shaft and pull rotor out. Remove high tension connector by taking out snap ring and pulling moulded part forward. Do not remove coil or condenser unless tests indicate these parts defective. Do not remove magnet unless magneto has been operated in extremely dusty territory and screened openings to coil compartment are clogged (magnet should be recharged on the magneto—do not remove for this purpose).



Coil. Take out two screws at front and remove coil clamp. Pull coil straight forward. Coil is held by wedge fit and can be freed by slight side-to-side motion. Do not try to lift coil and do not apply strain to condenser lead which passes ver top of coil.

Condenser. Take out three screws on back plate of magneto. Lift condenser out.

Magnet. Mark one side of magnet and housing to insure correct replacement. Pry out sealing cap (new cap must be used when reassembling), take out mounting screw on top of magnet, lift magnet straight up.

Servicing:—Test coil and condenser as directed below. Clean and inspect all parts. Replace parts which are worn perceptibly (replace breaker arm and stationary contact screw together if either worn). Clean ball bearings in gasoline and pack with high melting point soft grease.

Assembly:—Reverse dismantling directions given above. Check rotor endplay with front bearing plate tight and held by stud at bottom and two holding screws at side (lockwasher must be in place on stud). Rotor should be free but endplay must not exceed .001". If endplay incorrect, refit bearing shims (see Adjustment below). When replacing high tension connector, coat with thin film of vaseline and see that spring and coil quill enter hole in connector and that two wires are in place in slots (where coil quill terminates in flat washer, see that pyramid shaped spring is in place in bottom of quill hole in back of connector). See that snap ring seats firmly in groove with open end at top. When replacing cam see that key enters proper keyway for desired rotation and that cam marks are toward open end of magneto. When replacing distributor spool see that pointer on spool driving member is midway between R and L marks on distributor gear and that snap ring is seated. When installing distributor gear, mesh gears so that punch mark on pinion is opposite R or L mark on distributor gear in accordance with rotation. See that breaker plate fits snugly without sideplay but rotates freely for advance and retard. Clamp primary lead under second screw on right side and see that this lead is free from interference with moving parts. Charge magnet, check and adjust contact gap, test magneto.

Coil. To replace coil, clean coil core ends and coil shoes in housing, apply thin film of soft grease or oil to these surfaces. See that insulation in place in arch of housing with condenser lead inside insulator and insulator notch on ventilating hole side. Before tightening hold-down clamp, tap coil lightly to seat it at the back. With clamp tightened, coil should be down firmly on coil shoe. Test condenser for short-circuit to ground (connect one end of test light to frame, other end to condenser lead).

Magnet. Replace in accordance with marks made previously. In general, magnet pole marked 'N' should be on right side for right hand rotation and left side for left hand rotation. Clean magnet poles and pole shoes on housing, apply thin film of grease or oil to these surfaces, see that magnet seats firmly on shoes and apply new sealing cap using special punch to seat cap on magnet screw.

TESTING:—Magneto should be run for one hour at 1500 R.P.M. before making these tests. Block open breaker contacts if breaker assembly in place.

Primary Voltage. Connect voltmeter between primary coil lead and magneto housing. Operate magneto at 800 R.P.M. Voltage must not be less than 6 volts. If voltage low, recharge magnet, repeat test. If still low, install new magnet. If no improvement, see that magnet down firmly on pole shoes and that coil down firmly on coil shoes and that these surfaces are clean. Then replace coil.

Primary Current. Connect ammeter in place of voltmeter making certain connections are good. Operate magneto at 800 R.P.M. Amperage must not be less than 1.65 amperes. If current reading low and ammeter connections are good, replace coil.

Secondary Tests. Operate magneto at 3000 R.P.M. Use short piece of good high tension cable, hold one end against high tension connector insert and other end against magneto frame. Draw frame end of cable away slowly to form a gap. Spark should occur and can be drawn out into arc. If less than ⅛" in length, remove high tension connector and repeat test at quill spring. If spark now OK, replace high tension connector. If spark still weak, replace coil. In making this test, spark must be drawn out, it will not jump the gap.

CHARGING MAGNET:—Use large charger with special pole pieces arranged so that magneto can be placed between them with tips of pole pieces contacting sides of magnet poles at extreme lower ends. Magnet pole marked 'N' must be made north pole (attracts north pole of compass needle). Turn magneto shaft so that keyway is 45° from vertical on either side. Close charger switch for three successive 1-2 second intervals, opening switch so that decided arc is drawn out. Open charger pole pieces before removing magneto. If magnet must be charged separately, use assembled 'U' shaped keeper which will allow magnet to be replaced before keeper is removed. When removing keeper, slide it down over ends of magnet or open it sideways, do not slide keeper up toward magnet arch.

ADJUSTMENT:—Rotor Timing. Connect 110 volt series test lamp across breaker contacts (lamp will light with contacts closed and go out when contacts open). Fully advance breaker assembly. Remove small cover plate on side of magneto under magnet pole (right side for RH rotation, left side for LH rotation when facing driving end). Turn magneto shaft in direction of rotation until sharp edge of rear rotor lobe (lobe toward drive end) is visible in slot. Contacts should open when distance from this edge to top of slot is .045-.060". To check, insert .045" feeler (do not insert feeler at extreme end of slot), turn rotor so that feeler is gripped between sharp edge of lobe and top of slot. Contacts should be closed (lamp lighted). Repeat test with .060" feeler. Contacts should be opened (lamp not lighted). To adjust, loosen two screws on breaker assembly stop plate, hold rotor firmly against .060" feeler, rotate breaker plate until contacts just open. Hold breaker plate in this position, rotate stop plate until right leg (RH. rotation), left leg (LH rotation) when facing breaker plate is against stop stud, tighten two mounting screws. For fixed spark ignition, stop plate has two notches marked R and L which engage the stud. Recheck rotor position with .045" and .060" feelers.

Rotor Endplay. Controlled by shims between rotor and bearing inner race at one end only. If endplay incorrect (should be free to .001"), use Splitdorf inner race puller to remove one race, adjust shims, use special race replacer to install race. Clean and pack bearings with high melting point soft grease.

Advance Range. Adjusted by replacing breaker assembly stop plate with new plate of correct type. Advance controlled by arc between legs on plate which engage stop stud at end positions (for fixed spark, plate has notch which engages stud). Rotor must be retimed whenever stop plate is removed.

CHANGING ROTATION:—Magneto. Proceed as follows, engaging all marked parts as indicated, at 'R' for right hand or 'L' for left hand rotation. Remove front plate, distributor spool, breaker assembly, disconnect wires at terminal plate, remove plate, distributor gear, and cam. Install cam with key in keyway marked R or L and marks toward open end of magneto. Mesh distributor gear tooth marked R or L with punch mark on pinion. Replace breaker assembly. Replace terminal plate and connect leads. See that pointer on driving spool member midway between R and L marks on gear, replace distributor spool. Check rotor timing and shift breaker assembly stop plate over so that opposite leg contacts stop stud with breaker contacts opening and breaker assembly fully advanced (for fixed spark engage stop plate notch marked R or L with stop stud). If Impulse Starter fitted, change as directed below.

Type SA. Change entire rotating assembly (magneto and drive member) for unit for opposite rotation, shift stop block and round felt to opposite side. Check lag angle of new unit.

Type STM. Change entire rotating assembly (magneto member and drive member) and starter pawl for units for opposite rotation. Check lag angle of new unit.

IMPULSE STARTERS:—When impulse starters are fitted, lag angle must be 5° greater than advance range of magneto (or 5° more than firing position advance if fixed spark type). If lag angle less than this amount, engine may fire before top dead center, if more than 5°, firing will be too late for easy starting.

TYPE CO OSCILLATING MAGNETO

NOTE:—This unit is a standard Type C magneto without distributor assembly (gears, distributor bearing assembly and distributor rotor). Plate on drive end carries tripping mechanism.

TRIPPING MECHANISM:—Consists of hardened trip lever furnished 2 9/16" (standard), 2¾", 2⅞", 3¼", 3½" long, mounted on drive shaft and linked to two heavy actuating springs which snap rotor over firing position when trip lever is released from the trip cam, operating rod, or rocker arm which is operated by the engine. Operating mechanism must be designed to oscillate the magneto over an angle of at least 35°.

SERVICING:—Serviced in same manner as Type C. See instructions above and disregard sections covering distributor and distributor drive.

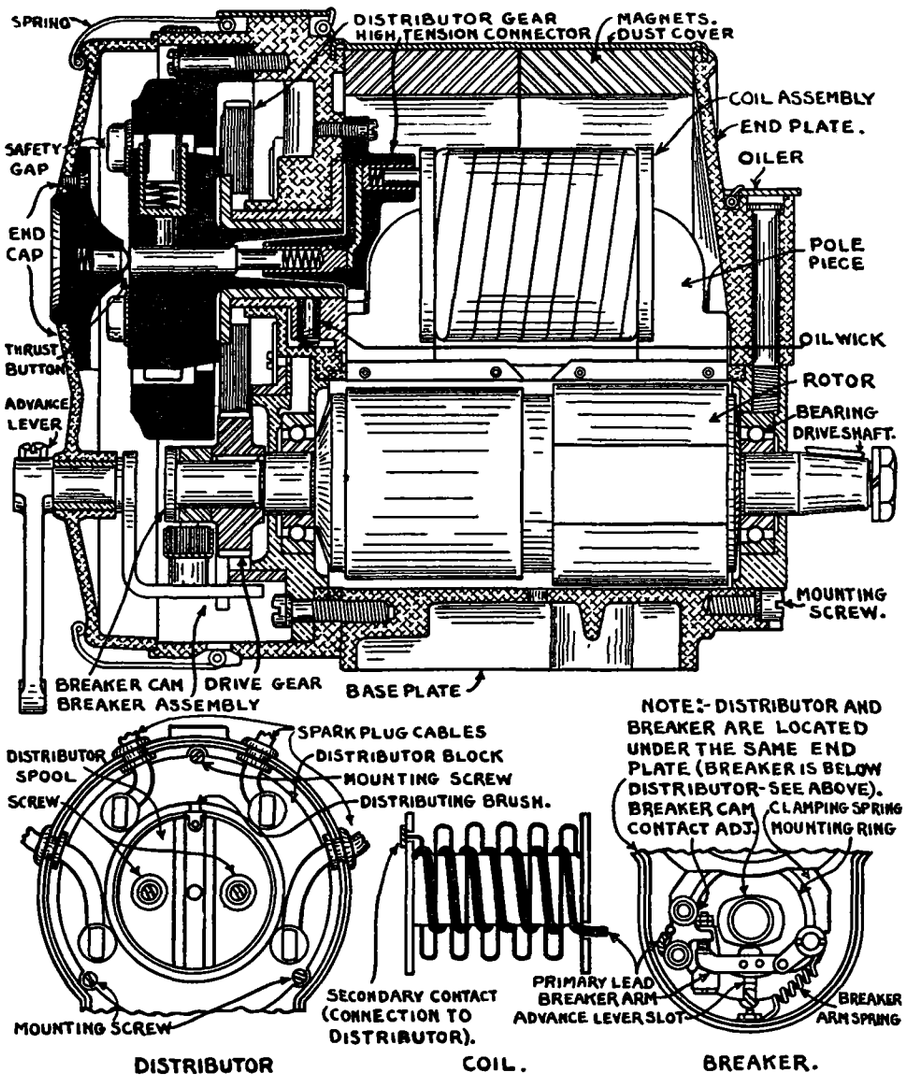
Rotation:—Tripping lever provided with two keyways for drive shaft key. Use lower keyway for right hand oscillation, upper keyway for left hand oscillation. Breaker cam key should be inserted in keyway 'R' for right hand, or keyway 'L' for left hand operation.

SPLITDORF MAGNETO

DESCRIPTION:—The Model SS Splitdorf Magneto is of the inductor type with a stationary coil and magnets and rotating inductors. The inductors complete the magnetic path between the magnet pole pieces and the coil core pole pieces and direct the magnetic flux through the coil core. The rotation of the inductors breaks this magnetic path and reverses the magnetic flux while the opening of the breaker contacts generates the ignition current in the coil secondary. The coil is mounted on a 'U' shaped core mounted within the magnets directly above the rotating inductors. The condenser is mounted under the end frame at the distributor end of the magneto. The distributor ring is mounted on the end plate by three cap screws and carries the cable terminals and contacts. The distributor block and brush assembly rotates within the distributor ring and is bolted on the face of the distributor gear. These parts are exposed for examination and service by disconnecting the advance rod and fastening clips and lifting off the front cover plate.

ROTATION:—The direction in which the magneto should be driven is stamped on the end plate directly above the drive shaft. It is not practical to attempt to change the direction of rotation.

BREAKER:—The breaker assembly is mounted on the front end of the magneto under the front cover plate. The breaker arm and contact assembly is stationary and the breaker cam is mounted on the end of the inductor shaft. Breaker contacts are made of platinum. Contacts separate .020-.024 inch with the breaker arm on the high point of the cam. Set contact gap by loosening lock nut on stationary contact mounting stud and turning up stud until correct gap is secured. The manufacturer advises that no attempt be made to resurface contacts and that they will seat themselves in service.



TIMING:—With magnet disconnected, crank engine over until piston No. 1 reaches firing position with spark retarded. It is very important that engine manufacturer's specifications be followed exactly in order to secure satisfactory engine performance. Then retard magnetic breaker assembly and remove front cover plate so that contacts can be observed. Carefully turn magneto shaft until contacts begin to separate. Couple magneto to engine in this position without disturbing the relative position of the magneto shaft and crankshaft.

Timing Magneto with Impulse Coupling:—The magneto may be equipped with a Splitdorf Type ML semi-automatic impulse coupling. If the impulse coupling is used it will be necessary to see that the impulse coupling starter pawl is disengaged before rotating the magneto shaft. If the pawl is engaged the magneto shaft will be spun over the firing position by the impulse coupling and it will be impossible to determine the point at which the contacts open.

OILING:—The magneto shaft is carried on ball bearings. The distributor shaft is carried on a plain bearing. There is an oiler at each end of the magneto. Put 2 or 3 drops of light machine oil in each oiler every 100 hours of operation. If the magneto has been out of service for any length of time it must be oiled before being used. The impulse coupling is packed with grease and this should be renewed whenever the coupling is disassembled. There is an oil hole in the case and this should be oiled every week with light machine oil. Put a few drops of oil on the pawl pin, spring and plunger and see that these parts work freely.

SPARK PLUGS:—Spark plug gaps for ordinary service should be .025 inch. The spark plug gap is very important and will vary on different engines. The specific instructions for each particular engine should be followed.

SPECIAL NOTE:—In starting an engine equipped with an impulse coupling, the Impulse Starter pawl must be engaged with one of the notches in the rotating housing. The Impulse Starter automatically retards the spark so that it will occur at the proper piston position. With the pawl engaged the magneto will be 'impulsed' until the speed increases sufficiently to throw the pawl out of engagement when the magneto will operate as though it were directly coupled to the engine. If the impulse coupling is sluggish in action examine the coupling and see that the clearance is sufficient to prevent binding.

TYPE:—Models are similar in design except that rotor on Model AP is mounted on needle bearings and are inductor type with stationary coil. Coil is mounted on laminated core on top of pole pieces under magneto housing top cover. Distributor and breaker assembly is similar to type used with battery ignition and is mounted horizontally on one end of magneto housing (gear driven from rotor shaft) with a secondary interlead connection between the coil terminal on the magneto case and the center terminal on the distributor cap. All models can be fitted with impulse Coupling and are furnished for fixed spark ignition or manual spark control (advance range determined by Range Plate which can be changed for greater or smaller spark advance—Range Plate furnished in 21 different types for advance ranges from 0° to 35° in 2½° steps).

TIMING:—**Timing Magneto to Engine (Without Impulse Coupling)**—Turn engine over to firing position of #1 piston with advanced spark (usually indicated by flywheel mark 'IGN', 'SP.ADV' etc.—see engine manufacturers recommendations). Rotate magneto rotor until breaker contacts are just opening with pointer on distributor arm marked with correct number of cylinders for engine in line with pointer on end of breaker box (with distributor cap removed), couple magneto to engine in this position. Connect distributor cap terminal in line with rotor to #1 spark plug, connect remaining spark plugs in accordance with firing order of engine.

Timing Magneto to Engine (With Impulse Coupling)—Turn engine over to firing position for #1 piston (if specific timing recommendations for engine not available, place #1 piston on top dead center entering power stroke). Turn magneto shaft in regular direction of rotation until impulse starter has just tripped and distributor rotor is at No. 1 terminal in distributor cap. Couple magneto to engine in this position, connect No. 1 terminal in distributor cap to No. 1 spark plug and connect remaining spark plugs in accordance with firing order of engine.

Timing (Rotor Position when Breaker Contacts Open)—See Adjustment Section below for directions on testing magneto for correct rotor position with contacts open).

BREAKER CONTACTS:—Breaker gap should be .015". To adjust loosen locknut on fixed contact mounting bracket, turn eccentric adjusting screw. When necessary, replace both contacts as a unit (see Servicing directions below).

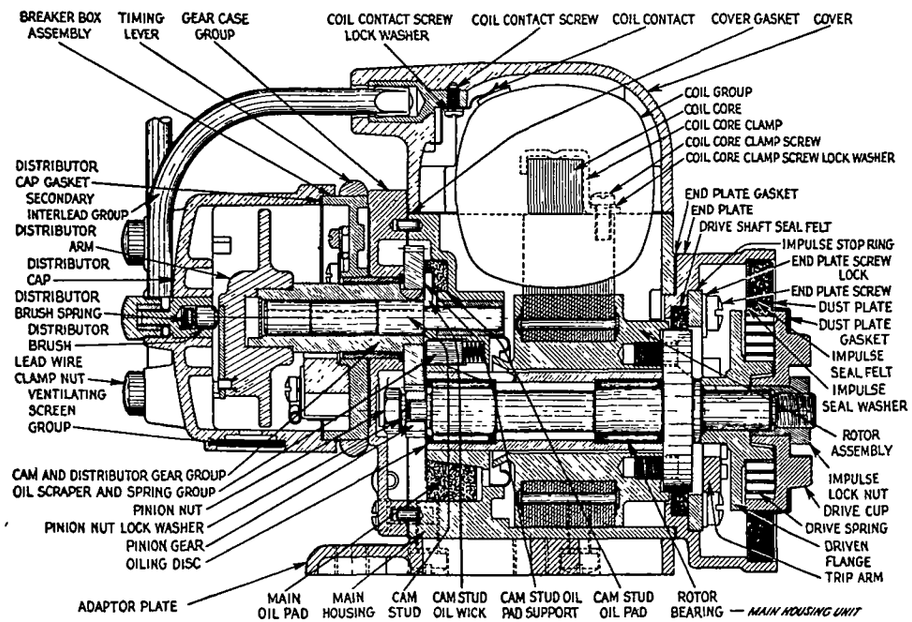
LUBRICATION:—Oiler provided on each side of housing at distributor end for convenience (use either oiler). Fill oiler to overflowing at 200 hour intervals using special Wico oil or SAE. #20. At 1000 hour intervals, remove plug located just below distributor cap and lubricate gears (Model A). Whenever magneto serviced, or at 1000 hour intervals, saturate cam oil pad with special Wico Cam Lubricant, working lubricant thoroughly into pad.

SERVICING:—**Breaker Contact Renewal**—To remove movable contact point (integral with breaker arm, spring, and spring terminal), remove breaker arm clamp screw, lockwasher, clamp washer, breaker arm spring terminal screw and lockwasher. Remove assembly from breaker arm pivot. Remove fixed contact mounting screw, remove contact and bracket from breaker arm pivot.

Coil Assembly—To remove coil, pull secondary interlead out of terminal on magneto cover, loosen cover screws (screws retained in cover by springwasher and cannot be removed), remove cover. Remove screws holding core clamps and lockwashers. Loosen screw holding primary lead to condenser case in breaker box and straighten lead so that it will pull through opening in housing (Model A), unscrew small slotted nut holding primary lead to condenser (Model AP). Turn rotor until magnetism no longer grips coil core to pole pieces in main housing and leave rotor in this position while coil is off magneto—**this is important to avoid necessity of recharging magnet when coil replaced.** Pull coil and coil core free. If coil is to be replaced, pull gaskets on either side of coil off core, press coil off core (coil held in place by wedge, considerable force required to remove coil, use extreme care not to damage coil windings when pressing coil off core). When replacing coil, make certain that ground surface of core is against pole pieces of housing and that primary leads are properly located and connected.

Condenser (Model A)—Gear case must be removed. Then take out screw holding primary and ground lead to condenser, and two filister head screws holding breaker box on housing, remove breaker box, take out two filister head condenser mounting screws, remove condenser. NOTE—When replacing breaker box make certain that locating mark at top is lined up with mark on housing.

Condenser (Model AP)—Remove magneto top cover by loosening cover screws (screws retained in cover by spring and cannot be removed). Disconnect lead to condenser support, remove screw holding condenser support in housing.



Distributor—Wedge distributor clips out with screwdriver, disconnect secondary interlead, pull distributor cap and gasket off. Pull rotor arm off cam. When replacing rotor arm, see that key molded in arm hole is entered in slot in end of cam. Clean ventilation screen at bottom of distributor cap.

Breaker Box—To remove (with distributor off), remove two breaker box screws and spring washers, disconnect primary lead, pull breaker box off.

Gear Housing—To remove (with breaker box off), take out four screws holding gear housing on main magneto housing, pull gear housing off threading primary lead back through slot in housing.

Breaker Cam & Distributor Gear—With gear housing removed, cam and distributor gear can be pulled off which will expose cam stud and oil wick. NOTE—When installing cam and distributor gear, make certain that marked tooth on rotor pinion is lined up with mark on distributor gear for correct rotation (gear marked for clockwise and counter-clockwise rotation).

Rotor & Shaft Assembly—With cam and distributor gear removed, remove nut on pinion gear (keep shaft from turning by holding lugs on impulse cap), remove Impulse Coupling and end plate (see Impulse Coupling data below),

pull shaft and rotor assembly out at impulse end. Remove oiling disc, pinion gear, oil pads, oil scraper, and spring. Install in reverse order. NOTE—Magnets must be recharged whenever rotor removed from magneto—see Charging directions below.

TESTING:—Operate magneto at speed of 225 R.P.M. and observe spark on Wico Star Type spark gap (electrodes must be clean and bright) with secondary current taken through distributor gap. Magneto should fire steadily with 5/16" gap (Standard Model AP), 7/16" gap (Heavy Duty Model AP).

ADJUSTMENT:—**Rotor Timing (Model AP)**—Must be checked when range plate setting disturbed. To adjust range plate, advance plate as far as possible with range plate lockscrew loose. With impulse coupling inoperative (hold magneto upside down), turn shaft in direction of regular rotation until 3/32" shim or No. 42 drill rod can just be inserted between trailing edge of rotor and pole shoe in main housing. Retard breaker box until contacts just close, lock range plate screw in this position (for fixed spark ignition), or hold breaker box in this position, advance range plate as far as possible and then tighten lock screw (for manual spark control type). NOTE—Magnet must be recharged after this adjustment complete.

Advance Range—Adjusted by replacing Range Plate (furnished in different types for advance ranges from 0° to 35° in 2½° steps). Spark advance limited by

slot in range plate (plate for fixed spark has hole instead of slot which prevents any movement of plate). When installing range plate, adjust rotor timing as directed above.

CHARGING MAGNET:—Magneto can be recharged without being removed from magneto by holding magneto between poles of charger so that charger pole pieces contact sides of housing at nameplates. Turn rotor horizontal and make-and-break charger circuit several times.

Note for Heavy Duty Types—When recharging heavy duty types, or when low voltage charger used, magneto cover and coil and coil core unit can be removed and magneto mounted on charger so that pole pieces contact pole shoe laminations at top of magneto housing. If magneto charged in this manner, turn rotor horizontal while charging but turn rotor to vertical position before magneto removed from charger to prevent loss of magnetism while coil is being re-installed.

CHANGING ROTATION:—Magneto must be dismantled and Breaker Cam, End Plate, Impulse Stop Assembly, Impulse dust cover base, and driven flange group replaced with correct units for opposite rotation. See Servicing data above for dismantling instructions and Impulse Coupling data below for reversing Impulse Coupling. When reassembling magneto, make certain that correct mark on distributor gear is meshed with marked tooth on pinion gear (distributor gear marked for both clockwise and counter-clockwise rotation).

IMPULSE COUPLING.

SERVICING:—**Removal**—When dust cover used on impulse coupling, take out four screws holding dust plate and gasket on impulse cup, pry out impulse seal felt, remove impulse seal washer. Take out cotter pin and remove impulse nut (on clockwise rotation magnetos, use Wico tool No. 1820 between driven flange and impulse stop to prevent shaft turning while nut unscrewed, on counter-clockwise units, turn shaft until trip arm is against impulse stop which will prevent shaft turning). With nut removed, turn in direction of regular rotation until trip arm latches against impulse stop and continue until projection on cup clears projection on driven flange, then pull cup out until it is released and spring unwinds, pull cup off. Pull driven flange off shaft (pry off with two screwdrivers 180° apart using care not to damage end plate casting).

Installation—Make certain that all parts are clean, place small amount of grease in spring turns. Pull inner end of spring out of cup slightly and insert inner eye of spring in slot in driven flange, press cup and driven flange together. Wind flange up against spring tension ½ turn, separating parts so that projections on flange clear projections on cup, and stop with flange projections ahead of cup projections (this will provide correct spring tension). Press entire unit on shaft making certain that woodruff key is in place in driven flange.

CHANGING ROTATION:—**Spring Assembly**—Spring must be installed in cup so that spring turns spiral in toward eye in clockwise direction for clockwise rotation, counter-clockwise direction for counter-clockwise rotation. See Servicing directions above for impulse dismantling and assembling directions.

Trip Arm Assembly—To reverse rotation, trip arms must be reversed on pivots. Clamp driven flange in vise, hold snap ring from turning by wedging screwdriver between flange hub and point on ring gear opening, use hacksaw blade or pointed tool to unwind snap ring from around pivot so that it is free to fly off. If one trip arm only is used, shift trip arm to opposite pivot. Install new snap ring (if old ring distorted by removal), make certain that snap ring seats properly in groove.

Impulse Stop Ring—Must be shifted on end plate to reverse rotation. Stop ring has two marks 180° apart and mark for correct rotation must be lined up with correct mark on end plate (see Impulse Lag adjustment below).

ADJUSTMENT:—**Impulse Lag**—Lag must be correctly set so that impulse range is greater (by at least 1°) than manual advance range of magneto (to insure spark when impulsing with manual control retarded). Adjust lag as follows:

Model A—Impulse stop can be shifted from one to another of the three holes in the end plate to provide lag of 5° to 36°. Entire end plate can be shifted in mounting slot to provide intermediate settings between these different mounting holes.

Model AP—End plate marked with eleven 5° graduations to indicate lag range Install impulse stop ring with mark on ring for correct rotation (see Changing Rotation data above) in line with center graduation on end plate (for impulse range of 24-25°). Shift stop ring in direction of regular rotation (for greater range), in opposite direction to rotation (for less range). One graduation is equal to approximately 5°. Tighten end plate screws after this adjustment completed. Manufacturer recommends that impulse lag be set on rotary spark gap so that range can be accurately determined (graduation figures approximate only).

NOTE:—Type numbers for these drives are designated by prefix 'A' (A-1673). See Starter Drive listing on each car model page for type used.

DESCRIPTION:—This type drive retains Bendix inertia principle of engagement and free longitudinal movement to insure pinion mesh but has been redesigned so that all parts of drive mechanism except drive spring are located within the pinion barrel. The threaded sleeve is mounted loosely on an extension of the drive head (instead of directly on the starter shaft) and is rtained by the stop nut which is screwed and staked in place on the outer end of the head. The pinion is integral with the barrel or drive sleeve and is mounted loosely on the starter shaft (not on threaded sleeve as in former types). Starter drive is through lugs on the control nut or driving ring on the screw shaft which engage slots in the end of the pinion barrel. Pinion barrel is held in place on control nut by a locking ring within the end of the barrel directly behind the driving lugs. A coil type anti-drift spring is mounted on the threaded sleeve ahead of the control nut and a meshing spring is located within the head of the barrel

OPERATION:—Pinion, barrel and control nut operate as a unit so that pinion is moved out into mesh with the flywheel as the control nut is threaded along the threaded sleeve. If the pinion teeth strike the ends of the flywheel teeth, the free longitudinal movement of the threaded sleeve on the drive head allows the pinion to turn slightly and mesh properly. This free movement important to insure correct meshing and prevent jammed pinion or damage to gear teeth.

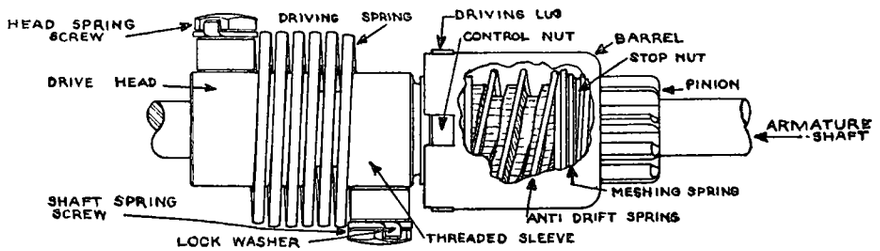
TROUBLE SHOOTING:—If pinion jams or does not mesh properly with flywheel teeth check following points:

(1) Armature shaft rough or burred, dirty or rusty under threaded sleeve (first type only). Remove Bendix, clean and smooth shaft, lubricate shaft lightly with graphite grease Gredag 31½ before replacing drive.

(2) Armature shaft rough, burred or dirty under Bendix pinion (all types). Thread pinion back on threaded sleeve (demeshed position), smooth shaft with emery cloth or clean with kerosene (do not use gasoline), lubricate shaft lightly with Gredag 31½ graphite grease.

(3) Armature Shaft Bent. Remove Bendix drive. Check shaft and straighten

(4) Drive spring screw at threaded sleeve end too long. See that spring does not project through sleeve and bind on drive head extension (on first type screw will bind on armature shaft).



(5) Cocked or deformed drive spring. This will cause threaded sleeve to drag on armature shaft (first type) or on drive head extension (later types). Remove spring by taking out spring screws, examine spring, replace if necessary. Spring eye centers should be at right angles to spring axis (See Spring note below). Use new lockwashers under spring screw heads when replacing screws and see that one lip of washer is turned down in spring eye gap and other lip turned up against screw head flat.

SERVICING:—No servicing required other than cleaning and oiling of threaded sleeve and armature shaft under pinion when operation not satisfactory.

Armature Shaft:—Rotate pinion back to demeshed position, clean exposed portion of shaft with kerosene lubricate lightly with Gredag 31½ graphite grease

Threaded Sleeve:—Rotate pinion forward to meshed position as far as possible, wipe threads clean with dry cloth or use kerosene sparingly (not gasoline). Do not wash entire drive in kerosene or grease installed under threaded sleeve at time of assembly will be removed (threaded sleeve cannot be removed to replace this lubricant). Lubricate threaded sleeve lightly with 10-W engine oil.

BENDIX SPRINGS:—Both Type 'F' and 'H' driving springs formed with special smaller diameter end coil designed to fit closely on shaft at ends. No spring clips used with these types. Springs may be identified by larger (⅜") spring eye. Spring eyes located on same side of coil (Type F), or 180° apart (Type H).

SPECIAL 'BARREL' TYPE USED ON FORD '60' & STUDEBAKER 'CHAMPION'

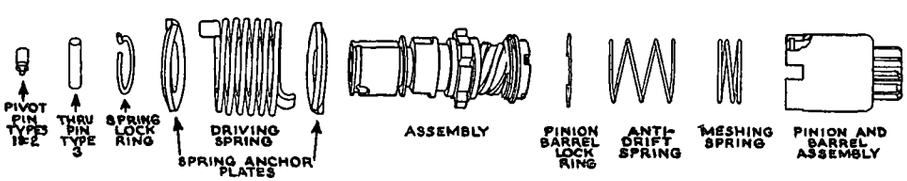
IDENTIFICATION NOTE:—Type A-1806 (Ford '60') stamped with letter "B" on pinion barrel. Type A-2033 (Studebaker Champion) stamped with letter "D" on pinion barrel. Units identical except for pinion tooth design. **These two drives should never be interchanged due to difference in form of pinion teeth.**

FORD NOTE:—Three different Drives have been used as follows: TYPE 1—First 1937 cars only. TYPE 2—Before Sept. 15, 1937. TYPE 3—After Sept. 15, 1937.

TYPE 1. Ford No. 52-11350. This type serviced by Type 2. Drive Spring and Anchor Plates were permanently assembled on Screw Shaft Assembly so that spring cannot be serviced in the field (Use Type 2 'SA' assembly for replacement). Mounting on armature shaft same as Type 2.

TYPE 2. Ford No. 52-11350B, Bendix No. A-1806 BR. Similar to Type 1 except that Drive Spring Anchor Plates can be removed and spring serviced in the field (see Servicing data below). Drive mounted on armature shaft by short stub pilot pin and woodruff key.

TYPE 3. Ford No. 52-11350C, Bendix No. A-1806. Same design as Type 2 except that Drive mounted on armature shaft by special pilot pin extending through armature shaft. No woodruff key used. Type 2 and Type 3 drives not interchangeable because of this different mounting.



TYPE:—Design same as other 'Barrel' type Bendix Drives except that Drive Spring is anchored by two identical notched plates (instead of screws used on other types). Inner anchor plate retained by locking ring (Types 2 and 3 only) and anchor plates and drive spring can be taken off after locking ring removed.

REMOVAL & INSTALLATION:—To remove drive from armature shaft, screw pinion and barrel assembly all the way back toward the drive spring, push head anchor plate in against drive spring compression to uncover pilot pin, remove pin, slide drive off shaft being careful not to lose woodruff key in shaft (Types 1 and 2). When installing drive, make certain that pilot hole in armature shaft is clean to permit full seating of pilot pin, install woodruff key in shaft, see that pilot pin tongue does not extend above the edge of the hole when installed and that the head anchor plate covers the top of the pin (this is important to prevent pin working out in service).

SERVICING:—Disassembly. Remove locking ring within pinion barrel (at drive spring end) by inserting screwdriver in lug recess in barrel nearest lock ring end and working ring out (be careful not to distort ring), remove pinion and barrel assembly from screw shaft. To remove anti-drift spring, pull spring back until end coil slips over stop nut shoulder (hook finger under spring 180° from end coil), remove spring taking care not to distort it.

Drive Spring & Anchor Plates (Types 2 and 3 only). Remove lock ring on screw shaft at outer end of anchor plate (use pliers and take care not to distort ring), slide head anchor plate and spring off. Do not remove shaft anchor plate (nearest barrel) unless necessary. If this anchor plate removed, install by cocking the fibre washer so that the edge projects through hole at point under spring slot in anchor plate, then feed it through hole in anchor plate carefully to avoid damage. When installing drive spring, see that dished faces of anchor plates face spring (see illustration), and that the anchor plate covers the top of the pilot pin. See that lock ring is properly seated in groove and spring opening is over the top of the pilot pin (important).

Drive Assembly. Check anti-drift spring clearance in pinion barrel (spring should fall into barrel freely, if either end binds, install new spring). To install spring hook end over stop nut and thread spring in until it strikes control nut, then push end over stop nut. Check by threading control nut half turn forward on screw sleeve and making certain that spring does not project beyond control nut or stop nut shoulder. See that meshing spring is in place in pinion barrel, install pinion barrel and lock ring. See that pinion and barrel assembly moves freely on screw sleeve. In fully demeshed position, pinion and barrel assembly should rethread itself (slight click will be evident) on all three screw sleeve threads with slight reverse rotation of barrel.

SOLENOID TYPES SS-4000 SERIES

*On the Lincoln type, the lead for the winding is taken from the battery terminal within the switch case and the pushbutton switch is grounded. On all other models, the feed lead is connected to the pushbutton and the coil winding is grounded (see car wiring diagrams).

DESCRIPTION:—These are conventional magnetic solenoid type switches mounted on the starter field frame and controlled by a pushbutton switch on the instrument panel. The feed wire for the switch solenoid is connected to the coil side of the ignition switch so that the starter is operative only with the ignition turned on. See car diagrams for wiring and connections of each installation.

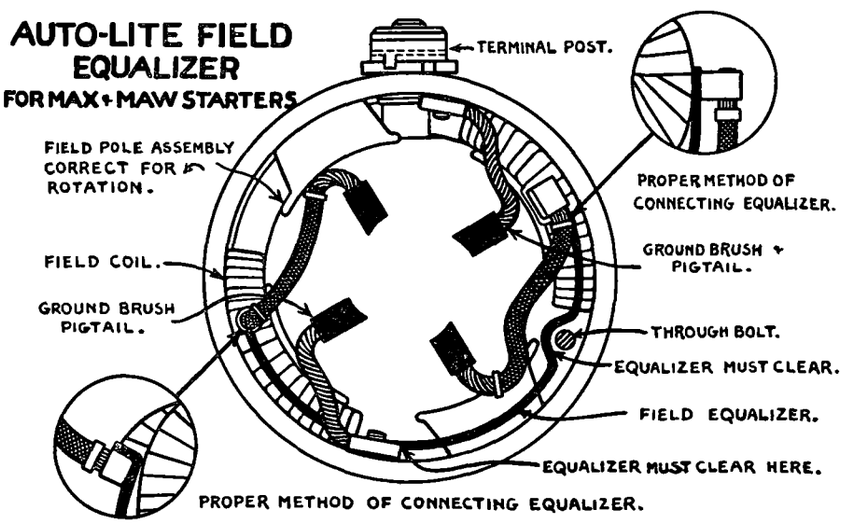
OPERATION:—Two springs are used in connection with the solenoid coil to control the switch action. When the solenoid circuit is completed by pressing the pushbutton switch, the solenoid plunger is drawn into the coil against the tension of a light spring. After the main switch contacts close, the plunger compresses a second spring, insuring a positive connection at the switch contacts. When the pushbutton switch is released, breaking the solenoid circuit, this second spring quickly separates the main switch contacts, preventing arcing or burning of the contacts. The first spring then returns the solenoid plunger to the off position.

PERFORMANCE:—The solenoid coil winding resistance is 1.82-2.06 ohms at 77°F. and the coil draws 2.9-3.3 amperes at 6 volts. Terminal voltage required for initial closing of switch contacts is less than 4 volts and plunger should bottom with not more than 5.25 volts. The switch releases when the terminal voltage falls to .75-2.0 volts. Switch has a capacity of 450 amperes at 10°F. or 250 amperes at 70°F. when held closed for not more than 4 minutes.

NOTE:—For emergency operation the switch can be operated by hand by taking off the brass cap on the end and pushing the plunger in by hand.

AUTO-LITE STARTER FIELD EQUALIZER

AS INSTALLED ON MODELS MAW AND MAX STARTERS



This Field Equalizer should be installed on all Model MAW and MAX starters where commutators are found to be burnt or 'smoky'. It consists of a jumper or connector across the brush leads from the field coil assemblies, which equalizes the load on the ungrounded brushes.

INSTALLING EQUALIZER:—Disassemble starter and remove armature. Install Equalizer on commutator end of field coil assembly, looping ends of Equalizer in grooves formed by the looping of the field coil ribbon end around the brush pigtail. Solder Equalizer ends securely in place, using a non-acid flux (alkaline paste or flux made of white rosin and denatured alcohol). Position Equalizer so that it does not touch starter frame or grounded brush pigtails. Turn down commutator and polish to remove all traces of burning before reinstalling. Equalizer type to be used on each starter model is as follows:

Starter Model	Equalizer Part No.
MAW (with switch terminal)	MAW-58
MAW (with terminal post)	MAW-59
MAX (all models)	MAX-58

TESTING INSTALLATION:—With starter reassembled see that Equalizer is not grounded at any point (frame, grounded brush pigtail, through-bolt, etc.). Check brush spring tension. See that brushes bear on commutator over entire face and are correctly installed (long side of brush should be toward direction of armature rotation). Bend grounded brush pigtails up so that they cannot touch Equalizer. Test starter for correct performance.

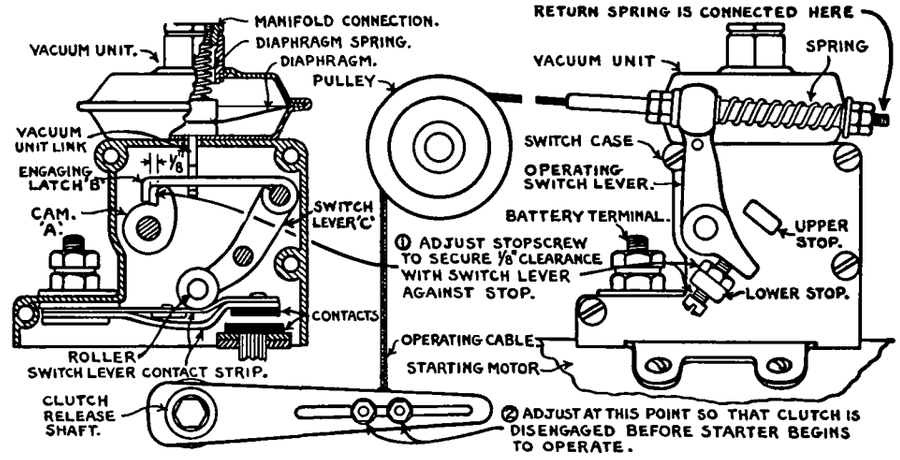
FIELD POLE ASSEMBLY:—The field poles used on these starters are formed with a long and a short tip. Viewed from the commutator end of the starter, the pole pieces should be installed with the short tip in a clockwise direction from the pole piece center line (see illustration).

DESCRIPTION:—This type starting switch is operated by the clutch pedal (clutch is disengaged to start engine), and uses a vacuum release and lock to prevent operation while the engine is running. The operating linkage must be adjusted whenever the clutch pedal is adjusted (see instruction below).

Car Model	Vacuum Control Type
Nash Six 1220 ('34), 3520 ('35)	VC-4002
Nash Ambass. Six, Model 3620 ('36)	VC-4002
Nash Adv. Eight 1280 ('34), 3580 ('35)	VC-4003
Nash Adv. Eight 1280 ('34), 3580 ('35) Export	VC-4002
Nash Ambass. Eight, 1290 ('34), 3680 ('36), 3780 ('37)	VC-4003
Nash Ambass. Eight, 3880 ('38), 3980 ('39)	VC-4003

OPERATION:—The switch is mounted directly on the starter field frame and is linked to the clutch throw-out shaft by a cable and pulley mechanism. When the clutch pedal is depressed, the cam 'A' is rotated, operating the switch lever 'C' through the latch 'B'. The latch will be engaged whenever the engine is not running. When the switch lever 'C' is rotated, the roller on the lower end of the lever depresses the switch upper contact arm and closes the starting switch contacts. As soon as the engine begins to fire, the intake manifold vacuum acts on the vacuum unit on top of the switch case, the diaphragm moving up and disengaging the switch latch. As long as the engine is running, the switch latch is held in this upper or disengaged position so that subsequent rotation of the switch cam (whenever the clutch is disengaged) does not operate the switch. When the engine is stopped, the return spring in the vacuum unit engages the switch latch.

Two springs are used on the switch operating lever rod. A return spring attached to the end of the control rod returns the switch operating lever and cable linkage to the 'off' position when the clutch is engaged. The control rod spring is designed to permit full travel of the clutch pedal after the starting switch contacts are closed. This spring is adjustable.



ADJUSTMENT:—The starting switch assembly should be adjusted as follows:

(1) Operating lever position. Adjust stop screw below operating lever so that switch lever is 5° plus or minus ½° past the vertical position with the lever against the stop screw. This setting can be checked by measuring distance from center of switch lever to edge of switch case (see illustration). This distance should be 1 19/32" with correct setting. Clearance between switch lever and upper stop lug must be at least 1/16" after initial contact is made on new switches.

(2) Control rod spring tension should be adjusted so that spring is not compressed more than ⅛" before starting to close switch contacts. This spring is compressed after switch contacts are closed to permit full clutch pedal travel. Check clutch pedal operation and see that spring is not compressed solidly under any conditions.

Adjust switch operating cable linkage so that switch is closed as soon as clutch is disengaged. Test as follows to determine if clutch pedal travel is too great, or if switch operates before clutch is disengaged:

(1) **Switch operates before clutch is disengaged.** Place car in gear. Do not turn ignition on. Slowly depress clutch pedal until starting switch closes. If car has a tendency to move, clutch is not fully released. Loosen cable clamp on switch lever on clutch throw-out shaft, move clamp toward shaft to decrease cable travel. Tighten clamp and repeat test.

(2) **Clutch pedal travel is excessive.** Place car in gear. Turn on ignition. Depress clutch pedal until switch contacts are closed and engine starts. Slowly release clutch pedal until clutch begins to engage (engine take hold), note clutch pedal travel. Correct by loosening cable clamp on switch lever on clutch throw-out shaft and moving clamp out or away from shaft to increase cable travel. All tests must be made with the switch operating lever return spring in place.

TROUBLE SHOOTING:—If switch action is unsatisfactory, check following points:

(1) **Engine does not start when clutch pedal is depressed.** Check starting motor cable and connections at switch and battery. See that switch operating lever return spring is in place. Check switch and operating linkage adjustment (see Adjustment above).

(2) **Switch operates whenever clutch is disengaged.** Check vacuum line and connections. Replace vacuum unit.

DESCRIPTION:—This is a solenoid type combined starting switch and pinion shift mounted on the starter field frame. The solenoid plunger is connected to the pinion shift lever by an adjusting stud and link so that the pinion is engaged and the switch contacts closed when the solenoid is energized. The solenoid is controlled by a relay in the solenoid case which is operated by a pushbutton on the instrument panel. Types used as standard equipment on current car models are as follows:

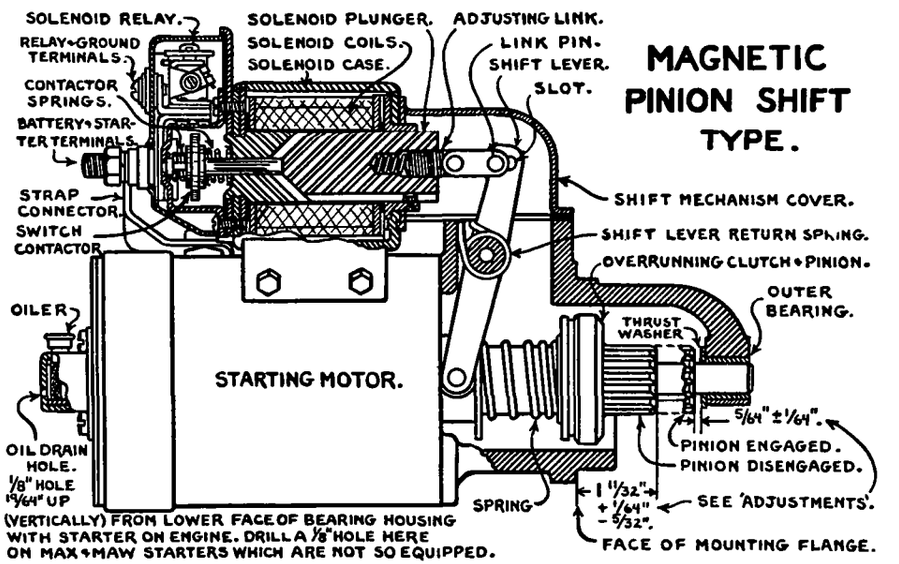
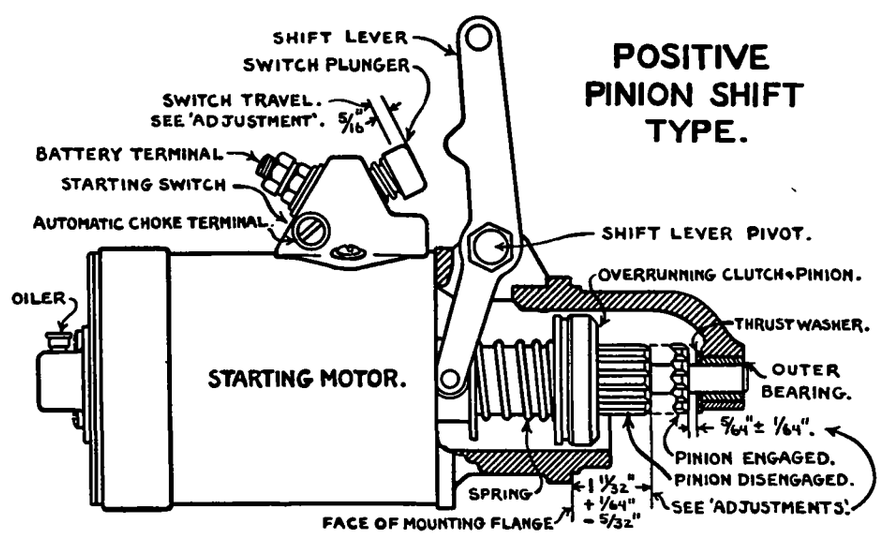
Chrysler C23, C24 (1939)	SS-4206	MAX-4037
DeSoto S5, Dodge D8, Plymouth P5, P6, Export models (1938)	SS-4203	MAW-4011-A

OPERATION:—The feed wire for the starting pushbutton is normally connected to the ignition switch (or switch side of gasoline gauge) so that the starter can be operated only when the ignition is turned 'on'. The closing of the pushbutton contacts completes the solenoid relay circuit, energizing the relay and closing the relay contacts. This completes the solenoid circuit, allowing a current flow of approximately 65 amperes through the two (series and shunt) coils of the solenoid. The solenoid plunger is drawn into the solenoid coil, engaging the starter pinion with the flywheel and closing the main starting switch contacts. The series coil is short-circuited when the switch contacts close (being connected across the contacts), but a current of approximately 15 amperes continues to flow through the shunt coil which holds the plunger in so that the pinion remains in mesh and the switch contacts closed while the starter is cranking the engine. When the pushbutton is released, the solenoid relay circuit is broken, the relay contacts open, breaking the solenoid circuit, and interrupting the current flow through the shunt coil. The return spring on the shift lever then disengages the pinion from the flywheel and the starting switch contacts open.



An overrunning clutch is built into the starter pinion to prevent the starter being driven by the engine after the engine begins to fire and before the pushbutton is released. A spring between the shift lever collar on the armature shaft and the overrunning clutch housing is provided to assist in meshing the pinion.



ADJUSTMENT:—The position of the pinion at rest or with the starter not operating and the clearance of the pinion when fully meshed should be checked as follows:

Pinion Position when Disengaged:—The distance from the mounting face of the pinion housing (face of starter mounting flange) to the outer face of the pinion should be 1 11/32" plus 1/64" or minus 5/32". The pinion should be meshed with the flywheel teeth to a depth of 33/64" when the starting switch contact is made (operate shift by hand by pressing on the end of the plunger—do not press on shift lever) and a further movement of approximately 3/16" is required to bottom the plunger in the core. See paragraph below for adjustment.

Pinion Clearance when Engaged:—With the plunger bottomed in the core, the clearance between the outer face of pinion and the thrust washer next to the outer pinion bearing should be 5/64" plus or minus 1/64". To check this clearance, press in on the plunger by hand until it bottoms (do not press on shift lever or pinion) or disconnect strap connector to starter terminal so that starter will not spin and connect battery to solenoid relay terminal and ground on starter field frame. Current flow through shunt coil will hold plunger in while adjustment is being made. Take out pin connecting shift lever and plunger link, turn adjusting stud in or out of plunger until pin can just be inserted with pinion in correct position. Pin should be against the solenoid end of the slot in the upper end of the shift lever. The endplay in the linkage provided by the slot is necessary for correct operation and should not be taken up by pressing on the shift lever or the pinion.

Starter Armature Endplay—Armature endplay must be held within limits of .005-.030". Adjust by using thrust washers (Part MU-54) between the thrust washer and the commutator end plate.

SPECIFICATIONS:—Solenoid—The pull of the solenoid plunger with the solenoid coils energized should be 45 lbs. with plunger ¾" from end of stroke bottomed in core), or 105 lbs. with plunger ⅜" from core with a current draw of 65 amperes. The pull with the plunger bottomed should be 80 lbs. with a current draw of 15 amperes at 6 volts (shunt coil only—series coil short-circuited with starting switch contacts closed). Current draw for the coils is shown below. NOTE—On '4200' Series, plunger pull should be 170 lbs. (⅜" gap), 40 lbs. (¾" gap), 75 lbs. (0" gap). All other specifications are same for both '4100' and '4200' series.

Coils	Minimum — Amperes — Maximum		Volts
Both Coils	34	38	3
Shunt Coil only	14	16	6

Solenoid Relay:—Relay is built in solenoid case at starting switch end. Performance should be as follows:

Contacts Close—3.5-4.5 volts. Adjust by changing position of armature upper stop (contact gap adjustment). Increase gap to increase operating voltage or decrease gap to decrease voltage.

Contacts Open—1.5-2.5 volts. Adjust by changing armature spring tension. Increase spring tension to increase operating voltage or decrease spring tension to decrease voltage.

Contact Gap—.025-.030". Adjusted by changing position of armature upper stop (see closing adjustment above).

Air Gap—.005-.007" with contacts closed. Adjusted by changing position of lower armature stop.

Coil Resistance—7.5-8.3 ohms at 77°F.

POSITIVE PINION SHIFT TYPE

DESCRIPTION:—This is a manually operated pinion shift and starting switch. Starting switch is mounted on the starter field frame and the switch plunger is depressed by a knob on the shift lever after the pinion has been meshed with the flywheel. It is used as standard equipment on current car models as follows:

Car Model	Starting Switch	Starter
Chrysler C-6 ('35)	SW-2813	MAX-4002

Studebaker Dict. 5A, 6A ('37)	SW-2677-B	MAX-4028**

(**)—This starter used on first 15,000 cars only. Model MAX-4019 with Bendix drive used on later cars.

OPERATION:—The shift lever is connected through a linkage to the starting pedal in the driving compartment and is operated by depressing the pedal. A spring located on the shaft between the shift lever collar and the starter pinion permits movement of the lever in case the starter pinion and flywheel teeth strike. When the switch is closed and the armature begins to turn, the spring then meshes the pinion. Normally this spring will not be compressed and the switch will not be closed until the pinion is meshed in the flywheel to a depth of 33/64" (see adjustments below). An overrunning clutch is built into the starter pinion to prevent the starter being driven by the engine after the engine begins to fire. When the starting pedal is released, the pinion is pulled out of mesh by the shift lever return spring and the starting switch contacts are opened by the spring on the plunger.

ADJUSTMENTS:—Pinion Position when Disengaged—The distance from the outer face of the pinion housing (face of starter mounting flange) to outer face of pinion should be 1 11/32" plus 1/64" or minus 5/32". The pinion should be meshed with the flywheel teeth to a depth of 33/64" when the starting switch makes contact. See paragraph below for adjustment.

Pinion Clearance when Engaged—With shift lever at end of travel clearance between outer face of pinion and thrust washer next to outer pinion bearing should be 5/64" plus or minus 1/64". Adjust by pressing down on spring on switch plunger and turning button at outer end of plunger in or out. The button is locked by the end of the spring.

Switch Travel—The stroke or travel of the switch plunger should be approximately 5/32" (see paragraph above).

Starter Armature Endplay—Armature endplay must be held within limits of .005-.030". Adjust by using thrust washers (Part MU-54) between thrust washer and commutator end plate.

DESCRIPTION:—The Starterator consists of a mechanism by which the accelerator pedal is connected to the starter switch operating linkage (with the engine stopped) so that pressing down on the accelerator pedal starts the engine. It is entirely automatic in operation and is engaged by a spring whenever the engine stops and the accelerator is released. After the engine has been started, the linkage is disengaged by the vacuum of the intake manifold and is held out of engagement as long as the engine is running.

OPERATION:—The starter control fork, which is pivoted on the end of the cross shaft, is operated by a rod connected to the vacuum unit mounted on the right hand end of the cross shaft support bracket. With the engine stopped, when there is no vacuum in intake manifold, the vacuum unit diaphragm will be pushed to the left by the spring in the vacuum unit. The connecting rod will force the control fork to the left so that it engages the slot in the accelerator pedal linkage. When the accelerator pedal is pressed (after the ignition has been turned on), the rotation of the cross shaft caused by the movement of the control fork will depress the starter switch mounted on the starter field frame (through the switch linkage), closing the switch and allowing the starter to crank the engine. As soon as the engine begins to fire, the vacuum in the intake manifold will draw the vacuum unit diaphragm to the right, disengaging the control fork from the accelerator linkage. This allows the starter switch return spring to open the switch and the starter Bendix pinion is automatically disengaged from the flywheel. As long as the engine is running the control fork will be held out of engagement by the vacuum unit so that the accelerator pedal controls the carburetor throttle in the usual manner. Whenever the engine is stopped or stalls, the control is automatically engaged.

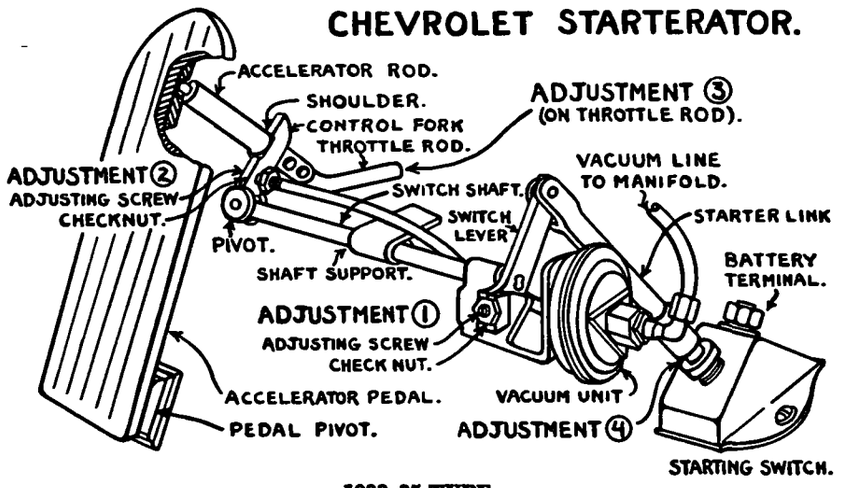
ADJUSTMENT (1933-35):—Starterator should not require attention. However if new parts are installed or Starterator does not operate satisfactorily the following points should be checked and the adjustments correctly made:

1. Clearance between Control Fork and Floor Boards. Clearance between control fork and floor board should be ⅛ inch. To adjust, take up floor board and install special gauge in toe board anchor nut holes. Loosen check nut and turn adjusting screw on starter link arm at vacuum unit end of Starterator until control fork just touches gauge. Tighten check nut. This will give the required ⅛ inch clearance.

2. Control Fork at right angles to Cross Shaft. If the control fork is not at right angles to cross shaft, loosen check nut on left hand side of control fork and turn adjusting screw until angle between control fork and adjusting shaft is exactly 90°. Tighten check nut.

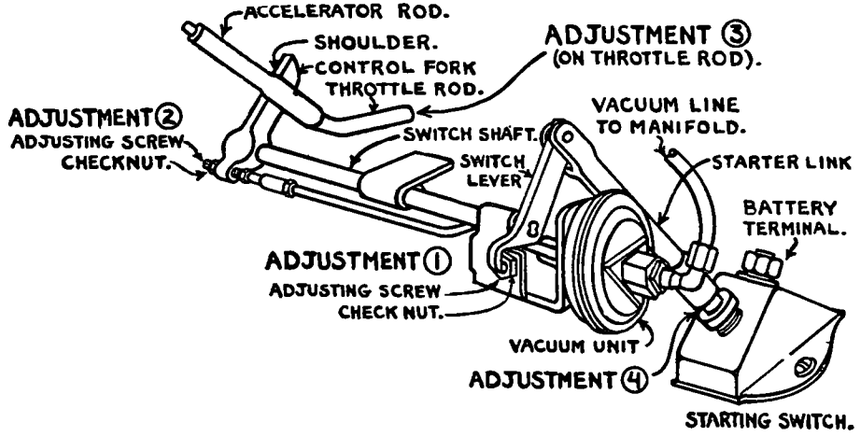
3. Clearance between face of Control Fork and Accelerator Rod. Clearance between the face of the starter control fork and the accelerator rod must be ⅛ inch. To adjust, disassemble the accelerator rod from the accelerator bell crank on the side of the engine, loosen the lock nut on the yoke end of the accelerator rod and adjust the length of the rod so clearance between rod and face of control yoke is ⅛ inch when accelerator rod is connected to bell crank with bell crank in idle position. Tighten lock nut on accelerator rod at yoke to hold adjustment.

4. Clearance between Starter Link and Switch. Clearance between the end of the starter link and the starter switch must be 5/16 inch. If this distance is greater than 5//16 inch, a special adjusting spring should be snapped in place below the link.



ADJUSTMENT (1936-37):—Check following points and make adjustments in the order shown. Engine must not be running when adjustments are made.

1. Control Fork and Toeboard Clearance—Should be ¾". To adjust, loosen locknut on adjusting screw on bracket at right hand end of control shaft (screw serves as stop for control shaft lever), turn adjusting screw. Tighten locknut after making adjustment.



2. Control Fork Angle—Loosen locknut on end of control fork operating rod (at control fork), turn adjusting screw until fork is ⅛" to the right of a right-angle position on the rod. Tighten locknut.

3. Control Fork and Accelerator Rod Clearance—Clearance between top of notch in accelerator rod and control fork should be ⅛" (necessary for correct throttle opening when starting). To adjust, disassemble accelerator rod from bellcrank on left side of engine, loosen locknut on clevis end of rod, turn clevis in or out on rod, tighten locknut, re-connect rod and check clearance.

4. Starter Link and Switch Clearance—Clearance between shoulder on starter link (pushrod connected to starterator lever) and switch button should be ⅜-½". To adjust, add or remove snap rings on link shaft between shoulder and button.

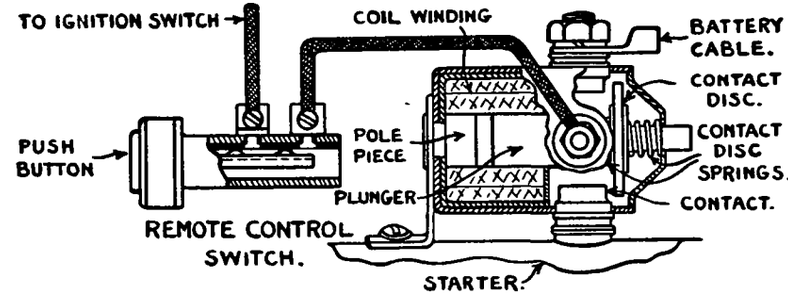
1933-35 TYPE

1936-37 TYPE

NOTE—This type switch used on the following car models.

Car Model	Control (Dash) Switch	Magnetic Switch
Chevrolet (1933-36) Export	1378	1503
Chevrolet (1937) Export	1378	1528
Packard Six 115C (1937)	1417	1539
Packard Super 8, 1500, 1, 2 ('37)	—	1540
Packard 12, 1506, 7, 8 ('37)	—	1541
Packard Six, 1600 ('38), 1700 ('39)	—	1539
Pontiac 601 (1933)	1379	1503
Pontiac 605 (1934) First cars	1379	1503
Pontiac 36-26A, B ('36), 37-26CA ('37) RHD	1588 (See Note)	1528
Pontiac 38-26DA ('38)	1605 (See Note)	1528

NOTE—Type 1588 and 1605 control switches are Vacuum Type with accelerator pedal control for automatic starting. See preceding article for Vacuum Switch data.



DESCRIPTION:—This model is a magnetic switch mounted on the starter field frame. It is used in connection with a Bendix drive and does not include the pinion shifting mechanism of the previous models. It is operated by a 'remote control switch' or push-button starting switch connected to the ignition switch so that the starter may only be operated with the ignition turned on.

OPERATION:—Switch has two windings (pull-in coil, and hold-in coil) both connected to the switch terminal. Both coils are energized when the starting button circuit is closed so that a strong 'pull-in' action results. When the main switch contacts close, the pull-in coil is short-cricuited and the contact disc is held in by the hold-in coil only. Contact disc is returned to off position by the spring when the starting button is released.

PERFORMANCE DATA:—Switch current draw is 3.1-3.7 amperes at 4.0 volts. Switch contacts should remain closed with current of .54-.65 amperes at .7 volts.

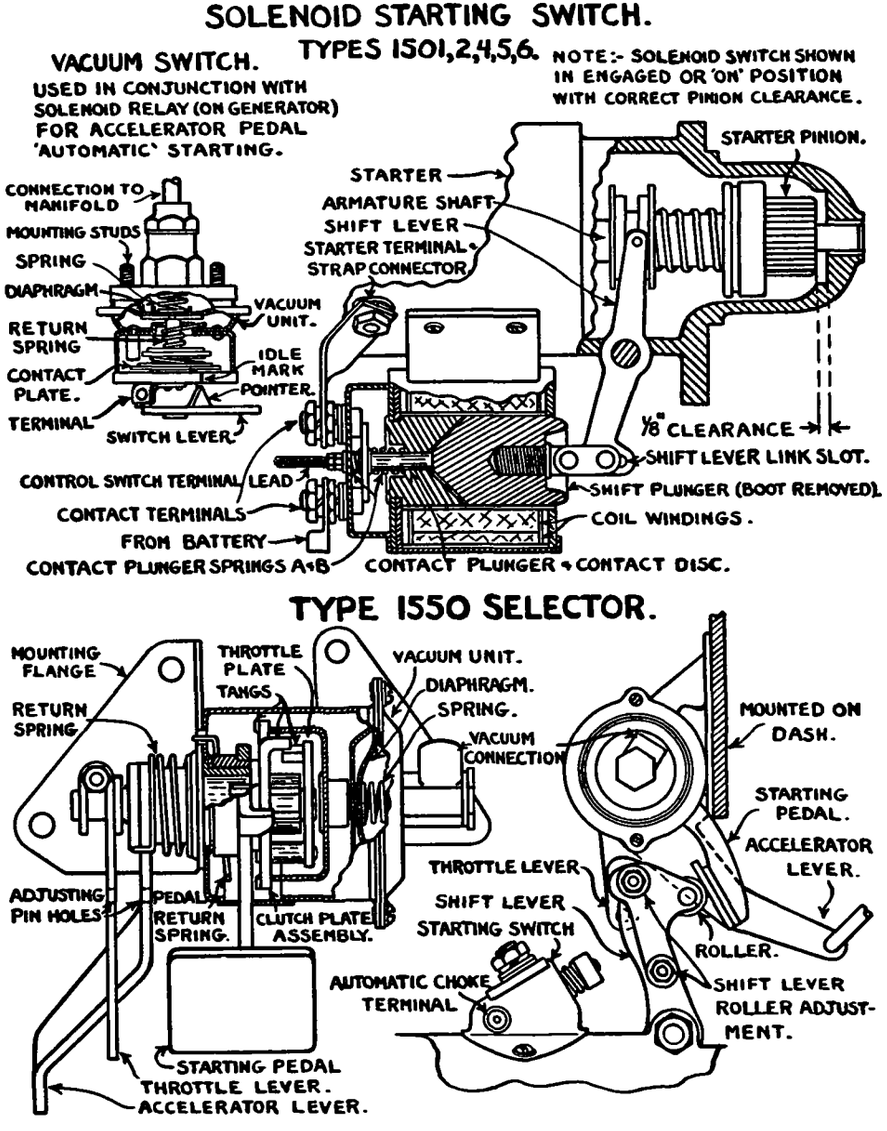
ADJUSTMENT:—This model requires no adjustment.

TYPE 1503 SOLENOID SWITCH

MODEL 1550 SELECTOR (DE SOTO AND CHRYSLER, 1933)

DESCRIPTION:—This Selector consists of a selective clutch by means of which the accelerator pedal is connected alternately to the starting pedel linkage (with the engine stopped) or to the carburetor throttle linkage (with the engine running. The operation is entirely automatic and employs a vacuum unit operated by the intake manifold vacuum. The unit is mounted on the engine side of the dash directly above the starter so that there is 1/16-⅛ inch clearance between the starting pedal on the unit and the pinion shift lever roller on the starter. The vacuum control unit is mounted on one end of the selector and is connected to the selector clutch plate assembly by a linkage within the selector case. The clutch plate is free to slide on the splined end of the selector shaft, which is linked to the accelerator pedal. In the inner position (vacuum unit not operating) a tang on the clutch plate engages with a tang on the starting pedal so that movement of the accelerator pedal operates the starter. In the outer position (vacuum unit opeerating as a result of vacuum in intake manifold) a tang on the clutch plate engages a tang on the throttle plate, which is connected to the throttle shaft running through the selector shaft (with the throttle lever connected to the carburetor throttle mounted on the other end) so that the accelerator pedal controls the carburetor throttle in the usual manner.

OPERATION:—When the accelerator pedal is depressed, with the engine stopped and ignition turned 'On', the starting pedal will rotate during the first 12° of movement. During the remainder of the accelerator pedal movement all the levers will move together so that the throttle is opened, the starter pinion meshed with the flywheel, and the starting switch closed, allowing the starter to crank the engine. As soon as the engine begins to fire, the accelerator pedal should be released momentarily to relieve the pressure on the selector clutch. The vacuum unit will then declutch the starter pedal and the return spring will demesh the starter pinion and open the starter switch. The accelerator pedal will then control the carburetor throttle in the usual manner as long as thte engine is operating. The vacuum unit will hold the starter out of engagement under all conditions of engine operation. If the engine stalls, the accelerator pedal should be released so that the selector clutch can engage the starting pedal. When the engine is stopped the lack of vacuum disengages the clutch plate from the tang on the throttle plate so that the accelerator lever returns to the starting position. It should be kept in mind that there are two 'closed throttle positions' of the accelerating lever, an 'idling' position with vacuum unit operative, and a 'starting' position with vacuum unit not operative.



ADJUSTMENT:—Starting Pedal. The roller on the pinion shift lever plate must be directly opposite the center of the starting pedal and there must be 1/16-⅛ inch clearance between the roller and the pedal with the starter inoperative. To adjust, loosen two bolts mounting the plate on shift lever, this will allow plate to be moved up and down and toward the pedal.

Throttle Lever. There are holes drilled through the accelerator lever and throttle lever on the Selector to maintain the alignment while adjusting the carburetor. The throttle lever linkage should be disconnected and a steel pin passed through these holes (a 5/16" drill may be used on the De Soto). With the carburetor correctly adjusted, adjust linkage so that throttle lever may be connected without disturbing position. Remove pin.

De Soto Data. After adjusting as directed in preceding paragraph, check by operating starter with ignition turned 'Off'. While cranking, the clearance between the idle adjustment screw and the stop on the carburetor should be 5/16 inch, corresponding to 1/3 throttle. Then turn ignition 'On' and start engine. With the accelerator pedal depressed, turn ignition 'Off' and depress accelerator pedal as far as possible. With accelerator pedal in this position see that throttle lever on carburetor is wide open and that clearance between accelerator pedal and floor boards is sufficient so that there is no interference. If throttle opening while cranking is more than 1/3, lengthen the adjustable link on the throttle lever of the Selector. If throttle opening is less than 1/3, the link should be shortened.

Assembly of Vacuum Unit. Vacuum unit diaphragm is connected to the clutch yoke hub by means of an adjustable stud. In assembling the unit, turn the entire unit in a clockwise direction until it is tight (farthest position). Then back assembly off until corfrect position as indicated by cover mark is reached. This must be at least ¼ turn; if less than ¼ turn, back off another complete turn. This will insure sufficient clearance within unit to prevent binding.

All vacuum connections must be tight and there must be no leaks in vacuum lines. This is very important. Also check all linkage for sufficient clearance to prevent interference or binding.

MODELS 1502 (BUICK 50, 1933), 1501 (BUICK 60, 80, 90, 1933)

MODEL 1501 (STUTZ MODELS SV-16, DV-32, 1933-34-35)

DESCRIPTION:—The solenoid switch, mounted rigidly on the starter field frame, consists of a pointed end plunger which is free to move within a double coil winding and is linked to the pinion shift lever. The pinion shifting linkage is similar to other Delco-Remy installations and the starter drives through an overrunning clutch. One end of the coil winding is connected to the small terminal on the end of the unit. This terminal is connected through the 'remote control switch' or push-button starting switch to the coil side of the ignition switch so that the control is operative only with the ignition turned 'On'. The other end of the coil winding is grounded. The two large terminals on the end of the unit are the starting switch contact terminals and are connected to the battery and the starting motor (through a strap connector).

OPERATION:—When the remote control switch is pressed with the ignition turned 'On' the solenoid is energized and the plunger is drawn into the coil. This causes the shift lever to mesh the pinion with the flywheel. The pointed end of the plunger then presses on the end of the contact plunger, forcing the contact disc against the starting switch terminal contacts and completing the starting circuit. This permits the starting motor to crank the engine. The movement of the contact disc toward the contacts compresses the contact plunger spring 'A' in front of the disc and when the disc stops against the contacts the further movement of the contact plunger compresses the spring 'B' on the contact plunger shaft in back of the contact disc. These springs insure a good contact between the contact disc and the terminal contacts and instantly break the circuit by movement of the disc when the remote control switch is released. The second coil winding is designed to instantly neutralize the magnetic field of the coil when the coil circuit is opened and allows the return spring on the shift lever to quickly demesh the pinion.

If the starting motor stalls for any reason when cranking the engine, the pinion will be held in mesh by the pressure between the teeth of the pinion and the flywheel, but as soon as the remote control switch is released the contact plunger spring 'A' will move the contact disc away from the contacts, forcing the plunger back the distance of the slot in the linkage. The opening of the starting motor circuit by this movement of the contact disc will relieve the pressure on the pinion teeth and permit the return spring to demesh the pinion.

ADJUSTMENT:—There is only one adjustment on the solenoid switch. With the solenoid plunger bottomed in the coil, the clearance between the end of the pinion and the starting motor drive housing must be ⅛ inch. This adjustment is made by taking out the pin in the linkage which passes through the shift lever slot and turning the stud in the plunger in or out until the correct setting is secured. In making this adjustment the starter should be off the car and the plunger must be held in position in the coil, preferably by the magnetic attraction of the coil. First, disconnect the starting motor from the solenoid switch by taking off the strap connector, close the circuit between the control terminal on the switch and the battery and press the plunger in until it is held in position by the coil. Then take out the linkage pin, position the pinion so that there is exactly ⅛ inch clearance between the end of the pinion and the housing, turn the adjusting stud in the plunger until the pin can be inserted in the slot in the shift lever so that it bears against the rear end of the slot (see illustration) without disturbing the position of the shift lever or the plunger.

MODELS 1504, 1505, 1506 (CHRYSLER, DE SOTO, DODGE, 1933)

DESCRIPTION:—These solenoid switch units are exactly the same as the units used on the Buick models insofar as the construction, mounting and adjustment of the unit is concerned. The control, however, is automatic, employing a vacuum switch and solenoid relay instead of the 'remote control switch' or push-button. The vacuum switch is connected to the accelerator pedal linkage so that depressing the accelerator pedal (with the engine stopped) serves to start the engine. The vacuum switch is held open by the intake manifold vacuum and a latch is used so that the switch is inoperative while the engine is running even at full throttle with consequent low manifold vacuum. The relay solenoid on the generator also holds the control circuit open as long as the generator is operating and acts as an auxiliary control device. Either unit will control the solenoid switch independently in case of failure of the other unit. The control circuit is connected to the ignition switch so that the starter may be operated only with the ignition turned 'On'.

OPERATION:—Vacuum Switch. The vacuum switch lever is connected to the accelerator pedal linkage so that the switch lever is rotated whenever the accelerator pedal is depressed. With the engine stopped, when there is no vacuum in the manifold, the contact plate and contact surface in the switch will be pressed together by the switch spring. When the accelerator pedal is depressed with the ignition turned on, the rotary movement of the switch lever will complete the circuit through the switch, energizing the solenoid switch and allowing the starting motor to crank the engine. When the engine begins to fire, the vacuum in the manifold will cause the vacuum switch diaphragm to open the switch circuit and latch the contact plate in the running or 'Open' position so that the control circuit is open and subsequent movement of the accelerator pedal will have no 'starting' effect as long as the engine is running. If the engine stalls with the car 'free-wheeling' and the accelerator pedal in 'closed throttle' position, the contact plate will be unlatched so that the next movement of the accelerator pedal will crank the engine. If the starting motor stalls while cranking the engine, releasing the accelerator pedal will open the vacuum switch circuit and allow the return spring to demesh the starter pinion in the usual manner.

Solenoid Relay. The solenoid relay is built in the cut-out relay case on the generator field frame. The current from the vacuum switch flows through the solenoid relay winding to ground through the generator. This energizes the relay, closes the relay contacts, and allows current from the battery to flow to the coil winding of the solenoid switch (see illustration of wiring). The solenoid relay contacts close at 3.2 volts max. and will remain closed while cranking until the battery voltage drops to 2.0 volts or less. As soon as the engine fires and the generator voltage builds up so that the difference between the generator voltage and battery voltage is less than 2.0 volts the solenoid relay contacts open. If the engine stalls and the generator voltage drops to zero the closing of the vacuum switch contacts by the movement of the accelerator pedal will again energize the solenoid relay.

ADJUSTMENT:—The adjustment of the solenoid switch mounted on the starter is same as given for Buick models (above). In addition, the Vacuum Switch and Solenoid Relay will require adjustment.

Vacuum Switch. There is a pointer on the vacuum switch lever which should be directly opposite the white line on the switch case with the throttle closed, or in idling position. To make this adjustment, first adjust carburetor for correct idling setting, then disconnect switch linkage and adjust so that pointer on lever is opposite line on switch case. See that all vacuum connections are tight and that there are no leaks in vacuum line to manifold. Any leakage will interfere with correct operation of the switch.

Solenoid Relay. Contact gap of solenoid relay should be .030-.045 inch. Air gap should be .010-.014 inch with contacts closed. Contacts should close at 3.2 max. and open at 2.0 volts or less. See that all connections are tight and check generator performance.

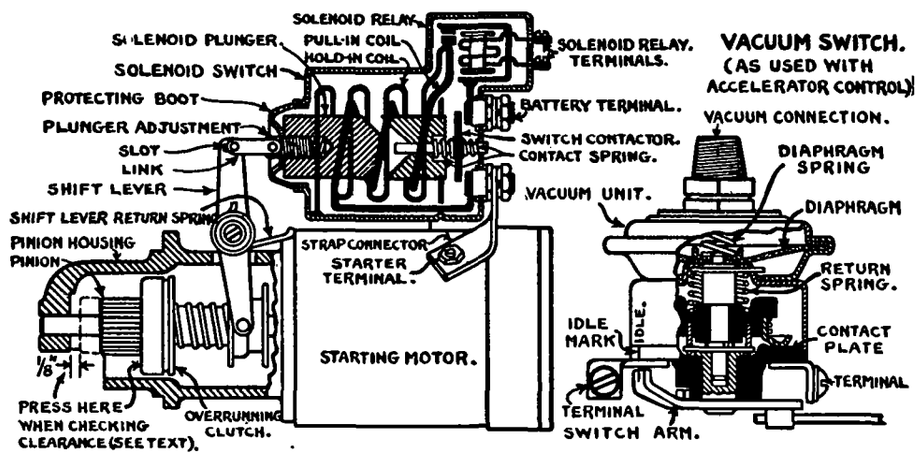
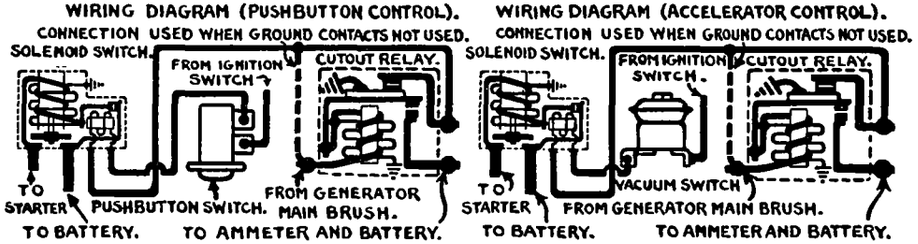
① Vacuum switch is mounted on carburetor. See following articles for data.

NOTE:—On the first Buick models in 1934, equipped with a Type 264-H Cut-out Relay (and Horn Relay), the starter solenoid lead was connected to the generator terminal of the relay and grounded through the generator. On later cars the Type 264-H Cutout Relay was superseded by Type 264-K, which has the extra ground contacts mounted on the cut-out relay armature. On this type the solenoid lead was connected to the extra terminal (this type has six terminals instead of five, used on Type 264-H).



On both the pushbutton type and vacuum switch control type, the relay circuit is grounded in one of three ways:



(1) Directly to the starter field frame.

(2) Through the generator main brushes (connected to generator terminal of cutout relay).

(3) Through special auxiliary contacts mounted directly above cutout relay armature (these contacts open when main contacts close).

See individual car wiring diagrams for circuit used on each car model.

DESCRIPTION:—This solenoid type switch is a combined pinion shift and starting switch. The design is the same as used in 1934 except that the solenoid relay terminals are now located on the side of the solenoid case instead of on the end of the case above the starting switch contacts.

OPERATION:—When the pushbutton switch is closed, or the accelerator pedal is depressed (vacuum switch type), with the ignition turned on, the solenoid relay circuit is completed, energizing the relay and closing the relay contacts. This completes the solenoid circuit. The solenoid plunger is drawn into the coil, meshing the starter pinion, and closing the starting switch contacts. When the engine begins to fire, the solenoid relay circuit is broken in one or more of the following ways:

(1) Operation of the vacuum switch. Caused by the vacuum built up in the intake manifold.

(2) By the rise in generator voltage. Where solenoid relay is grounded through generator main brushes or auxiliary contacts in cutout relay, the voltage built up by the generator opposes the current flow through the solenoid relay winding.

(3) By releasing the pushbutton switch. On De Soto, Graham, and other installations where solenoid relay is grounded directly to starter field frame, the circuit will not be broken until the pushbutton is released.

(4) By the opening of the ground contacts. Where solenoid relay is grounded through auxiliary contacts in cutout relay, these contacts open when generator begins to charge and main contacts close.

When the solenoid relay circuit is broken, the relay contacts open, breaking the solenoid circuit. The starting pinion is demeshed by the shift return spring and the starting switch contacts are opened by the contact spring.

1939 OVERRUNNING CLUTCH & PINION DESIGN:—Not interchangeable with previous models and may be identified by groove cut in pinion teeth approximately ⅛" from clutch shell. Clutch cam is now mounted on pinion and clutch collar (with plungers and springs) is mounted on sleeve and collar assembly (reversed from previous design). Serviced in same manner as previous types.

PERFORMANCE: The solenoid should close (bottom in core) against a pull of 70 pounds when the gap is ½ inch. Current draw should be 65-71 amperes at 5.0 volts (both coils). The hold-in coil current draw should be 12-14 amperes with the switch closed (pull-in coil shorted out).

ADJUSTMENT:—Solenoid Switch. There is only one adjustment on the solenoid switch. Clearance between the end of the pinion and the starting motor drive housing should be ⅛" with shift plunger at inner end of stroke. Remove starter from car, take out all lash in overrunning clutch by pressing on clutch shell before checking clearance. Adjust by taking out pin in shift lever and turning adjusting stud in or out of shift plunger.

Solenoid Relay Specifications

Solenoid Types 1542, 45, 46, 47, 48 & Relay Type 268-M

Contacts Close—1.9 volts Max. **Contacts Open**—1.0-1.2 volts.
Contact Gap—.035". **Air Gap**—.010" (contacts closed).

Solenoid Types 1512,13,14,15,16,17,18,19,21,23,30,32

Contacts Close—3.2 volts Max. **Contacts Open**—1.6-2.0 volts.
Contact Gap—.035". **Air Gap**—.010" (contacts closed).

Where the solenoid relay circuit is grounded through auxiliary ground contacts in the cutout relay, the contact gap for these contacts should be .015-.025" (main contacts closed). If starting system does not operate, see that these contacts are in good condition and closed. If main contacts stick or do not open, check cutout relay as directed on car data sheets. Where solenoid relay circuit is grounded through generator main brushes, check condition of generator armature. Armature must be kept clean and free from oil.

VACUUM SWITCH

Buick 1938-39 Models—Switch mounted on Automatic Carburetor Control (Delco-Remy Carburetor Control) on 1938-39 models except 39-40. On 39-40 switch (Carter Car Starter) is built in carburetor. See following articles for complete servicing and adjustment data on these switches.

Vacuum Switch (all other models)—Only adjustment of switch is the 'off' position (accelerator pedal released—engine not running). The correct position of the vacuum switch lever is indicated by a line on the switch case and linkage should be adjusted so that pointer on lever is opposite this line. In operation, the manifold vacuum disengages the switch clutch drive tangs and clutch plate. The contact plate assembly is then returned to the original 'off' position by the return spring. The switch can not be operated again until the engine stops and the accelerator pedal is returned to the 'off' position.

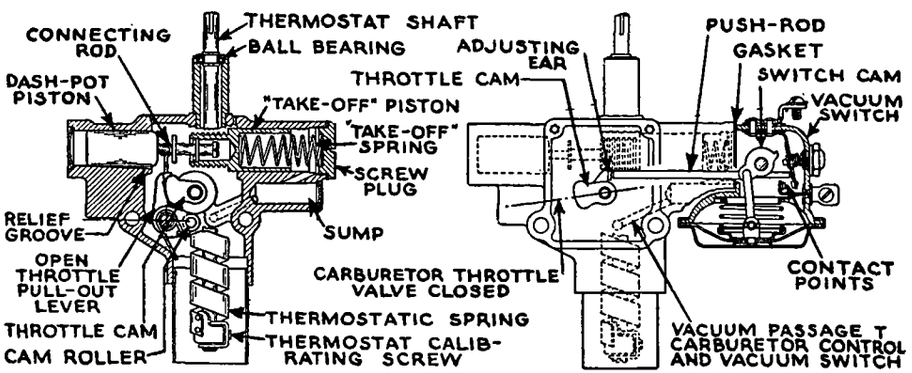
Vacuum Switch Specifications

Contacts Close (Rotation)—10-14° CCW for all type except 1937 Buick with Stromberg carburetor (Type 1607—10-14° CW).

Unlatch Action (30° from Latch Position)—3.4-4.6" of HG. (all).

VACUUM SWITCH—TYPE 1990101 CARBURETOR CONTROL

Switch No. **Used On:**



1868512—BUICK, SERIES 38-40, 38-60, 38-80, 38-90 (1938)

OPERATION:—Movable switch contact mounted on a spring loaded arm and controlled by a cam linked to the vacuum unit diaphragm and also by a pushrod operated by the throttle cam in the choke control housing. With the throttle closed and the engine not running, contacts will be held open by the pushrod and the vacuum unit diaphragm will be in the 'at rest' position (pushed down by spring) with switch cam rotated out of contact with the switch arm. When the throttle is opened 30-40°, pushrod movement in toward the choke housing allows contacts to close, completing solenoid circuit, and starter cranks engine. As soon as engine begins to fire and vacuum builds up to 5" of HG., vacuum diaphragm is pulled up (against diaphragm spring tension) and switch cam is rotated so that contacts are opened and latched in this open position (lug on cam engages under insulated pin on switch arm). Vacuum diaphragm will remain in the upper or switch-open position until vacuum drops to ½" of HG. (due to spring and ball detent mechanism) and will then return to the 'at rest' position when unlatched by the pushrod action.

Unlatch Action. When manifold vacuum drops to less than ½", vacuum diaphragm will be prevented from returning to the 'at rest' position by the engagement of the cam lug and switch arm pin. When the throttle valve is closed to the 23-26° open position, pushrod will move switch arm sufficiently to release cam lug and diaphragm and cam then return to the 'at rest' position. Additional throttle opening will then allow switch contacts to close and starter will crank engine in the usual manner. NOTE—This 23-26° setting is designed to allow for stiffness of new engines. If starter pinion clashes on acceleration after engine has been broken in, setting can be changed to 20° (see directions below).

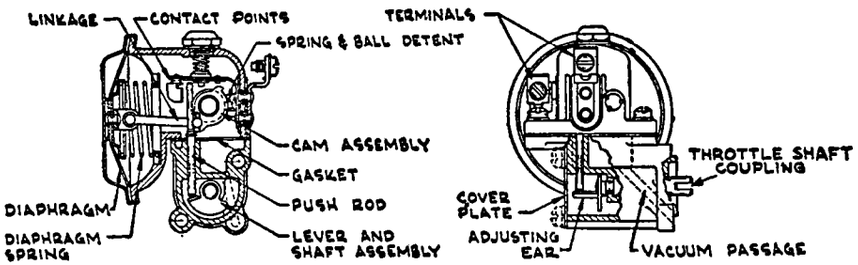
TESTING & ADJUSTMENT:—Unlatch action. With carburetor throttle stopscrew set for 8 M.P.H. hot or slow idling speed, engine not running and cold (so that Cold Idle Cam in fast idle position), pull out hand throttle button so that clearance between throttle stopscrew and cold idle cam is 1/16" and leave hand throttle in this position while making tests. Turn on ignition and start engine, stop engine, repeat start immediately. Start engine in this manner at least three or four times. If engine starts satisfactorily each time, vacuum switch is properly timed. Pull out hand throttle button so that clearance between stopscrew and cam is ¼", repeat tests. Engine should not start more than once with throttle open this far. Adjustment is made by bending lug on switch cam. Manufacturer recommends that Ac-U-Vac tester be used in making tests on switch.

NOTE—When installing switch on choke housing, make certain that gasket is in good condition and no leaks occur at this point (vacuum chamber in switch is above diaphragm).

DELCO-REMY VACUUM SWITCH

Delco-Remy No. **Used On:**

1990126—BUICK, SERIES 39-60, 39-80, 39-90 (1939)



DESCRIPTION & OPERATION:—Switch operated through pushrod by carburetor throttle valve shaft and controlled by vacuum in same manner as in 1938 but mounted on adapter which is mounted on carburetor casting at end of throttle shaft. Pushrod located in adapter housing and actuated by lever and shaft linked to carburetor throttle shaft by tongue-and-slot coupling. Vacuum passage to switch diaphragm chamber is drilled through adapter housing.

CHECKING & ADJUSTMENT:—To Check Switch Action. See that throttle lever stopscrew correctly set for 8 M.P.H. hot or slow idle speed, rotate fast idle cam to Cold or Fast Idle position and pull out hand throttle button so that clearance between stopscrew and fast idle cam is 3/64". Leave hand throttle button in this position while making tests. Turn on ignition, start engine, allow engine to run for several seconds (to build up vacum), stop engine. Repeat test three or four times in rapid succession. If engine starts each time, vacuum switch is correctly timed, if not, retime switch as directed below. Pull out hand throttle to 3/32" position, repeat test as given above. Engine should not start more than once with this throttle opening. If engine starts repeatedly vacuum switch should be retimed.

Timing Vacuum Switch. Loosen two cover screws on adapter housing, swing adapter cover to one side to expose operating lever, tighten screws (this is important). Check switch action as directed above bend ear on operating lever which contacts pushrod slightly toward pushrod (if engine does not start with 3/64" throttle opening), away from pushrod (if engine starts repeatedly with 3/32" throttle opening).

Vacuum Switch Calibration. Switch contacts should close when throttle valves rotated not more than 49° from closed position and switch lockout (unlatch action) should occur with throttle valves 25-28° from closed position (throttle valves must be rotated from wide open position toward closed position to check this action). Switch should lock out with 2-5" of HG. measured at vacuum passage.

SERVICING:—Serviced in same manner as 1938 type. Switch mounted on adapter by two screws, adapter mounted on carburetor casting by two screws (adapter cover screws). If switch and adapter disassembled, make certain that gasket between them and between adapter and carburetor is in good condition and that vacuum passage holes in gaskets line up with vacuum channels in carburetor casting and adapter body.

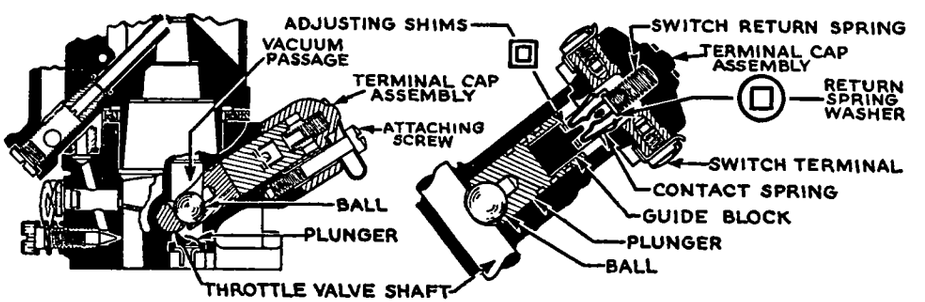
CARTER CAR STARTER (BUICK)

Carter No. **Used On:**

192-10U—BUICK SPECIAL SERIES 39-40 (1939)

NOTE:—This Carter Car Starter or Vacuum Switch is built in the Model WDO Type carburetor which is standard equipment on this car.

DESCRIPTION & OPERATION:—Plunger type switch mounted on carburetor body casting and operated by steel ball which engages switch plunger and flat on carburetor throttle valve shaft when engine is not running. Depressing accelerator pedal to open throttle forces switch plunger up until 'W' shaped contact spring on upper end completes circuit between two brass contact blocks in the switch cap. When the engine begins to fire, switch ball is drawn up out of engagement by manifold vacuum (ball blocks vacuum passage as long as engine is running) so that switch is inoperative. When engine stops, throttle must be closed momentarily to allow switch ball to drop down between throttle shaft and switch plunger.



ADJUSTMENT:—Checking Vacuum Switch Timing. Use special Carter tool T109-121S consisting of protractor scale clamped on choke housing and indicator arm fastened on throttle lever. Connect test lamp in switch circuit to check switch closing. Rotate fast idle cam to hot or slow idle position, back off throttle lever stopscrew so that throttle valves are tightly closed. Loosen setscrew and set indicator arm opposite '0' on the 'WDO' scale of the gauge. Open throttle valve and note gauge reading when switch closes (test lamp will light). Gauge reading should be between 30° and 40°. Adjust by adding (if throttle opening more than 40°), removing (if throttle opening less than 30°) square brass adjusting shims located on bakelite guide block under 'W' shaped contact spring (these shims have square hole which engages tongue on guide block, do not confuse these shims with round spring seat washer which seats on middle leg of contact spring).

Checking Switch Without Gauge. If tool not available, rough check can be made on car by measuring clearance between machined surface of stop boss on carburetor throttle base and nearest edge of throttle stop arm. Distance should be 23/64" minimum, 27/64" maximum when switch closes.

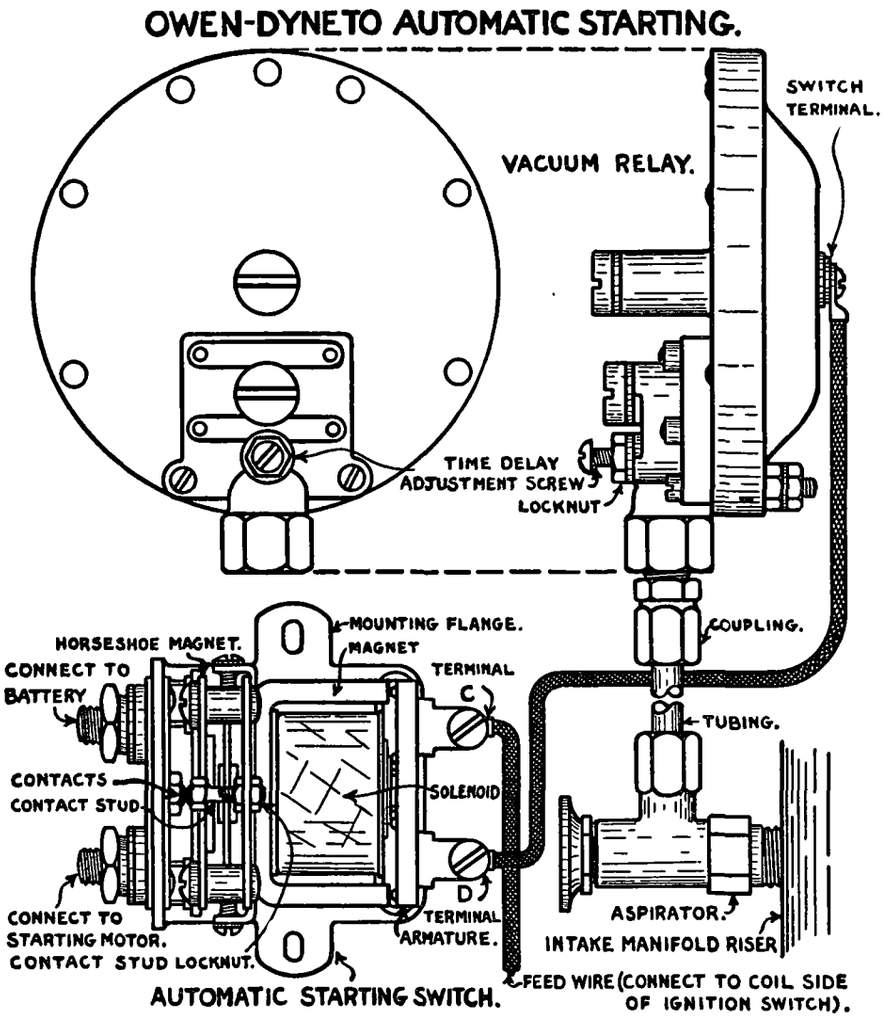
SERVICING:—Removal & Disassembly. Disconnect and tape leads on switch terminals (wire with red tracer on terminal nearest engine is 'hot' with ignition turned on). Remove switch terminal cap attaching screw, hold-down clip, switch cap, withdraw return spring, guide block and contact spring assembly, switch plunger and ball. Be careful not to lose spring seat washer (on contact spring) or adjusting shims (on guide block under contact spring).

Servicing. Clean switch ball, plunger, cylinder, carburetor vacuum chamber and inlet screen, throttle valve shaft flat with gasoline. Check 'W' contact spring dimension across outer contact legs which should be 3/8" plus or minus 1/64" with spring seat washer seated on middle leg. Check spiral switch return spring tension. Free length should be 11/16-3/4" and pressure of 24 ozs. required to compress spring to 3/8".

Reassembly. When installing switch plunger make certain that lip on inner end of plunger is down toward manifold (lip will prevent ball engaging on flat of shaft if installed incorrectly). See that adjusting shims are in place under contact spring, and spring seat washer seated on middle leg of contact spring. Make certain that return spring enters socket in switch cap and that boss on cap enters counterbore on casting. Do not oil any part of switch mechanism. Connect wire with red tracer (hot wire) to terminal nearest engine (away from throttle stopscrew).

OWEN-DYNETO AUTOMATIC STARTING

DESCRIPTION:—The Owen-Dyneto automatic starting device consists of an electrically operated starting switch controlled by a Vacuum Relay. The starting switch containing the main switch contacts is actuated by a solenoid connected to the ignition switch so that the solenoid is energized whenever the ignition switch is turned on. The solenoid circuit is completed through a set of contacts in the Vacuum Relay. These contacts are normally closed with the engine stopped. In operation when the ignition switch is turned on, the starting switch is energized, the main switch contacts are closed, completing the starter circuit, engaging the Bendix drive and cranking the engine. As the vacuum in the intake manifold builds up, the diaphragm in the vacuum relay opens the solenoid circuit contacts. There are a second set of contacts in the switch case, connected in parallel with the relay contacts, which remain closed as long as the starter is cranking the engine. These contacts are controlled by a horseshoe magnet which opens the contacts as soon as the engine begins to fire and the starter drive is disengaged (the current drawn by the starter decreases when cranking stops which allows the horseshoe magnet to open the contacts). This opens the solenoid circuit and breaks the starter circuit.



As long as the engine is running and a vacuum exists in the manifold the starter will not operate. Whenever the engine stops, the diaphragm in the Vacuum Relay will close the contacts, completing the solenoid circuit and cranking the engine. The Vacuum Relay is fitted with a time delay adjustment to permit a short interval between stalling of the engine and cranking so that the Bendix drive will not engage while the flywheel is still rocking (see paragraph on Adjustment).

INSTALLATION:—The magnetic switch is designed to be mounted on the starter field frame. The left hand main terminal should be connected to the car battery. The right hand terminal is connected to the starter terminal through a short busbar or strap connector. The right hand solenoid terminal is connected to the coil terminal of the ignition switch (this connection may be made to the gasoline gauge or any other 'hot' point connected directly to the ignition switch. The left hand solenoid terminal is connected to the Vacuum Relay (see illustration).

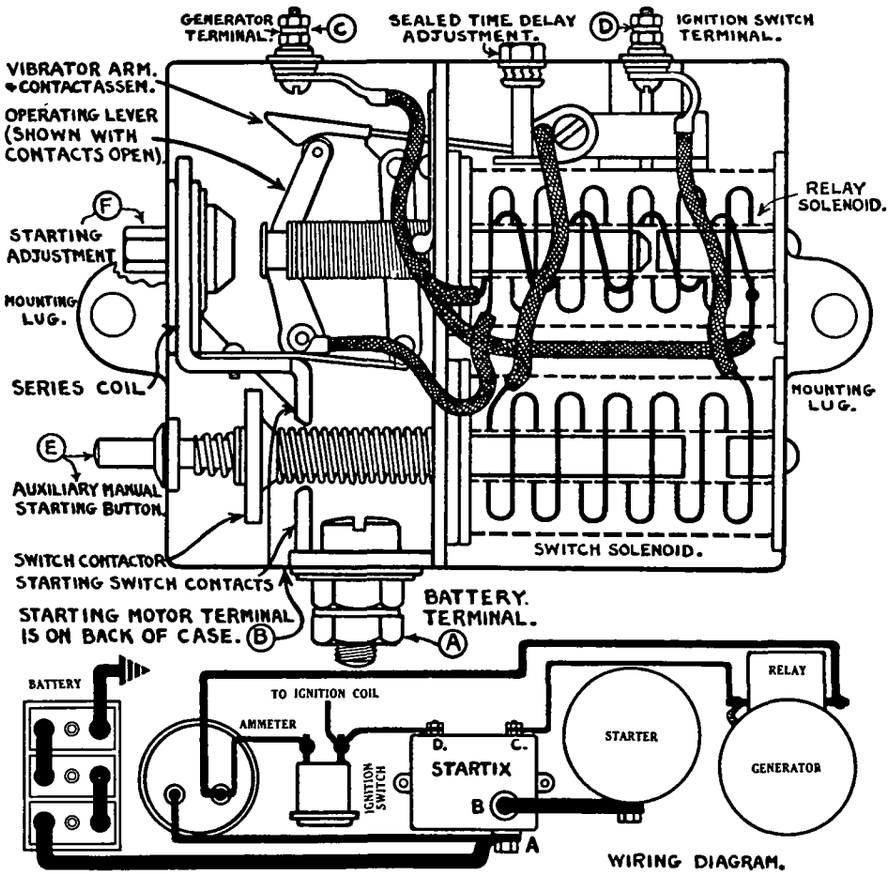
The Vacuum Relay is mounted on the manifold and is connected to the 'Aspirator' (manifold connection) through a short piece of ⅛ inch pipe. It is necessary to drill and tap a ⅛ inch hole in the manifold directly above the carburetor in order to install the Aspirator.

ADJUSTMENT:—The magnetic switch is correctly adjusted at the factory. However, an adjustment is provided so that the original setting can be changed if the starter gives evidence of faulty operation by interrupted cranking (repeated attempts to crank the engine at irregular intervals) or if the starter spins after the engine has begun to fire. To check and adjust switch operation, remove high tension cable, open throttle wide, take off switch cover, loosen lock nuts on contact screw. With ignition turned on, turn screw slowly clockwise (right hand direction) until starter cranks engine without interruption. Tighten adjustment lock nuts and test setting. If starter spins after engine begins to fire, loosen lock nuts and turn contact screw slowly counter-clockwise (left hand direction) while the starter is spinning until contacts open. Then test for interrupted cranking. The extreme left hand or counter-clockwise setting of the contact screw will cause interrupted cranking, while the extreme right hand or clockwise setting will result in the starter spinning. The correct setting will be found between these two positions. All tests should be made after the engine has been thoroughly warmed up.

Time Delay Adjustment. The Vacuum Relay is correctly adjusted at the factory so as to provide a short interval of time between the stalling of the engine and the closing of the relay contacts in order to permit the engine to stop rocking before the starter is engaged. If the time delay adjustment is too short the starter will spin and will not engage the Bendix drive. This can be remedied by increasing the time lag or delay. Time delay setting is adjusted by a screw on the back of the Vacuum Relay. The throttle should

be open whenever time delay is checked in order to overcome any vacuum in the intake manifold. Correct time delay should be one to two seconds. To increase the time delay, loosen the lock nut on the adjustment screw and turn screw in (clockwise) until correct interval is obtained. To shorten or decrease the time delay, turn adjustment screw out (counter-clockwise) until correct interval is obtained. When satisfactory adjustment is obtained tighten the lock nut to hold adjustment.

DESCRIPTION:—Startix is an automatic magnetically operated switch. It will be found installed on a number of 1932 car models as original equipment. It is used in conjunction with starters equipped with Bendix drives and is designed to crank the engine automatically whenever the ignition switch is turned on. It will also crank the engine whenever the engine stalls with the ignition switch on.



OPERATION:—Startix consists essentially of the main switch contacts, a movable contactor and two solenoids, a main switch solenoid, and a relay solenoid. The starting switch contactor is mounted on a plunger in the main switch solenoid. The main switch solenoid is connected between the 'IGN' terminal on the startix case and ground through a set of contacts controlled by a vibrating arm operated by the relay solenoid plunger. The 'IGN' terminal is connected to the coil side of the ignition switch so that the main switch solenoid is energized whenever the ignition switch is turned on (the contacts are normally closed with the ignition switch off and the engine stopped). This causes the main switch solenoid plunger to move in closing the circuit between the main switch contacts, completing the starter circuit and cranking the engine. There is a large one half turn series coil wound around the relay solenoid plunger which is connected in series with the starting switch contacts so that the entire starting motor current flows through this coil. When the engine begins to fire, disengaging the Bendix drive, the current drawn by the starter will decrease sufficiently so that the effect of this series coil (which tends to hold the relay solenoid plunger out and the vibrating arm contacts closed) will be overcome by the outer starting motor circuit winding on the relay solenoid drawing the plunger into the relay solenoid and causing the operating lever to deflect the vibrating arm and open the contacts. This opens the main switch solenoid circuit and the starting motor circuit is opened by a spring on the solenoid plunger. There is also a second winding on the relay solenoid connected between the 'GEN' terminal and ground. The 'GEN' terminal is connected to the generator side of the relay and a small current will begin to flow through this coil as soon as the generator begins to operate. This assists in holding thte relay solenoid plunger in as long as the engine is operating. Whenever the engine stalls, the relay solenoid moves out, closing the contacts and completing the main switch solenoid circuit.

Manual Operation. An auxiliary starter button is located on the end of the Startix case for use whenever it is desired to operate the starting switch manually. The button should be pressed firmly and released quickly.

Ignition Settings:—A number of the ignition switches used on car models in conjunction with Startix provide two switch positions. The first 'On' position connects the Startix in the circuit, providing automatic cranking. The second 'On' position completes the ignition circuit but does not complete the Startix circuit. This switch position should be used in setting the ignition (with the ignition turned on) when the automatic cranking feature is not desired. On cars not equipped with this type switch it will be necessary to disconnect the wire on the 'IGN' terminal of the Startix case to prevent Startix operation.

INSTALLATION:—Startix is usually mounted on the engine block near the starter, or on the dash. The case is grounded and a separate ground wire must be run from the case to the car frame or engine block whenever the Startix is mounted on a wooden dash or other insulated mounting. Connections should be made as indicated on the diagram. In making connections to the main terminals care should be taken not to twist the main terminal posts as this may interfere with correct operation of the starting switch by affecting the alignment of the switch contacts.

ADJUSTMENT:—A starting adjustment is provided on the end of the Startix case directly in front of the relay solenoid plunger. This adjustment consists of a slotted screw held in position by a locknut. It is designed to correct interrupted cranking (repeated attempts to crank the engine) or spinning of the starter after the engine has begun to fire and the Bendix drive has been disengaged. The extreme outward (counter-clockwise or left) position of the adjustment screw will cause interrupted cranking while the extreme inner (clockwise or right hand) position of the adjustment screw

WIRING DIAGRAM.

will result in the starter spinning. The correct adjustment will consist in finding a position between these two extremes which will result in satisfactory starter operation. To set Startix adjustment, first disconnect coil high tension lead at center terminal of distributor cap (to prevent engine firing). Loosen locknut on adjustment screw, turn ignition on and while starter is cranking engine determine interrupted cranking position of adjustment screw by turning screw slowly to left or counter-clockwise until interrupted cranking begins. Tighten locknut slightly and make a mark on the case in line with the screw slot. If adjustment is being made because of interrupted cranking, turn screw slowly to the right until starter cranks engine steadily and make the mark at this point. Then connect coil high tension lead so that engine will fire, disconnect wire on 'GEN' terminal of Startix case, turn on ignition and turn adjustment screw to right or clock-

wise until starter spinning occurs after engine begins to fire. Then turn adjustment screw to left or counter-clockwise until a click is heard indicating the opening of the starting switch contacts. Tighten the locknut and check this point by operating the Startix by turning ignition switch on. The starting motor should begin to slow down as soon as the engine begins to fire. Mark position of adjustment screw slot by a line on the case. The final setting of the adjustment screw should be midway between the two lines on the case (where the lines are less than 180° apart), or one quarter turn or 90° from the 'starter spinning' reference line (when the two lines are more than 180° apart). Lock the adjustment screw by securely tightening the locknut.

Time Delay Adjustment. There is a sealed 'Time Delay Adjustment' screw on the top of the Startix case. This adjustment is set and sealed at the factory and should not be disturbed. It is designed to provide a short interval of time between the stalling of the engine and the automatic cranking operation to prevent damage to the Bendix drive through engagement of the Bendix while the engine crankshaft is rocking.

TROUBLE SHOOTING:—Failure of the generator or a short-circuit in the line between the 'GEN' terminal on the Startix and the generator will be evidenced by a clicking sound caused by the meshing contact of the Bendix drive pinion and the flywheel. This may be corrected temporarily to enable the car to be driven to a service station by disconnecting the wire on the 'IGN' terminal on the Startix case rendering the Startix inoperative. Correct by checking line, checking generator connections, cleaning generator commutator, checking ground, and, in some cases, advancing engine idling speed slightly where engine idles at so low a speed that generator will not operate the relay solenoid.

THERMOSTATIC SAFETY DEVICE:—There is a thermostatic control incorporated in the Startix which will open and close the circuit (this will be evidenced by a clicking sound) whenever the Bendix pinion sticks or jams in the flywheel for as long as the ignition is left on. This clicking sound will indicate that the ignition should be turned off and the Bendix pinion freed. No adjustment will be necessary on the Startix.

STARTIX CIRCUIT CONTROLLER

DESCRIPTION:—This device is an automatic circuit breaker designed to open the Startix circuit and prevent automatic cranking momentarily whenever a backfire occurs. It is designed to be screwed in the intake manifold and is operated by the pressure built up in the manifold when the backfire occurs. The two terminals on the side of the Circuit Breaker case should be connected as follows: Terminal marked 'IGN' to Startix terminal on ignition switch (feed terminal), Terminal marked 'STARTIX' to 'IGN' terminal on Startix case. These connections must not be reversed as incorrect connections will interfere with the proper action of the Circuit Breaker.

OPERATION:—The pressure built up in the manifold by the backfire causes the plunger within the Circuit Breaker case to move upward, closing a set of contacts on a thermostatic arm and short-circuiting the current from the ignition switch through the thermostatic arm to ground. The thermostatic arm is heated and is flexed upward, opening the main contacts and breaking the circuit to the Startix switch, thus stopping the automatic cranking of the engine. As soon as the crankshaft stops moving backward and the pressure in the intake manifold drops, the plunger drops down, opening the thermostatic arm contacts, breaking the circuit through the thermostatic arm and permitting the arm to cool. After several seconds the arm flexes downward, closing the main contacts and the Startix switch will then resume the cranking operation. The entire action of the Circuit Breaker is automatic. It must be kept in mind that several seconds will intervene between a backfire and the resumed cranking.

SERVICING:—The Circuit Breaker requires no service operations. Connections should be kept tight and care must be taken that the unit is correctly hooked up ('IGN' terminal on unit should be connected to ignition switch and 'STARTIX' terminal connected to 'IGN' terminal on Startix case). If the Circuit Breaker does not operate satisfactorily it should be replaced by a new unit.

OPTIONAL EQUIPMENT ON PACKARD EIGHT, SUPER EIGHT, TWELVE (1934-35-36)

NOTE:—Type F Startix not interchangeable with standard Type D. Types may be readily identified by red background (Type F), black background (Type D) on nameplate on which type number and operating voltage is indicated. Type F must always be used with special cutout relay and any attempt to use this type with conventional cutout relay will result in burnt out generator winding of Startix relay solenoid.

DESCRIPTION AND OPERATION:—Similar to Type D in construction and operation except that generator winding of relay solenoid is special low resistance type to make this winding effective with low generator voltages (characteristic of Owen-Dyneto high capacity generator armatures). Resistance unit in Relay-Regulator case on generator is cut into this coil circuit when the cutout relay contacts close to protect the winding from overload when the generator is charging. This resistance is short-circuited by the auxiliary contacts above the cutout relay armature when the main contacts open. A cutout relay of this type (Owen-Dyneto No. 40203, used also in 40210 assembly) must always be used with the Type F Startix.

SERVICING:—Same as for Type D. See previous Startix article. Type F is designed to hold out with voltage of .07 volt or greater at 'GEN' terminal on Startix case. If Startix cuts in with engine idling, check voltage with voltmeter connected between 'GEN' terminal and ground on Startix case. If voltmeter reading less than .07 volt, check generator for burnt or worn commutator, high mica, worn or defective brushes, open field coils or connections, defective armature. Check cutout relay. If voltmeter reading more than .07 volt, Startix is defective. See Trouble Shooting.

TROUBLE SHOOTING:—If Startix operation is not satisfactory, turn on ignition switch making certain that 'on' position is one in which Startix is operative, note whether one or more 'clicks' heard in Startix case when switch turned on

No 'click', Starter does not operate.

(1) Startix relay plunger sticking. Check by jarring car or tapping on Startix case with screwdriver. Replace Startix if this condition repeated frequently.
(2) Open-circuit in Startix 'IGN' lead. Disconnect lead at terminal and flash to ground. If no spark noted, check ignition wiring.
(3) Short-circuit in Startix main switch solenoid. Connect ammeter in lead at 'IGN' terminal (flash lead to terminal only to avoid damage to ammeter if current excessive. Current draw should be approximately 1 ampere. Replace Startix if excessive.
(4) Open-circuit in Startix main switch solenoid. No current draw in test (3) above with 'IGN' lead known to be live. Replace Startix.
(5) Current in generator winding of relay solenoid. Check by disconnecting lead at 'GEN' terminal on Startix. If Startix cranks engine, generator cutout relay is defective or lead is shorted at some live point (this lead must be connected on generator side of cutout relay, not to battery terminal).

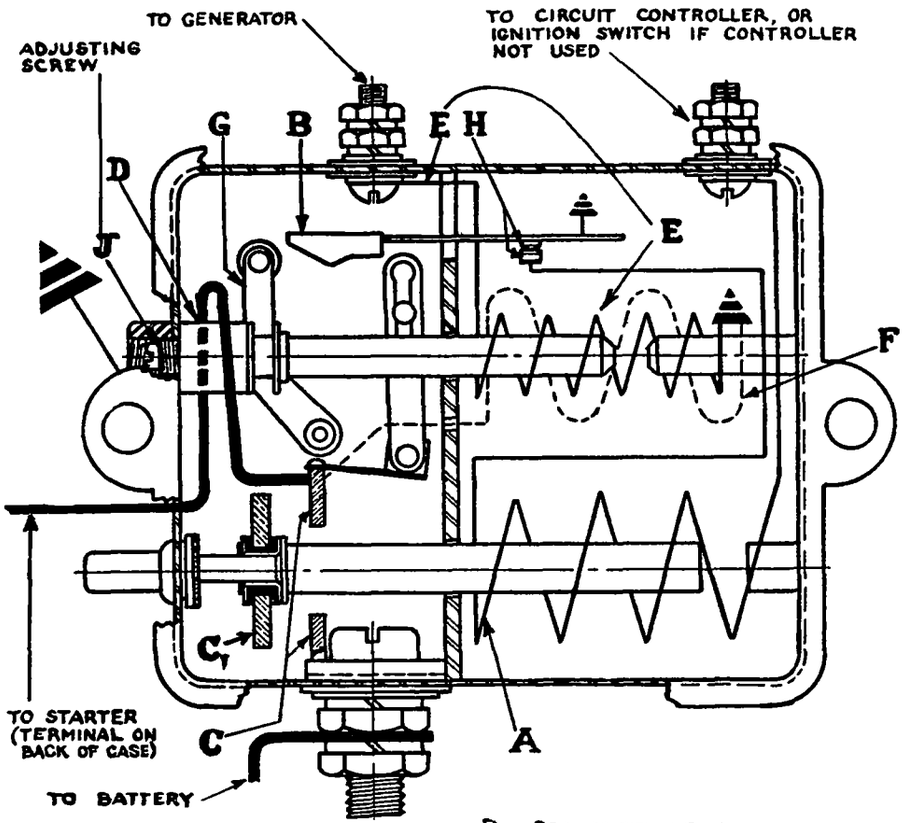
Single 'click' heard, Starter does not operate.

(1) Main switch contacts defective or out of alignment. Check by connecting heavy jumper (starter cable) across Startix main switch terminals.
(2) Loose or corroded battery terminals, broken cables, or defective ground connection. Examine cables and terminals.
(3) Second winding of relay solenoid defective. See test (3) under Starter spinning below.

Series of 'clicks' heard, Starter does not operate.

(1) Open-circuit in starter. Examine cable and connections at Startix and starter, check internal wiring and connections in starter, check starter brushes and commutator.

Starter Spins but Bendix does not engage before Startix cuts out.



(1) Bendix drive defective. Check for broken spring, broken spring screw, dirty or gummy Bendix shaft.

Bendix engages, Starter does not crank engine.

(1) Bendix pinion jammed. Release Bendix. Examine Bendix drive and flywheel teeth. See that engine is free and can be turned over easily.

Starter overruns or Spins after engine fires, Contacts may flutter.

(1) Startix not properly grounded. Startix grounded through case. When mounted on dash, or if good ground connection not secured through mounting screws, connect ground lead between mounting lug and engine.
(2) Startix 'IGN' lead connected to wrong side of ignition coil. If this lead connected at coil instead of ignition switch, see that connection is made to switch side of coil.
(3) Discharged battery or excessive starter draw when running free. Replace battery if voltage when starter running free is less that 4.8 volts. Check starter draw (see '0 ft. lb.' torque test figure on car page).
(4) Startix adjustment incorrect. To adjust with ignition turned on, disconnect lead on 'GEN' terminal, loosen locknut on starting adjustment screw 'J', turn screw counter-clockwise until click is heard indicating that main contacts have opened. Turn screw ⅛ turn further counter-clockwise, tighten locknut.

Starter makes repeated attempts to crank engine. Does not crank continuously.

(1) Discharged battery. Voltage should not drop below 4.8 volts when starter is spinning freely.
(2) Dirty or gummy Bendix Drive. Wash drive in kerosene and apply thin film of light oil.
(3) Startix adjustment incorrect. To adjust with ignition turned on, disconnect lead on 'GEN' terminal, loosen locknut on starting adjustment screw 'J', turn screw slowly clockwise until point is reached where starter begins to spin continuously after engine begins to fire, then turn screw ⅛ turn counter-clockwise, tighten locknut. This adjustment must be made slowly since turning the screw in too far will result in the main switch solenoid contacts being held open so that the Startix will be inoperative.

AUTO-LITE
SOLENOID PINION SHIFT TYPES

Car Model	Solenoid Switch	Starter Model
Chrysler C25 (1940)	SS-4206	MAX-4020A
Chrysler C26 (1940)	SS-4206	MAX-4027
Chrysler C27 (1940)	SS-4206	MAX-4020A
Packard Super 8 (1940)	SS-4205	MAX-4041

These Starter Controls same as types used on corresponding 1939 car models (see Packard note).

PACKARD NOTE:—Packard Super 8 starter is new type reduction gear unit with solenoid operated pinion on reduction gear shaft which is driven at 14/29 armature speed. Grease plug provided on drive end of starter through which gear compartment can be packed with heat-resisting grease. Solenoid Switch unit is similar to types use on other starters and is serviced in the same manner.

PERFORMANCE & ADJUSTMENT:—Same as for previous types. *See 'Auto-Lite Starter Control—Solenoid Pinion Shift Type' article in Electrical Equipment Section of manual for complete data and adjust to the following specifications:*

Solenoid Winding Tests—Shunt and series windings together should draw 34-38 amperes at 3.0 volts. Shunt coil only should draw 14-16 amperes at 6.0 volts (this is 'hold-in coil' and operates when series coil has been shorted out by closing of main switch contacts).

Solenoid Relay Specifications

Contacts Close—3.5-4.5 volts. **Contacts Open**—1.5-2.5 volts.

Contact Gap—.025-.035". **Coil Resistance**—7.5-8.3 ohms at 77° F.

Pinion Position when disengaged—With pinion at rest, distance between outer face of mounting flange on pinion housing to outer end of pinion should be 1 11/32" (MAX-4020A, MAX-4037), 15/16" (MAX-4041) plus 1/64" or minus 5/32".

Pinion Clearance when engaged—With switch closed and plunger fully bottomed in core (press in on plunger when making this test), clearance between end of pinion and thrust washer next to outer pinion housing bearing should be 5/64" plus or minus 1/64". To adjust, remove pin in plunger link and turn stud in or out of plunger.

Armature Endplay—Armature endplay must be .005" minimum, .030" maximum. Adjust by inserting MU-54 thrust washer of correct thickness between the MAD-96 thrust washer and the commutator end plate. These thrust washers furnished in three thicknesses as follows: MU-54—1/32", MU-54A—1/64", MU-54B—3/64".

Checking Switch Action—Switch action can be checked by slipping special steel spacer (square stock 1" wide, ¾" thick, with ⅝" slot in the 1" face) on armature shaft between pinion and thrust washer at pinion housing outer bearing. With spacer in place, switch plunger should bottom and switch contacts should close with normal voltages.

TROUBLE SHOOTING:—Pinion fails to engage or disengage properly. Check for interference between shift yoke and collar at open end of yoke where curved section passes over rim on collar. Binding of yoke on collar at this point should be corrected by filing yoke at point where interference occurs. Check for binding of yoke shoes on mounting pins which causes shoes to turn and bind in collar. Correct by cleaning all dirt from between shoes and yoke, lubricate shoe pins and make certain that yoke shoes installed with curved side toward pinion end of starter clutch. Check for binding of yoke assembly on yoke fulcrum pin due to paint or dirt on pin. Clean yoke pin and yoke sleeve thoroughly, examine return spring on pin. If starter does not function correctly after these corrections have been made, yoke assembly should be replaced.

Flywheel ring gear teeth damaged by pinion. May be caused by too early closing of starting switch contacts which will result in starter operating before pinion has been meshed with flywheel. Check pinion position (see specifications above). Switch contacts should close approximately 3/16" plunger travel before plunger bottoms in solenoid core.

AUTO-LITE
POSITIVE PINION SHIFT TYPES

Plymouth P9, P10 (1940)	SW-2813	MZ-4062
Plymouth P9, P10 ('40) Canada	SW-2813	MAW-4016

These Starter Controls same as types used on corresponding 1939 models.

PERFORMANCE & SERVICING:—Same as for previous types. *See 'Auto-Lite Starter Control—Positive Pinion Shift Type' article in Electrical Equipment Section of manual for complete data and adjust to following specificatinns:*

Pinion Position when disengaged—With pinion at rest, distance from outer face of mounting flange on pinion housing to outer end of pinion should be 1 1/32" plus 1/64" or minus 5/32".

Pinion Clearance when engaged—With pinion fully meshed in flywheel (full travel of shift lever), clearance between outer end of pinion and face of thrust washer next to outer pinion housing bearing should be 5/64" plus or minus 1/64".

Armature Endplay—Armature endplay should be .005" minimum, .030" maximum. Adjust by inserting MU-54 thrust washer of correct thickness between the MAD-96 thrust washer and the commutator end plate. These thrust washers furnished in three thicknesses as follows: MU-54—1/32", MU-54A—1/64", MU-54B—3/64".

Switch Travel—Plunger travel between at rest position and closed position should be approximately 5/32".

Willys 440 Truck (1940)	SS-4001	MZ-4049

These Switches same as types used on corresponding 1939 car models.

PERFORMANCE & ADJUSTMENT:—Same as for previous types. *See "Auto-Lite Starter Controls—Magnetic (Solenoid) Types SS-4000 Series" article in Electrical Equipment Section of manual for complete data.*

DELCO-REMY
MANUAL PINION SHIFT TYPES

Car Model	Starting Switch	Starter Model
Chevrolet All Models ('40)	820052	1107009
Oldsmobile F-40, G-40 ('40)	820052	1107007
Oldsmobile L-40 (1940)	820052	1107907
Pontiac 40-25, 26 (1940)	820052	1107022
Pontiac 40-28, 29 (1940)	820052	1107914

These Starter Controls same as types used on corresponding 1939 models.

DESCRIPTION:—These starters have a pinion assembly and shift lever similar to that used on Solenoid Pinion Shifts but the shift lever is connected through linkage to the starting pedal so that the pinion is positively engaged with the flywheel teeth when the starting pedal is depressed. The starting switch is mounted on the starter field frame and switch plunger is depressed by lug on shift lever to close switch contacts and operate starter after pinion has been meshed with the flywheel.

SERVICING:—No servicing required and no adjustments provided. Switch contacts should not close until after pinion has been meshed (except when pinion teeth butt against flywheel teeth in which case compression of spring between shift collar and overrunning clutch on pinion sleeve will allow switch contacts to close and revolve pinion to meshing position). Return spring on shift lever should have sufficient tension to disengage pinion promptly when starting pedal is released.

Pinion Assembly. Same as types used on Solenoid Pinion Shift Starters (see above). Compression spring and collar can be serviced but no attempt should be made to dismantle or service overrunning clutch.

②—**These Starter Controls same as types used on corresponding 1939 models.**

PERFORMANCE & ADJUSTMENT:—Same as for previous types. *See 'Delco-Remy Starter Control—Solenoid Switch Type' article in Electrical Equipment Section of manual for complete data and adjust to following specifications:*

Solenoid Switch Performance—Solenoid should close (bottom in core) against 70 lb. pull with ½" gap drawing 65-71 amperes at 5 volts. While closed, current should be 12-14 amperes (hold-in coil only).

Solenoid Setting—Clearance between end of pinion and inner face of starter pinion housing should be ⅛" with solenoid plunger bottomed in core. Adjustment will be simplified if lead disconnected at terminal on starter field frame (so starter will not spin) and relay contacts closed so that plunger is drawn into coil core. Press back on pinion to take up backlash in overrunning clutch, remove solenoid plunger link pin, adjust link (by turning link stud in plunger) until pin can just be inserted at forward end of shift lever slot.

Relay Specifications (1542, 1545, 1546)

Contacts Close—1.9 volts maximum. **Contacts Open**—1.0-1.2 volts.
Contact Gap—.035" (.025-.045"). **Air Gap**—.012" (contacts closed).

268-M Relay Specifications (1555 Solenoid)

Contacts Close—3.2 volts maximum. **Contacts Open**—1.6-2.0 volts.
Contact Gap—.035" (.025-.045"). **Air Gap**—.010" (contacts closed).

Pinion Assembly & Compression Spring—Pinion assembly same type as used on 1939 models (may be identified by groove in pinion teeth approximately ⅛" from clutch shell). Compression spring must have tension of at least 34 lbs. when compressed to 1". To remove spring, press shift collar down on pinion sleeve to compress spring until lock ring on end of sleeve is exposed, remove lock ring. Spring and collar can be serviced but no attempt should be made to dismantle overrunning clutch mechanism. Clutch is packed with high melting point grease and pinion assembly should not be cleaned by any method which may remove this lubricant.

Shift Lever Return Spring—Return spring on shift lever should have tension of 9-12 lbs. (start of travel), 28-35 lbs. (end of travel). Weak spring may cause sluggish disengagement particularly in cold weather or if shaft is gummy.

1940 DELCO-REMY VACUUM SWITCH

Model **Used On:**

1990127—BUICK, SERIES 40-40, 50, 60, 70, 80, 90 (1940)

This Switch new design and not similar to type used on 1939 Buick models.

DESCRIPTION:—Switch is entirely new design 'direct operated type' with contact rotor mounted directly on end of throttle valve shaft within switch body (switch assembly mounted directly on carburetor casting at end of throttle shaft by two screws). Vacuum chamber is formed within top cover plate and is connected to the manifold below the throttle valve by a channel extending through the top cover, switch body, and carburetor casting. Diaphragm is clamped between switch body and top cover and consisted of a riveted assembly including spring cup (spring sits in cup and is positioned by recess in top cover) and combination guide pin and lockout plunger (which moves in guides formed in switch body). The internal circuit through the switch is completed from one contact spring through the contact rotor to the opposite contact spring (mounted on the lockout lever).

OPERATION:—With the engine not running (no vacuum) and the throttle valve closed, lockout will free lockout lever (diaphragm pressed down by return spring) but lockout lever and contact will be held away from contact plate on contact rotor by insulating knob on rotor. When the throttle is opened to start the engine, contact rotor turns with throttle valve shaft and as soon as insulating knob is turned away from the lockout lever, the contact spring on the lever contacts the rotor and completes the circuit through the switch. As soon as vacuum is developed in the manifold, diaphragm attempts to move upward but is prevented from doing so by hook on upper end of lockout lever which engages top of lockout plunger. When throttle is closed (to idle engine after it has started), insulating knob on contact rotor presses out on lockout lever and frees lockout plunger, diaphragm then moves up and lockout engages lockout lever so that the contact spring is held away from the contact rotor while the engine is running. When engine is stopped, the closing of the throttle valve lifts the lockout lever from the lockout (this Unlatch Action occurs 17-23° from closed throttle position) and diaphragm and lockout plunger drop down into position for a new start.

ADJUSTMENT:—No adjustment ordinarily required. Switch is "timed" for correct throttle position when contacts closed by timing washer assembled on face of contact rotor which positions rotor on throttle valve shaft. Timing can be checked, and new washers installed to change timing as follows:

Switch Timing Check:—See that carburetor throttle lever stopscrew set for correct 8 MPH. hot or slow idle speed. Take out screws and remove side cover plate on switch. Start engine, close throttle, then open throttle until clearance between throttle stopscrew and highest step of fast idle cam is ¼" (cam in fast idle position—engine must be cold), stop engine without disturbing throttle position. Place mirror so that switch guide pin and lockout visible from left side of car, close throttle slowly by lightly tapping on hand throttle lever until guide pin and lockout releases, then measure clearance between stopscrew and fast idle cam with cam in fast idle position. Clearance should be 3/64" minimum, 3/32" maximum. If less than 3/64" timing washer should be replaced by one having a **higher number.** If more than 3/32", timing washer should be replaced by one having **lower number.** See directions below.

Switch Action Check (On Car):—See that carburetor throttle lever stopscrew set for correct 8 MPH. hot or slow idle speed. Start engine, close throttle then open throttle until clearance between throttle stopscrew and highest step of fast idle cam is ¼" (cam in fast idle position—engine cold), stop engine. Tap throttle closed until clearance between stopscrew and cam is exactly 3/64" (use extreme care not to close throttle further, if clearance less than 3/64", repeat entire procedure). Start engine by opening throttle from this position. Repeat this test several times. Engine should start each time. If engine does not start more than once, timing washer should be replaced with one having a **higher number.** After making above test for minimum clearance between fast idle cam and stopscrew, check for maximum clearance as follows. Repeat test instructions given above except that clearance between fast idle cam and stopscrew should be set at not less than ⅛". Engine should not start from this position. If engine starts, timing washer should be replaced with one having a **lower number** and first test (for minimum clearance) should be repeated.

Timing Washers:—Washer has slot which engages flat on throttle shaft and lug which engages hole in contact rotor (rotor is free on shaft and is positioned by timing washer). Washer marked by number on side opposite rotor lug and furnished with lug in different positions for smaller or larger stopscrew-to-fast idle cam clearance (washer with higher number will increase clearance, lower number decrease clearance). Select correct washer by means of tests given above and install as follows:

Timing Washer Installation. Take out screws in side cover on switch, remove cover and gasket. Remove nut on end of throttle valve shaft within switch, remove lockwasher and timing washer (if contact rotor removed, make certain that steel washer installed on shaft behind rotor). Install timing washer being careful to see that lug engages hole in contact rotor, install lockwasher and tighten nut, replace cover and gasket. Recheck switch timing.

SERVICING:—No servicing required. If top cover removed (for diaphragm replacement), make certain that return spring properly seated in cover recess and spring cup on diaphragm and that vacuum channel in top cover and switch body line up. When installing new parts, always check switch timing and install correct timing washer as directed above.

CAUTION—Cover gasket is felt and is designed to provide necessary 'breathing' action required by diaphragm movement. This gasket must always be installed under side cover and no other type gasket should be used.

CARBURETOR SECTION

'C' PAGES

This Section covers the Illustrations, Adjustment, Performance, Jet Sizes, Overhaul and Special Instructions for all Carburetors.

Two Separate Indexes are provided. The Carburetor Index directs you to Each *Carburetor Type.* The Carburetor Car Model Index to the Carburetor *Installed on Each Car Model.* The Jet Specifications for Each Car Model are listed in Separate Tables following the sections on each make of Carburetor.

NOTE: For EQUIPMENT connected with the Fuel System *see Carburetion Equipment Section.*

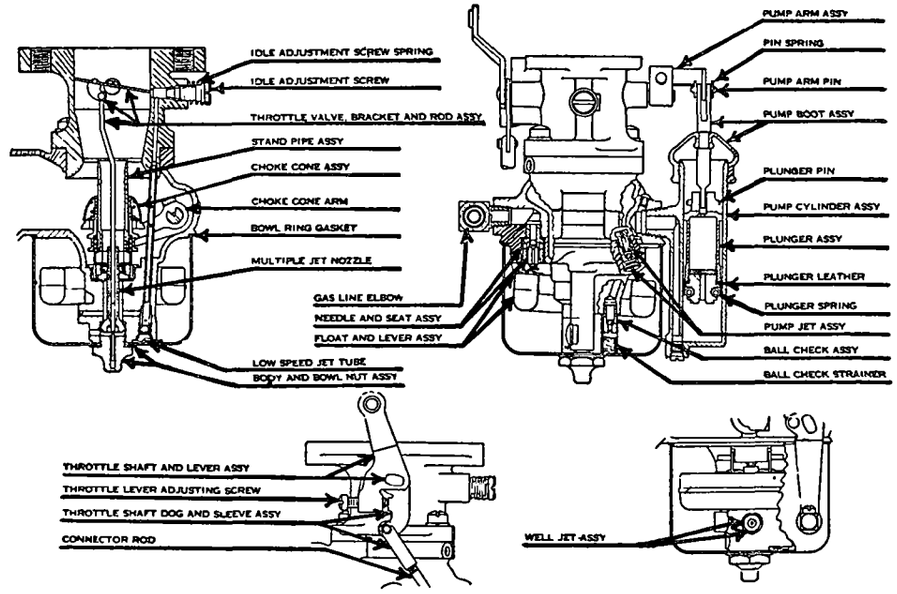
215-S—DODGE SIX, MODEL DL (1932)

147-SA—NASH SIX, MODEL 9-60 (1932)

TYPE:—Plain tube updraft type with throttle operated accelerating pump and economizing device (metering rod). Multiple jet nozzle (main discharge nozzle) is fed by fuel flowing through well jet. Discharge from multiple jet nozzle is controlled by metering rod which is lifted in the nozzle as the throttle is opened, providing maximum economy for partial throttle operation and full power with wide open throttle. All jets are 'fixed' type (non-adjustable). Fuel for idling is taken from float chamber through low speed jet tube and discharged through a port in the carburetor wall opposite the throttle edge (closed throttle position). Idle discharge passage has an air bleed hole regulated by the idling adjusting screw. Idle adjustment and accelerating pump adjustment (summer and winter setting) are the only points requiring attention.

IDLE ADJUSTMENT:—Air bleed type operating on air. Engine must be thoroughly warmed up before idling adjustment is made (on Nash models pull out heat control button on dash and leave in this 'Heat On' position while warming up engine and adjusting carburetor). With engine warm and running, close throttle, adjust throttle stop screw if necessary to secure correct idling speed of 300 R.P.M. or approximately 5-6 M.P.H. Adjust idling adjusting screw by turning screw out until engine begins to miss (mixture too lean), then turn screw in or clockwise slowly until engine fires smoothly. Idling screw operates on air and should be turned out or counter-clockwise to secure leaner mixture and in or clockwise for richer mixture. After completing adjustment, readjust throttle stop screw to secure correct idling speed. Do not idle engine below 300 R.P.M. or 5 M.P.H.



If correct idling adjustment cannot be secured, take out idling tube (in float bowl) and clean with compressed air. See that soldered joints on tube are tight and that tube is seated airtight in casting at top and bottom.

PERFORMANCE AND ECONOMY:—Multiple jet nozzle fuel supply is metered by main well jet, which is not adjustable. Well jet can be changed to secure leaner-than-standard fuel mixtures (see specifications). This is done ordinarily to compensate for special fuels or high altitudes.

Metering rod attached to throttle restricts discharge of multiple jet nozzle with throttle partly open. When throttle is opened wide, metering rod is raised in nozzle, permitting greater fuel discharge for full power operation. Metering rod is not adjustable and requires no attention.

ACCELERATING PUMP:—Low pressure delayed action type. Fuel is drawn into pump cylinder through ball check strainer and ball check valve (in lower part of float chamber) when throttle is closed and discharged through pump jet into mixing chamber when throttle is opened. Pump arm on throttle valve shaft has two or three holes for engagement of pump arm pin to provide varied pump stroke. Center hole in pump arm (when provided) should be used for normal temperature ranges. Pump pin should be engaged in outer hole (marked 'W') providing maximum pump stroke for winter driving. Inner hole (marked 'S') providing minimum pump stroke should be used for summer driving, high altitudes, or high test gasoline.

NOTE:—If increased resistance on foot throttle is noticed, take out pump discharge jet and clean with compressed air or replace jet. Poor acceleration may be caused by incorrect pump setting (above), damaged or worn pump plunger leather, loose pump cylinder, bent pump arm, clogged ball check strainer or ball check assembly. Ball check assembly can be removed and cleaned with compressed air. If pump plunger is removed from pump cylinder, a loading tool should be used to install the plunger in order to avoid damaging the plunger leather.

FLOAT LEVEL:—To check float level, take out float bowl nut, remove float bowl, invert carburetor, remove gasket, measure distance from gasket seat (machined surface on carburetor body) to nearest point on float (top when not inverted) at a point opposite needle valve. Correct float levels on all models should be 11/16". Adjust by bending lip of float lever.

THROTTLE VALVE SETTING:—When installing throttle valves, idle port opening above valve should be .030-.034" (315-S), .048-.052" (147-SA) with valve closed tightly. Idle ports are slotted or key-hole type.

CHOKE:—Compensating cone type consisting of a cone-shaped restriction on the standpipe which is raised in the venturi by the choke cone arm, increasing the air flow through the standpipe and the relative fuel discharge of the multiple jet nozzle. Choke lever and throttle lever on all models except 150-S (Chevrolet) are interconnected so that throttle valve is opened slightly when carburetor is fully choked. Connecting lever will not require adjustment and setting should not be disturbed.

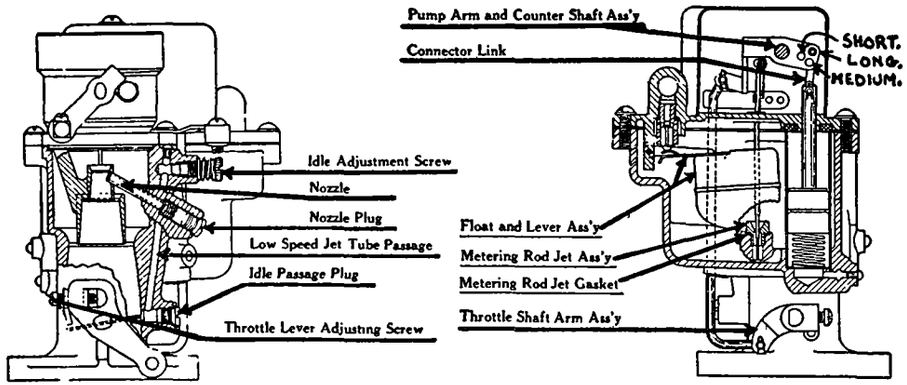
222-SA—CHEVROLET TRUCK, SERIES BB (1932).
235-S —CHEVROLET CONFEDERATE, SERIES BA (1932).
259-S —CHEVROLET MASTER SIX, SERIES CB (1933).
260-S —CHEVROLET STANDARD SIX, SERIES CC (1933).
243-S —ESSEX TERRAPLANE SIX, SERIES K (1932), SERIAL NOS. 350000 TO 367858.
267-S —ESSEX TERRAPLANE SIX, SERIES K, KU (1933), SERIAL NOS. 367858 UP.
261-S —ESSEX TERRAPLANE EIGHT, SERIES KT (1933).
258-S —HUPMOBILE SIX, SERIES K (1933).
255-S —PONTIAC EIGHT, SERIES 601 (1933), BEFORE SERIAL NO. 778380.
266-S —PONTIAC EIGHT, SERIES 601 (1933), AFTER SERIAL NO. 778380.
280-S PONTIAC EIGHT, SERIES 601 (1933), AFTER SERIAL NO. 827801.

TYPE:—Plain tube downdraft type with throttle operated accelerating pump and economizing device (metering rod). Main nozzle is located at an angle in the upper or primary venturi with a secondary and a main venturi directly below this point in the mixing chamber. Fuel for main nozzle is metered by metering jet and metering rod. Accelerating pump discharges through a pump jet against the wall of the secondary venturi. Idle adjustment and accelerating pump setting are the only points requiring attention.

IDLE ADJUSTMENT:—Air bleed type operating on air. Engine must be thoroughly warmed up before adjustment is made. With engine warm and running, close throttle, adjust throttle stop screw if necessary to secure correct idling speed of 300 R.P.M. or approximately 5-6 M.P.H. Turn idling adjusting screw out or counter-clockwise until engine begins to miss (mixture too lean), then turn screw slowly in or clockwise until engine fires smoothly. Idling screw operates on air and should be turned out to secure leaner mixture and in for richer mixture. Correct idling settings are as follows:

	Idling Screw	Idling Speed
Chevrolet (all)	½-1 turn open	300-350 R.P.M.
Hupmobile	⅜-1 turn open	
Pontiac	⅝-1⅛ turns open	300 R.P.M.
Terraplane 6 (243-S)	⅝-1⅛ turns open	300 R.P.M. or 5 M.P.H.
Terraplane 6 (267-S)	¾-1¼ turns open	300 R.P.M. or 5 M.P.H.
Terraplane 8	⅜-1 turn open	300 R.P.M. or 5 M.P.H.

Check idling speed after completing idling adjustment and readjust throttle stop screw if necessary. Do not idle engine below 300 R.P.M. If correct idling adjustment cannot be secured, remove low speed jet tube and clean with compressed air. See that tube is seated airtight in casting at top and bottom. If necessary replace with new tube of same characteristics.



ACCELERATING PUMP:—Pump arm (on countershaft under dust cover) has three holes for engagement of pump plunger connector link to provide varied pump stroke. Medium setting with pin engaged in center hole is correct for ordinary temperature ranges and standard gasoline. Engage pin in inner hole (short pump stroke) for operation in hot climates, high altitudes, or with high test gasoline. Upper hole (long stroke) should be used for extremely cold temperatures. Accelerating pump countershaft should be lubricated at 5000 mile intervals. Take out dust cover screw (on top of cover) and fill threaded hole with a good grade of graphite grease.

METERING ROD (ECONOMIZER):—Fuel is metered by a two or three step metering rod being raised in the metering jet as the throttle is opened, allowing an increased fuel flow through the jet. No adjustment is provided but metering rods can be changed to secure leaner-than-standard fuel mixtures to compensate for special fuel or operating conditions such as high altitudes. To change metering rod, take off dust cover, take off pin spring, turn rod one-quarter turn to left to disengage pump arm, lift rod out, being careful not to lose disc on rod. Insert new rod (with disc in place), holding rod vertically so that lower end of rod will enter jet in float chamber. Turn rod one-quarter turn to engage pin on pump arm (throttle must be closed). If rod is correctly assembled no difficulty will be experienced in connecting the rod to the pin and rod will hang vertically. Replace pin spring and dust cover.

NOTE:—Metering rod setting should be checked whenever carburetor is serviced or when rods are changed. This will require a special gauge, Part No. T109-15 (2.797″). To check rod setting, remove dust cover, disengage upper end of throttle connector rod, back off throttle lever adjusting screw so that throttle closes tight, remove metering rod (see above), insert gauge in place of rod so that beveled end is seated in metering rod jet and gauge is held in vertical position. See that metering rod pin rests on top of gauge with throttle closed and upper end of connecting rod centering freely in the hole in the pump arm. If setting is not correct, bend lower end of throttle connector rod so that upper end centers freely in hole.

FLOAT LEVEL:—To check float level, take off float bowl cover, remove gasket, invert cover, measure distance from gasket seat (machined surface) on cover to nearest point on float (top when not inverted) at a point opposite the needle valve. Float level can be reset by bending lip of float lever.

Car Model	Carburetor Model	Float Level
Chevrolet	All Carbs	⅜″
Hupmobile Six 321	258-S	½″
Pontiac Eight	255-S, 266-S	½″
Pontiac Eight	280-S	⅜″
Terraplane Six	243-S, 267-S	⅜″-13/32″
Terraplane Eight	261-S	½″

THROTTLE VALVE SETTING:—When installing throttle valves, set valve so that idle port opening is as shown in table below with valve tightly closed.

Model	Idle Port Opening	Model	Idle Port Opening
Chevrolet 212-S	.031-.035″	Essex 267-S	.032-.036″
Chevrolet 222SA, 35S	.031-.035″	Hupmobile 258-S	.018-.022″
Chevrolet 259S, 60S	.035-.038″	Nash 186S	.048-.052″
Essex 243-S	.028-.032″	Pontiac 255S, 66S	.023-.027″
Essex 261-S	.018-.022″	Pontiac 280-S	.010-.014″

CHOKE:—On all models except Chevrolet and Nash (186-S, 212-S, 222-SA, 235-S, 259-S, 260-S) choke valve and throttle valve are interconnected so that throttle is opened slightly when carburetor is partially choked. This provides a fast idle during warming up period. Throttle returns to closed position when choke valve is fully open. Carburetor models 255-S, 261-S, 267-S are fitted with auxiliary relief poppet valves on the choke valve to prevent over-choking. Models 186-S, 212-S, 222-SA, 235-S, 259-S, 260-S, 243-S, 266-S have one side of the choke valve hinged and controlled by a spring so that when the engine begins to fire, this hinged portion of the valve acts as an automatic air valve during the warming up period. The hinged portion of the valve is held closed by a trigger lock when carburetor is fully choked and choke valve must be opened slightly to release this lock. Adjust valve lip under lock pawl so that clearance between valve edge and carburetor wall is .008-.012″ (259-S, 260-S), or .058-.068″ (266-S) with choke in fully closed position.

Car Model	Carburetor	Throttle Opening (Choke Closed)
Pontiac 601 ('33)	255-S, 266-S, 280-S	.031-.035″
Terraplane K ('32)	243-S	.022-.026″
Terraplane K ('33)	267-S	.036-.040″
Terraplane KT ('33)	261-S	.038-.042″

348-S—TERRAPLANE, DE LUXE MODEL 71, COMMERCIAL MODEL 70 (1937)

NOTE:—Chevrolet (all). Main nozzle consists of Slip Nozzle in primary venturi and Screw Nozzle seated in slip nozzle. Furnished as an assembly and must not be dismantled.

Chevrolet Cab-over-Engine Trucks—Use Carter (BB) updraft type carburetors. See separate article for data on these models.

Chevrolet Models 319-S and 334-S Carburetors. Metering rod changed in production from Part No. 75-144 (319-S), 75-171 (334-S) to Part No. 75-176. Fuel economy will be improved in intermediate range (319-S) or throughout driving range (334-S) by installing this new metering rod.

Chevrolet Fleet Models. This carburetor has smaller main venturi and jet calibration and is fitted with stop pin which limits throttle opening to half-throttle (45 M.P.H.). Pin may be removed to permit top speed where necessary by inserting hacksaw blade behind lever and cutting off pin.

Chevrolet 420-S, 434-S Jet Changes—The metering rod and low speed jet changed in production for better low speed economy and performance. Original Standard Metering Rod changed to 1 Size Lean. See Carter Jet Specification Table for complete jet data.

Hupmobile Model 333-S—This model fitted with Anti-percolator. Adjustment instructions given below.

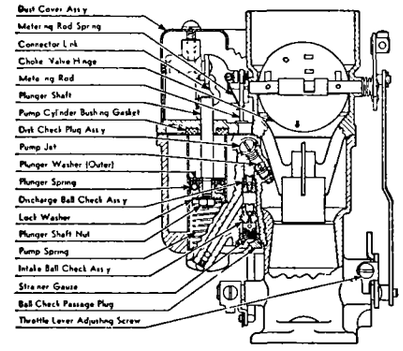
Pontiac Model 314-S—This model fitted with Anti-percolator. Adjustment instructions given below.

Terraplane Models. Carburetor fitted with Anti-Percolator and Throttle Cracker. See these sections below for adjustments.

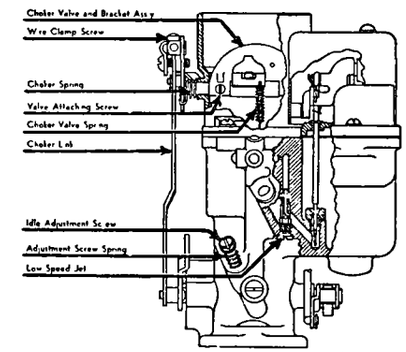
SPECIAL SHOP NOTES:—Chevrolet Engine Running Backward (When key is turned off)—To corect this complaint, check idle speed and set stopscrew for idle speed not to exceed 7 M.P.H. Check throttle valve and make certain that it is not sticking. Check manifold heat control valve thermostatic spring. Spring must be wound up only enough so that end can be slipped over manifold pin (approximately ½ turn). Excessive tension will cause poor performance.

Chevrolet 391-S Stalling when Hot. If engine stalls while idling when hot but idles properly when cool, this condition probably caused by pressure in float bowl caused by fuel 'percolation' forcing fuel through nozzle to manifold and stalling engine. Correct by installing new lightweight Bakelite Metering Rod Disc Part No. 129-21 (supersedes No. 129-18). Any pressure in float bowl will raise this disc and relieve bowl pressure. This stalling not caused by carburetor flooding and fuel pump pressure should not be reduced or jets and intake needle valve changed.

Chevrolet 391-S Excessive Pinging. If engine pings excessively at start of acceleration from constant speed of 20 MPH (after Octane Selector correctly set for slight ping when accelerating with wide open throttle from 10 MPH—see tune up data on car model for instructions), this ping probably caused by 'time lag' of vacuum control in retarding spark. Correct by removing vacuum line brass fitting on carburetor body and, on first models with small round hole in carburetor casting, drill hole out first with a #52 (.0635") drill and then with a #46 (.081") drill. On later models with rectangular hole in carburetor body, do not make this correction. Remove vacuum line fitting at vacuum diaphragm and drill out with #46 (.081") drill. On cars after March 15th, vacuum line and fittings were increased to 3/16" (first cars ⅛") to cut down this vacuum control 'time lag.'



Chevrolet 391-S 'Loading' on Rough Roads. See that correct bowl cover gasket (No. 121-55) installed which has hole provided for vent by-pass. No. 121-46 gasket (used on 1937 models) does not provide for this vent by-pass and must not be used.



Chevrolet 391-S Excessive Fuel Consumption (Poor Mileage). Make certain that small gasket between air horn and carburetor body at the air horn and fuel bowl air passage is in good condition and that the sealing washer at metering rod on bowl cover is in place. Air leaks at either point will upset the balanced bowl vent system (see description below) and cause excessive gasoline consumption at intermediate speeds.

Chevrolet 420-S, 434-S Rich & Lean Complaints—To correct fuel mixture being too rich at low speed, or too lean at high speed (caused by metering rod disc hanging on metering rod), install special Metering Rod Disc Retainer No. 201-10. This retainer should be installed on these carburetors (420-S, 434-S) whenever carburetors are serviced.

TYPE:—Plain tube downdraft type with throttle operated accelerating pump and economizing device (metering rod). Main nozzle is located at an angle in the upper or primary venturi with a secondary and a main venturi directly below this point in the mixing chamber. Fuel for main nozzle is metered by metering jet and metering rod. Accelerating pump discharges through a pump jet against the wall of the secondary venturi. Idle adjustment and accelerating pump setting are the only points requiring attention.

Chevrolet Model 391-S. New 'balanced' type bowl construction. Bowl is vented through system of passages in bowl cover, carburetor body, and air horn casting to air intake below air cleaner (#35 drill hole below choke valve, #27 hole above choke valve through drilled hole in shaft). This construction eliminates surging of fuel into air passages on rough roads (bowl vent located in top of countershaft dome on bowl cover) and holds air-and-fuel proportions constant under all conditions. See Loading and Gasoline consumption complaint remedies above.

IDLE ADJUSTMENT:—Needle valve type controlling fuel mixture. Engine must be thoroughly warmed up before adjustment is made. With engine warm and running, close throttle, adjust throttle stop screw if necessary to keep engine from stalling (do not set lower than 300 R.P.M. or approximately 5-6 M.P.H.). Turn idling adjusting screw in or clockwise until engine begins to miss (mixture too lean), then turn screw slowly out or counter-clockwise until engine fires smoothly. Idling screw controls fuel mixture and should be turned in to secure leaner mixture or out for richer mixture. See tune up data for each model on car model page. Approximate settings as follows:

Car Model	Idle Screw Setting	Idling Speed
Auburn (all models)	½-1⅛ turn open	350 R.P.M., 6 M.P.H.
Chevrolet (1934-35)	½-1½ turn open	350 R.P.M.,
Chevrolet 1936-37-38-39	1-2 turn open	400 R.P.M., 7 M.P.H.
Hudson	⅜-1 turn open	350 R.P.M., 7 M.P.H.
Hupmobile (all models)	⅜-1 turn open	300 R.P.M.,
Pontiac (all models)	½-1 turn open	360 R.P.M., 6 M.P.H.
Terraplane (all models)	⅜-1 turn open	350 R.P.M., 7 M.P.H.

METERING ROD (ECONOMIZER):—Fuel is metered by a two or three step metering rod being raised in the metering jet as the throttle is opened, allowing an increased fuel flow through the jet. No adjustment is provided but metering rods can be changed to secure leaner-than-standard fuel mixtures

to compensate for special fuel or operating conditions, such as high altitudes. To change metering rod, take off dust cover, take off pin spring, turn rod one-quarter turn to left to disengage pump arm, lift rod out, being careful not to lose disc on rod. Insert new rod (with disc in place), holding rod vertically so that lower end of rod will enter jet in float chamber. Turn rod one-quarter turn to engage pin on pump arm (throttle must be closed).

NOTE:—Metering rod setting should be checked whenever carburetor is serviced or when rods are changed. This will require a special gauge (see table below for correct gauge for each carburetor model). To check rod setting, remove dust cover, disengage upper end of throttle connector rod, back off throttle lever adjusting screw so that throttle closes tight, remove metering rod (see above), insert gauge in place of rod so that beveled end is seated in metering rod jet and gauge is held in vertical position. See that metering rod pin rests on top of gauge with throttle closed and upper end of connecting rod centering freely in the hole in the pump arm. If setting is not correct, bend lower end of throttle connector rod so upper end centers freely in hole Replace metering rod and dust cover (lubricate pump shaft—see Accelerating Pump Section). Readjust throttle stopscrew for correct idling speed.

Car Model	Carburetor Model	Gauge Part No.	Length
Auburn 652X, Y	288-S	T-109-15	2.797"
Auburn 653	307-S	T-109-20	2.795"
Chevrolet DC Std.	285-S	T-109-15	2.797"
Chevrolet DA, EA, EC, ED	284-S, 321-S	T-109-20	2.795"
Chevrolet	All 1936-37-38-39 Models	T-109-25	2.795"
Hudson LTS	299-S	T-109-20	2.795"
Hupmobile 518-D	316-S	T-109-21	2.718"
Hupmobile 618-G	333-S	T-109-25	2.795"
Pontiac 603 '34	283-S	T-109-15	2.797"
Pontiac all '35	306-S	T-109-21	2.718"
Terraplane all '34-35	295-S, 311-S	T-109-20	2.795"
Terraplane '36-37	331-S, 348-S	T-109-25	2.795"

NOTE—On Chevrolet Model 391-S, make certain that gasket is in place at metering rod on bowl cover. This gasket seals off metering rod opening and must be in good condition (air leaks at this point will disturb 'balanced' operation).

ACCELERATING PUMP:—Low pressure type positively actuated by throttle lever. Fuel drawn into pump chamber through intake ball check valve and strainer on upstroke of plunger and discharged through outlet disc check valve to pump jet in carburetor wall on downstorke of plunger when throttle opened.

Adjustment—Pump arm on countershaft under dust cover on top of float bowl cover provided with three holes for engagement of pump plunger connecting link. Inner hole provides minimum stroke, outer hole medium stroke, and upper hole maximum stroke. See tune up data on car model page for recommended setting and seasonal changes.

NOTE—Pump countershaft should be lubricated at 5000 mile intervals by removing dust cover screw at top of carburetor and filling screw hole with good grade of graphite grease before replacing screw.

PERFORMANCE:—Should be satisfactory if Idle Setting and Accelerating Pump setting are correct. See Carter Jet Specification Table and tune up data on car model pages for any recommended changes.

ANTI-PERCOLATOR:—Saxophone Type. Consists of a vent above main jet well controlled by a cap linked to the accelerating pump rod so that the vent is opened with the throttle closed to prevent any 'percolating' discharge of fuel through the main jet with the carburetor hot. The setting of the Anti-percolating device should be checked as follows:

Adjustment—Anti-percolating cap must be off seat when throttle closed in idling position. Adjust by bending anti-percolating cap arm slightly to permit pump arm to depress bracket. Cap must be seated when throttle opened slightly beyond idling position. Check by opening throttle .030" (insert drill rod between throttle edge and carburetor wall on side opposite port), adjust rocker arm so that clearance between rocker arm lip and pump arm is .005-.015" (with metering rod setting correct).

FLOAT LEVEL:—To check float level, take off float bowl cover, remove gasket, invert cover, measure distance from gasket seat (machined surface) on cover to nearest point on float (top when not inverted) at a point opposite the needle valve. Float level can be reset by bending lip of float lever. Correct float level setting is ½" (Chevrolet 420-S, 434-S), ⅜" (all others).

CHOKE:—Choke valves on these models are in most instances fitted with a pressure relief device of the split-valve or poppet-valve type.

Models 283S, 84S, 316S, 19S, 21S, 33S, 34S, 35S, 46S, 58S. Split type with half of the choke valve hinged and controlled by a spring. The hinged portion is held closed by a trigger lock when carburetor is fully choked for starting but is released as soon as the choke valve is opened slightly and acts as an automatic air valve during the warming-up period. Valve lip under pawl should be adjusted so that clearance between edge of choke valve and carburetor wall is .070-.075" (284-S, 285-S) with choke valve closed.

Models 281-S, 282-S, 288-S, 295-S, 298-S, 299-S, 307-S, 309-S, 310-S, 311-S, 315-S. Poppet type relief valve mounted on choke valve. Poppet valve is spring-controlled and opens to prevent over-choking when engine begins to fire.

391-S, 420-S, 34-S—Offset valve, semi-automatic type. Choke valve shaft and lever linked by coil springs (light inner spring allows choke valve to operate automatically during warming up period regardless of choke button position, heavy outer spring absorbs back pressure and prevents damage to valve.

Throttle Connector Used on Models 283-S, 288-S, 295-S, 299-S, 306-S, 307-S, 311-S, 314-S, 331-S, 348-S. Choke and throttle valves interconnected on these models so that throttle valve is opened slightly when carburetor is choked for starting, providing a 'fast idle' for as long as the choke valve is in use. Throttle returns to closed position when choke valve is opened. Correct throttle openings with choke valve closed are shown in table below:

Car Model	Carburetor	Throttle Opening
Auburn (all models)	288-S, 307-S	.031-.035"
Hudson LTS	299-S	.036-.040"
Pontiac Eight 603 ('34)	283-S	.031-.035"
Pontiac Six 701A, B ('35)	306-S, 314-S	.031-.035"
Terraplane ('34-37)	295-S, 311-S, 331-S, 348-S	.036-.040"

THROTTLE VALVE SETTING:—When installing valves, check setting with stopscrew backed off so that valve tightly closed. Idle Port Opening is opening of lower port (below throttle valve) except as noted.

Car Model	Carburetor	Idle Port Opening
Auburn	288-S	.008-.012"
Auburn	307-S	.003-.007"
Chevrolet	284-S (Keyhole Type Port), 285-S	.011-.015"
Chevrolet	284-S (Slotted Type Port)	.014-.018"
Chevrolet	319-S, 334-S	① .016-.020"
Chevrolet	321-S	① .158-.162"
Chevrolet	335-S, 358-S	① .012-.016"
Chevrolet	346-S	① .034-.038"
Chevrolet	391-S, 420-S, 434-S	① .047-.051"
Hudson	299-S	.007-.011"
Hupmobile	316-S, 333-S	.008-.012"
Pontiac	283-S, 306-S, 314-S	.010-.014"
Terraplane	295-S, 311-S, 331-S, 348-S	.016-.020"

①—Top of lower idle port above top edge of throttle valve.

TROUBLE SHOOTING:—Poor Idling Performance—If correct adjustment cannot be secured, engine stalls, or low speed performance is unsatisfactory, remove low speed idle tube, clean with compressed air, see that tube is tight in casting at top and bottom. Remove idle adjusting screw and clean idle passage with air.

Acceleration Unsatisfactory—Check pump setting, examine pump for damaged or worn plunger leather, bent pump arm or loose plunger, corrosion or sediment in pump cylinder. Use loading tool when replacing plunger in pump cylinder to avoid damage to plunger leather. If increased resistance felt on throttle lever, remove pump jet and clean with compressed air. Examine ball check valves and see that they are free and seat gasoline tight.

Carburetor 'Loads Up'—If carburetor has been in use for some time, check float level and adjust if necessary.

SERVICING:—To Disassemble Carburetor—Take out screw and remove pump arm dust cover, disconnect choke and throttle interconnecting link (when used), take off pin spring on metering rod, lift out rod and disc (disc is loose on rod). Take off pin locks on throttle connector link and pump connector link, disengage links and remove. Take out float bowl cover screws, lift off cover being careful not to damage float chamber gasket. Pull out pump plunger, remove plunger spring from pump cylinder. Remove idle adjusting screw and spring, nozzle plug and main nozzle, pump jet plug and pump jet being careful not to lose jet gasket, idle passage plug, low speed jet tube assembly, metering rod jet assembly, and other jets and plugs. Take out float lever pin, lift out float and lever assembly being careful not to drop float needle valve.

Servicing—Wash all parts and body castings in gasoline, blow out all passages in castings and jets with dry air. Replace all worn and damaged parts.

Reassembling Carburetor—Reverse disassembly directions above. Use new gaskets where necessary. Soak new metering rod jet gasket and needle seat gaskets in warm water for 15 minutes before installing. See that all jets and plugs tightened securely.

Adjusting—Check metering rod setting and float level. Adjust carburetor, when installed n engine, as directed in tune-up data on each car model page.

282-S—HUDSON EIGHT, MODELS LL, LT (1934).
309-S—HUDSON SIX, MODEL GH (1935).
310-S—HUDSON EIGHT, MODELS HT, HU, HHU (1935).
329-S—HUDSON SIX, MODEL 63 (1936).
330-S—HUDSON EIGHT, MODELS 64, 65, 66, 67 (1936).

338-S—REO FLYING CLOUD, MODEL 6-D (1936).
371-S—STUDEBAKER DICTATOR, MODS. 5A, 6A (1937), ENG. No. D-143675 UP
281-S—TERRAPLANE, STD. MODEL K, DELUXE MODEL KU (1934).
309-S—TERRAPLANE, DELUXE SIX MODEL GU (1935).
329-S—TERRAPLANE, CUSTOM MODEL 62 (1936).

NOTE:—All models fitted with Carter Climatic Control (automatic choke), Fast Idle, Unloader and Choke Valve Lock, and Anti-Percolator. See complete article in Carburetion Equipment Section for data on Climatic control, Fast Idle and Unloader. Anti-Percolator adjustment given below.

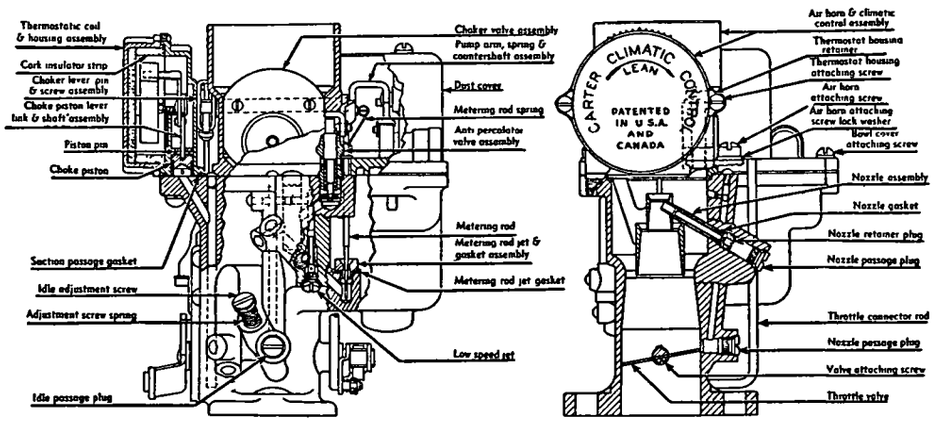
Nozzle Assembly on 327S, 38S, 39S, 42S, 51S, 85S. Consists of outer 'Slip Nozzle' in primary venturi and inner nozzle seated within this outer nozzle. Do not dismantle nozzle assemblies.

Oldsmobile F-38 Model. Model 385-S carburetor used on cars without automatic Self-shifting Transmission only. See Carter Vacumeter Carburetor article for data on type used with Self-shifting transmission.

Oldsmobile 1939 Models—Later cars use Carter WA1 Models 425-S, 426-S carburetors. See following article for complete data.

TYPE:—Same design as other Carter W1 carburetors except for Climatic Control, Fast Idle and Unloader mounted on carburetor air horn.

IDLE ADJUSTMENT:—Needle valve type controlling fuel mixture. Adjusting screws should be turned in for leaner mixture or out for richer mixture. Do not adjust until engine warmed up so that choke valve wide open and idling at hot or slow idling speed with fast idle bar raised to clear throttle stopscrew. Adjust throttle stopscrew so that idling speed is approximately 350 R.P.M., turn idling screw in until engine begins to miss, then turn screw out slowly until engine fires evenly. Readjust throttle stopscrew if necessary. See tune up instructions on car model pages. Approximate idle screw settings shown in table below.



Car Model	Idle Screw Setting	Idle Speed
Hudson (1934-35)	⅜-1 turn open	350 RPM., 7 MPH.
Hudson (1936)	½-1 turn open	350 RPM., 7 MPH.
Oldsmobile (1936-37)	¾-1¼ turn open	350 RPM., 6 MPH.
Oldsmobile (385-S)	1-1½ turns open	350 R.P.M., 6 M.P.H.
Pontiac (All 1935-36)	½-1¼ turn open	360 RPM., 6 MPH.
Pontiac 6 (1937)	¾-1¼ turn open	360 RPM., 6 MPH.
Pontiac 8 (1937)	½-1 turn open	350 RPM., 6 MPH.
Reo	½-1¼ turn open	350 RPM., 6 MPH.
Studebaker	½-1¼ turn open	360 RPM., 6 MPH.
Terraplane (1935)	⅜-1 turn open	350 RPM., 7 MPH.
Terraplane (1936)	½-1 turn open	350 RPM., 7 MPH.

ACCELERATING PUMP:—Low pressure type positively actuated by throttle lever. Fuel drawn into pump cylinder through intake check valve and strainer on upstroke of plunger and discharged through outlet disc check valve to pump jet in carburetor wall on downstroke of plunger when throttle opened.

Adjustment—Pump arm on countershaft under dust cover at top of cylinder provided with three holes for engagement of pump plunger connecting link. Inner hole provides minimum stroke, outer hole medium stroke and upper hole maximum stroke. See tune-up data on car model pages for recommended settings and seasonal changes.
NOTE—Pump countershaft should be lubricated at 5000 mile intervals by removing dust cover screw at top of carburetor and filling screw hole with good grade of graphite grease before replacing screw.

PERFORMANCE:—Should be satisfactory if idle setting and accelerating pump setting correct. See Carter Jet Specification Table and tune-up data on car model pages for standard jet calibrations and any recommended changes.

METERING ROD (ECONOMIZER):—All fuel for main nozzle metered by three-step metering rod linked to pump arm so that rod is raised permitting increased fuel flow through metering jet as throttle is opened. No adjustment provided but metering jet may be changed to secure leaner-than-standard fuel mixtures to compensate for special fuel or high altitude operation (see Jet Specification table). Metering rod setting should be checked whenever metering rods are removed.

To Remove Metering Rod—Take out dust cover screw, lift off dust cover, take off pin spring, turn metering rod one-quarter turn to left to disengage it from arm, lift rod out being careful not to lose disc on rod.

To Check Metering Rod—See that choke valve opened and fast-idle block raised to clear throttle stopscrew, back off stopscrew so that throttle closes tightly. Disconnect throttle connector at pump arm. Use special gauge (see table below for type for each model), insert gauge in place of metering rod so that beveled end seats in metering jet and gauge is held vertically. Rotate pump arm so that metering rod pin rests lightly in lower end of notch in gauge, bend lower end of throttle connector so that upper end centers freely in hole in pump arm. Remove gauge and re-connect throttle connector.

Car Model	Carburetor	Gauge Part No.	Length
Hudson LL, LT	282-S	T-109-15	2.797"
Hudson GH, HT, HU, HHU	309-S, 310-S	T-109-20	2.795"
Hudson 63, 64, 65, 66, 67	329-S, 330-S	T-109-25	2.795"
Oldsmobile	327-S, 339-S, 342-S, 351-S	T-109-25	2.795"
Oldsmobile	385-S	T109-25	2.795"
Pontiac 605	298-S, 315-S	T-109-21	2.718"
Pontiac 1936-37	322-S, 24-S, 40-S, 50-S, 52-S	T-109-26	2.718"
Reo	338-S	T-109-25	2.795"
Studebaker	371-S	T-109-25	2.795"
Terraplane K, KU	281-S	T-109-15	2.797"
Terraplane GU	309-S	T-109-20	2.795"
Terraplane 62	329-S	T-109-25	2.795"

To Install Metering Rod—Insert rod (with disc in place) vertically so that lower end enters metering rod jet, turn rod one-quarter turn to engage pin on pump arm, replace pin spring. See that rod hangs freely, replace dust cover and cover screw.

ANTI-PERCOLATOR:—Saxophone Type (329-S Only). Consists of a vent above the main jet well controlled by a cap linked to the accelerating pump rod so that the vent is opened when the throttle valve is closed to prevent any 'percolating' discharge of fuel through the main jet when the carburetor is hot. The cap must be closed when the throttle is opened.

Adjustment. Anti-percolating cap must be off seat when throttle closed to idling position. Adjust by bending anti-percolating cap up slightly to permit pump arm to depress bracket. Cap must be seated when throttle opened slightly beyond idling position. To adjust, open the throttle valve exactly .030" using a drill rod of the correct size inserted between the throttle edge and carburetor wall on side opposite idle ports to maintain opening, adjust rocker arm so that clearance between rocker arm lip and pump arm is .005-.015". Be careful not to disturb metering rod setting.

ANTI-PERCOLATOR:—Plunger Type. Consists of a spring-loaded plunger type valve which is opened by a lip on the pump arm when the throttle is closed to vent the main jet well and prevent any 'percolating' discharge from the main jet when carburetor is hot. Valve must be closed when throttle is opened (incorrect adjustment will cause flat spots in performance).

Adjustment. Take out dust cover screw and remove dust cover. Back off throttle stopscrew, hold throttle valve tightly closed, adjust lip on pump arm so that anti-percolator valve is depressed so that indicator line on valve stem is flush with top of anti-percolator plug. This adjustment should be made after metering rod setting checked and care taken not to disturb metering rod.

Adjustment (Early Types without Indicator Line). On these models, use tool J-109-29 or drill rod of correct size inserted between throttle valve edge and carburetor wall on side opposite idle ports so that throttle valve opening is exactly .020", adjust lip on pump arm so that clearance between pump arm lip and anti-percolator valve stem is .005-.015".

FLOAT LEVEL:—To check float level, take off float bowl cover, remove gasket, invert cover, measure distance from gasket seat to nearest point on float (top when not inverted and at free end). Float level can be corrected by bending lip of float lever. Settings should be as follows:

Car Model	Carburetor Model	Float Setting
Hudson LL, LT	282-S	13/32"
Hudson all others	309-S, 310-S, 329-S, 330-S	3/8"
Oldsmobile	327-S	1/2"
Oldsmobile	339-S, 342-S, 351-S, 385-S	3/8"
Pontiac all models	298-S, 315-S, 322-S, 324-S, 340-S, 350-S, 352-S	3/8"
Reo	338-S	7/16"
Studebaker	371-S	3/8"
Terraplane all models	281-S, 309-S, 329-S	3/8"

FAST IDLE:—1936 & Studebaker 371-S. Consists of fast idle block linked to the choke valve which drops down behind the throttle stopscrew so that the throttle is held open in the fast idle position when the choke valve is in use (throttle must be opened momentarily to allow fast idle to operate). No adjustment required.

FAST IDLE:—1937-38 Models except Studebaker 371-S. Consists of fast idle cam pivoted directly above the throttle lever so as to serve as a stop for the throttle stopscrew. Fast idle cam is linked to Climatic Control and is rotated to the fast idle position when the carburetor is cold (choke valve closed).

Adjustment. Back off throttle stopscrew, rotate fast idle cam to normal (hot) idling position, turn stopscrew in so that it just contacts first step on fast idle cam with throttle valve seated, use tool T109-41 to bend offset portion of fast idle link so that clearance between inside wall of air horn and lower edge of choke valve is 5/8". Make certain that fast idle linkage does not bind.

CHOKE:—All choke valves are offset type. See article in Carburetion Equipment Section for complete data on automatic choke (Climatic Control).

Unloader (1936 & Studebaker 371-S):—Consists of a curved lip on the fast idle block which opens the choke valve when the throttle valve is opened wide. To adjust, bend the curved lip so that the choke valve opening (distance from lower edge to air horn wall) is 7/16" (329-S, 330-S), 1/4" (322-S, 371-S), 1/2" (324-S, 327-S, 338-S, 339-S, 340-S, 342-S) with throttle valve wide open.

Choke Valve Lock. Consists of a lip on the choke valve lever and lug on fast idle link which prevents choke valve closing when throttle valve is wide open. See that clearance between lip and fast idle lug is 1/16" with both choke valve and throttle valve wide open. Can be adjusted by filing off top edge of fast idle link slightly using care to maintain original contour. See that choke valve is released when throttle valve is closed.

Unloader (1937-38 Models except Studebaker 371-S):—Consists of a cam on the throttle lever which opens the choke valve when the throttle valve is opened wide. To adjust, bend the cam so that the choke valve opening (distance from lower edge of valve to air horn wall) is 3/8" (351-S, 385-S), 1/4" (350-S, 352-S) with throttle valve wide open.

Choke Valve Lock. Consists of a lip on the fast idle link which prevents choke valve closing with throttle valve wide open. To adjust, hold choke valve and throttle valve wide open, bend lip so that clearance between it and throttle lever lock is 1/32". See that choke valve is released when throttle valve closed.

TROUBLE SHOOTING:—Same as for other Carter W1 models. See preceding article.

THROTTLE VALVE SETTING:—'Idle Port' opening is distance from lower edge of throttle valve to lower edge of port with valve closed. 'Vacuum Port' figure is distance from lower edge of port to top edge of valve. Throttle valves are Part No. 2-72 (281-S, 282-S, 298-S, 309-S, 310-S), No. 2-90 (all others).

Car Model	Carburetor	Idle Port	Vacuum Port
Hudson	282S, 309S, 10S, 29S, 30S	.016-.020"	
Oldsmobile	327S	.010-.014"	.041-.047"
Oldsmobile	339S, 42S, 51S, 85S	.010-.014"	.021-.029"
Pontiac	298S	.014-.018"	
Pontiac	322S, 24S, 40S, 50S, 52S	.014-.018"	.022-.027"
Reo	338S	.010-.014"	.041-.047"
Studebaker	371S	.014-.018"	.022-.027"
Terraplane	281S, 309S, 29S	.016-.020"	

NOTE—Throttle valve shims furnished .002" thick (2-93), .005" thick (2-94) to correct throttle valve location.

SERVICING:—Disassembly. Remove dust cover, remove fast idle cam attaching screw and fast idle cam or take out two screws and remove fast idle drop-bar, remove nozzle plug, retainer plug, nozzle and gasket (do not take nozzle assemblies apart). Remove air horn attaching screws and lockwashers (two above, one below), lift off air horn and Climatic Control assembly. Remove pin spring and connector link at top of accelerating pump stem, remove pin spring, unhook metering rod spring, take out metering rod and disc (do not lose disc which is free on metering rod). Remove spring retainers and connector rod springs, remove throttle connector. Remove bowl cover retaining screws and lockwashers, lift off bowl cover, lift off cover gasket. Remove pump arm and countershaft on cover by revolving one-half turn. Remove float and lever assembly, pin and pump cylinder bushing gasket, needle and seat from bowl cover. Remove pump plunger and rod assembly and pump spring (remove nut on stem to disassemble pump plunger). Remove metering rod jet and gasket assembly. Use special 13/32" socket wrench No. 15451 to remove Anti-Percolator valve plug assembly. Remove pump jet passage plug, gasket, and pump jet, loosen screw and remove throttle shaft arm, remove low speed jet, ball check passage plug, strainer, and intake and outlet ball check plug assemblies, throttle valve screws, valves, throttle shaft assembly, idle port plug, and idle adjustment screw. Do not lose copper washers used on low speed jet, ball check assemblies.

Servicing. Wash all parts in gasoline (do not immerse cork gaskets). Replace worn parts (replace metering rod and metering jet as an assembly). Blow out all passages in castings. Use all new gaskets when re-assembling.

Assembly. Reverse disassembly directions above. See that all jets and plugs tightened securely. When replacing throttle valves, install valve with trademark up, insert screws loosely, back off stopscrew so that valve closes tightly, tap valve lightly to centralize it in bore before tightening screws. Use loading tool to install pump plunger and lubricate plunger leather with caster oil. Check float level and metering rod setting as directed above and adjust carburetor when replaced on car.

***411-S—HUDSON '112', 89 (1938) BEFORE ENG. NO. 89-36571.**
***417-S—HUDSON '112', 89 (1938) AFTER ENG. NO. 89-36572**
***437-S—HUDSON, MODELS 90, 91, 92, 98 (1939)—SEE NOTE**
***438-S—HUDSON, MODELS 90, 91, 92, 98 (1939)—SEE NOTE**
398-S—HUPMOBILE SIX, MODEL E-822 (1938)
HUPMOBILE, SENIOR SIX MODEL 922-E (1939)
HUPMOBILE SKYLARK, MODEL 915-R (1939).
388-S—*OLDSMOBILE 6, F-38* WITH SELF-SHIFTING TRANS. (1938)
†364-S—PONTIAC TAXICAB, MODEL 37-26CA (1937)
401-S—PONTIAC SIX, MODEL 38-26DA (1938)
400-S—PONTIAC EIGHT, MODEL 38-28DA (1938)
***397-S—TERRAPLANE, MODELS 80, 81, 88 (1938)**

* These models not fitted with Climatic Control and Fast Idle.
†—Used with special Monarch Governor only.

NOTE:—Hudson 1939. Model 437-S carburetor used on cars with Automatic Clutch, 438-S on other cars. Model 437-S has "slow-closing throttle."

SPECIAL SHOP NOTES:—Hudson 112. To correct Lean Idle complaints on this model, enlarge vent hole in bowl cover by drilling out hole with #38 (.1015") or #39 (.0995") drill.

Pontiac 1938 Surge & Flat Spot Correction—Caused by improper seal between anti-percolator cap and seat which admits air at speeds above idle. Correct by installing new anti-percolator cap and arm assembly 184-14S, rocker arm spring 61-179, and anti-percolator bracket pin 150-89. New cap and rocker arm assembly has same number as earlier type but may be identified by brown leather seal (first type had black leather seal). Adjust anti-percolator after installing new parts. CAUTION—All above parts must be installed as a unit.

Pontiac Taxicab—Model 364-S carburetor has vacuum controlled Metering Rod (not adjustable). This carburetor used only in conjunction with Monarch Governor and special gasket No. 1A-42 must be used between Governor and carburetor (standard gasket must not be used).

Whistling Complaints (all models)—To correct whistle at vacuum spark port, remove vacuum passage plug (on side of body casting near idle adjusting screw), install special bushing No. 38A-35 and new rivet plug.

TYPE:—Same design as other Carter Carburetors (see preceding article) except for new 'Vacumeter' type metering rod control as follows:

Vacumeter Metering Rod Control. Metering rod is linked to stem of spring-loaded vacuum piston and is normally held against stop-pin on pump shaft by manifold vacuum (stop-pin insures correct metering rod position for any throttle opening and will lift metering rod out of metering jet mechanically in same manner as on other Carter Carburetors when throttle is opened). Whenever vacuum decreases due to throttle being opened for acceleration, or added load placed on engine, vacuum piston spring forces piston and metering rod up so that richer mixture is supplied for acceleration and power. As soon as vacuum builds up again, piston pulls metering rod against stop-pin so that correct maximum-economy mixture is supplied.

IDLE ADJUSTMENT.—Idle adjusting screw controls idle fuel mixture and should be turned in for leaner mixture, out for richer mixture. Approximate settings shown in table below. Idle speed controlled by throttle lever stopscrew. Adjustments should be made only with engine warmed up and idling at hot or slow speed (choke valve wide open, fast idle inoperative). See tune up data on car model page for complete tune up adjustment data for each model.

Car Model	Idle Screw Setting	Idling Speed
Hudson 112	¾-1½ turns open	350 R.P.M., 7 M.P.H.
Hudson 90, 91, 92, 98	½-1¼ turns open	7 MPH.
Hupmobile	¾-1¼ turns open	300 R.P.M.
Oldsmobile F-38	½-1 turn open	350 R.P.M., 6 M.P.H.
Pontiac Taxi (1937)	¼-¾ turn open	360 RPM., 6 MPH.
Pontiac 6 38-26DA	¾-1¼ turns open	360 R.P.M., 6 M.P.H.
Pontiac 8 38-28DA	½-1 turn open	350 R.P.M., 6 M.P.H.
Terraplane 80, 81, 88	¼-1 turn open	350 R.P.M., 7 M.P.H.

METERING ROD (ECONOMIZER):—All fuel for main nozzle metered by metering rod and jet. Metering rod operated by vacuum piston with throttle control (see Vacumeter Metering Rod Control description above). No adjustment provided but metering rods may be changed to secure leaner-than-standard fuel mixture to compensate for special fuel or high-altitude conditions. Metering rod setting must be checked whenever metering rods removed or changed.

To Remove Metering Rod—Take out dust cover screw, remove dust cover, free metering rod spring, disengage metering rod from piston link and lift rod out being careful not to lose metering rod disc.

To Check Metering Rod—Install gauge (see table below for correct type for each model) in place of metering rod making certain that beveled end is seated in metering jet and that gauge is vertical. Back off throttle stopscrew so that throttle valve is completely closed. Bend lip of vacuum piston link so that when piston pushed all the way down with lip on link against pump arm stop-pin, metering rod pin rests on shoulder in notch on gauge.

Car Model	Carburetor	Gauge Part No.	Length
Hudson	411-S, 17-S, 37-S, 38-S	T109-25	2.795"
Hupmobile	398-S	T109-25	2.795"
Oldsmobile F-38	388-S	T109-25	2.795"
Pontiac 6 & 8	401-S, 400-S	T109-26	2.718"
Terraplane 80, 81, 88	397-S	T109-25	2.795"

NOTE—Metering rod on 364-S (Pontiac Taxicab) not adjustable. See that vacuum piston operates freely (piston must be clean and dry—do not oil). Use new spring under piston whenever carburetor overhauled.

To Install Metering Rod—Make certain that piston moves freely, install metering rod being careful that lower end enters metering jet and that disc is in place on rod. Engage upper end of rod on piston link pin and install metering rod spring.

NOTE—Whenever vacuum piston removed, check piston spring and replace if weak or length not correct. Piston must be clean and dry and show no evidence of wear.

PERFORMANCE:—Should be satisfactory if idle adjustment and accelerating pump setting correct. See Carter Jet Specification Table and tune up data on car model page for standard jet calibrations and any recommended changes. See Trouble Shooting below.

ACCELERATING PUMP:—Low pressure type. Positively operated by throttle lever through countershaft and linkage under dust cover on float bowl cover. Fuel is drawn into pump cylinder through inlet strainer and ball check valve when throttle is closed and is discharged through outlet ball check valve and pump jet into mixing chamber when throttle is opened for acceleration.

Pump Adjustment—Three holes provided in pump arm on countershaft (under dust cover on float bowl cover) for pump link engagement. Inner hole provides minimum stroke, outer hole medium stroke, upper hole maximum stroke. See tune up data on car model page for recommended setting and seasonal changes. Adjustment accessible after taking out screw and removing dust cover.

Pump Stroke Setting—To check pump stroke, remove dust cover, back off throttle lever stopscrew, hold throttle valve tightly closed, install gauge (see table below for correct type for each model) on flat surface of bowl cover. Top of pump shaft (piston rod) should contact lower edge of gauge arm with pump link connected in lower (medium stroke) hole on arm. Adjust by bending throttle connecting rod at lower angle. If gauge not available, mark pump rod at edge of bowl cover with throttle closed and again with throttle wide open. Distance between marks (pump stroke) should agree with figure in table below.

Universal Pump Stroke Gauge Note—To check pump stroke, mount the gauge No. T109-117S on bowl cover so that projection on gauge rests on top of connector link at pump shaft. Back off throttle stopscrew so that throttle valve tightly closed, note gauge reading, open throttle wide and again note gauge reading. Difference between two readings is pump stroke (in sixty-fourths of an inch) and should agree with figure in table below. Adjust by bending throttle connector rod at lower angle near throttle lever. CAUTION—Check metering rod adjustment (disturbed by this adjustment).

Car Model	Carburetor	Gauge No.	Pump Stroke
Hudson	411-S, 17-S, 37-S, 38-S	T-109-112	7/32"
Hupmobile	398-S	T-109-108	9/32"
Oldsmobile	388-S	T-109-108	19/64"
Pontiac	364-S, 400-S, 401-S	T-109-45	19/64"
Terraplane	397-S	T-109-112	7/32"

Pump Countershaft Lubrication—Every 5000 miles, remove dust cover screw, fill screw hole with good grade of graphite grease, replace screw.

ANTI-PERCOLATOR:—'Saxophone' Type. Consists of vent above main jet well controlled by a cap linked to the accelerator pump rod so that the vent is opened with the throttle closed to prevent any 'percolating' discharge of fuel through the main jet when the carburetor is hot. The cap must close when the throttle is opened.

Adjustment—Remove dust cover, crack throttle valve open by inserting correct size tool or drill rod (see table below) between edge of valve and carburetor wall on side opposite idle port, bend anti-percolator arm so that clearance between it and pump arm is .005-.015" with anti-percolator cap seated.

Car Model	Carburetor	Gauge Part No.	Throttle Opening
Terraplane 80, 81, 88	397-S	-----	.025"
All Others			.030"

FLOAT LEVEL:—To check float level, remove float bowl cover, invert cover, measure from gasket seat (machined surface) of bowl cover to nearest point of float (top at free end). Should be 3/8" (all models). Adjust by bending lip of float lever.

Float Needle Valve & Seat—Furnished only in matched sets as follows:

Car Model	Carburetor	Part No.	Intake Hole
Hudson	411-S, 17-S, 37-S, 38-S	25-33S	#48
Hupmobile	398-S	25-33S	#48
Oldsmobile F-38	388-S	25-75S	#46
Pontiac 6 & 8	364-S, 400-S, 401-S	25-42S	#38
Terraplane 80, 81, 88	397-S	25-33S	#48

THROTTLE VALVE SETTING:—When installing throttle valves, tap valve lightly to centralize it in bore before tightening screws. Check throttle valve setting as shown in table below (idle ports are slotted type), opening for models marked by * is height of idle port above throttle valve. Vacuum port height is distance from lower edge of port to top of throttle valve. Shims furnished .002" thick (2-93), .005" thick (2-94) to correct valve.

Car Model	Carburetor	Idle Port Opening	Vacuum Port Height
Hudson 112	411-S, 417-S	.115-.119"*	
Hudson 90, 91, 92, 98	437-S, 438-S	.016-.020"	
Hupmobile	398-S	.010-.014"	
Oldsmobile F-38	388-S	.132-.136"*	.021-.029"
Pontiac 6 & 8	401-S, 400-S	.014-.018"	.022-.027"
Terraplane 80, 81, 88	397-S	.016-.020"	

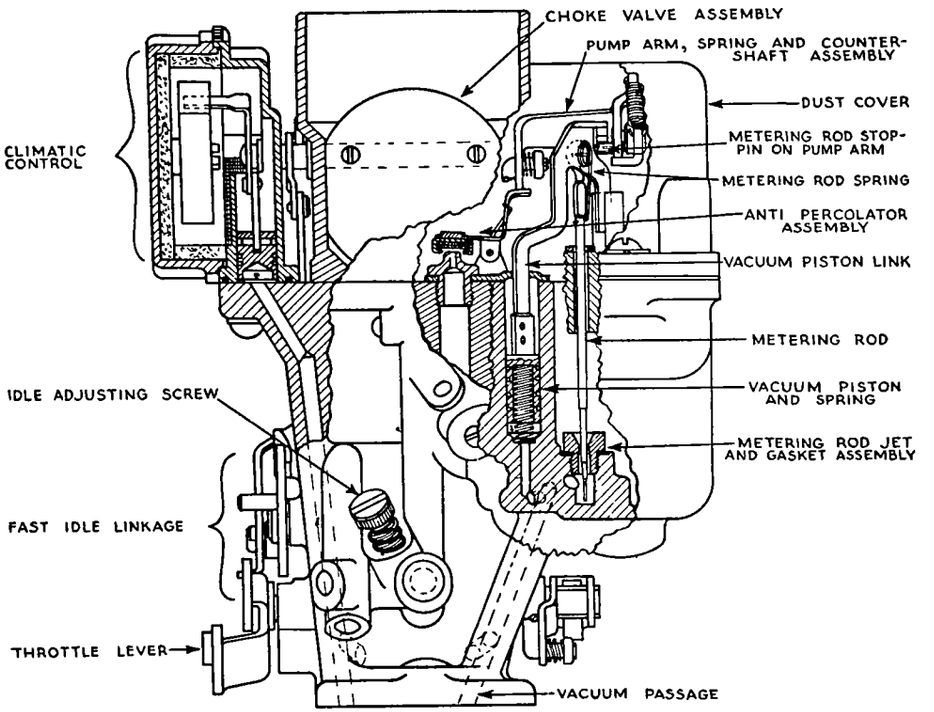
FAST IDLE:—**Not used on Hudson and Terraplane Models.** Consists of a fast idle cam pivoted directly above the throttle lever so as to serve as a stop for the throttle stopscrew and linked to choke mechanism. To adjust, back off throttle stopscrew, rotate fast idle cam to normal (hot) idling position, turn stopscrew in so that it just contacts first (upper) step of fast idle cam with throttle valve seated, use Tool T109-41 to bend offset portion of fast idle link so that clearance between inside wall of air horn and lower end of choke valve is 5/8" (all models). Make certain that fast idle linkage does not bind.

THROTTLE CRACKER:—**Hudson and Terraplane Models.** Choke valve and throttle valve interconnected by lever which opens throttle valve .036-.040" when choke valve fully closed. Should not require adjustment.

CHOKE:—**Except Hudson and Terraplane Models.** Carter Climatic Control (automatic choke). See article in Carburetion Equipment Section for complete adjusting and servicing directions. These models fitted with Unloader and Choke Valve Lock which are adjusted as follows:

Unloader:—Consists of a cam on the throttle lever which opens the choke valve (through fast idle linkage) when throttle valve is wide open. To adjust, with throttle valve wide open, adjust cam on throttle lever so that clearance between lower edge of choke valve and wall of air horn is 3/8" (all models except Pontiac), 1/2" (Pontiac 364-S), 5/16" (Pontiac 400-S, 401-S).

Choke Valve Lock:—Prevents choke valve from closing when throttle valve is wide open. To adjust, hold throttle valve and choke valve wide open, bend lip on fast idle link so that clearance between lip and throttle lever lock is 1/32" (all models except Pontiac 400-S, 401-S), 1/16" (Pontiac 400-S, 401-S). See that lock prevents choke valve closing as long as throttle valve is held open and that choke valve released when throttle valve closed.



TROUBLE SHOOTING:—**Poor Idling Performance.** If correct adjustment cannot be secured, engine stalls or low speed performance is unsatisfactory, remove low speed idle tube and clean with compressed air. See that idle tube seats air-tight in carburetor casting at top and bottom (always use new tube, do not use tube from any other carburetor). Remove idle adjusting screw and blow out idle channels with air. If idle is rich, see that vacuum piston is clean and moves freely in cylinder and that metering rod linkage is not binding.

Poor Acceleration—Check pump setting, examine pump for damaged or worn plunger leather, bent pump arm or loose plunger, corrosion or sediment in pump cylinder, sticking or leaking ball check valves, dirty intake strainer. If plunger removed from cylinder, use loading tool when installing to avoid damage to plunger leather. If increased resistance felt on throttle lever, remove pump jet and clean with compressed air or replace jet. Make certain that vacuum piston is clean and not worn, that it is free in vacuum cylinder and that spring under piston is in good condition.

Carburetor 'Loads Up'—If carburetor has been in use for sometime, check for wear on float lever lip, reset float level. See that vacuum piston channel is open and that linkage is not binding.

SERVICING:—**Note.** All Hudson and Terraplane models not fitted with Climatic Control and Fast Idle and all servicing directions below for these items should be disregarded.

Disassembly. Take out dust cover screw, remove dust cover, remove fast idle cam screw and cam, remove nozzle plug, nozzle retainer plug, nozzle assembly (use tool J109-55), do not dismantle nozzle assemblies (where inner and outer nozzle used). Take out air horn attaching screws (top and bottom), remove air horn and Climatic Control (see article in Carburetion Equipment Section for Climatic Control servicing). Remove Anti-percolator plug (use wrench T-109-77). Remove anti-percolator and vacuum piston assembly, pin spring connecting plunger shaft and pump arm, link, spring retainers and connector rod springs, throttle connector rod. Take out bowl cover attaching screws, lift off bowl cover and gasket. Revolve pump operating lever and countershaft assembly one-half turn on bowl cover and remove. Remove pump arm and collar assembly and spring, float and lever assembly, pump cylinder bushing gasket, needle seat (needle clipped to float lever by spring clip). Take out vacuum piston spring,

metering rod jet and gasket assembly, pump jet passage plug, pump jet. Loosen screw and remove throttle arm shaft assembly. Remove low speed jet and copper washer, ball check passage plug, ball check plug assemblies, strainer and copper washer. Remove throttle valve screws, valve, shaft and lever assembly. Take out idle port rivet plug, idle adjustment screw and spring.

Servicing—Clean casting and all parts with gasoline (do not immerse cork parts in gasoline), blow out all channels and passages with compressed air, dry all parts with air before reassembling. Check all parts for wear, see that they agree with specifications, replace all worn parts.

Assembling—Use all new gaskets (soak needle seat gasket and metering rod jet gasket in 90 proof alcohol for 15 minutes, install on part and allow to dry before using). When assembling Idle tube see that new copper washer is seated in casting and that tube is tight at top and bottom. Replace bowl cover if warped. Check throttle valve setting (see above), adjust metering rod, Anti-Percolator, Fast Idle, Choke Unloader and Lock, Float level as directed above.

435-S—NASH AMBASS. SIX, MODEL 3920 (1939).
426-S—OLDSMOBILE SIX, F-39 '60', G-39 '70' ('39)—STD. TRANS.
****425-S—OLDSMOBILE SIX, '60' & '70' ('39)—SELF-SHIFTING TRANS.**
433-S—PONTIAC SIX, MODELS 39-25, 39-26 (1939).
432-S—PONTIAC EIGHT, MODEL 39-28 (1939).
******Vacumeter Type Carburetor.

NOTE:—These models have Climatic Control (Automatic Choke), Fast Idle, Unloader, Choke Valve Lock, and Anti-percolator. See Carter Climatic Control article in Carburetion Equipment Section for service data on these units.

SPECIAL SERVICE NOTE:—Whistling Complaints—To correct whistle at vacuum spark port, remove vacuum passage plug (on side of main casting near idle adjusting screw), install special bushing #38A-35 and new rivet plug.

TYPE:—New design single barrel downdraft type. Primary and secondary venturis are mounted in main body casting (not air horn) by two streamlined struts with nozzle directly above one strut on center-line of venturis and float bowl. Float bowl has been designed to eliminate clearance between sides of bowl and float. Bowl cover extends down in bowl to eliminate air space above fuel and float is larger than W1 type. Low speed jet is installed through top of float bowl (no external plug). Anti-percolator seat is cast in bowl cover and complete anti-percolator, pump arm, vacumeter arm (vacumeter types) is mounted on top of bowl cover. Air horn contains only choke valve assembly (choke valve sides not exactly parallel and ridge in air horn serves as stop for valve in wide open position). Lower throttle flange casting contains main (third) venturi and throttle assembly.

Fuel System—Same as for W1 models. Metering rod is controlled by pump arm (426-S, 32-S, 33-S, 35-S), separate vacuum piston (425-S—vacumeter type). See special adjustment directions for each type below.

IDLING ADJUSTMENT:—Adjust carburetor only with engine warmed up and idling at hot or slow idling speed with choke valve wide open and fast idle inoperative. Idle adjusting screw controls fuel mixture and should be turned in for leaner mixture, out for richer mixture. Approximate settings are shown in table below. Idle speed is controlled by throttle lever stopscrew. See car model 'T&E' page for complete carburetor tune up data on each car model.

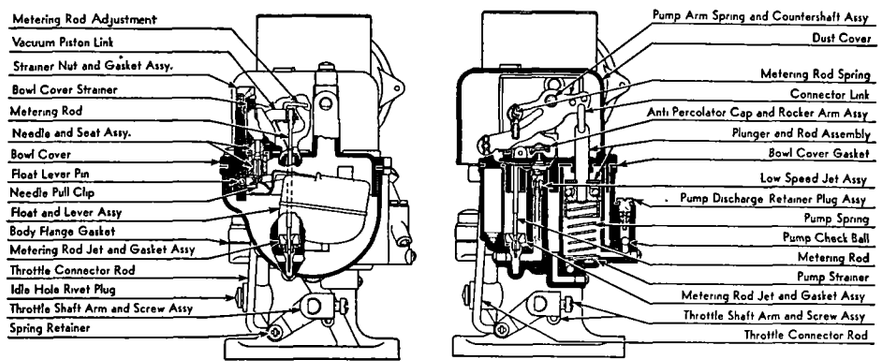
Car Model	Idle Screw Setting	Idle Speed
Nash 3920	¾-1½ turns open	7-8 MPH.
Oldsmobile F & G-39	½-1½ turns open	6 MPH.†
Pontiac 6 39-25, 26	½-1½ turns open	7 MPH.
Pontiac 8 39-28	½-1½ turns open	7 MPH.

†—Third speed (not High) for Self-Shifting Trans. cars (425-S).

PERFORMANCE:—Should be satisfactory if Idling Adjustment and Accelerating Pump Setting correct. See Carter Jet Specification Table for standard jet calibrations and special lean metering rods (for special operating conditions such as high altitude). See Trouble Shooting below.

ACCELERATING PUMP:—Low pressure type. Positively operated by throttle lever through arm and countershaft assembly on bowl cover. Fuel is drawn into pump cylinder through inlet ball check valve (in bottom of cylinder) when throttle is closed and is discharged through outlet ball check valve and pump jet (in side of mixing chamber opposite secondary venturi) when throttle is opened for acceleration.

Pump Seasonal Adjustment—Three holes provided in pump arm on countershaft for pump link connection. Inner hole provides minimum stroke, lower hole medium stroke, outer hole maximum stroke. See tune up data on car model 'T&E' page for recommended setting and seasonal changes. This adjustment accessible after taking out screw and removing dust bowl cover.



Pump Stroke Adjustment:—To check pump plunger travel, back off throttle lever stopscrew so that throttle valve closes tightly, adjust pump connector link for correct pump stroke as shown in 'Pump Setting' column of table below (see Pump Adjustment above for this connector link adjustment). Install Universal Pump Stroke Gauge T109-117S on ridged portion of bowl cover so that projecting portion of gauge rests on top surface on connector link at pump shaft. Hold gauge vertical and note reading, then open throttle wide and again note reading. Difference between these two readings is pump stroke (in sixty-fourths of an inch) and should agree with 'Pump Stroke' figure in table below. To adjust, bend throttle connector rod at lower angle near throttle lever. CAUTION—Check metering rod adjustment (disturbed by this adjustment).

Car Model	Carburetor	Pump Stroke	Pump Setting
Nash 3920	435-S	27/64"	Long Stroke
Oldsmobile F & G-39	425-S, 26-S	13/64"	Short Stroke
Pontiac 6	433-S	17/64"	Short Stroke
Pontiac 8	432-S	19/64"	Medium Stroke

METERING ROD (ECONOMIZER):—Metering rod and jet assembly meters all fuel for main nozzle (stepped and tapered rod is lifted out of jet as throttle is opened and provides greater fuel flow through jet to nozzle). Metering rods can be changed for special operating conditions such as high altitudes. See Carter Jet Specification Table for standard and leaner-than-standard metering rod calibrations. Check and adjust Metering Rod whenever rods removed and replaced or when pump stroke setting is changed.

Vacumeter Type Note—On these types, metering rod is linked to vacuum piston stem so that rod is controlled by vacuum piston within limits determined by throttle valve opening (lug on pump arm serves as stop for lip on piston link to prevent vacuum piston pulling metering rod down in jet beyond correct point for the particular throttle opening). These models adjusted in special manner (see instructions below).

Metering Rod Adjustment (except Vacumeter Types)—Take out screw and remove dust cover on float bowl cover. Unhook metering rod spring, disengage metering rod from arm on pump shaft, lift out rod being careful not to lose metering rod disc. Install gauge in place of metering rod (see table below for correct gauge for each model) making certain that gauge seats in metering rod jet and is held vertical. Back off throttle lever stopscrew so that throttle valve tightly closed. Clearance between pin in arm on pump shaft and shoulder of notch in gauge should be less than .005" and gauge should not drag on pin. Adjust by bending arm (use extreme care not to bend lower portion of arm to which throttle connector link is attached—this will disturb pump stroke setting). Remove gauge, install metering rod and disk, connect metering rod spring.

Metering Rod Adjustment (Vacumeter Type 425-S)—Remove metering rod (hung on pin on upper end of vacuum piston link) being careful not to lose metering rod disk. Install gauge in place of metering rod (see table below for correct gauge for each model), making certain that gauge seats in metering rod jet and is held vertical. Back off throttle stopscrew so that throttle valve tightly closed. Clearance between pin on piston link and shoulder of notch in gauge should be less than .005" and gauge should not drag on pin. Adjust by bending lip on piston link so that it contacts lug on pump arm (use special tool T109-105). Remove gauge, install metering rod and disc, connect metering rod spring.

Car Model	Carburetor	Metering Rod Gauge No.	Length
Nash 3920	435-S	T109-102	2.468"
Oldsmobile F & G-39	425-S (Vacumeter)	T109-102	2.468"
Oldsmobile F & G-39	426-S	T109-102	2.468"
Pontiac 6 & 8	432-S, 33-S	T109-102	2.468"

ANTI-PERCOLATOR:—Saxophone Key Type. Consists of a main nozzle vent in the bowl cover controlled by a leather-faced, felt-backed metal cap which opens the vent when the throttle is closed to prevent any percolating discharge from the nozzle. The cap must be seated to close the vent when the throttle is opened beyond idling position.

Adjustment—Crack throttle open by inserting special gauge (see table below for gauge for each model) between edge of valve and carburetor wall on opposite idle port. Bend anti-percolator rocker arm (use special tool T109-105) so that clearance between lip on rocker arm and pump arm is .005-.015" (use feeler gauge to check this clearance).

Car Model	Carburetor	Gauge Number	Throttle Opening
Nash 3920	435-S	T109-29	.020"
Oldsmobile F & G-39	425-S, 26-S	T109-29	.030"
Pontiac 6 & 8	432-S, 33-S	T109-29	.030"

NOTE—T-109-29 Gauge used for both .020" and .030" settings.

FLOAT LEVEL:—To check float level, remove float bowl cover, invert cover, measure from top edge of machined projection on cover at free end of float to top of soldered seam. See table below for special checking gauge and float level for each model. Adjust by bending lip of float lever at valve needle.

Car Model	Carburetor	Gauge No.	Float Level
Nash 3920	435-S	T109-80	3/8"
Oldsmobile F & G-39	425-S, 26-S	T109-80	3/8"
Pontiac 6 & 8	432-S, 33-S	T109-83	1/2"

Float Travel—Should be ½" (all models). To check, hold float bowl in normal position, note drop at free end of float. To adjust, bend two small float stop lips at hinge end of float.

Float Needle Valve & Seat—Furnished only in matched sets as follows:

Car Model	Carburetor	Part No.	Intake Hole
Nash 3920	435-S	25-34S	#46
Oldsmobile F & G-39	425-S, 26-S	25-75S	#46
Pontiac 6 & 8	432-S, 33-S	25-42S	#38

THROTTLE VALVE SETTING:—When installing valves, see that trademark is up and on idle port side, install screws loosely, tap valve lightly to centralize it in bore, tighten screws securely. See that throttle valve stopscrew is backed off so that valve closes tightly, check throttle valve setting as shown in table below (idle ports are slotted type). Vacuum port height is distance from top of valve to bottom of port. Shims furnished .002" thick (2-93), .005" thick (2-94) to correct throttle valve position.

Car Model	Carburetor	Idle Port Opening	Vacuum Port Height
Nash 3920	435-S	.137-.141"	
Oldsmobile F & G-39	425-S, 26-S	.158-.162"	.021-.029"
Pontiac 6	433-S	.107-.111"	.022-.027"
Pontiac 8	432-S	.120-.124"	.022-.027"

NOTE—Throttle valves on all models are No. 2-97.

FAST IDLE:—Consists of a fast idle cam pivoted directly above the throttle lever so as to serve as a stop for the throttle stopscrew and linked to the automatic choke mechanism. See Climatic Control article in Carburetion Equipment Section for complete sevicing directions.

Adjustment—To check, turn fast idle cam to normal or slow idle speed position, tighten throttle lever stopscrew until it just seats against cam, rotate cam until stopscrew is against first step of cam (screw must not be on step), check clearance between lower edge of choke valve and air horn wall (use tool T109-85—all models). Distance should be 5/8". To adjust, use tool T109-41 and bend offset portion of fast idle link.

CHOKE:—Offset type plain valve. See article in Carburetion Equipment Section for servicing data on Carter Climatic Control (automatic choke).

Setting—Thermostatic coil housing should be rotated counter-clockwise until mark on thermostatic coil housing is correct number of notches 'rich' from center mark on piston housing as shown in table below.

Car Model	Carburetor	Choke Setting
Nash 3920	435-S	2 Notches Rich
Oldsmobile F & G-39	425-S, 26-S	2 Notches Rich
Pontiac 6 & 8	432-S, 33-S (First—see A)	2 Notches Rich
Pontiac 6 & 8	432-S, 33-S (Later—see B)	1 Notch Rich

(A)—Carburetors with #42 choke heat suction hole.
(B)—Carburetors with #36 choke heat suction hole.

Unloader—Consists of a cam on the throttle lever which opens the choke valve (through fast idle linkage) when throttle is held wide open to correct flooding. To check, hold throttle wide open, check clearance between lower edge of choke valve and air horn wall. See table below for correct clearance and checking gauge on each model. To adjust, bend cam on throttle lever (use Tool T109-41).

Car Model	Carburetor	Gauge No.	Choke Valve Clearance
Nash 3920	435-S	T109-82	31/64"
Oldsmobile F & G-39	425-S, 26-S	T109-85	5/8"
Pontiac 6	433-S	T109-106	7/32"
Pontiac 8	432-S	T109-31	1/4"

Choke Valve Lock—Prevents choke valve closing when throttle valve held wide open. To adjust, hold choke and throttle valves wide open, bend lip at lower end of fast idle link so that clearance between lip and lock on throttle lever is 1/32" (use tool T109-105).

TROUBLE SHOOTING:—**Poor Idling Performance**—If engine stalls while idling, low speed performance is unsatisfactory, or correct adjustment cannot be secured, remove idle tube (low speed jet) and clean with compressed air or install new tube. See that tube seats tightly at shoulder. Remove idle adjusting screw and clean low speed channels with air. If idle is rich, check metering rod linkage for binding and see that rod is not rubbing on dust cover. On Vacumeter types, see that vacuum piston is clean and operates freely.

Poor Acceleration—Check pump seasonal adjustment and pump stroke. Remove and clean or replace pump jet. Examine pump for damaged or worn plunger leather, loose plunger, corrosion or dirt in pump cylinder, ball check valves sticking or leaking. If plunger removed from cylinder, use loading tool when re-installing to avoid damaging plunger leather. On vacumeter types, make certain that vacuum piston is clean and operates freely in cylinder, examine spring under piston.

Carburetor Loads Up or Performance is Poor—Check and adjust float level. See that correct type metering rod installed (replace metering rod and jet as an assembly—check metering rod setting when installed). On vacumeter types, see that vacuum piston operates freely and vacuum channel open and clean.

SERVICING:—**Disassembly**—Take out attaching screw and remove dust cover, remove fast idle cam attaching screw and cam, air horn attaching screws, air horn and gasket (one screw located beneath Climatic Control housing). Take out retainer screws, remove retainers and thermostatic coil housing assembly. Remove piston housing strainer, choke valve screws, choke valve. Loosen screw on choke lever screw and link assembly four full turns, pry lip on lever away from shaft with screwdriver, rotate choke shaft counter-clockwise until piston is free from cylinder and remove assembly. CAUTION—Do not remove pin holding piston housing on air horn casting (these parts must be line-reamed if assembly disturbed). Remove pin spring, spring retainer and retainer spring from throttle connector rod and remove rod. Remove pin spring and connector spring from pump arm. Remove low speed passage plug and gasket (next to anti-percolator). Take out bowl cover attaching screws and lockwashers, remove bowl cover assembly and take off cover gasket. On Vacumeter types, remove vacuum piston from link by rotating it ¼ turn, then remove piston link and metering rod being careful not to lose metering rod disk, disassemble rod from link. On other types, remove metering rod and disk being careful not to damage spring. Remove pump arm, spring, and countershaft assembly by rotating it ½ turn. Remove float and lever assembly, needle and seat assembly, strainer nut and gasket, and strainer. Take out pin and remove anti-percolator cap and rocker arm assembly and spring. Remove pump plunger and rod assembly, pump spring, strainer, and inlet check ball. Remove nozzle passage plug and gasket, nozzle retainer plug, nozzle, nozzle gasket (use tool T109-55 to remove nozzle). Remove metering rod jet and gasket assembly, pump jet passage plug and gasket, pump jet, pump discharge ball retainer, check ball, low speed jet assembly, lower body casting and gasket, idle adjusting screw, spring, idle passage plug, throttle shaft arm and screw assembly. Take out throttle valve attaching screws, remove valve and withdraw throttle shaft.

Servicing:—Clean body castings and all parts with gasoline (do not immerse cork parts in gasoline), blow out all channels and passages in castings and all jets with compressed air, dry all ports with air before reassembling. Check all parts for wear and see that they agree with specifications (see Carter Jet Specification Table), replace all worn parts.

Assembling:—Use all new gaskets (soak metering rod jet gasket and needle seat gasket in 90 proof alcohol for 15 minutes, install on part and allow to dry for 15 minutes before using). Reassemble by reversing disassembly directions given above and note following points:

Body Gasket Caution—Body casting used on early production WA1 carburetors has bosses on vacumeter passage and idle passage holes, later carburetors do not have these bosses. Use Body Gasket No. 121-65 on first carburetors (with bosses), No. 121-72 on later carburetors (without bosses). These gaskets not interchangeable and correct type must be used on each carburetor.

Nozzle Installation—Always use new gasket on nozzle. Use special tool T109-55 to install nozzle. Make certain that flat side of nozzle is upward.

Low Speed Jet—Make certain that hole at lower end is open. Work jet into seat by moving it back and forth, so jet seats tightly in casting at shoulder.

Float Assembly—Engage float needle clip on float lever lip, then install float and needle as an assembly, insert float lever pin. Check float level and float travel (see instructions above).

Choke Valve—Use new screws when installing valve, install screws loosely, tap valve lightly to centralize it in bore, then tighten screws securely. Check choke valve and shaft assembly to make certain it is free (valve should fall open of own weight before climatic control thermostatic spring installed).

Throttle Valve—See Throttle Valve Setting above for installation data.

Pump Shaft Lubrication—Fill dust cover attaching screw hole with graphite grease before installing screw. Do not lubricate other parts of carburetor.

Climatic Control—Install thermostat coil and housing assembly with word 'Climatic' at bottom, turn counter-clockwise to engage thermostatic coil hook on prong, set for correct number of notches rich (see Choke Setting above).

Adjustment—Adjust Idle, Metering Rod, Pump Stroke and setting, Fast Idle, Float Level, Choke Setting, Unloader, and Choke Valve Lock as directed above.

444-S—STUDEBAKER CHAMPION, G (1939)—FIRST CARS—SEE NOTE.
453-S—STUDEBAKER CHAMPION, G (1939)—LATER CARS.

IMPORTANT PRODUCTION CHANGE NOTE:—Model 444-S carburetor (used on first cars) can be brought up to later (453-S) standards by making the following changes: Remove float bowl cover, remove and discard original Float & Lever Assembly (21-45S), Needle & Seat Assembly (25-92S), Bowl Gasket (121-73). Install new type Float & Lever Assembly No. 21-74S, Needle & Seat Assembly No. 25-94S, Bowl Gasket No. 121-25 and set Float Level at ¼" (was ⅜"). These parts furnished in package as Part No. 25-95U. See Service instructions below.

TYPE:—Single barrel, downdraft type. Similar in design to WA1 (see preceding article) except as follows:

Idle System—Idle Orifice Tube (low speed jet) is located in idle well which is fed directly from float bowl (not main nozzle well as on other models) through a drilled passage in the body casting in which the Idle Well Jet is located. Idle well is vented to float bowl by drilled channel in carburetor body. Cross-channel at top of idle tube has two air bleed openings into mixing chamber above main venturi (upper air bleed hole is located ahead of economizer restriction in cross-channel and lower air bleed opening is beyond this restriction). In all other respects idle system is similar to that used on W1 and WA1 carburetors.

Venturi—Double venturi system used with small (primary) venturi located in main body casting above large (main) venturi which is integral with casting.

Choke Control—Climatic Control not used. Choke valve and throttle valves are connected so that throttle opened to fast idle position when choke closed for starting.

IDLE ADJUSTMENT:—Adjust only when engine warmed up and choke valve wide open (fast idle inoperative). Idle adjusting screw controls fuel mixture and should be turned in for leaner mixture, out for richer mixture. Approximate setting of screw should be ¾-1¼ turns open. Idle speed controlled by throttle lever stopscrew and should be set for speed of 600 RPM. or 8 MPH. (high gear speed). See car model 'T&E' page for complete carburetor tune up instructions.

PERFORMANCE:—Should be satisfactory if Idling Adjustment and pump stroke setting correct. See Carter Jet Specification Table for standard jet calibrations and special lean metering rods for special operating conditions such as high altitudes. See Trouble Shooting.

ACCELERATING PUMP:—High pressure type (spring operated). Operated by throttle lever through spring connection between pump operating lever and pump arm (under dust cover on bowl cover). Fuel is drawn into pump cylinder through strainer and inlet ball check valve when throttle is closed and is discharged through outlet ball check valve and pump jet located in side of mixing chamber above main venturi when throttle is opened for acceleration. Pump is not adjustable for seasonal changes.

Pump stroke Adjustment—To check pump plunger travel, remove dust cover on float bowl cover, install Universal Pump Stroke Gauge T109-117S on raised portion of bowl cover so that gauge is vertical and projecting ear rests on top surface of pump shaft. Back off throttle lever stopscrew so that throttle valve tightly closed, note gauge reading. Open throttle wide and again note gauge reading. Difference between two readings is pump stroke (in sixty-fourths of an inch) and should be 12 (pump stroke 3/16" or 12/64"). To adjust, use special bending tool, T109-41, and bend throttle connector link at lower angle near throttle lever. CAUTION—Check metering rod setting (disturbed by this adjustment).

METERING ROD (ECONOMIZER):—Metering rod and jet assembly meters fuel for main nozzle and rod is operated by throttle lever in same manner as on other Carter models. Metering rod mounting on pump operating lever is new and consists of a pin locked in place in a slotted hole in the pump arm by a nut. Metering rods can be changed for special operating conditions such as high altitudes. See Carter Jet Specification Table for standard and lean metering rod calibrations. Check and adjust metering rod whenever rods removed and replaced or when pump stroke setting is changed.

Metering Rod Adjustment—Disconnect choke linkage, take out air horn attaching screws, remove air horn and dust cover. Unhook metering rod spring, remove metering rod being careful not to lose disk on rod at bowl cover. Insert special gauge, T109-26 (2.718") in place of metering rod so that tapered end is seated in metering rod jet and gauge is vertical. Back off throttle lever stopscrew so that throttle valve closes tightly. Metering rod pin on pump operating rod should be even with shoulder of notch in gauge. To adjust, loosen pin nut, shift pin on arm, tighten nut securely (use special wrench T109-76). Remove gauge, install metering rod and disk, install pin spring, connect metering rod spring.

FLOAT LEVEL:—**Note**—Float level on 444-S carburetor was originally set at ⅜" (Gauge T109-80). This should be changed to ¼" when new float and needle valve assembly installed. See Production Change Note above.

Float Level—To check, remove bowl cover and float assembly, invert cover, turn gasket so that machined surface of bowl cover is exposed, measure distance from this bowl cover surface to top of float at free end. Should be ¼" (Gauge No. T109-30—see note above for 444-S. To adjust, bend lip of float lever at point where it contacts valve needle (do not bend float arm).

Float Travel—To check, hold bowl cover and float assembly in normal position. Free end of float should drop ½". To adjust, bend two small float stop lips at hinge end of float.

Needle Valve & Seat Assembly—Furnished only as matched sets, Part No. 21-74S (see Production Change Note above on first 444-S carburetors).

THROTTLE VALVE SETTING:—When installing valves, back off throttle lever stopscrew, see that trademark on valve is on idle port side, use new attaching screws and install screws loosely, tap valve lightly to centeralize it in carburetor bore and tighten screws securely. Check setting.

Setting—With throttle valve closed tight (stopscrew backed off), idle port opening (below lower edge of valve) should be .028-.032" and top of vacuum spark port should be .042-.048" above upper edge of valve. Shims furnished .002" thick (2-93), .005" thick (2-94) to correct valve position.

CHOKE:—Offset type valve with poppet type relief valve. Check choke linkage to see that choke valve closed when control button on instrument panel pulled out and open with control button pushed in (engine not running—choke control is semi-automatic and spring-loaded).

Fast Idle:—Consists of an interconnecting linkage between the choke valve lever and throttle valve lever so that throttle valve is opened to fast idle position with choke valve closed. Should not require adjustment.

TROUBLE SHOOTING:—Poor Idling Performance—If motor stalls while idling, low speed performance is unsatisfactory, or if correct idling adjustment cannot be secured, remove idle well plug and gasket assembly and allow fuel to drain from bowl which will flush out idle well jet. Remove idle well jet and clean with compressed air, remove low speed jet and clean with air, see that jet seats gasoline tight at shoulder in casting when replaced. Check carburetor wall at throttle valve edge for carbon deposits. Remove idle adjusting screw and clean out idle passages with air.

Poor Acceleration—Check pump stroke. Remove and clean or replace pump jet. Examine pump for damaged or worn plunger leather, loose plunger or bent pump arm, sediment or corrosion in pump cylinder, sticking or leaking ball check valves. If pump plunger removed from cylinder, use loading tool to install plunger to avoid damage to plunger leather.

Carburetor Loads up or Performance is Poor—See Production Change Note above for recommended changes on first 444-S carburetor. Check float level, see that correct type metering rod installed and check metering rod setting.

SERVICING:—Disassembly—Remove choke connector link and spring, take out attaching screws and remove air horn assembly. Remove idle well plug and gasket assembly, remove idle well jet. Remove throttle shaft arm and connector rod. Take out screws and remove bowl cover assembly, disassemble parts on bowl cover. Remove low speed jet plug and gasket, low speed jet, idle adjusting screw and spring, metering rod jet and gasket assembly, nozzle passage plug and gasket, nozzle retainer plug, nozzle (use tool T109-55). Take out body casting flange attaching screws, remove flange casting and throttle valve assembly. Remove pump strainer plug and gasket, strainer, inlet ball check valve assembly, outlet ball check valve assembly. Remove pump jet passage plug and gasket, and pump jet. Remove idle port rivet plug. Take out throttle valve attaching screws, remove valve, withdraw shaft and lever assembly. Remove choke control bracket assembly from air horn, take out choke valve attaching screws, remove valve, withdraw choke valve shaft and lever assembly.

Servicing:—Clean body castings and all parts in gasoline, blow out all passages in castings and all jets with compressed air, dry all parts with air before reassembling. Check all parts for wear, see that they agree with specifications (see Carter Jet Specification Table), replace all worn parts.

Reassembly:—Use all new gaskets (soak metering rod gasket and needle seat gasket in 90 proof alcohol for 15 minutes, install on part and allow to dry before using). Reassemble by reversing disassembly directions above and note:

Nozzle Installation—Use new gasket. Use special tool T109-55 to install nozzle and make certain that flat side of nozzle is upward.

Low Speed Jet—Make certain that hole at lower end is open, work jet into seat by moving it back and forth, make certain that jet seats tightly in casting and install jet plug and gasket.

Choke Valve—Centralize valve in air horn by tapping valve lightly before tightening attaching screws.

Throttle Valve—See Throttle Valve Setting above for installation data.

Adjustments—Adjust Idle, Metering Rod, Pump Stroke, Float Level, and choke linkage as directed above.

407-S—CADILLAC V16, SERIES 90 (1938-39)—LEFT HAND CARBURETOR
408-S—CADILLAC V16, SERIES 90 (1938-39)—RIGHT HAND CARBURETOR
373-S—CHRYSLER IMPERIAL, MODEL C14 (1937)
344-S, 377-S—HUDSON SIX, MODEL 73 (1937).
HUDSON EIGHT, MODELS 74, 75, 76, 77 (1937)
TERRAPLANE SUPER SIX, MODEL 72 (1937)
402-S—HUDSON SIX, MODEL 83 (1938)
HUDSON EIGHT, MODELS 84, 85, 87 (1938)
TERRAPLANE, SUPER MODEL 82 (1938)
317-S—HUPMOBILE EIGHT, MODEL 521-O (1935), 621-N (1936).
399-S—HUPMOBILE EIGHT, MODELS 825-H ('38), 925-H ('39)
374-S—LA SALLE, V8, SERIES 37-50 (1937)
392-S—LA SALLE V8, SERIES 38-50 (1938)
423-S—LA SALLE V8, SERIES 39-50 (1939)
436-S—NASH AMBASSADOR EIGHT, MODEL 3980 (1939)
328-S—OLDSMOBILE EIGHT, MODEL L-36 (1936). FIRST 27,334 CARS.
341-S—OLDSMOBILE EIGHT, MODEL L-36 (1936). SERIAL NO. L-127334 UP.
345-S—OLDSMOBILE EIGHT, MODEL L-37 (1937)
367-S—OLDSMOBILE EIGHT, MODEL L-37 (1937) LATER CARS.
386-S—OLDSMOBILE EIGHT, MODEL L-38 (1938)—FIRST CARS
366-S—PACKARD EIGHT, MODEL 120C (1937)—ENG. NO. 112-822 UP

NOTE:—These models fitted with Carter Climatic Control (automatic choke), Fast Idle, Unloader, Choke Valve Lock, and Anti-Percolator. See Carburetion Equipment Section for complete data.

Cadillac V-16 Models. One carburetor used for each cylinder bank. Carburetors must be equalized as well as adjusted (see directions below).

La Salle Idling Adjustment Correction—On first cars equipped with 392-S and 423-S carburetors, if idle adjustment range is insufficient and correct performance cannot be secured, a #54 size drill hole should be drilled in each throttle valve in the 'C' stamped on the idle port side of the valve. Recommended idle adjusting screw setting on La Salle carburetors has been changed from ¼-1 to ½-1¼ turns open.

Chrysler C14—Carter Climatic Control not used on this model (see separate article for Sisson Automatic Choke which is standard equipment). Carter Fast Idle, Unloader, and Anti-Percolator are used.

Oldsmobile L-37—To correct complaints of hesitation on part throttle acceleration at low speed, install new metering rods Part No. 75-224 in place of original No. 75-195 and tune up motor.

Oldsmobile Model 328-S Carburetor. Main nozzle was changed from Part No. 12-203 to No. 12-209. Nozzle gasket No. 20-60 must be used when installing this new type nozzle.

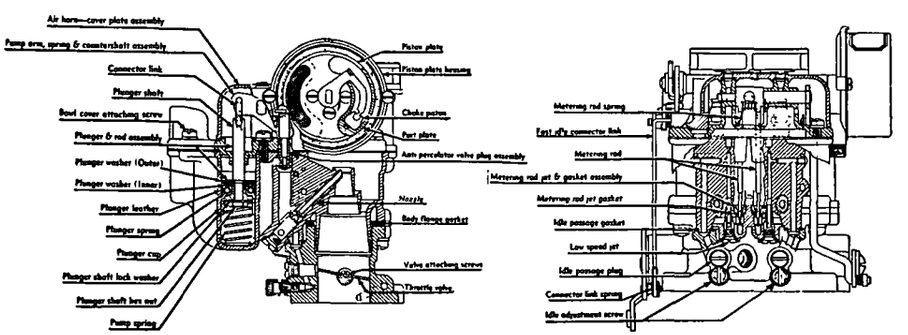
Oldsmobile L-38. This carburetor used on first cars only. Model 389-S Vacumeter type carburetor used on later cars. See separate article for data.

TYPE:—Dual barrel, plain tube, downdraft type. Similar in design to other Carter models except that carburetor has two barrels or mixing chambers and that main nozzles, accelerating pump discharge jets, throttle valves, and idling systems duplicated for each barrel. Anti-Percolator is used.

IDLE ADJUSTMENT:—Engine must be thoroughly warmed up so that choke valve is wide open and Fast Idle is inoperative. Idle adjusting screw provided for each carburetor barrel. Screws control fuel mixture and should be turned in for leaner mixture or out for richer mixture (adjust screws in succession, or start with same opening for each screw and turn both screws same amount simultaneously). See tune up instructions on car model page. Approximate idle settings as follows:

Car Model	Carburetor	Idle Screw Setting	Idle Speed
Cadillac V16	407-S, 408-S	¼-1 turn open	6 M.P.H.
Chrysler C14	373-S	¾-1¼ turn open	7 M.P.H.
Hudson 6 & 8	344-S, 377-S, 402-S	¼- ¾ turn open	7 M.P.H.
Hupmobile	317-S	¾-1¼ turn open	6 M.P.H.
Hupmobile	399-S	¼-1 turn open	6 M.P.H.
La Salle 37-50	374-S	¾-1¼ turn open	6 M.P.H.
La Salle 38-50	392-S	¼-1 turn open	8 M.P.H.
LaSalle 39-50	423-S	½-1¼ turns open	6 MPH.
Nash 3980	436-S	¼-1 turn open	7-8 MPH.
Oldsmobile 8	328-S, 41-S, 45-S, 67-S, 86-S	¾-1¼ turn open	6 M.P.H.
Packard 120C	366-S	½-1¼ turn open	6 M.P.H.
Terraplane 72, 82	344-S, 377-S, 402-S	¼- ¾ turn open	7 M.P.H.

Cadillac V16 Carburetor Equalization—Use mercury column "U" tube connected to ⅛" pipe plug openings in long leg of each intake manifold (do not connect gauge to vacuum balancing tube between carburetors). Disconnect throttle rods, idle engine, note mercury levels in tube. Adjust throttle stopcsrew at each carburetor so that engine idles at 7-8 M.P.H. and mercury column is equal in both tubes. Adjust right hand throttle rod (trunnion with fine threads on rod near carburetor) so that rod can be connected without disturbing throttles or unbalancing mercury levels. Open throttle so that engine runs at 1000 R.P.M. (use foot throttle, not hand throttle), make any necessary re-adjustment to secure equal mercury column levels. If adjustment made, recheck idle setting (idle speed equalization more important and should be favored).



METERING ROD (ECONOMIZER):—Fuel is metered by a stepped metering rod which is raised in the metering jet as the throttle is opened, allowing greater fuel flow to the nozzle. One metering rod used for each carburetor barrel (rods must be same size and must be changed as a unit). No adjustment provided but rods can be changed to secure leaner-than-standard fuel mixture to compensate for special fuel or operating conditions such as high altitude (See Carter Jet Specification Table). Metering rod setting must be checked whenever metering rods are removed or changed.

Metering Rod Removal—On models with integral air horn and dust cover, remove this assembly to expose pump countershaft and metering rods (on models with separate dustcover, take out two retaining screws and remove dust cover only). Remove pin spring from metering rod pin, slide pin out being careful not to lose metering rod springs, lift out metering rods and springs. Remove small brass screw and take out metering rod disk retainers and disks.

Metering Rod Setting—Back off throttle lever stopscrew so that throttle valves tightly closed, loosen anti-percolator arm screw. Install metering rod gauge (see table below for each model) in place of each metering rod, making certain that gauges seat in metering rod jets and are vertical. Install metering rod pin and pin spring in metering rod arm. Press down lightly on pump arm pin rests on shoulders of notches in both gauges (bend arm slightly to equalize if necessary) with clearance of less than .005" between pin and each gauge. Tighten anti-percolator arm screw. Remove gauges and metering rod pin, install metering rods and disks, springs, pin, and pin spring.

Car Model	Carburetor	Metering Rod Gauge	Length
LaSalle 39-50	423-S	T-109-113	2.280"
Nash 3980	436-S	T-109-113	2.280"
All Other Models		T-109-27	2.359"

CAUTION—Anti-percolator must be checked after this adjustment completed.

ACCELERATING PUMP:—Low pressure type (Hudson, Hupmobile, LaSalle, Oldsmobile, Packard), Delayed action type (Chrysler 373-S), High pressure type with spring loaded pump arm (Cadillac, Hupmobile 399-S, Oldsmobile 386-S.)

Adjustment—Some models provided with two holes in pump countershaft arm for pump stem link connection to provide seasonal adjustment. Lower hole provides minimum stroke, upper hole maximum stroke. See tune up data on car model page for recommended setting for each model.

Pump Stroke Setting—Whenever carburetor disassembled, check and adjust pump linkage for correct pump stroke. With pump connector link in place, back off throttle stopscrew, hold throttle tightly closed, install gauge (see table below for type for each model) on flat surface of bowl cover. Top of pump shaft (piston rod) should contact lower edge of gauge arm with pump set for minimum or maximum stroke (see table). Adjust by bending throttle connector rod at lower angle. If gauge not available, mark pump rod at edge of bowl cover with throttle tightly closed and again with throttle wide open. Distance between marks (pump stroke) should agree with figure in table below.

Universal Pump Gauge—This gauge has a graduated plunger (marked in sixty-fourths of an inch) and may be used to check pump travel on all carburetor models. To use gauge, install on rim of bowl cover at pump plunger so that projection on gauge rests on top surface of connector link at pump shaft. Note gauge reading with throttle closed, then open throttle wide and again note

gauge reading. Difference between two readings is pump stroke in 64ths of an inch. Adjust by bending throttle connector rod at lower angle near throttle lever with tool T-109-75. CAUTION—Check Metering Rod Setting and Anti-percolator Adjustment after adjusting pump stroke.

Car Model	Carburetor	Gauge No.	Pump Stroke	Pump Setting
Cadillac V16	407-S, 408-S	T-109-111	19/64"	Max.
Chrysler C14	373-S.	T-109-46	1/4"	Max.
Hudson 6 & 8	344-S, 77-S, 402-S	T-109-47	15/64"	Min.
Hupmobile	399-S	T-109-48	31/64"	Min.
LaSalle	374-S, 392-S	T-109-46	1/4"	Max.
LaSalle	423-S.	*T-109-117S	26/64"	Non-Adj.
Nash	436-S	*T-109-117S	32/64"	Max.
Oldsmobile	345-S, 367-S	T-109-46	1/4"	Max.
Oldsmobile	386-S	T-109-111	19/64"	Max.
Packard	366-S	T-109-48	31/64"	Non-Adj.
Terraplane	344-S, 77-S, 402-S	T-109-47	15/64"	Min.

*—Universal Pump Gauge—See Note

ANTI-PERCOLATOR:—Plunger Type. Consists of two spring-loaded plunger type valves (one for each main jet well) which are opened by anti-percolator arm (linked to metering rod arm) when throttle is closed to vent main nozzles and prevent any 'percolating' discharge when carburetor is hot. Valve must be closed when throttle is open (will cause 'flat spots' if not properly adjusted).

Adjustment—Remove air horn and Climatic Control (see dismantling instructions in Servicing section below). Do not disturb metering rods or pump setting. Back off throttle stopscrew so that throttle valves closed tightly, insert .015" feeler between each anti-percolator stem and lip on anti-percolator arm (Hudson, Terraplane, Cadillac, LaSalle—do not use feeler on Hupmobile, Nash, Oldsmobile). Bend lips on arms until each anti-percolator stem depressed so that indicator line on stem is flush with top of anti-percolator plug. NOTE—Use extreme care to secure equal adjustment for both units.

Hupmobile (317-S)—Set throttle valve so that clearance between edge of valve and carburetor wall on side opposite idling ports is .030" (turn up throttle stopscrew or close throttle on .030" feeler). Bend lips on metering rod arm until clearance between lips and anti-percolator valve stem is .005-.015". In making this adjustment be very careful not to disturb setting of metering rod. See that both anti-percolating units are equalized.

Oldsmobile (First models without Indicator Line)—Throttle valve opening should be .020" (back off throttle stopscrew, insert Carter gauge No. T-109-29, Oldsmobile No. J-512, between throttle valve edge and wall on side opposite idle ports). Adjustment and setting same as for Hupmobile. Reset throttle stopscrew.

FLOAT LEVEL:—To check float level, remove bowl cover and air horn (see Dismantling instructions in Servicing section), invert cover, measure distance from top of float to gasket surface on cover at each side of soldered seam on float. Correct float level by bending lip of lever (do not bend float).

Car Model	Carburetor	Float	Checking Tool
Cadillac V16	407-S, 408-S	13/64"	T109-39
Chrysler C14	373-S	13/64"	T109-39
Hudson 6 & 8	344-S, 377-S, 402-S	15/64"	T109-32
Hupmobile	317-S	5/32"	
Hupmobile	399-S	3/16"	T109-28
La Salle 37-50	374-S	13/64"	T109-39
La Salle 38-50	392-S	3/16"	T109-28
La Salle 39-50	423-S	1/8"	T109- 36
Nash 3980	436-S	3/16"	T109- 28
Oldsmobile	328-S, 341-S	3/16"	T109-28
Oldsmobile	345-S, 367-S, 386-S	9/64"	T109-34
Packard 120C	366-S	1/8"	T109-36
Terraplane 72, 82	344-S, 377-S, 402-S	15/64"	T109-32

Float Needle Valve & Seat Assembly—Furnished only as matched sets.

Car Model	Carburetor	Part Number	Intake Hole Size
Cadillac V16	407-S, 408-S	25-80S	#42
Chrysler C14	373-S	25-59S	#38
Hudson 6 & 8	344-S, 377-S, 402-S	25-59S	#38
Hupmobile	317-S	25-59S	#38
Hupmobile	399-S	25-66S	#34
La Salle	374-S, 392-S	25-59S	#38
La Salle 39-50	423-S	25-59S	#38
Nash 3980	436-S	25-59S	#38
Oldsmobile	328-S, 41-S, 45-S, 67-S	25-59S	#38
Oldsmobile	386-S	25-74S	#38
Packard 120C	366-S	25-66S	#34
Terraplane 72, 82	344-S, 377-S, 402-S	25-59S	#38

FAST IDLE:—Consists of a fast idle lever linked to the throttle valve lever and mounted directly below the fast idle cam on the choke valve shaft. Dashpot assembly (Hudson, Terraplane only) mounted on side of float bowl and linked to outer end of fast idle lever. To adjust, hold choke valve tightly closed, adjust fast idle arm screw so that distance from edge of throttle valve to carburetor wall on side opposite idle port is correct as shown in table below (use special checking gauge to gauge throttle valve opening).

Car Model	Carburetor	Throttle Opening	Checking Gauge
Cadillac V16	407-S, 408-S	.026"	
Chrysler C14	373-S.	.018"	T-109-44
Hudson 6 & 8	344-S, 77-S, 402-S	.018"	T-109-44
Hupmobile	317-S	.018"	T-109-44
Hupmobile	399-S	.030"	T-109-29
LaSalle	374-S, 92-S, 423-S	.030"	T-109-29
Nash	436-S	.015"	T-109-44
Oldsmobile	328-S, 41-S, 45-S, 67-S, 86-S	.018"	T-109-44
Packard	366-S	.018"	T-109-44
Terraplane	344-S, 77-S, 402-S	.018"	T-109-44

CHOKE:—All choke valves are offset type. See article in Carburetion Equipment Section for complete data on automatic choke (Climatic Control).

Unloader:—Consists of a lip on the throttle connector which engages the choke trip lever on the choke valve shaft so that the choke valve is opened when the throttle is opened wide. Check by opening throttle valve wide open, and checking distance between upper edge of choke valve and air horn wall (see table below for distance and checking tool for each model). Adjust by bending lip on fast idle connector link. With correct adjustment, choke valve will be locked open when moved to the wide open position (with throttle valve wide open) and will be released when throttle closed.

Car Model	Carburetor	Checking Tool No.	Distance
Cadillac V16	407-S, 408-S	T109-38	3/16"
Chrysler C14	373-S	T109-31	1/4"
Hudson 6 & 8	344-S, 377-S, 402-S	T109-31	1/4"
Hupmobile	317-S	T109-31	1/4"
Hupmobile	399-S	T109-34	9/64"
La Salle 37-50	374-S	Use Drill Rod	3/16"
La Salle 39-50	423-S	T109- 36	9/64"
Nash 3980	436-S	T109- 34	1/8"
Oldsmobile	328-S, 41-S, 45-S, 67-S, 86-S	T109-31	1/4"
Packard 120C	366-S	T109-31	1/4"
Terraplane 72, 82	344-S, 377-S, 402-S	T109-31	1/4"

THROTTLE VALVE SETTING:—Install valves with trademark 'C' on idle port side, back off throttle stopscrew so that valves close tightly and tap valves lightly to centralize them in carburetor bore before tightening valve screws. Check idle port and vacuum port openings. Shims furnished .002" thick (2-93), .005" thick (2-94) to correct throttle valve locations. With throttle valves tightly closed, idle port opening (or height of top of port above throttle valve as noted) and height of top of vacuum port above valve (except as noted) are as follows:

Car Model	Throttle Valve	Idle Port	Vacuum Port
Cadillac V16	2-98	(A) .127-.133"	None
Chrysler C14	2-92	.009-.015"	.029-.033"
Hudson 6 & 8	2-89	.013-.019"	None
Hupmobile 521-O, 621-N	2-88	.015-.023"	None
Hupmobile	2-92	.016-.022"	None
La Salle	2-92	.009-.015"	None
La Salle 39-50	2-92	(A) .119-.125"	None
Nash 3980	2-89	(A) .162-.168"	None
Oldsmobile	2-92	.009-.015"	(C) .029-.033"
Packard 120C	2-95	(A) .124-.130"	(B) .009-.013"
Terraplane	2-89	.013-.019"	None

(A)—Top of Idle port above throttle valve.

(B)—Height of Bottom of Vacuum Port above throttle valve.

(C)—Height of bottom of Vacuum Port above throttle valve (328-S only).

NOTE—Packard throttle valves have a #49 bleed hole.

TROUBLE SHOOTING:—Poor Idling Performance—If correct idling adjustment cannot be secured, or if engine stalls while idling, remove low speed jet tubes and clean with compressed air, clean out idling passages and ports, see that tube seats airtight at top and bottom.

Acceleration Unsatisfactory—Check pump setting, remove pump jets and check valves and clean with compressed air, examine pump for bent pump arm, loose plunger, damaged or worn plunger leather, corroded cylinder or sediment in cylinder. Use special loading tool to install pump plunger in cylinder to avoid damage to plunger leather.

Carburetor Loading—Check and adjust float level.

SERVICING:—To Disassemble Carburetor—Remove fast idle arm pin and screw assembly, cam and collar assembly, spring and connecting link. Take out two air horn attaching screws (outside), blank disc check (inside under choker valve), remove air horn and automatic choke assembly. Take out pin spring, slide out pin, remove metering rods. Remove throttle connector rod and accelerator pump connecting link. Take out float bowl cover screws, remove cover. Take out float lever pin, remove float and lever assembly, remove float needle valve and seat. Take out pin spring on pump arm spring, loosen clamp screw on metering rod arm, remove pump arm and shaft. Remove body gasket, pump plunger assembly and plunger spring. Use tool J-511 and remove anti-percolator assemblies. Remove metering rod jet and gasket assemblies. Remove pump jet plugs, pump jets and gaskets. Remove body flange assembly, flange gasket, idle passage gaskets, idle adjustment screws and springs, idle passage plug. Take off throttle shaft arm, remove throttle centering screw in face of body flange and throttle valve screws, take out throttle valves and pull shaft out. Take out nozzle retaining plugs being careful not to lose washers, remove nozzles. Remove low speed jets, check valve passage plug and strainer, pump intake check valve plug and housing, pump discharge check valve plug.

NOTE—On Hudson and Terraplane models, disconnect the dashpot connector link before removing air horn. If dashpot plunger removed from cylinder, use special loading tool Part No. T52-19 to install to avoid damage to plunger leather.

Servicing:—Wash all parts in gasoline, blow out all passages in carburetor body and dry with air, replace all worn and damaged parts.

Reassembling Carburetors—Reverse disassembly directions above. Use new gaskets, soaking needle seat gasket, blank check gasket, metering rod jet gasket in warm water for 15 minutes before installing. When assembling throttle valves, hold body flange assembly with intake manifold side down, assemble throttle valves loosely (trademark 'C' on valves down and on idle port side), back off throttle stopscrew so that valves close tightly, tap valves lightly to centralize them in carburetor barrel, tighten valve screws securely, install throttle shaft centering screw and throttle arm. Use special loading tool (J-507) to install pump piston assembly in cylinder to avoid damaging plunger leather. Check float needle valve for tightness after installing. Set float level and adjust carburetor on engine (see above and tune-up data on car model pages).

419-S—BUICK, MODEL 39-40 (1939)—BEFORE SERIAL No. 13388548.
440-S—BUICK, MODEL 39-40 (1939)—AFTER SERIAL No. 13388548.
430-S—HUDSON SIX, MODEL 92 (1939)—LATER CARS.
HUDSON COUNTRY CLUB 6, MODEL 93 (1939)
HUDSON COUNTRY CLUB 8, MODELS 95, 97 (1939)
389-S—OLDSMOBILE EIGHT, MODEL L-38 (1938)—SEE NOTE.
OLDSMOBILE EIGHT '80', MODEL L-39 (1939)

NOTE:—Oldsmobile L-38. This carburetor used on cars with Self-Shifting Transmission (Serial Nos. L-180969 to L-217504) and all cars beginning with Serial No. L-217505. Model 386-S (without Vacumeter control) used on earlier cars. See separate article for 386-S data.

SPECIAL SERVICE NOTES:—Buick Hard Starting—To correct hard starting complaints on these models (with starter control switch mounted on carburetor and operated by accelerator pedal), carefully adjust carburetor linkage so that throttle is wide open when pedal pressed down to floor (mat must be in place when adjustment made or pedal travel will be cut down when mat installed). Full throttle opening is necessary for correct 'unloader' action. Check Unloader Setting (see Choke below). Check starter Vacuum Switch Timing (see separate article on Carter Car Starter.

Buick Cold Performance & Gasoline Mileage Complaints—Small hole in metal plate covering hot air stove (lower right hand corner of plate facing carburetor side of engine) must be kept open as this hole supplies air to stove and automatic choke. If hole is allowed to become clogged, choke will not open fully causing unsatisfactory warming up performance, crankcase dilution, and poor gasoline mileage.

Buick Choke Valve Rattle—To correct rattles at 45-65 MPH. on acceleration, remove choke valve and file both sides of valve for additional .010" side clearance (.013-.017" total, valve closed). Greater clearance will increase cold starting time.

TYPE:—Same design as Single barrel Vacumeter type carburetors (see preceding article) except for dual feature. Carburetor has two independent mixing chambers, main nozzles, metering rods and jets, throttle valves, and idling systems. One accelerating pump (with double discharge jets) and one economizer vacuum piston assembly used for both barrels.

Buick 419-S, 440-S—These models equipped with Carter Car Starter (vacuum switch) mounted on carburetor and operated by throttle valve switch. See separate article on 'Starter Controls' in Electrical Equipment Section

IDLING ADJUSTMENT:—Adjust carburetor only with engine warmed up and idling at hot or slow idling speed (choke valve wide open, fast idle inoperative). Idle adjusting screw provided for each carburetor barrel. Screws control fuel mixture and should be turned in for leaner mixture, out for richer mixture and both screws just be adjusted exactly alike. See table below for approximate settings on each car model. Idle speed controlled by throttle lever stopscrew and should be set for speed shown in table. See car model 'T&E' page for complete carburetor tune up instructions on each car model.

Car Model	Carburetor	Idle Screw Setting	Idle Speed
Buick 39-40	419-S	⅜-1 turn open	7-8 MPH.
Buick 39-40	440-S	½-1¼ turns open	7-8 MPH.
Hudson 6 & 8	430-S	¼-1 turn open	7 MPH.
Oldsmobile	389-S	½-1¼ turns open	6 MPH.†

†—High gear (Std. Trans.), Third gear (Self-shifting Trans.).

PERFORMANCE:—Should be satisfactory if Idling Adjustment and Accelerating Pump Setting correct. See Carter Jet Specification Table for standard jet calibrations and special lean metering rods (for special operating conditions). Both metering rods must be same size and adjusted alike. See Trouble Shooting below.

METERING ROD (ECONOMIZER):—Fuel for main nozzles metered by metering rod and jet (independent rod and jet for each nozzle). Metering rods operated by single vacuum piston with throttle control (stop pin on pump arm limits piston travel so that metering rod lifted in accordance with throttle opening). No adjustment provided but metering rods can be changed to secure leaner-than-standard fuel mixture to compensate for special fuel or high altitude conditions (both rods must be same size and should be changed as a unit). Check metering rod setting whenever rods removed and replaced or when pump stroke setting is adjusted.

To Remove Metering Rods—Take out screws and remove dust cover or remove air horn and dust cover assembly (where these parts integral—see Service data for removal instructions). Remove pin spring from metering rod pin and slide pin from vacuum piston link being careful not to bend metering rod spring. Lift out metering rods, remove brass metering rod disc retainer by taking out brass screw, remove the two small metering rod discs from beneath retainer.

To Check Metering Rods—Back off throttle lever stopscrew so that throttle valves are tightly closed. Install metering rod gauge (see table below) in place of each metering rod making certain that tapered ends are seated in metering rod jets. Install metering rod pin in piston link. Push piston link down until metering rod pin rests lightly on shoulder of notch in each gauge. With throttle valves seated, and vacuum piston held down, bend lip on anti-percolator arm (which extends under metering rod pin) so that lip just touches pin (use adjusting tool T109-105).

To Install Metering Rods—Make certain that discs are in place under disc retainer and that pin spring and metering rod springs are properly connected.

Car Model	Carburetor	Metering Rod Gauge No.	Length
Buick 39-40	419-S, 40-S	T109-113	2.280"
Hudson 6 & 8	430-S	T109-113	2.280"
Oldsmobile	389-S	T109-104	2.312"

ACCELERATING PUMP:—High pressure type (spring operated—pump operating lever and pump arm linked by small coil spring). Inlet ball check valve located in bottom of pump cylinder, outlet ball check valve under retainer plug in main body casting.

Pump Seasonal Adjustment—On some models, pump arm (under dust cover) has two or three holes for pump rod link connection to provide varied pump stroke for seasonal pump requirements. See car model 'T&E' page for recommended settings and seasonal changes.

Pump Stroke Adjustment—On models with integral air horn and dust cover, remove this assembly to expose pump countershaft and connector link (on models with separate dust cover, take out two retaining screws and remove dust cover only). Back off throttle lever stopscrew so that throttle valves tightly closed, check pump seasonal adjustment (connector link must be engaged in hole for correct stroke as shown in table below). Install Universal Pump Stroke Gauge T109-117S on rim of bowl cover at plunger shaft so that projection on gauge rests on top surface of connector link at pump shaft (see gauge note below). Note gauge reading with throttle closed, then open throttle wide and again note gauge reading. Difference between two readings is pump stroke (in sixty-fourths of an inch) and should agree with figure shown in table below. Adjust by bending throttle connector rod at lower angle near throttle lever (use bending tool T109-75). CAUTION—Check metering rod setting and anti-percolator adjustment after adjusting pump stroke.

NOTE—**Pump Gauge Design Change.** On first type pump stroke gauge T109-117S design of indicator arm may make it difficult to check pump stroke on 1939 carburetors (later gauges have different design indicator arm). This new indicator arm No. T109-119 can be installed on old type gauges (or gauge can be returned to factory for arm installation). If arm installed in field, set notch in indicator nut at '8', check arm for projection beyond base of gauge (if arm projects, file flush with base).

Car Model	Carburetor	Pump Stroke	Pump Setting
Buick 39-40	419-S, 40-S	21/64"	Medium Stroke
Hudson 6 & 8	430-S	18/64" (9/32")	Long Stroke
Oldsmobile	389-S	19/64"	Non-Adj.

ANTI-PERCOLATOR:—Plunger Type. Consists of a vent above each main jet well controlled by spring-loaded plunger type valves. Valves are opened by anti-percolator arm connected to throttle when throttle valves are closed to vent nozzles and prevent any 'percolating' discharge when carburetor is hot. Valves must be closed when throttle is opened (incorrect adjustment will cause flat spots).

Adjustment—Make this adjustment after metering rod setting and pump stroke setting have been adjusted (use extreme care not to disturb these settings). On models with integral air horn and dust cover, remove this assembly to expose anti-percolators (on models with separate dust cover, take out two retaining screws and remove dust cover only). Back off throttle lever stopscrew so that throttle valves tightly closed. Adjust by bending lips on anti-percolator arms so that indicator line on each anti-percolator stem is flush with top of anti-percolator plug. Use extreme care to adjust both anti-percolator units alike. NOTE—Anti-percolator not used on later (440-S) Buick carburetor which has anti-percolation vent tube located above each nozzle.

FLOAT LEVEL:—To check float level (with bowl cover assembly removed), remove cover gasket, invert cover, measure from machined gasket seat on cover to top of float (check at both ends of float—settings must be alike). See table below for float level and special checking gauge for each model. To adjust, bend lip on float lever at point where it contacts valve needle (do not bend float or arm).

Car Model	Carburetor	Float Level	Checking Gauge
Buick 39-40	419-S, 40-S	3/16"	T109- 28
Hudson 6 & 8	430-S	3/32"	T109-125
Oldsmobile	389-S	9/32"	T109-126

Needle Valve & Seat—Furnished only in matched sets as shown in table below. When installing assembly on Oldsmobile 389-S, see that clip on needle valve engages float lever.

Car Model	Carburetor	Part Number	Intake Hole
Buick 39-40	419-S, 40-S	25-80S	#42
Hudson 6 & 8	430-S	25-59S	#38
Oldsmobile	389-S	25-74S	#38

THROTTLE VALVE SETTING:—Install valves with trademark 'C' toward idle port side, use new attaching screws, install screws loosely, tap valves lightly to centralize them in bore, then tighten screws securely. Check valve setting with throttle lever stopscrew backed out so that valves tightly closed. Idle port figure is distance from top edge of valve to top of idle port. Vacuum spark port figure is distance from top edge of valve to top (or bottom as noted) of vacuum spark port. Shims furnished .002" thick (2-93), .005" thick (2-94) for throttle valve setting adjustment.

Car Model	Carburetor	Idle Port	Vacuum Spark Port
Buick 39-40	419-S	.060-.066"	(A) .040-.044"
Buick 39-40	440-S	.060-.066"	(A) .052-.056"
Hudson 6 & 8	430-S	.108-.112"	None
Oldsmobile	389-S	.140-.146"	(C) .029-.033"

(A)—Distance to top of port. (C)—Distance to bottom of port.

FAST IDLE:—Consists of a fast idle lever linked to the throttle valve lever and mounted directly below the fast idle cam on the choke valve shaft. To adjust, hold choke valve tightly closed, adjust fast idle arm screw so that clearance between throttle valve and carburetor wall on side opposite idle port is correct as shown in table below (use special checking gauge inserted between throttle valve and wall to check opening).

Car Model	Carburetor	Throttle Opening	Checking Gauge
Buick 39-40	419-S, 40-S	.018"	T109-44
Hudson 6 & 8	430-S	.018"	T109-44
Oldsmobile	389-S	.018"	T109-44

NOTE—T109-44 gauge used for both .015" and .018" settings.

CHOKE:—Carter Climatic Control (automatic choke) is standard. See article in Carburetion Equipment Section for complete servicing and adjusting directions.

Setting—Thermostatic coil housing reference mark should be centered on mark on piston housing (for all models except those shown in table below) or should be rotated counter-clockwise (Rich), clockwise (Lean), the correct number of notches from the center mark as follows:

Car Model	Carburetor	Choke Setting
Buick 39-40	419-S	1 Notch Rich
Buick 39-40	440-S	1 Notch Lean
All Others		Centered

Unloader:—Consists of a lip on the throttle connector which engages the choke trip lever on the choke valve shaft so that the choke valve is opened when the throttle is wide open. To adjust, hold throttle valve wide open, bend lip on fast idle connector link so that clearance between upper edge of choke valve and air horn wall is correct as shown in table below (use specified gauge to check this opening).

Car Model	Carburetor	Unloader Gauge	Clearance
Buick 39-40	419-S	T109-125	3/32"
Buick 39-40	440-S	T109- 28	3/16"
Hudson 6 & 8	430-S	T109- 31	¼"
Oldsmobile	389-S	T109- 31	¼"

Choke Valve Lock:—With unloader properly adjusted, choke valve will be locked in wide open position with throttle valves wide open. Choke valve will be released when throttle valves closed.

TROUBLE SHOOTING:—Same as for other Carter models (see preceding article).

SERVICING:—Disassembly. Remove fast idle arm screw, fast idle arm and spring assemblies. Take out air horn attaching screws (two screws outside, one screw inside under choke valve) and remove air horn and Climatic Control assembly. Remove pin spring and pump connector link, spring retainers and springs to remove throttle connector rod, take out four flange attaching screws and lift off flange, gasket and two idle passage gaskets taking care not to lose vacuum piston spring. Disconnect piston from piston link, lift out metering rod and piston link assembly, disconnect metering rods from link. Remove four bowl cover attaching screws, remove bowl cover and body gasket. Remove metering rod disc retainer and discs, pump plunger and rod assembly, pump spring, pump inlet ball check, metering rod jets and gaskets, anti-percolators (use 13/32" socket wrench T109-66), pump jet passage plugs, pump jets, nozzle plug and gasket assemblies, nozzle retainer plugs and nozzles (nozzles pressed in, use tool No. T109-55), nozzle gaskets, low speed jet and gasket assemblies, pump outlet ball retainer plug and ball (in center of casting next to air horn retaining screw hole), throttle valve attaching screws and throttle valves, throttle centering screw, arm attaching screw, washer, and arm. Remove fast idle spring retainer, spring, connector link, connector link spring, withdraw throttle shaft and lever assembly. Take out idle adjusting screws and springs, remove idle port rivet plugs.

Servicing—Clean castings and all parts with gasoline (no not immerse cork parts in gasoline), blow out all passages with compressed air, check all parts for correct specifications and replace all worn parts. Use all new gaskets when reassembling. Soak needle seat gasket, low speed jet gasket and metering rod jet gasket in 90 proof alcohol for 15 minutes, install and let dry on part before using.

Reassembly—Reassemble in reverse order. Check throttle valves (see Throttle Valves above), make certain that low speed jets seat at both ends and are tight, install nozzles with flat side facing up. Vacuum piston is offset from link and should be installed with large side of piston toward bores. When installing flange assembly on body casting, hold body casting upside down with vacuum piston vertical, place piston spring in piston, then place flange assembly on body casting, guiding piston and spring into cylinder in flange casting. Check metering rods, anti-percolator, pump, and fast idle as directed above.

NOTE:—Metering Rod markings indicate size of Rod. A rod marked '56-44' is .056" in diameter (Economy Step) and .044" (Power Step). On three step rods only the first and last steps are indicated by the marking.

(A) Nozzle Assembly (12-186 Screw Nozzle, 12-196 Slip Nozzle).
(B) Nozzle Assembly (12-211 Screw Nozzle, 12-210 Slip Nozzle).
(L) Screw Nozzle #31, Slip Nozzle .125".
(M) 1 Size Rich—Marked 68-41. Part No. 75-210.
(N) Closed Tip. Top Hole #70 (45° angle), Lower Hole #52 (60° angle).

** Supersedes 75-144 used on first cars.
*** Supersedes 75-171 used on first cars.
† Screw nozzle—Slip nozzle 12-196—.125" also used.
†† Screw nozzle—Slip nozzle 12-210—#40 also used.

①—Supersedes No. 75-371 (63-55).
②—Upper Hole #75, Lower Hole #52.
③—Supersedes No. 12-242.
④—Closed Tip. Top hole #70 (45° Angle), Lower hole #54 (60° Angle).
⑤—Supersedes No. 11-238 (#72).
⑥—Inner (Screw) Nozzle #31, Outer (Slip) Nozzle .125".
⑦—Inner (Screw) Nozzle #53, Outer (Slip) Nozzle #40.
⑧—Nozzle Assembly (Inner & Outer Nozzle).
⑨—Supersedes No. 75-342 (67-42) which becomes 1 Size Lean.
⑩—Supersedes No. 75-361 (69-43) which becomes 1 Size Lean.
⑪—Upper Hole #75, Lower Hole #51.
⑫—Closed Tip. Top hole #70 (45° Angle), Lower hole #52 (60° Angle).

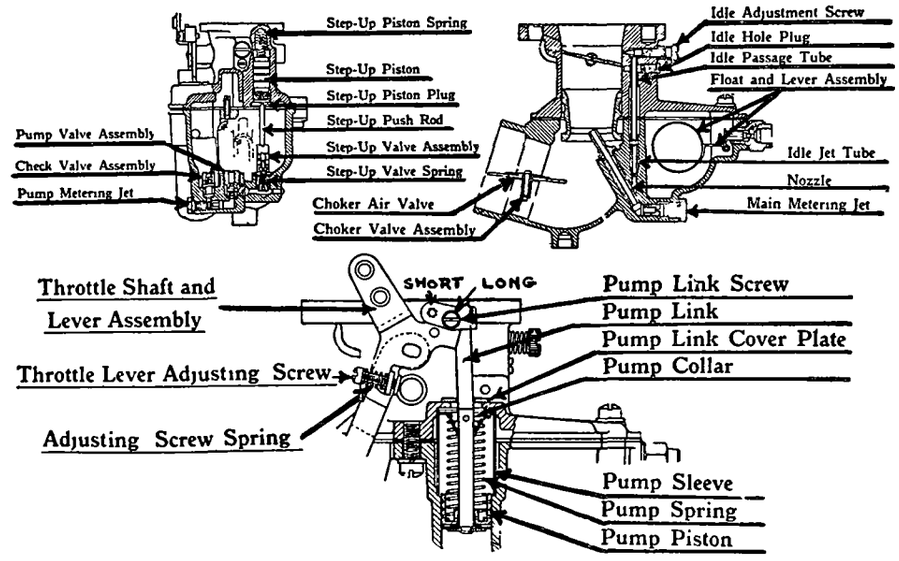
6-B2—DODGE SIX, MODEL DL (1932) (VACUUM CLUTCH CONTROL).

TYPES:—Plain tube updraft type with throttle operated accelerating pump and vacuum operated 'step-up' device (economizer). Fuel for main nozzle is metered by main metering jet (under float bowl) and power orifice or step-up jet (for high speed or wide open throttle operation with step-up valve open). There are two idling ports, a lower or non-adjustable port (below the throttle), and an upper port (above throttle in closed throttle position) which is controlled by the idling adjustment screw. Idling adjustment and accelerating pump adjustment (summer and winter setting) are the only point requiring attention.

IDLE ADJUSTMENT:—Needle valve type operating on fuel mixture. Engine must be warmed up before adjustment is made. With engine warm and running, close throttle, adjust throttle stop screw so that engine idles at approximately 300 to 375 R.P.M. Turn the idle adjusting screw in or clockwise until engine begins to miss (mixture too lean), then turn screw slowly out or counter-clockwise until engine fires smoothly. Idling screw controls fuel mixture (turn screw in for leaner mixture, out for richer mixture). Setting should be approx. ½-1¼ turns open. Check idle speed after completing adjustment and readjust throttle stop screw if necessary. Do not idle engine below 300 R.P.M.

NOTE:—If correct idling adjustment cannot be secured or engine stalls while idling, take out idling adjustment screw and lower idle port plug and see that ports are clear, remove idle passage tube and idle jet tube and clean with compressed air.

ACCELERATING PUMP:—Low pressure delayed action type. Accelerating pump is connected to throttle shaft lever and discharges fuel through main nozzle when throttle is opened. Pump discharge is metered by pump metering jet in pump valve cage assembly (separate pump metering jet used on 4A2, 6A1, 6B, 6B1—see illustration).



Adjustment:—Pump link screw should be engaged in outer hole in throttle lever (long pump stroke) for winter driving or cold temperatures. Engage screw in inner hole (short pump stroke) for summer driving (hot climates), high altitudes, or high test gasoline.

NOTE:—If acceleration is unsatisfactory, check pump setting (above), remove main metering jet, pump metering jet, check valve assembly, and pump valve assembly and clean with compressed air.

PERFORMANCE AND ECONOMY:—All jets are 'fixed' type (non-adjustable). Main metering screw is flow-tested and rated in accordance with capacity. It should not be gauged for size with wire drills. Main metering screw can be changed to secure leaner-than-standard fuel mixtures to compensate for special fuels or operating conditions such as high altitude (see Specifications). If performance and economy are not satisfactory, examine step-up valve cage assembly, see that ball check is free and seats properly, that valve cage is screwed tight against its seat, that step-up piston is not binding, and that step-up push rod moves freely in upper and lower guides. Check float level.

VACUUM STEP-UP (ECONOMIZER):—Consists of a step-up valve assembly controlled by a vacuum piston. Vacuum piston is normally held at top of stroke by manifold vacuum so that step-up valve is closed. At high speeds or for wide open throttle operation, the drop in manifold vacuum allows the spring (above piston in cylinder) to force the vacuum piston down and open the step-up valve. Additional fuel then flows through valve and power orifice jet to main nozzle.

NOTE—When installing carburetor on manifold make certain that correct gasket used on carburetor flange (gasket has four slots) so that vacuum step-up channel in carburetor mounting flange is open. Fuel consumption will be excessive if this hole is cut off.

FLOAT LEVEL:—To check float level, take off float bowl cover (upper carburetor body casting), remove gasket, hold lip of float lever firmly against needle valve, place a metal rule across top of float bowl and check distance from top of float (not float seam) to top of bowl edge. Float should be flush with top of bowl to 1/32" max. below top of bowl with gasket removed (except 412-S, 47-S), 1/32-1/16" below top edge of bowl (412-S, 47-S). Level can be adjusted by bending lip of float lever (not bracket). To raise float level, bend lip of lever toward needle valve. To lower float level, bend lip of float lever toward float.

CHOKE:—Carburetors have interconnected choke valve and throttle valve levers so that throttle valve is opened slightly when carburetor is choked. Throttle is returned to closed position when choke valve is opened wide. Choke valve is fitted with a compensating or relief poppet valve to prevent overchoking. Adjust choke linkage so that choke valve is fully closed with choke control button pulled all the way out and wide open with choke button pushed in.

304S—REO, FLYING CLOUD MODEL 6A (1935) SERIAL NOS 6A251 TO 2038
320S—REO, FLYING CLOUD MODEL 6A (1935) SERIAL NOS. 6A2038 UP

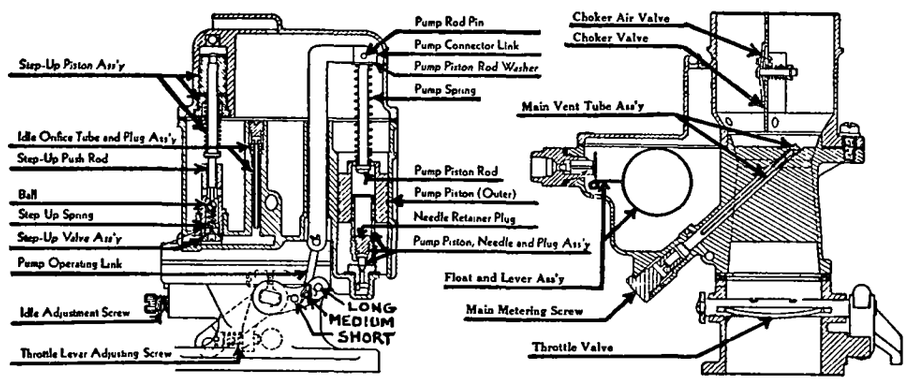
NOTE:—On Models C6A, C6A2, E6A, E8A, the accelerating pump discharges through the main discharge nozzle. On all other models a separate pump discharge jet is used and the accelerating pump discharges through this jet.

TYPE:—Plain tube downdraft type with throttle operated accelerating pump and vacuum operated 'step-up' device (economizer). Fuel is metered by main metering screw under float chamber and by power orifice or step-up jet (for high speed or wide open throttle operation with step-up valve open). There are two idling ports, an upper port (above the throttle valve) and a lower port (below valve when throttle is closed) which is controlled by idling adjustment screw. Idle adjustment and accelerating pump adjustment (summer and winter setting) are the only points requiring attention.

IDLING ADJUSTMENT:—Needle valve type operating on fuel mixture. Engine must be warmed up before adjustment is made. With engine warm and running, close throttle, adjust throttle shaft dog adjusting screw so that engine idles at approximately 300 R.P.M. or 6 M.P.H. Turn idling adjusting screw in or clockwise until engine begins to miss (mixture too lean), then turn screw slowly out or counter-clockwise until engine fires evenly. Adjusting screw controls fuel mixture and should be turned in to secure leaner mixture and out for richer mixture. Correct setting for adjusting screw is shown on table below. Check idling speed after completing adjustment and readjust as necessary. Do not idle engine at less than 300 R.P.M.

Car Model	Carburetor	Idle Screw Setting
Chrysler, DeSoto ('34)	E6B1, E6C1	½-1¼ turns open
Chrysler, DeSoto ('35)	E6F1	¼-1 turn open
DeSoto (1933)	E6A	½-1¼ turns open
DeSoto (1933)	E6A3, E6A4	⅝-1¼ turns open
Dodge 8 (1933)	E8A	⅝-1¼ turns open
Plymouth (1933-34)	C6A, 2, 3, 4, C6D1	½-1 turn open
Plymouth (1934)	B6A1, A2, C1, C2	½-1¼ turns open
Plymouth (1935)	B6E1, C6D1	¼-1 turn open
Reo (1935)	303-S, 304-S, 320-S	¼-¾ turn open

NOTE:—If correct idling adjustment cannot be secured, engine stalls while idling, or low speed operation is unsatisfactory, take out idle hole plug and idle adjustment screw and see that ports are not clogged, take out idle passage and jet tubes and clean with compressed air. See note below.



IMPORTANT NOTE:—Air horn casting (upper body casting) must be tight fit on main body casting at the step-up vacuum passage joint to prevent gasoline being drawn down into this passage which will cause stalling at idling or low speeds. Where this trouble is experienced, manufacturer advises that a step-up passage bushing, Part No. 38A-26, be installed in the main body casting and the air horn casting reassembled with TWO Part No. 121-17 body gaskets. The bushing must be in perfect alignment with the passages in both castings.

ACCELERATING PUMP:—Accelerating pump is connected to throttle shaft lever and discharges fuel through a pump jet located in the venturi when the throttle is opened, supplying the extra fuel required for acceleration. Pump lever on throttle valve shaft has two or three holes for engagement of pump operating link to secure varied pump stroke. Pump operating link pin should be engaged in outer or end hole, providing maximum pump stroke for winter driving or extreme cold temperatures. Pin should be engaged in inner hole, providing minimum pump stroke for summer driving (hot climates), high altitudes, or high test gasoline. Center hole in lever provides an intermediate pump stroke and should be used for normal temperature ranges.

NOTE:—If acceleration is unsatisfactory, check pump setting (above), remove and clean jets and valves as follows:

First Type—Discharging through Main Jet. Remove main metering jet, pump metering jet, check valve, and pump valve assembly. Clean with compressed air.

Later Type—With separate Pump Jet. Remove main metering jet and pump discharge jet and clean with compressed air. Examine pump piston needle and seat assembly and clean or replace.

PERFORMANCE AND ECONOMY:—All jets are 'fixed' type (non-adjustable). Main metering screw is flow-tested and rated in accordance with capacity. It should not be gauged for size with wire drills. Main metering screw can be changed to secure leaner-than-standard fuel mixture to compensate for special fuels or operating conditions such as high altitudes (see specifications). If performance and economy are not satisfactory, examine step-up valve cage assembly, see that ball check is free and seats properly, that valve cage is screwed tight against its seat, that step-up push rod moves freely in upper and lower guides, and that step-up piston is not binding Check float level.

FLOAT LEVEL:—To check float level, take off float bowl cover (upper carburetor body casting), remove gasket, hold lip of float lever firmly against needle valve and measure distance from top edge of float bowl to top of float (not soldered seam). Use special gauge Part No. 1522-B (5/64") or 15222 (1/64") to check float level or place a straightedge or metal rule across top of float bowl and measure distance from lower edge of rule to float. Distances should be as follows:

Car Model	Carburetor	Float Setting
Chrysler, DeSoto ('34-35)	E6B1, C1, F1	5/64"
DeSoto (1933)	E6A	1/16"
DeSoto (1933)	E6A3, 4	5/64"
Dodge 8 (1933)	E8A	1/16"
Plymouth (1933)	C6A	1/16"
Plymouth ('33-34-35)	All Models	5/64"
Reo (1935)	303-S, 304-S, 320-S	1/64"

Float level can be corrected by bending lip of float lever (not the bracket). To lower float level, bend lip of float lever toward needle valve. To raise float level, bend lip of float lever toward float.

1933-35 TYPE CONT.

CHOKE:—Choke valve is fitted with poppet type relief valve to prevent overchoking. Choke valve and throttle valve are interconnected so that throttle is opened to 'fast idle' position when choke valve is more than one-half closed. Throttle valve returns to closed position when choke valve is opened NOTE—This "Fast Idle" not used on Models B6A1, B6A2, B6C1, B6C2, B6E1 (Plymouth Economy Carburetors).

THROTTLE VALVE SETTING:—When installing throttle valves, see that distance from throttle valve edge to top or bottom of upper idle port is correct as shown in following table.

Car Model	Carburetor	Idle Port Height
Chrysler	E6C1	.004-.008"①
Chrysler	E6F1	.076-.080"②
DeSoto	E6A3, A4, B1, C1	.004-.008"①
DeSoto	E6F1	.076-.080"②
Plymouth	C6A	.005-.009"②
Plymouth	C6A2	.013-.017"②
Plymouth	C6A3, A4; C6B1; B6A1, A2; B6C1, C2; B6E1	.013-.017"①
Plymouth	C6D1	.080-.084"②
Reo	303-S, 304-S, 320-S	.008-.012"③

①—To Bottom of Idle Port. ②—To Top of Idle Port.
③—Actual Idle Port Opening with throttle valve tightly closed.

PLYMOUTH SPECIAL INSTRUCTIONS:—Manufacturer advises that the Model C6A carburetor used on the first Plymouth cars can be brought up to C6A2 specifications (as used on later cars) by changing following parts. All parts listed must be changed at the same time.

	Part No.
Idle Port Restriction Plug	11B-53
Main Vent Tube and Plug Assembly	145-18S
Pump Spring	61-78
Pump Valve Cage Assembly	149-29S
Pump Piston	160-16
Pump Rod, Plate, and Rod Assembly	161-16S

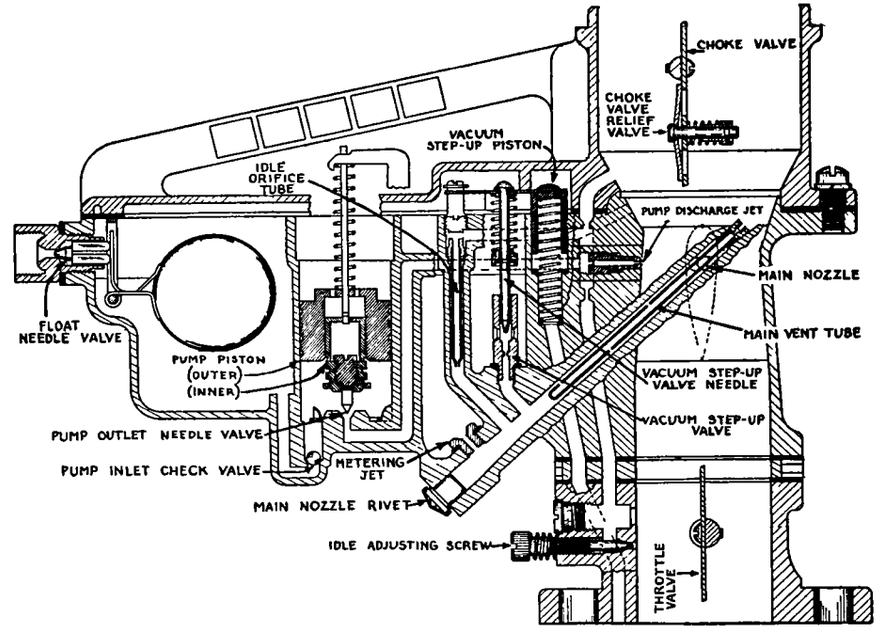
TROUBLE SHOOTING:—Poor Idling Performance—If correct adjustment cannot be secured, engine stalls, or low speed performance is unsatisfactory, take out idle hole plug and idle adjusting screw, examine ports and clean with air, take out idle passage tube and idle jet tube and clean with air.

Acceleration Unsatisfactory—Check pump setting, remove main metering jet and pump discharge jet, clean with air. Examine pump piston needle and seat assembly, replace if necessary.

High Speed Operation & Economy Unsatisfactory—Disassemble and examine Step-up valve cage assembly, see that ball-check is free and seats properly, that valve cage is screwed tight against its seat, that step-up piston is not sticking and push-rod moves freely in upper and lower guides. Check float level.

SERVICING:—To Disassemble Carburetor—Remove air horn (upper body casting) attaching screws, lift off air horn, remove step-up piston push-rod, drain carburetor, remove float lever pin and plug assembly, remove float needle valve and seat assembly, unscrew and remove step-up valve assembly and any ball-checks in carburetor bowl, remove pin spring on pump link at throttle lever, remove pump link, remove pump rod and piston assembly (pull out from above), remove pump piston assembly (inner piston, needle, plug) by inverting carburetor and catching parts as they fall out (do not drop this assembly or needle will be damaged), remove pump piston needle seat and gasket assembly being careful not to lose steel ball, remove idle orifice tube assembly, remove pump jet plug and pump jet being careful not to damage jet with screwdriver, remove main metering screw, main vent tube and plug assembly, idle adjustment screw and spring, and idle hole plug. Take out throttle valve body attaching screws, lift off main body casting, remove gasket, remove step-up piston assembly and small gasket under piston, remove power orifice jet from assembly being careful not to lose ball and spring in assembly.

Servicing—Wash all parts and body in gasoline, blow out all passages in body and dry with air. Replace all worn and damaged parts.



Reassembling Carburetor—Assemble in reverse order from disassembly instructions, use new gaskets soaking metering jet gasket and step-up jet gasket in water for 15 minutes before installing. See that all jets and plugs are tightened securely. In assembling step-up valve assembly, insert steel ball in housing first, then spring, finally screw in jet. When replacing steel ball in pump cylinder see that ball is not placed in center hole in pump cylinder. See that small inner pump piston moves freely in outer piston and install pump assembly by turning carburetor down on one side and guiding connector link in guide and piston in cylinder (do not allow inner piston to drop out of outer piston). When replacing air horn (upper body) casting see that bushing is in place in step-up vacuum passage. This bushing should be installed on all carburetors not originally equipped. Check float level and adjust carburetor on engine.

1935-36 TYPE

E6F2—CHRYSLER, AIRSTREAM SIX MODEL C6 (1935) AFTER 18,268 CARS.
DE SOTO, AIRSTREAM MODEL SF (1935) AFTER 15,846 CARS.
DE SOTO, AIRFLOW MODEL SG (1935) AFTER 4,788 CARS.
E6G1—CHRYSLER AIRSTREAM SIX, MODEL C7 (1936).
DE SOTO AIRSTREAM SIX, MODEL S1 (1936).
DE SOTO AIRFLOW SIX, MODEL S2 (1936).
C6D2—PLYMOUTH, STD. & DELUXE MODEL PJ (1935) AFTER 145,872 CARS.
C6E1—PLYMOUTH, STD. & DELUXE P1, P2 (1936) BEFORE ENG. NO. 269323.
C6E2—PLYMOUTH, STD. & DELUXE P1, P2 (1936) AFTER ENG. NO. 269323.
B6F1—PLYMOUTH, 'ECONOMY' MODELS P1, P2 (1936).
B6G1—PLYMOUTH, ECONOMY MODELS P1, P2 (1936)

NOTE:—On Plymouth models with standard carburetors (C6E1, C6E2), main metering screw was changed in production from Part No. 159-56S to No. 159-58S. Fuel economy on first cars equipped with this 159-56S (262-266cc.) jet will be improved by installing the new type 159-58S (248-252cc.) jet.

Chrysler, De Soto, Plymouth Altitude Economy. Standard vacuum step-up springs (61-118, 61-146, 61-135) when used at altitudes over 3000' will actuate step-up valve at speeds of 45-55 MPH. To correct poor gasoline mileage or economy complaints for altitude operation, install new Vacuum Step-up Spring No. 61-134 (this spring will operate vacuum step-up valve at car speeds of 66-68 MPH).

TYPE:—Plain tube downdraft type similar to previous designs except for main metering jet and Vacuum Step-up Device design as follows:

Main Metering Jet—New type tapered jet located in float bowl and controlling fuel flow through passage between bowl and nozzle channel. Jet can be removed through bowl after it has been unscrewed (fitted with hexagonal head). Jet is tapered and should not be gauged for size with wire drills. Lower end of nozzle channel (where metering screw formerly located) now closed by blank rivet.

Vacuum Step-Up Device. Vacuum cylinder now located in main body casting. Vacuum piston stem and power orifice needle valve stem connected by piston plate (see illustration). Idle orifice tube has an extension on its head which acts as a guide for the piston plate. Step-up needle valve should be seated with approximately 1/64-1/32" clearance between stem and piston plate when vacuum piston down at end of stroke (see adjustment below).

IDLING ADJUSTMENT:—Idle adjustment screw controls fuel discharge through lower idle port and should be turned in for leaner mixture or out for richer mixture. To adjust with engine warm and idling, set throttle stopscrew so that idling speed is approximately 300 R.P.M. or 6 M.P.H. Turn idling adjusting screw in or clockwise until engine begins to miss, then turn screw out slowly until

1935-36 TYPE CONT.

engine fires smoothly. Readjust throttle stopscrew to correct idling speed if necessary. See tune up instructions on car model pages. Approximate idling screw settings are as follows:

Car Model	Carburetor	Idle Screw Setting
Chrysler all models	E6F1, E6F2, E6G1	¼-1 turn open
De Soto all models	E6F1, E6F2, E6G1	¼-1 turn open
Plymouth PJ, PJ(E)	B6E1, C6D1	¼-1 turn open
Plymouth PJ, P1, P2	C6D2, C6E1, C6E2, B6F1	⅛-¾ turn open

ACCELERATING PUMP:—Delayed action type positively operated by throttle valve shaft. Fuel drawn into pump chamber past piston needle on upstroke of piston and discharged through pump jet in side of venturi on downstroke (when throttle opened for acceleration). Pump piston constructed in two sections, inner or lower piston carrying inlet valve needle, and outer or upper piston being linked to pump rod through spring. Outer piston lags behind (compressing spring) when throttle opened suddenly and subsequent piston movement when spring expands continues piston movement and draws out pump discharge.

Adjustment—Pump lever on throttle shaft provided with three holes for pump rod link engagement. Inner hole (short radius) provides minimum pump stroke and outer hole (long radius) maximum stroke. See tune-up on car model page for recommended settings and changes for seasonal requirements on each car model.

VACUUM STEP-UP (ECONOMIZER):—New design (see description above). See that needle valve is seated and that clearance between needle valve stem and piston plate is 1/64-1/32" with piston down at the end of its stroke (piston spring compressed). Adjust by bending piston plate slightly. This clearance must be maintained to insure needle valve seating and prevent fuel discharge through power orifice at low speeds or when throttle is not wide open. See that needle works freely in the guide and does not stick on its seat. Acceleration and high speed performance will be unsatisfactory if needle does not open when throttle is wide open.

PERFORMANCE & ECONOMY:—All jets are fixed (non-adjustable). Main metering screw flow-tested and rated in accordance with capacity. Do not check size with wire drills. Main metering screw can be changed to secure leaner-than-standard fuel mixture (high altitude calibration) for special fuels and operating conditions. See Carter (B & B) Jet Specification Table.

FLOAT LEVEL:—To check float level, take off float bowl cover (upper body casting), hold lip of float lever firmly against needle valve, use special gauge (see table below) to check float height (not soldered seam). To adjust, bend lip of float lever toward needle valve to lower float level, or away from needle valve to raise float level.

Car Model	Carburetor Model	Float Level	Checking Gauge
Chrysler (all)	E6F1, E6F2, E6G1	5/64"	1522-B
De Soto (all)	E6F1, E6F2, E6G1	5/64"	1522-B
Plymouth (all)	C6D2; C6E1, E2; B6F1	5/64"	1522-B

THROTTLE VALVE SETTING:—When installing throttle valves, see that distance from top edge of valve to top of upper idle port "Idle Port Height" is correct as shown in following table.

Car Model	Carburetor	Idle Port Height
Chrysler, DeSoto	E6F2, E6G1	.081-.085"
Plymouth	C6D2	.080-.084"
Plymouth	C6E1, E2; B6F1, B6G1	.085-.089"

CHOKE:—Choke valve mounted off-center and choke control connected through spring providing semi-automatic action. Poppet type relief valve mounted on choke valve to prevent over-choking.

FAST IDLE:—Throttle valve stopscrew stop-cam pivoted below throttle shaft and linked to choke lever so that throttle opened to fast idle position when choke valve in use. Linkage should not require adjustment.
NOTE—This Fast Idle not used on B6F1, B6G1 Plymouth Economy models.

TROUBLE SHOOTING:—Same as for previous models. See preceding article.

SERVICING:—Same as for previous models (see preceding article) except that entire vacuum step-up device located in main body casting and not disturbed by removal of air horn. Use care in installing step-up jet (excessive pressure will distort orifice and change fuel flow rate).

1937-39 TYPE

CHRYSLER ROYAL, MODEL C16 (1937)

E6I1—ENGINE NUMBERS C16-1001 TO 4073.
E6K1—ENGINE NUMBERS C16-4074 TO 4318.
E6K2—ENGINE NUMBERS C16-4319 TO 11151.
E6K3—ENGINE NUMBERS C16-11153 TO 23802.
E6K4—ENGINE NUMBERS C16-23803 AND UP.

DE SOTO, MODEL S3 (1937)

E6I1—ENGINE NUMBERS S3-1001 TO 3967.
E6K1—ENGINE NUMBERS S3-3968 TO 4289.
E6K2—ENGINE NUMBERS S3-4290 TO 11156.
E6K3—ENGINE NUMBERS S3-11157 TO 22087.
E6K4—ENGINE NUMBERS S3-22088 AND UP.

PLYMOUTH STANDARD & DELUXE MODELS P3, P4 (1937)

C6F1—ENGINE NUMBERS P4-1001 TO 10497.
C6F2—ENGINE NUMBERS P4-10498 TO 88610.
C6F3—ENGINE NUMBERS P4-88611 TO 96179.
C6F4—ENGINE NUMBERS P4-96180 TO 136611.
C6F5—ENGINE NUMBERS P4-136612 AND UP.
C6H1—ALL MODELS (1937)—SEE NOTE.
B6F1—ALL MODELS WITH ECONOMY ENGINE (1937)
B6G1—ALL MODELS WITH ECONOMY ENGINE (1937)—SEE NOTE.

1938 Car Models

E6M1—CHRYSLER ROYAL, MODEL C18 (1938)
DE SOTO SIX, MODEL S5 (1938)
E6L1—DE SOTO TAXICAB (1938)
C6J1—PLYMOUTH, DELUXE MODEL P6 (1938)
B6H1—PLYMOUTH, ECONOMY MODELS P5, P6 (1938)

B6K1—PLYMOUTH, P7, P8 ECONOMY MODELS (1939)
B6M1—PLYMOUTH, P7, P8 ECONOMY MODELS (1939)
BBR1-439-S—PLYMOUTH REPLACEMENT CARBURETOR—SEE NOTE.

SPECIAL NOTES (1937):—Models B6G1, C6H1. These models used only on engines where crankcase is ventilated through carburetor.

Chrysler, De Soto, Plymouth Altitude Economy. Standard vacuum step-up springs (61-118, 61-146, 61-135) when used at altitudes over 3000' will actuate step-up valve at speeds of 45-55 MPH. To correct poor gasoline mileage or economy complaints for altitude operation, install new Vacuum Step-up Spring No. 61-134 (this spring will operate vacuum step-up valve at car speeds of 66-68 MPH).

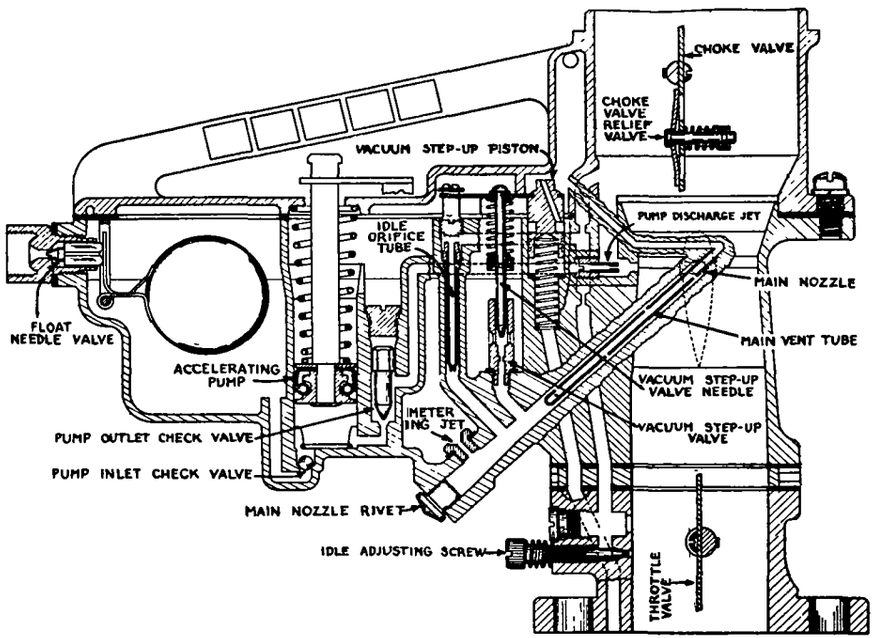
1937 Carburetor Changes:—Similar design. To bring earlier models up to performance standard of later models and to correct complaints of poor acceleration on part throttle at speeds of 10-15 M.P.H. make changes as follows:

E6K1, E6K2—Replace original Pump Check Needle 17-34 with new type 17-35 (this type has relief on stem). Replace Pump Plunger Assembly 64-40S with new type 64-41S (see installation instructions below).

C6F1, C6F2, C6F3—Replace original Pump Spring No. 61-144 with new type 61-145. Replace Pump Check Needle No. 17-34 with new type 17-35 (relieved stem). Replace Pump Plunger Assembly No. 64-40S with new type 64-41S as follows:

To Remove Pump Plunger Assembly—Remove pump operating link (throttle lever connector), pull pump plunger assembly and connector link from carburetor. Move connector link to point where plunger assembly will rotate 90° on pump plunger stem, remove plunger assembly from link. Replace pump spring with new type (Plymouth only) before connecting new plunger assembly.

Metering Jets on All Models—Main metering jets on these models have been changed to secure better performance and fuel economy. See Carter B & B Jet Specification table following for latest jet calibrations.



SPECIAL NOTES (1938):—Plymouth Econ. Models. Approximately first 25 cars shipped with wrong type gasket under carburetor flange (1A-32 gasket with four small holes used instead of 1A-33 with four slots). This gasket will cause mileage complaints. Check gasket and install correct type.

Plymouth Models—If ragged performance noted at 20-30 M.P.H. or lack of power at 10 M.P.H. with ¾ throttle opening, make certain that engine is warming up properly and that water temperature is at least 160°F. Carburetor jet calibration set for maximum mileage and engine temperature is important.

SPECIAL NOTES (1939):—Models E6N2, D6A2. Same as types used on first 1939 cars except for the following parts which are used on the later models only: Body Flange Assembly 1-264S (E6N2), 1-262S (D6A2); Throttle Shaft & Arm Assembly 3-363S (E6N2), 3-362S (D6A2); Throttle Lever Assembly 4-343S (all), Throttle Shaft Dog 4A-79 (E6N2), 4A-78 (D6A2); and new Throttle Centering Spring Washer 136-55 (all).

Model BBR1-439-S—This model replaces carburetors used on 1933-38 Plymouth cars as follows: C6A, C6A2, C6A3, C6A4, C6B1, C6D1, C6D2, C6E1, C6E2, C6F1, C6F2, C6F3, C6F4, C6F5, C6J1. Adjustment specifications for this model given below and complete jet data in Carter (B&B) Jet Specification Table.

All Models. Whenever body gasket No. 121-69 (between the main body casting and air horn and bowl cover casting) is removed for carburetor servicing, use new gasket when reassemblying. This is important to prevent air leaks at this point which will affect carburetor economy (carburetors are 'balanced' type with bowl vented through air horn).

TYPE:—Plain tube, downdraft type with throttle operated accelerating pump and vacuum operated step-up device (economizer). Similar to previous design except for Accelerating Pump, Main Vent, and Vacuum Step-up design as follows:

Accelerating Pump (Except E6I1, B6F1, G1). Delayed action type. Pump has a single piston with leather seal (similar to design used on other Carter models). Pump stem is loose on pump connector and plunger is forced down by conical spring in body above plunger. Outlet check needle is now located in pump discharge channel at side of pump cylinder (not incorporated in pump piston). Inlet ball check valve located at bottom of pump cylinder as in earlier models.

NOTE—See preceding article (1936) type) for data on accelerating pump used on B6F1, B6G1, E6I1 carburetors.

Main Vent—Main nozzle now air bled from bowl vent. Main vent tube is new design and is installed from bottom (rivet plug at lower end of nozzle under float bowl must be removed to get at vent tube). See special directions in Servicing section.

Vacuum Step-up (Economizer)—Vacuum piston chamber located in main body casting with upper end opening in bowl vent and lower end connected through channel to manifold at carburetor flange. Step-up jet or power orifice valve now needle type connected to vacuum piston plate so that needle is raised to open valve and permit fuel flow through power orifice.

1939 Models:—Float bowl is vented through balance tube cast in air horn to provide uniform fuel-air ratio regardless of air cleaner condition. The bowl cover seal is important with this type construction (see special service note above). Pump jet design has been changed slightly, a rivet is used to close the pump jet passage (instead of a screw) and spring above discharge ball check not used.

Plymouth D6A1, D6A2—Flange size has been increased to 1½". For this reason, these models not interchangeable with previous types (see BBR1-S note).

Fuel System (Idling):—Fuel taken from main nozzle well up through Idle Orifice tube (metered by restriction in tube) to cross-channel in which it is mixed with air admitted through idle air bleed opening in carburetor wall above venturi. From this point fuel mixture is taken down through channel to discharge ports at throttle edge (lower port only for closed throttle idling, both ports for low speed).

Driving Range—Fuel for main nozzle metered by main metering jet in float bowl. Main nozzle air bled by main vent tube in upper end of nozzle which connects with air vent leading to bowl vent. Lower end of nozzle closed by blank rivet.

High Speed & Wide Open Throttle Operation—Vacuum piston, which is normally at lower end of stroke with piston spring compressed, will be forced up by spring when manifold vacuum falls off, raising the step-up rod or needle and opening the valve, permitting additional fuel to flow through the power orifice (step-up jet) to the main nozzle.

IDLING ADJUSTMENT:—Idle adjusting screw controls fuel discharge through lower idle port and should be turned in for leaner mixture, out for richer mixture. Approximate idle screw settings given in table below. Adjust only with engine warmed up so that choke valve is wide open and fast idle inoperative. Idle speed controlled by throttle lever stopscrew. See car model 'T&E' page for complete carburetor tune up instructions.

Car Model	Carburetor	Idle Setting	Idle Speed
Chrysler, DeSoto	E6I1	¼-1 turn open	6 M.P.H.
DeSoto Taxicab	E6L1	½-1¼ turn open	6 M.P.H.
Chrysler, DeSoto	All Others	½-1¼ turn open	6 M.P.H.
Plymouth Econ	B6F1, H1, J1	¼-¾ turn open	6 M.P.H.
Plymouth	All Others	½-1¼ turn open	6 M.P.H.

ACCELERATING PUMP:—New type (see description above). Pump discharge jet now located in antechamber behind main venturi but discharges through hole in venturi wall directly into mixing chamber.

Adjustment—Three holes provided in throttle lever for pump connector link engagement. Inner hole provides minimum stroke, center hole medium stroke, outer hole maximum stroke. See tune up data on car model page for recommended settings.

Pump Stroke Adjustment—To check, remove air horn and float bowl cover assembly, back off throttle stopscrew so that throttle valve closes tightly, connect pump connector link in correct hole of throttle lever (see table below), install Universal Pump Stroke Gauge T109-117S on bowl so that indicator lip on gauge rests on top of pump plunger shaft. Note gauge reading, then open throttle wide and again note gauge reading. Difference between two readings is pump stroke (in sixty-fourths of an inch) and should agree with table below. To adjust, bend horizontal portion of connector link.

Car Model	Carburetor	Pump Stroke	Pump Setting
Chrysler, DeSoto	E6M1, E6L1	④ 27/64"	Medium
Chrysler, DeSoto	E6N1, E6N2	26/64"	Medium
Plymouth	C6J1	④ 25/64"	Medium
Plymouth	D6A1, D6A2	24/64"	Medium
Plymouth Econ	B6H1, J1, K1	④ 20/64"	Medium
Plymouth Rplmt	BBR1-439-S	24/64"	Medium

④—Use Gauge No. T-109-115.

PERFORMANCE:—Performance should be satisfactory if idling adjustment and accelerating pump setting correct. Main metering jet is non-adjustable type (jets are flow-tested and should not be gauged with wire drills). Leaner main metering jets available for special fuel or operating conditions such as high altitude but are not recommended for use at lower altitudes (these jets will give greater fuel economy but with some loss of power and performance).

VACUUM STEP-UP ECONOMIZER:—Consists of vacuum piston operated step-up or by-pass valve controlling fuel flow through power orifice to main nozzle. No adjustment required but setting should be checked when carburetor dismantled to insure complete closing of valve when vacuum piston held down at lower end of stroke by manifold vacuum.

Step-up Valve Setting—With vacuum piston down at bottom of stroke, clearance between piston plate and head of step-up valve needle should be 1/64-1/32" (needle is loose in plate and is spring-loaded by spring on stem under plate). Adjust by bending piston plate slightly.

Vacuum Step-Up Spring—When servicing carburetor, make certain that correct step-up spring installed as follows: No. 61-135 (E6N1, E6N2, B6K1, BBR1-439S), No. 61-146 (D6A1, D6A2), No. 61-134 (B6M1).

NOTE—No. 61-146 step-up spring used on first B6K1 & BBR1-439S carburetors.

FLOAT LEVEL:—To check float level, remove air horn (integral with float bowl cover), use special gauge No. 1522-B, placing gauge on top edge of bowl with lugs extending down toward float on either side of soldered seam. Press lip of float lever against needle valve, float should contact both lugs on gauge. Adjust by bending float lever lip slightly at point where it contacts valve needle (do not bend float arm). If gauge not used, top of float (not soldered seam) should be 5/64" plus or minus 1/64" (all models except B6M1), 5/32" plus or minus 1/64" (B6M1—do not use gauge) below top edge of bowl with needle valve seated.

Float Needle Valve & Seat. Furnished only in matched sets. Part No. 25-61S (#42 drill size intake hole) used on all 1937 models and first 1938 models. Part No. 25-82S (#44 drill size intake hole) used on later 1938 and all 1939 models except B6M1. No. 25-77S used on B6M1.

CHOKE:—Choke valve offset type. Fitted with poppet type relief valve. See article in Carburetion Equipment Section for data on Sisson Automatic Choke control.

FAST IDLE:—Consists of a throttle shaft dog (throttle stopscrew stop) pivoted below throttle shaft and linked to choke valve lever so that throttle is opened to fast idle position when choke valve closed for starting. No adjustment required.

NOTE—This Fast Idle not used on B6F1, B6G1, B6H1, B6J1, B6K1, B6M1 Plymouth Economy models.

THROTTLE VALVE SETTING:—Throttle valve setting when fully closed is shown in table below. Idle Port Height is distance from top of upper idle port (ports are keyhole type) to top of throttle valve. Vacuum Port Height is distance from top of port (ports are slotted type) to top of throttle valve. Shims furnished .002" thick (No. 2-93), .005" (No. 2-94) for throttle valve adjustment.

Car Model	Carburetor	Idle Port Height	Vacuum Port Height
Chrysler, DeSoto	E6I1; E6K1,2,3,4	.081-.085"	④ .010"
Chrysler, DeSoto	E6L1, E6M1	.088-.092"	.035-.041"
Chrysler, DeSoto	E6N1, E6N2	.088-.092"	.035-.041"
Plymouth	C6F1,2,3,4,5; C6H1	.118-.122"	④ .015"
Plymouth.	C6J1, BBR1-439-S	.118-.122"	.035-.041"
Plymouth	B6F1, B6G1	.085-.089"	
Plymouth	D6A1, D6A2	.118-.122"	④.003-.009"
Plymouth	B6H1, J1, K1, M1	.096-.100"	.035-.041"

④—From lower edge of port to top edge of throttle valve

SERVICING:—Disassembly. Disconnect fast idle rod, take out air horn attaching screws, lift off air horn and float bowl cover (upper casting). Take out float pin spring and pin, lift out float, remove float needle valve. Disconnect pump connector link at throttle lever, push out pump plunger assembly. Take out vacuum step-up piston assembly (piston, plate, and step-up valve needle). Remove step-up jet being extremely careful not to distort jet which may change power orifice jet size. Remove idle orifice tube. Remove main metering jet. Main vent tube cannot be taken out unless blank rivet at lower end of main nozzle is first removed.

Servicing. Wash all parts except cork gaskets in gasoline. Blow out all jets and channels in body casting with compressed air. Replace all worn or damaged parts.

Assembly. Use new gaskets. Reverse disassembly directions above. Use extreme care when tightening step-up jet not to use excessive pressure which may distort power orifice jet size. Check vacuum step-up setting (see Economizer section above), check float level, adjust carburetor when installed on engine.

Main Nozzle Servicing:—Use tool No. T-109-42 to remove rivet at lower end of main nozzle, No. T-109-70 to install new rivet after installing new Vent Tube (vent tube must be removed and installed from lower end of nozzle).

Balance Tube—When servicing carburetor make certain that balance tube in air horn is open and clean. Always use new gasket between body casting and air horn to insure air tight joint at bowl cover. Any air leak at bowl cover will upset 'balance' feature and affect fuel economy.

Vacuum Step-up Passage—Passage opens on carburetor mounting flange and special gasket (with slots which register with this vacuum passage hole) must be used when installing carburetor on manifold. Shutting off of this vacuum passage hole will cause excessive fuel consumption.

TROUBLE SHOOTING:—Poor Idling Performance. Remove idle adjusting screw and idle hole plug, remove Idle Orifice Tube, blow out tube and channels in body with compressed air. If carburetor loads up, check float level.

Acceleration Unsatisfactory. Remove pump jet and clean with compressed air, or replace jet. Disassemble pump and check for damaged or worn plunger leather, sediment or corrosion in cylinder, clogged inlet ball check valve. Use care in installing pump plunger not to damage plunger leather. Check step-up jet needle to see that it is clean and straight and moves freely in guide. Bent needle or one with eccentric point will stick on seat and will not open at wide open throttle.

Excessive Richness or Poor Gas Mileage. Check Vacuum step-up setting and see that needle seats in valve to prevent fuel flow through power orifice at part-throttle. Excessive richness at speeds above 50 M.P.H. may be caused by clogged main vent tube.

‡ 248-252cc. No. 159-75S (244-248cc) and 159-56S (262-266cc) used on first cars.

‡‡ No. 145-18S used on Models B6A1 and B6C1.

(A) Cars without Crankcase Ventilator.

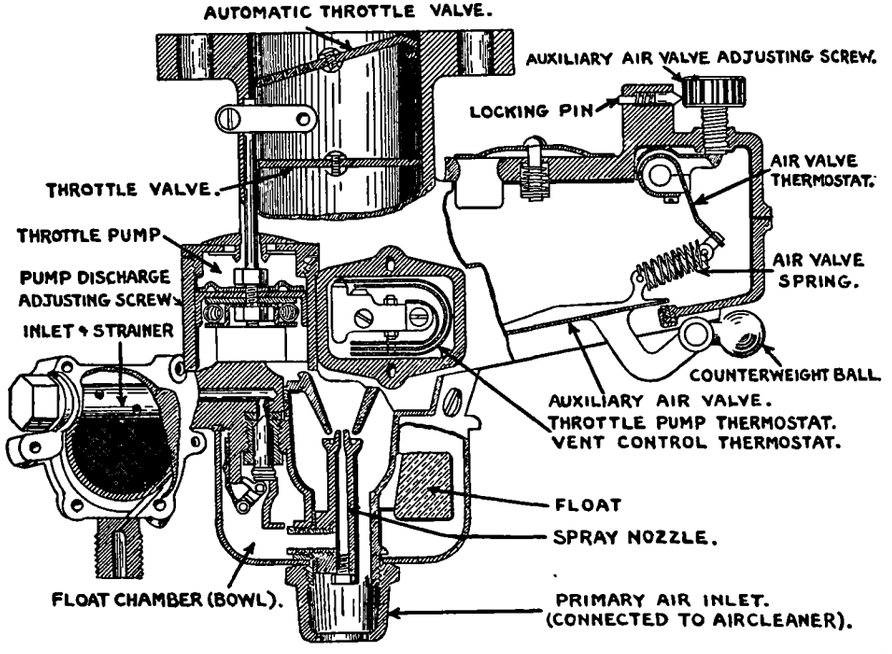
(B) Cars with Crankcase Ventilator.

(C) Cars without Governor.

(D) Cars with Governor.

§ 149-56S on first cars.

* 145-17 on first cars.



NOTE:—C6H1 and B6G1 used only on Plymouth cars where crankcase ventilated through carburetor.

CADILLAC V8, SERIES 355 (1931), 355B (1932), 355C (1933).
LA SALLE V8, SERIES 345 (1931), 345B (1932), 345C (1933).

TYPE:—Air valve updraft type with positively operated pneumatic accelerating pump (throttle pump). All fuel is metered by spray nozzle located in center of primary air passage. Auxiliary air valve in air horn is controlled by air valve spring and thermostat and is adjustable.

1932-33 Type. Air cleaner added with main air intake elbow bolted over air valve and a smaller elbow leads from the main air intake to the primary intake at the bottom of the bowl. Auxiliary air valve adjustment screw is located on top of carburetor body in same position as before.

PRELIMINARY ADJUSTMENT:—Check choke control linkage to see that choke lever on carburetor is against stop when choke control button is pulled all the way out. With carburetor fully choked see that free movement of air valve tip is 1/16-3/32" at room temperatures (65-80°F.). If this requires adjustment, take out air valve cover screws, lift cover slightly and unhook air valve spring (if air valve spring is stretched or distorted it must be replaced), remove cover, loosen two screws on bracket carrying thermostatic arm, turn shaft slightly and tighten screws, replace air valve spring.

AIR VALVE ADJUSTMENT:—With engine warm and idling at approximately 300 R.P.M. turn adjusting screw to right or clockwise until engine speed decreases or engine begins to roll, then turn screw to left or counter-clockwise until speed decreases or engine begins to miss. Correct setting should be midway between these points. Setting can be determined accurately by counting the number of notches on the adjusting screw between extreme rich and extreme lean positions and then turning screw back one-half this number of notches. With air intake elbow removed setting can be checked by pressing lightly up and down on air valve counterweight. If setting is correct, engine speed should decrease slightly in each case. If engine speed increases when counterweight is pressed up, setting is too lean. If engine speed decreases when counterweight is pressed up and increases when counterweight is pressed down, setting is too rich. In making the air valve adjustment the adjusting screw should be turned one or two notches at a time and the engine performance noted.

THROTTLE PUMP:—Throttle pump discharges air in pump chamber into float chamber when throttle is opened, increasing the pressure above the gasoline and causing an increased fuel discharge from the spray nozzle. Throttle pump thermostat opens at 74-78°F., providing a vent for part of the pump discharge and decreasing the float bowl pressure. A second thermostat controlling a float chamber vent is set to open at 125-130°F. (or 115-120°F. with high-test gasoline. Thermostats should not require adjustment.

Adjustment:—Throttle pump adjusting screw (by-pass needle valve) on side of pump cylinder should be turned down against its seat for normal operating conditions. For hot weather operation or with high test gasoline, adjusting screw can be backed off 2-3 turns. To make this adjustment loosen lock nut and turn adjusting screw counter-clockwise. Adjusting screw must be turned seven full turns to completely open by-pass valve.

AUTOMATIC THROTTLE:—Carburetors are fitted with an automatic (spring loaded) throttle valve above the regular throttle valve. Automatic throttle should not require adjustment and a special tool or testing spring must be used to check setting. With carburetor off the engine and held horizontally with the test tool clipped to the edge of the automatic throttle valve, the weight of the tool should be sufficient to open throttle to within 1/32" of the stop pin. If it does not and throttle shaft is free, loosen the two screws on the spring housing at the end of the throttle shaft and turn the center adjusting screw clockwise to increase spring tension or counter-clockwise to decrease spring tension. Tighten locking screws and check setting.

FLOAT LEVEL:—Float level should be 7/16-15/32" above flange on central tube of carburetor body. To check float level with carburetor off engine, remove float bowl, invert carburetor, take off gasket on float bowl seat, measure distance from bottom of float (bottom when not inverted) to top edge of flange on central tube of carburetor body (float bowl seat). This distance should be 7/16-15/32". Correct float level by bending hinge bracket.

CHOKE:—Adjust choke linkage so that choke lever on carburetor is against stop when choke button on instrument panel is pulled all the way out.

CADILLAC V-12, MODEL 370 (1930-31).
CADILLAC V-16, MODEL 452 (1930-31).

TYPE:—Twin installation consisting of two carburetors of the same design as used on V-8 model (see previous article). One carburetor is used to supply fuel for each bank of cylinders. Carburetors must be equalized as well as adjusted in order to assure smooth running.

NOTE:—Throttle pump on these carburetors has been changed slightly and throttle pump thermostat is mounted on the pump body under a flat cover. Thermostat is set to operate at 75-80°F.

PRELIMINARY ADJUSTMENT:—Same as for V8 type (see preceding article). Idle speed should be set for 320 RPM. and can be checked by taking off oil filler cap and noting rocker arm which should move 40 times in 15 seconds at 320 R.P.M.

AIR VALVE ADJUSTMENT:—With engine warm and idling at 320 R.P.M. adjust air valve on each carburetor by turning adjusting screw to right or clockwise until engine speed decreases or engine begins to roll, then turn screw to left or counter-clockwise until speed decreases or engine begins to miss. Final setting should be midway between these points.

EQUALIZING ADJUSTMENT:—Use special Cadillac Equalizing Gauge, Part No. 109626. Gauge consists of a 'U' tube partly filled with mercury and with a rubber tube connected to each leg of the tube. These tubes should be connected to the intake manifolds after the vacuum lines on the manifolds have been disconnected. Gauge should be hung on one of the radiator tie rods so that it hangs vertically with the mercury level in the tubes even when the engine is not running. With the gauge in place, disconnect the throttle rod on the right hand carburetor, idle engine at 320 R.P.M. and note mercury level in tubes. If engine speed is exactly 320 R.P.M. (rocker arm will move 40 times in 15 seconds) and mercury levels are even, the carburetor adjustment is correct. If mercury levels are even but engine speed is greater than 320 R.P.M., turn both throttle stop screws out evenly. If mercury levels are not equal and engine idles too fast, back off the throttle stop screw on the carburetor feeding the bank on which the mercury level is lower. If mercury levels are not even and engine speed is too slow, turn up throttle stop screw on carburetor feeding bank on which mercury level is higher. Continue adjustment until mercury levels are even and engine speed is exactly 320 R.P.M.

Check air valve setting by turning adjusting screw clockwise until engine slows down from a too rich mixture, then turn screw counter-clockwise, counting the notches on the adjusting screw until engine slows down from a too lean mixture, then turn screw back exactly one-half this number of notches. Recheck idling speed and mercury level in gauge. Adjust length of right hand throttle rod so that it can be connected without disturbing position of carburetor throttle valve, connect rod. Open throttle and run engine at 1000 R.P.M. Check mercury levels in gauge. If columns are not equal, readjust right hand carburetor throttle rod slightly. Close throttle and idle engine. Check mercury levels and readjust if necessary.

Ford Part No. 78-9510—Marked '94'

Ford Part No. 86H-9510-A2—Marked 'LZ'
AA-1-121-2—LINCOLN-ZEPHYR MODEL 96-H (1939)

NOTE:—Stromberg Model EE-7/8 and EE-1 used on some Ford '60' (1939) and '85' (1938) cars. See Stromberg carburetor article for data on these types.

TYPE:—Dual or double barrel, plain tube, downdraft type with throttle operated accelerating pump and vacuum controlled economizer (power jet).

Fuel System (Idling):—Fuel for idling taken from main jet well up through Idle Tube (which meters the fuel) to cross-passage in main nozzle bar where it is mixed with air admitted through Idle Air Bleed drilled passage in top of nozzle bar. Fuel mixture flows from this cross-passage down through channel to idle ports at throttle edge. For closed throttle idling, all fuel discharged through lower idle port (below throttle) and controlled by Idle Adjusting Needle. As soon as throttle is opened, additional fuel is discharged through upper idle port also. Independent idle system used for each carburetor barrel.

Driving Range—At intermediate speeds, fuel metered by metering jet at lower end of main jet well flows through cross-passage in main nozzle bar to antechamber at center where it is mixed with air admitted through air bleed opening in side of cross-channel and through Nozzle Air Bleed Plug which is screwed in top of nozzle bar. Fuel mixture is then discharged through main nozzle opening below nozzle bar into throat of venturi.

High Speed & Wide Open Throttle Operation—At high speed or whenever throttle opened sufficiently so that vacuum decreases, economizer valve spring opens economizer valve allowing additional fuel to flow directly from float bowl to main jet well (by-passes metering jet). This fuel metered by economizer restriction which is small drilled passage at well end of economizer fuel channel.

IDLE ADJUSTMENT:—Idle adjusting needle or screw for each carburetor barrel controls fuel discharge from lower idling port. Screws should be turned in for leaner mixture or out for richer mixture and should be adjusted equally. Setting should be approximately ⅞ turn open from inner seated position. Idle speed controlled by throttle lever stopscrew and should be set for 6-7 M.P.H. idling speed. See tune up data on car model page for complete adjusting directions on car.

METERING JETS:—Main metering jets are non-adjustable type located in float bowl and accessible by removing plug on side of float bowl opposite each jet. Jets should be changed only to compensate for special operating conditions such as high altitude. See Chandler-Groves Jet Specification table for standard and leaner jet data.

ECONOMIZER:—Consists of a spring-loaded, vacuum diaphragm controlled, by-pass valve assembly screwed in lower face of main body casting so that valve extends into float bowl (diaphragm assembly fits in recess in throttle valve body casting and vacuum passage in casting connects diaphragm chamber with carburetor barrel below throttle valve). Vacuum economizer set at factory to open when vacuum decreases to 8½-9" of HG. (corresponding to engine speed of 3800 R.P.M.). No adjustment provided.

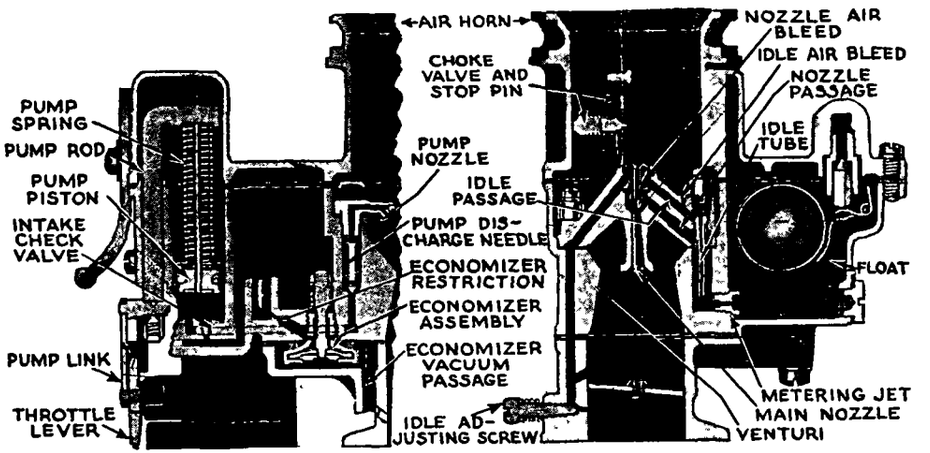
ACCELERATING PUMP:—Pump cylinder and piston located in float bowl, operated by inverted 'L' shaped pump rod linked to throttle lever. Fuel is drawn into pump cylinder through inlet ball check valve at lower end when throttle is closed and is discharged through outlet check valve and pump discharge nozzle when throttle opened for acceleration (nozzle is located at upper edge of venturis and has two discharge holes so that fuel is discharged equally into each carburetor barrel). Pump piston connection to pump rod is through a driving spring on the piston stem which prevents loading up engine when throttle opened suddenly and also prolongs pump discharge (spring compressed at beginning of piston travel, expands at end of travel).

Capacity—As shown in table below in cc. per 10 strokes. Throttle lever stop-screw must be backed off to allow throttle to close completely and pump link must be connected in center hole.

Car Model	Carburetor	Pump Capacity
Ford '38	AA-1-120-1	14-18 cc.
Ford '39, Mercury	AA-1-120-2	9-13 cc.
Lincoln-Zephyr	AA-1-121-1, AA-1-121-2	14-18 cc.

Adjustment—Three holes provided in throttle lever for pump link connection. Upper hole (short radius) provides minimum stroke, lower hole (long radius) maximum stroke. Center hole is normal setting. See tune up data on car model page for recommended settings.

NOTE—Pump link locked in lower end of pump rod by spring-loaded snap lock. Pull link shaft out of pump rod to disengage lock.



FLOAT LEVEL:—Fuel Level. Should be 21/32-23/32" (Ford '38-39, Mercury, Lincoln-Zephyr '39), 19/32-21/32" (Lincoln-Zephyr '38) below top edge of bowl with 3 lbs. pressure (engine idling). If glass tube type gauge used to check fuel level, be sure to allow for capillary attraction in tube.

Float Level. To check float level with air horn and bowl cover and float assembly removed, invert cover, measure distance from flanged face (gasket seat) on bowl cover to bottom of float (not soldered seam). Should be 1⅜-1 11/32" (Ford '38-39, Mercury, Lincoln-Zephyr '39), 1 5/16-1 9/32" (Lincoln-Zephyr '38). Correct by bending both float arms equally.

Float Needle Valve & Seat—Part No. 18R-2A. Replace as matched set.

CHOKE:—Offset type with poppet type relief valve to prevent over-choking.

THROTTLE-KICKER (STARTING):—Consists of a spring loaded lever pivoted on side of carburetor casting so as to contact cam on choke lever at upper end and throttle lever at lower end (through throttle stopscrew which is mounted on this starting lever). Lever is rotated by choke lever cam when choke valve

closed for starting and opens throttle to starting position. No adjustment required.

TROUBLE SHOOTING:—Poor Idling Performance. Make certain that entire engine tuned up, check idle setting. If idle is lean, check for air leaks at manifold, check gaskets between carburetor throttle valve body and bowl casting. Remove idle adjusting needle and Idle Tubes, blow out channels with air, clean idle tubes with air. If idle is rich, check Vacuum Economizer valve, see that valve is seating properly, and that diaphragm is not leaking. Check gasket between throttle valve body and bowl casting (vacuum chamber must be airtight).

Poor Running Performance. Check carburetor body gaskets, see that all carburetor body bolts are tight. Check metering jets for size. Blow out metering jet channel and main nozzle channels with compressed air. Check fuel level.

Poor Acceleration Performance. Check pump cylinder and channels for dirt which will prevent check-valves seating. See that piston leather is in good condition, check piston driving spring. To dismantle pump for cleaning (with air horn casting off carburetor), disconnect pump link, remove pump rod and piston assembly, inlet ball retaining spring and ball, discharge nozzle, and outlet check needle. Blow out all channels with compressed air. If pump is working properly, a fine, solid, steady stream should be discharged from each nozzle port at instant throttle is snapped open.

Poor High Speed Performance. Check engine compression, breaker contacts and gap, spark plug gaps first. Check vacuum economizer valve, remove economizer and blow out economizer channels and restrictions with compressed air. Check fuel level and float travel. Check fuel pump pressure.

Poor Economy or Gasoline Mileage. Check all parts of car which may cause this complaint (engine, valves, dragging brakes, etc.). Check fuel level and fuel pump pressure. Check metering jets for size. Manufacturer does not recommend use of leaner metering jets to secure fuel economy.

Code Mark MODEL—AOC-2

1-AA, 1-AB, 1-AC, 1-AD—PACKARD SIX, MODEL 115C (1937)

1-MA, 1-MB—PACKARD SIX, EXPORT MODELS 115C (1937)

1-BA—PACKARD SIX, MODEL 1600 (1938)—BEFORE APRIL 1, 1938

MODEL—A-2

A-2-3—PLYMOUTH, COMMERCIAL MODEL PT-50 (1937)

PLYMOUTH, STANDARD MODEL P3 (1937)—AFTER MARCH 10, 1937

Code mark identification is stamped on spacer above idle adjusting screw (AOC-2), on venturi (A-2).

NOTE:—Model AOC-2 (Packard) fitted with built-in Automatic Choke. See article on Chandler-Groves Automatic Choke in Carburetion Equipment Section for complete adjustment instructions. Both models fitted with Fast Idles.

Plymouth. Economy models fitted with Carter (B&B) Carburetors. See Carter (B&B) Carburetor article for data on these types.

PACKARD CHANGES:—On cars before Eng. No. 5735, insufficient float travel caused by float stop being too high may lower top speed or cause running out of gasoline at high speeds. To correct this complaint, file a slot ¼" wide and 3/64" deep, 3/32" from the end of the left hand float support arm as viewed from needle valve end of float assembly. Service floats designed to correct this trouble available on even-exchange basis under Part No. 16R-72A. This trouble should not be experienced on cars after Engine No. 5735.

Models marked 1AA or 1AB (On Venturi). These models can be brought up to 1-AC standards (see below for later 1-AD) by removing and discarding the Part No. 23R-19 Pump Discharge Needle valve and installing new Upper Pump Discharge Needle (23R-1), Lower Pump Discharge Needle (23R-2), and Pump Discharge Needle Spring (23R-7) in its place; and also removing and discarding the Part No. 37R-235 Pump Discharge Retainer Stud and installing the new Pump Discharge Needle Stud (37R-2). A new Pump Piston and Plunger Assembly (30R-5A) is available which replaces all of the following parts: Pump Piston (30R-172), Pump Piston Plunger (32R-158, 7R-155), Pump Piston Plunger Spring (38R-173). The new main body and plug assembly (6R-17A) as used on the later 1-AC type carburetor may be installed on 1-AA and 1-AB carburetors, if desired, providing the new type Idling Tube (14R-38-3) is installed in place of the original type (14R-38). To bring these 1-AA and 1-AB carburetors up to later 1-AD standards after all changes listed above have been made, follow same procedure as given below for modernizing 1-AC types.

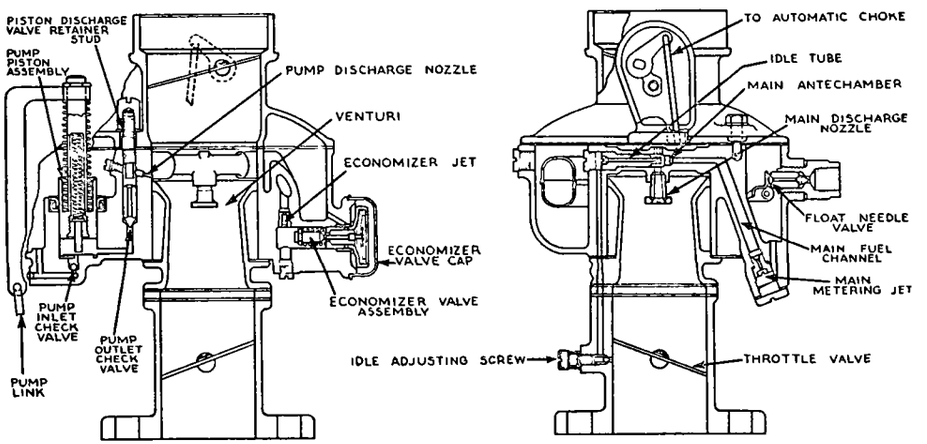
Model 1-AC. To bring this type up to later 1-AD standards, remove original metering jet and install new .058" jet (22R-1). Remove and discard original air horn gasket and install new vented type gasket (8R-16). Drill a ¼" extra air vent in air horn 1 15/16" to left of center air horn attaching screw and 15/16" up from lower flange (carburetor viewed from side with throttle lever to left and automatic choke assembly to right). Remove original throttle body to float chamber gaskets and install 3 new No. 8R-15 gaskets without spacer.

Models 1-AD, 1-BA. These models identical except for float chamber vent in air horn. Air horns are interchangeable and later (1-BA) type only stocked for service.

TYPE:—Plain tube, downdraft type with throttle operated accelerating pump and vacuum controlled economizer. Float bowl is concentric, entirely surrounding carburetor body. Float consists of two curved sections on opposite side of float bowl and linked together by float lever with float needle valve midway between them.

Fuel System (Idling):—Fuel for idling taken from main antechamber above main discharge nozzle through idling tube in end of antechamber and then down through channel to idling ports opposite throttle. The idling tube meters this fuel. For closed throttle idling, fuel is discharged through the lower idle port below the throttle valve and is controlled by the idle adjusting screw. Upper idle port (above the throttle valve) serves as an air bleed. As soon as the throttle is cracked open for low speed running, additional fuel is discharged through this upper port also.

Driving Range:—At intermediate speeds, the fuel in the antechamber is discharged through the main discharge nozzle located directly below the antechamber. This fuel is metered by the main metering jet located in the antechamber fuel channel from the float bowl. Jet is accessible by removing the large plug under the float bowl. Air bleed holes are drilled in top of antechamber wall.



High Speed & Wide Open Throttle Operation:—When the throttle is wide open, the drop in vacuum allows the economizer valve spring to open the valve allowing additional fuel to flow into the antechamber fuel channel above the main metering jet. This fuel is metered by the economizer jet located in the vertical channel leading to the main fuel channel. Jet is accessible by taking out plug in main body casting at lower end of economizer channel.

IDLE ADJUSTMENT:—Idle adjusting screw controls fuel discharge from lower idling port. Screw should be turned in for leaner mixture and out for richer mixture. Idle speed controlled by throttle lever stopscrew. Adjustments should be made only when engine warmed up so that choke valve is wide open and fast idle inoperative. See tune up data on car model page for complete adjustment directions on car.

METERING JET:—Main metering jet is non-adjustable fixed type. Jets should be changed only to compensate for special operating conditions such as high altitudes (5% and 10% leaner metering jets are available). See Jet Specification Table below for standard jet calibrations.

ECONOMIZER:—Consists of a spring loaded, vacuum diaphragm controlled bypass valve assembly located under a small round cap on the side of the carburetor body casting. No adjustment required. Set at factory to open with 4-6" vacuum in manifold. Cover forms vacuum chamber and must be kept tight.

ACCELERATING PUMP:—Fuel is drawn into pump chamber through inlet ball check valve on the upstroke of the piston and is discharged through the outlet check valve and the pump discharge nozzle at the upper end of the venturi on the downstroke of the piston when the throttle is opened. Pump rod connection to pump piston is through a driving spring on the piston stem. This permits prompt delivery of the accelerating charge but the spring is opposed by the plunger spring within the piston stem, which is compressed when the pump plunger contacts the bottom of the pump well, so that the accelerating charge is prolonged.

Capacity—As shown in table below in cc. per 10 strokes. Throttle lever stopscrew must be backed off to allow throttle to close completely when pump capacity is being checked.

Car Model	Carburetor	Pump Capacity
Packard Six 115C	1-AA, 1-AB, 1-AC, 1-AD	9-11 cc.
Packard Six Export	1-MA, 1-MB	8-10 cc.
Packard Six 1600	1-BA	9-11 cc.
Plymouth P3, PT-50	A-2-3	11-14 cc.

Adjustment—Three holes provided in throttle lever for pump rod link connection. Center hole is normal setting. Inner hole (short radius) provides minimum stroke and outer hole (long radius) maximum pump stroke. See tune up data on car model page for recommended settings.

FLOAT LEVEL:—Fuel level in float bowl set at 17/32" below top edge (gasket seat) of bowl with gasket removed. With this setting, top of float at free end should be 5/32" below top edge of bowl with float needle valve closed. Float level can be corrected by bending float lever at needle valve slightly.

NOTE—See instructions above (Packard Changes) to correct insufficient float travel on first cars.

CHOKE:—Choke valve is offset on shaft. Model A-2 fitted with poppet-type relief valve. No relief valve used on Model AOC-2.

FAST IDLE:—Model A-2. Consists of a throttle lever stopscrew stop cam which is linked to the choke valve so that the rotation of the cam when the choke valve is closed for cold starting opens the throttle to the fast idle position. No adjustment required.

Model AOC-2. Consists of a throttle lever stopscrew stop cam mounted on the automatic choke thermostatic coil floating shaft so that the cam tends to rotate, opening the throttle to the fast idle position, when the engine is cold (throttle must be opened momentarily to permit thermostatic coil to close choke valve and rotate fast idle cam). See article on Automatic Choke in Carburetion Equipment Section.

THROTTLE VALVE SETTING:—Model AOC-2. Throttle valve should be flush with the #60 drill size idle discharge holes when completely closed and should cover one-third of the #50 drill size vacuum spark control hole.

Model A-2. Throttle valve should be flush with the #60 drill size idle discharge ports and should be .005" below the #60 vacuum spark control hole when completely closed.

TROUBLE SHOOTING:—Over-choking or Flooding. Throttle should be opened once only to place fast idle and automatic choke in operation. Repeated operation of the throttle will cause accelerating pump to flood carburetor. To correct flooded carburetor, open throttle wide (throttle lever will open choke valve halfway). If flooding continues, check choke valve and linkage for binding, check automatic choke setting and thermostatic spring coil action, check vacuum piston.

Engine continues to fast-idle when warm. See that vacuum piston is free and vacuum passage to carburetor barrel is open, check small spring on floating shaft and lever assembly which causes fast idle cam to follow as choke valve opens, check thermostatic spring coil setting, see that heat passage to thermostat is open and that correct gasket used between thermostat assembly and carburetor body. Check action of manifold heat control thermostat.

Poor Idling Performance. Take out idle discharge plug and idling tube, blow out tube and idling passages with compressed air. If idle setting is rich and cannot be cut down, check vacuum economizer valve, see that valve is seated properly, diaphragm is not leaking, and that cover is tight. Do not disassemble valve as this will destroy factory setting.

Poor Running Performance. Remove metering jet plug and metering jet, check metering jet size, blow out main metering channel and main discharge channel with compressed air. Check fuel level (see note above to correct faulty high speed performance due to insufficient float travel on first cars). Check vacuum economizer valve. Take out economizer jet plug, blow out jet and fuel channel with compressed air.

Poor Acceleration Performance. Check pump setting (see recommended settings in tune up data on car model page). Examine pump inlet ball check valve and outlet check valve, blow out pump passages with compressed air, run wire drill or wire not to exceed #70 size through pump discharge jet passage in body. Be careful not to damage pump piston seal assembly when working on pump (this must be installed at the factory or a new carburetor body installed).

Code Mark **MODEL—AOC-25**

119-1, 119-3, 119-4—PACKARD SIX, MODEL 1600 (LATE 1938) SEE NOTE.

119-4A, 119-5—PACKARD SIX, MODEL 1700 (1939)

MODEL—A-25

A-25—PLYMOUTH, STANDARD MODEL P-5, COMMERC'L MODEL PT-57 ('38)

Code mark identification is stamped on carburetor directly above idle adjusting screw (AOC-25), on venturi (A-25).

PACKARD CHANGES:—These carburetors used after approximately April 1, 1938. First type (119-1) should be brought up to later (119-3) standards as directed below to correct complaints of running out of fuel at high speed after engine has warmed up. Later type (119-4) has new design main body casting (Part No. 24R-51) and separate Economizer Jet (No. 24R-51, Size .045"). This new main body casting need not be installed on earlier 119-1 and 119-3 carburetors.

119-1 Carburetor Changes to correct Running out of Fuel at High Speed Complaints:—Remove original No. 18R-266A Float Needle & Seat Assembly and replace with new type No. 18R-5A which has a .104" orifice. Remove and discard original No. 33R-13A pump link and install new longer type No. 33R-282A link which is marked with figure '1' on face. Connect this pump link in center hole on throttle lever.

TYPE:—Plain tube, downdraft type similar in design to the 'AOC-2' carburetors used on previous Packard models except for new metering jet location and nozzle design as follows:

Metering Jet location—Jet installed in wall between float bowl and fuel channel to nozzle. Accessible by removing plug on side of float bowl (see illustration).

Nozzle Design—Vertical fuel channel (from main metering jet and economizer jet) closed by plug at upper end. Idle tube is pressed in cross-channel above nozzle (antechamber) and end of channel is closed by plug. Economizer jet is screwed in bottom of economizer recess under economizer assembly (119-4 and later types).

Accelerating Pump—New type with single driving spring (inner spring not used). Outlet check valve design is new with return vent to bowl above valve controlled by a separate ball check valve.

IDLING ADJUSTMENT:—Adjust only with engine warm so that Automatic Choke and Fast Idle inoperative (choke valve wide open, throttle stopscrew resting on lowest step of fast idle cam). Set throttle lever stopscrew for correct 5 MPH. idling speed. Turn idle adjusting screw in for leaner mixture, out for richer mixture (this screw controls fuel discharge through lower idle discharge port). Recheck idling speed adjustment. See car model tune up page for complete adjustment instructions.

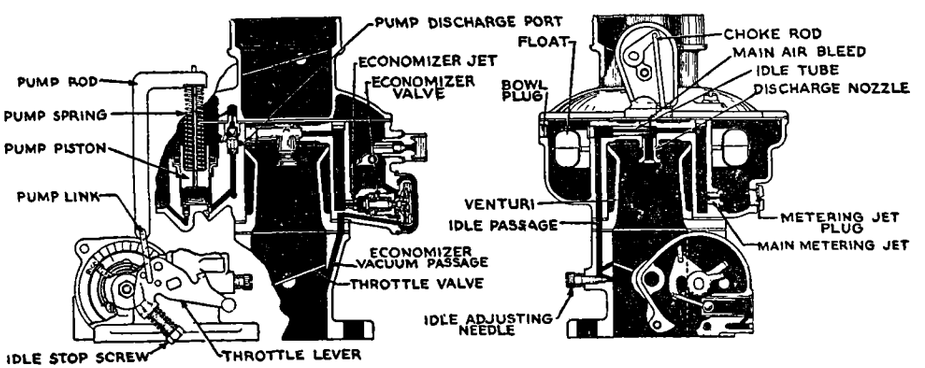
METERING JET:—Main metering jet is non-adjustable type located in float bowl and accessible from outside by removing plug on side of bowl. Jets should be changed only for special operating conditions such as high altitudes (5% and 10% lean jets available). See Chandler-Groves Jet Specification Table for data.

ECONOMIZER:—Consists of a spring-loaded vacuum diaphragm controlled by-pass valve assembly located under a small round cap on the side of the carburetor casting. Set at factory to open with 4-6" (Packard), 8¼" (Plymouth) of vacuum in manifold. No adjustment provided. See that cover over vacuum unit is tight.

ACCELERATING PUMP:—Fuel is drawn into pump cylinder through inlet check valve on upstroke of piston and is discharged through outlet check valve and discharge port located in carburetor wall at top of edge of venturi on the downstroke of the piston when the throttle is opened for acceleration. Pump piston is spring loaded by spring on piston rod below pump rod connection. A return vent to the float bowl is located at the upper end of the pump discharge channel (above the outlet check valve) and is controlled by a separate ball check valve.
Capacity—As shown in table below in cc. per 10 strokes (throttle lever stopscrew must be backed off to allow throttle to close completely when pump is checked) with pump rod link connected as indicated.

Car Model	Carburetor	Pump Capacity	Pump Setting
Packard 1600	119-1, 3	9-11 cc	Outer Hole
Packard 1600	119-4	12-16 cc	Center Hole
Packard 1700	119-4A, 5	14-18 cc	Center Hole
Plymouth P5, PT57	A-25	12-15 cc	Center Hole

Adjustment—Three holes provided in throttle lever for pump rod link connection. Center hole (medium stroke) is normal connection. Outer hole (long radius —maximum stroke) provides maximum pump discharge, inner hole (short radius—minimum stroke) minimum discharge. See car model tune up page for recommended settings and seasonal changes.



FAST IDLE:—**Packard.** Stepped fast idle cam mounted on the automatic choke lever shaft and serving as a stop for the throttle lever stopscrew. No adjustment required. See article on Chandler-Groves Automatic Choke and Fast Idle in Carburetion Equipment Section for complete servicing directions.

Plymouth. Consists of a fast idle lever linked to the choke valve lever and serving as a stop for the throttle lever stopscrew. This lever is rotated when choke valve closed for cold starting so that throttle valve is opened to fast idle position. No adjustment required.

FLOAT LEVEL:—**Fuel Level**—Should be 17/32" below top edge of float bowl (gasket seat) with engine idling and fuel pump pressure of 2 lbs.
Float Level—Tops of floats at free ends should be 3/16" below gasket surface of float bowl with float needle valve closed. Adjust by bending float arms. Make certain that both floats are uniform (bend both arms equally).

Needle Valve & Seat—No. 18R-5A (Packard—see note below for 119-1 type), No. 18R-4A (Plymouth). Furnished only in matched sets. Do not use excessive pressure when installing assembly.

Packard Note—This 18R-5A should be installed on 119-1 carburetors to replace original 18R-266A to correct complaints of running out of fuel at high speed.

CHOKE:—**Packard Models.** Chandler-Groves automatic type mounted integrally on carburetor. See article in Carburetion Equipment Section for servicing data.
Service Note—On cars with Overdrive, long side of choke valve must clear carburetor air horn by .005" with valve fully closed.

Choke Setting—Reference mark on thermostat plate should be lined up with punchmark on housing. To adjust, loosen screw and shift thermostat plate. Setting may be varied 5 graduations for better warming up performance.

CHOKE:—**Plymouth.** Offset butterfly type with poppet type relief valve to prevent over-choking. See article in Carburetion Equipment Section on Sisson Automatic choke (when used).

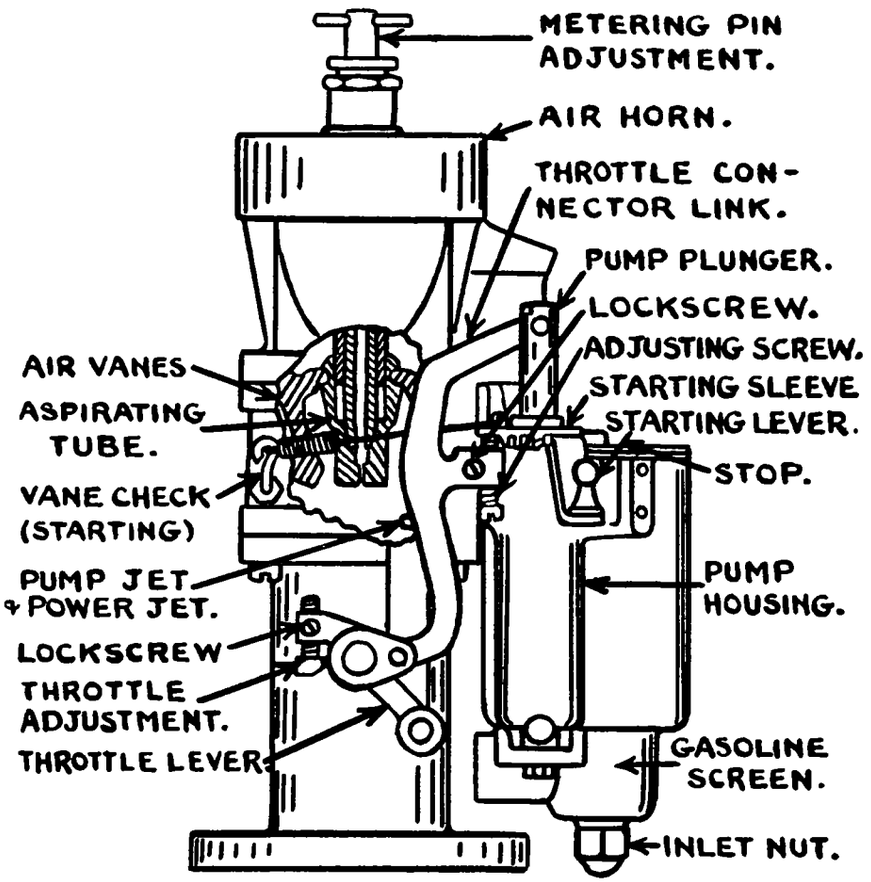
THROTTLE VALVE SETTING:—**Model AOC-25.** Throttle valve should be flush with the two #60 idle discharge ports when completely closed and should cover 1/3 of the #50 vacuum spark control port.

Model A-25. Throttle valve should be flush with the #60 idle discharge port and should be .005" below the #60 vacuum spark control port when fully closed.

FORD NO. 18-9510—FORD V-8, MODEL 18 (1932).

40-9510—FORD, MODEL V-8-112 (1933).

TYPE:—Expanding air valve downdraft type. Two hinged air valves or vanes located in air intake in upper body of carburetor engage a spring loaded aspirating tube so that aspirating tube is lowered as vanes open. Aspirating tube is attached to fuel metering orifice tube so that orifice is withdrawn from metering pin and fuel supply automatically increased as vanes open to admit more air. Fuel is automatically and correctly proportioned to air for all positions of throttle valve. The choke lever on the carburetor rotates the starting sleeve (conventional choke valve is not used), causing ports in the sleeve to line up with passages in the carburetor body and holding the air vanes closed (through a spring-operated lever). With carburetor fully choked the starting sleeve opens a passage in the carburetor wall terminating in a port below the edge of the throttle so that fuel is drawn from the float chamber through the pump cylinder and the hollow stem of the fuel pump and discharged through this priming port. The throttle button on the dash must be kept closed when the engine is started (kicker rod on lever connecting throttle and pump will open throttle slightly—see adjustment below). Accelerating pump and power jet are built in this 'auxiliary unit'. Metering pin adjustment and kicker rod clearance (for starting) are the only points requiring adjustment.



IDLE ADJUSTMENT:—If carburetor is completely out of adjustment, make a preliminary setting of metering pin by turning pin down until air vanes just begin to open and then back off exactly 5 (Model 18) or 3½ (V-8-112) full turns. Metering pin is at top of carburetor under air cleaner and air cleaner must be removed in order to make adjustments. Warm up engine thoroughly, see that all manifold connections are tight and that there are no air leaks. Adjust idle throttle plate adjusting screw until engine runs at approximately 5 M.P.H. with throttle button closed (loosen lock screw before turning adjusting screw). Then turn down metering pin (to right or clockwise) until engine speed decreases or engine begins to miss, indicating that mixture is too lean, then back off metering pin (turn to left or counter-clockwise) until engine fires smoothly. This adjustment should be made slowly allowing at least 30 seconds at each setting to note engine performance. Metering pin operates on fuel mixture and should be turned in for leaner mixture and out for richer mixture.

THROTTLE PLATE STARTING POSITION (KICKER ROD ADJUSTMENT:—This setting does not change in service and should not require adjustment unless carburetor has been tampered with. To check adjustment with carburetor off the engine, insert .020" feeler between throttle valve and carburetor wall on side opposite priming port, loosen lock screw and adjust choke cam adjusting screw so that throttle plate is in correct position to secure this .020" throttle opening with choke lever all the way to the rear and starting sleeve lug against the stop on the float bowl cover.

ACCELERATING PUMP:—When the throttle is opened quickly the down stroke of the accelerating pump plunger and piston forces gasoline from the chamber below the piston up through the hollow stem of the pump plunger and out through the discharge nozzle into the carburetor barrel directly below the lower end of the aspirating tube. This provides the extra fuel needed for quick acceleration. Accelerating pump is not adjustable and does not require attention.

POWER JET:—At speeds above 65 M.P.H. or when the throttle is held open, additional fuel is drawn up through the hollow stem of the accelerating pump plunger and discharged through the power jet. Power jet is controlled by the position of the accelerating pump plunger and is air vented through the upper holes in the plunger at partial throttle so that no fuel is drawn through the jet.

FLOAT LEVEL:—Fuel level in float bowl should be 1 3/16" (plus or minus 1/16") below the top edge of the float bowl. Float level should not require adjustment and if fuel level indicates that float assembly has been tampered with this should be corrected by installing new parts rather than changing settings.

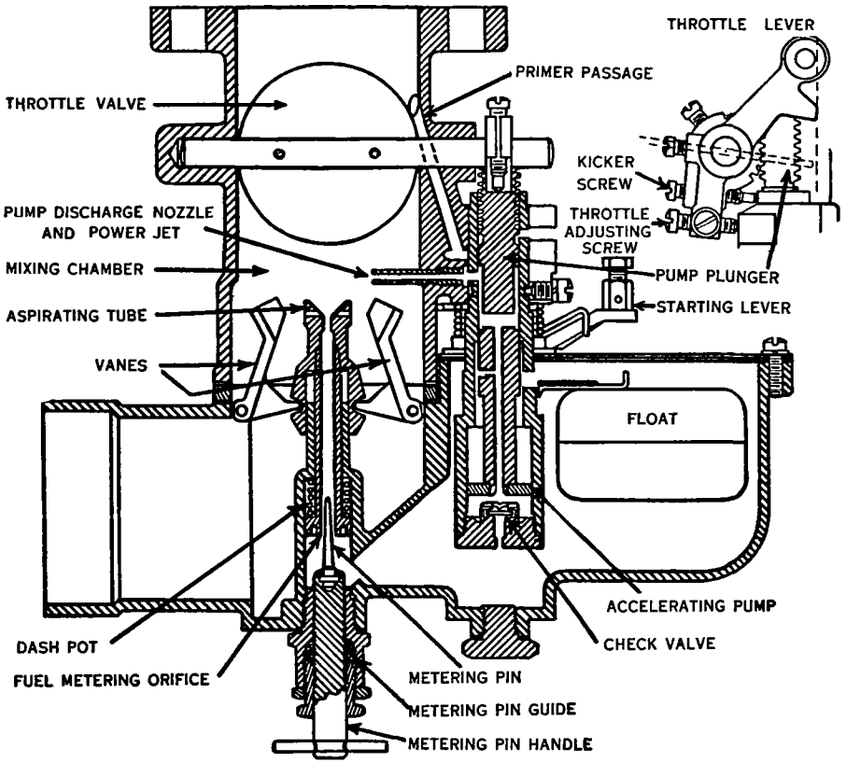
HIGH COMPRESSION ENGINES:—Metering pin specifications have been changed to improve high speed performance on the new Model V-8-112 with higher compression aluminum head. The size of the accelerating pump has also been increased from ⅝ to 11/16" diameter of pump piston. When high compression aluminum heads are installed on the previous Model 18 the accelerating pump need not be changed unless this improved acceleration performance is desired but the metering pin must be changed to the new type, Part No. 18-9525-AR.

Metering Pin Specifications

Carburetor	Standard Metering Pin	High Altitude Metering Pin
18-9510	18-9525-AR	18-9525-BR
40-9510	40-9525	18-9525-AR

GRAHAM SIX, MODEL 58 (1932).
GRAHAM BLUE STREAK EIGHT, MODEL 57 (1932).
GRAHAM SIX, MODEL 65 (1933).
GRAHAM EIGHT, MODELS 64, 57-A (1933).
PACKARD, MODELS 8-26, 33, 40, 45 (1931).
PACKARD LIGHT EIGHT, MODEL 900 (1932).
PACKARD STANDARD EIGHT, MODELS 901, 902 (1932).
PACKARD DE LUXE EIGHT, MODELS 903, 904 (1932).

TYPE:—Expanding air valve updraft type with auxiliary unit consisting of starting device or priming jet, accelerating pump, and power jet. Main metering unit consists of two hinged air valves or vanes which engage an aspirating tube so that aspirating tube is raised as vanes open. Aspirating tube is attached to a spring loaded metering orifice tube so that orifice is withdrawn from metering pin and fuel supply automatically increased as vanes open to admit more air. Fuel is automatically and correctly proportioned to air for all positions of the throttle valve.



When carburetor is choked for starting, choke lever on carburetor rotates starting sleeve (pump housing) holding the main air vanes closed through a spring operated lever and lining up passages in the upper end of the pump housing and carburetor body so that fuel is drawn up through the hollow stem of the accelerating pump and discharged through a priming port above the throttle valve directly into the mixing chamber. Throttle valve must be kept closed when engine is started (kicker-rod on throttle lever will open throttle correct amount for starting—see adjustment below). Metering pin adjustment and kicker-rod clearance (for starting) are the only points requiring attention.

METERING PIN ADJUSTMENT:—Metering pin should not be adjusted until engine has been thoroughly warmed up. With engine warm and running, close throttle and adjust throttle lever stop screw until engine idles at approximately 5-6 M.P.H. Turn metering pin under carburetor up or clockwise until engine speed decreases and engine begins to miss, then turn metering pin down or counter-clockwise until engine fires smoothly. This adjustment should be made slowly so that metering pin will not be turned beyond the point where smooth running is secured. Metering pin operates on fuel mixture and should be turned in to secure leaner mixture and out for richer mixture. This is the only mixture adjustment on the carburetor.

KICKER ROD (STARTING) ADJUSTMENT:—This setting does not change in service and should not require adjustment unless carburetor has been tampered with. Clearance between kicker rod screw (directly above throttle stop screw) and milled flat on pump housing should be .020-.025" with throttle closed and choke in running position (choke control button pushed in). The kicker rod screw opens the throttle slightly when carburetor is choked for starting.

ACCELERATING PUMP:—Accelerating pump piston is operated by the throttle valve through a gear-and-rack engagement or directly by a lever on the throttle shaft. When the throttle is opened the downstroke of the accelerating pump plunger and piston forces fuel from the well below the piston up through the hollow stem of the plunger and through the discharge nozzle or power jet into the carburetor mixing chamber. This provides the extra fuel required for acceleration. Accelerating pump is not adjustable. If acceleration performance is not satisfactory or if 'flat' spots are experienced, check valve assembly at lower end of accelerating pump should be removed and cleaned.

POWER JET:—Power jet is controlled by position of accelerating pump plunger. With throttle less than one-half open, power jet is air vented through holes in the pump housing and carburetor body so that no fuel is discharged through the jet. From half open position up to wide open throttle this upper air vent is closed by the pump plunger and fuel is drawn up from the accelerating well and discharged through the power jet. Fuel flow is controlled by a lower air bleed hole in the pump plunger. All fuel for accelerating pump and power jet is metered by the jet in the check valve assembly. Power jet is not adjustable.

FLOAT LEVEL:—Fuel level in float chamber is 13/16-15/16" below the top of the float chamber. Carburetor is not sensitive to fuel level and should not require adjustment. If fuel level indicates that float level has been tampered with, this should be corrected by replacing such parts as are necessary to secure correct fuel level.

CHOKE CONTROL:—Adjust choke linkage so that starting sleeve is rotated until choke lever on carburetor is against stop screw on float chamber cover when choke control button on instrument panel is pulled all the way out. This is very important in order to line up priming port passages properly for starting. The conventional choke valve is not used.

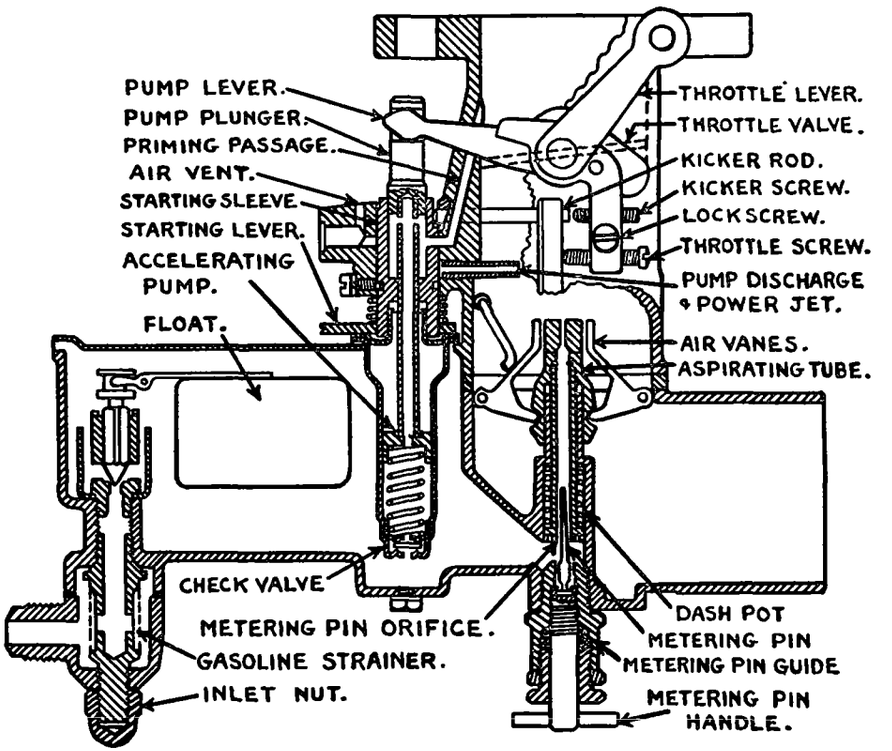
X-8244—CADILLAC V8, MODEL 355-D, SERIES 10, 20, 30 (1934-35).
MOD. 51—CADILLAC V12, MODEL 370-B ('32), 370-C ('33), 370-D ('34-35).
CADILLAC V12, SERIES 80, 85 (1936). SERIES 37-85 (1937).—
CADILLAC V16, MODEL 452-B ('32), 452-C ('33), 452-D ('34-35).
CADILLAC V16, SERIES 90 (1936). SERIES 37-90 (1937).

NOTE:—The V-12 and V-16 cars are equipped with two carburetors each. One carburetor is used for each cylinder bank. Carburetors must be equalized as well as adjusted in order to assure smooth running. Complete adjustment procedure given below should be followed closely. One carburetor only used on V8 model and equalizing instructions not necessary for this model.

TYPE:—Expanding air valve updraft type with auxiliary unit consisting of starting device or priming jet, accelerating pump and power jet. Main metering unit consists of two hinged air valves or vanes which engage an aspirating tube so that aspirating tube is raised as vanes open. Aspirating tube is attached to a spring-loaded metering orifice tube so that orifice is withdrawn from metering pin and fuel supply automatically increased as vanes open to admit more air. Fuel is automatically and correctly proportioned to air for all positions of the throttle valve.

When carburetor is choked for starting, choke lever on carburetor rotates starting sleeve (pump housing) holding the main air vanes closed through a spring-operated lever and lining up passages in the upper end of the pump housing and carburetor body so that fuel is drawn up through the hollow stem of the accelerating pump and discharges through a priming port above the throttle valve directly into the mixing chamber. Throttle valve must be kept closed when engine is started (kicker rod on throttle lever will open throttle correct amount for starting—see adjustment below). Metering pin adjustment and kicker rod clearance (for starting) are the only points requiring attention.

NOTE—Automatic choke must be made inoperative by blocking choke arm in 'off' or down position while making adjustments as lifting the hood may lower temperature sufficiently to cause slight choke action and prevent correct setting being secured.



PRELIMINARY ADJUSTMENT:—See that starting sleeve on carburetor is rotated so that choke lever is against stop on float chamber cover when choke control button on instrument panel is pulled out. This is important in order to line up priming port passages in pump housing and carburetor body for starting. If carburetors are completely out of adjustment, turn metering pin up until it just seats in aspirating tube orifice and then back metering pin off exactly 2¾ turns (V8), 3½ turns (V12, V16 '32-33 models), 4 turns (V12, V16 '34-37 models). Run engine until thoroughly warmed up close throttle, check idling speed. If speed not 320 R.P.M., adjust as follows:

IDLING ADJUSTMENT:—Idling speed is controlled by throttle lever stop screw. With carburetor off the engine, adjustment can be checked by using a feeler gauge to check distance between edge of throttle valve and carburetor wall. Turn stopscrew until this clearance is .004" (feeler not more than ⅛" wide). with throttle closed. To adjust on the engine, turn stop screw until engine speed is 320 R.P.M. This can be checked on the V-12 and V-16 models by removing oil filler cap on valve cover on one cylinder bank and noting rocker arm movement. Rocker arm should move 40 times in 15 seconds with engine running at 320 R.P.M.

METERING PIN (IDLING) ADJUSTMENT:—Metering pin of each carburetor should be adjusted by turning pin up or clockwise until engine begins to miss or speed decreases and then turning pin down or counter-clockwise until engine fires smoothly. This adjustment should be made slowly so that point of smoothest running is accurately determined. Final setting should be not more than ¼ turn past this point (slightly rich setting which will avoid any possibility of 'popping' back). Release automatic choke arm. Standard metering pins are listed in table below (optional metering pins not supplied).

Car Model	Metering Pin Size
V8 (all models)	#14
V12 (all models)	#12
V16 (all models)	#14

EQUALIZING CARBURETORS:—Using Gauge—Use equalizing gauge consisting of a 'U' tube partly filled with mercury which should be hung vertically on one of the radiator brace rods and connected to each intake manifold. A piece of rubber tubing is connected to each leg of the 'U' tube and special fittings can be secured so that the other end of the tubing can be connected to the vacuum fittings on the manifold after the brake booster and windshield wiper lines have been disconnected. Disconnect right hand carburetor throttle rod. With equalizing gauge in place, idle engine and note mercury level in tube. If mercury level is at same height in both legs of the tube, and engine idles at 320 R.P.M. (check rocker arm to see that it operates 40 times in 15 seconds), carburetors are correctly equalized. If mercury level is even and engine idles too fast, back off throttle stop screw in each carburetor an equal amount until correct speed is secured. If mercury levels are not equal and engine idles too fast, back off the throttle stop screw on the carburetor feeding the bank on which the mercury level is lower. If mercury levels are not equal and engine speed is too slow, turn up the throttle stop screw on the carburetor feeding the bank on which the mercury level is higher. With correct adjustment engine should idle at exactly 320 R.P.M. and mercury level should be equal in both tubes. Adjust right hand carburetor throttle rod so that it can be connected without disturbing position of throttle valve, connect rod, open throttle so that engine speed is 1000 R.P.M., check mercury levels, adjust by changing right hand carburetor throttle rod slightly. Recheck mercury level at idling speed.

Equalizing—Without Gauge:—If gauge not available, disconnect coil wire for right hand block, idle engine on left hand block cylinders, adjust metering pin for left hand carburetor (see above), set throttle stopscrew so that engine just turns over without stalling. Connect coil wire, disconnect wire for left hand block, repeat adjustment for right hand carburetor. Idle engine on all cylinders, check idling speed.

KICKER ROD (STARTING) ADJUSTMENT:—With carburetor off engine and choke in open position, check clearance between edge of throttle valve and carburetor wall (throttle must be closed). Adjust by turning kicker screw in in or out until clearance (measured by feeler gauge) is .017" (V8), .005-.010" (V12, V16 '32-33 models), .013" (V12, V16 '34-37 models).

FLOAT LEVEL:—Fuel level in float chamber should be 13/16-15/16" below top edge of float chamber. Carburetor is not sensitive to fuel level and should not require adjustment. Replace parts to correct float level.

AUTOMATIC CHOKE:—All models are fitted with a semi-automatic choke which is designed to control choke during the warming up period. Manual choke control should be used in the usual manner to start a cold engine but should be pushed in immediately when the engine starts. See complete article on operation and checking of Automatic Choke.

NOTE:—On all carburetors built after April 1936, a new type Main Nozzle, Float Needle Valve, Float Bowl Vent, and Accelerating Pump Lever mechanism has been used as follows:

Main Nozzle. New nozzle is capped over at outlet end and has three discharge holes which should point downward when nozzle is in place. This nozzle opens into a straight tube instead of an auxiliary venturi. Float level must be 5/8" for this new nozzle. Old and new type nozzles are not interchangeable and must be used in carburetors designed for them.

Float Needle Valve. New type needle valve is 1/8" longer and seat is deeper than old type. Interchangeable as an assembly with old type float valve and seat. Be sure that float level set at 9/16" for old type nozzle or 5/8" for new type nozzle.

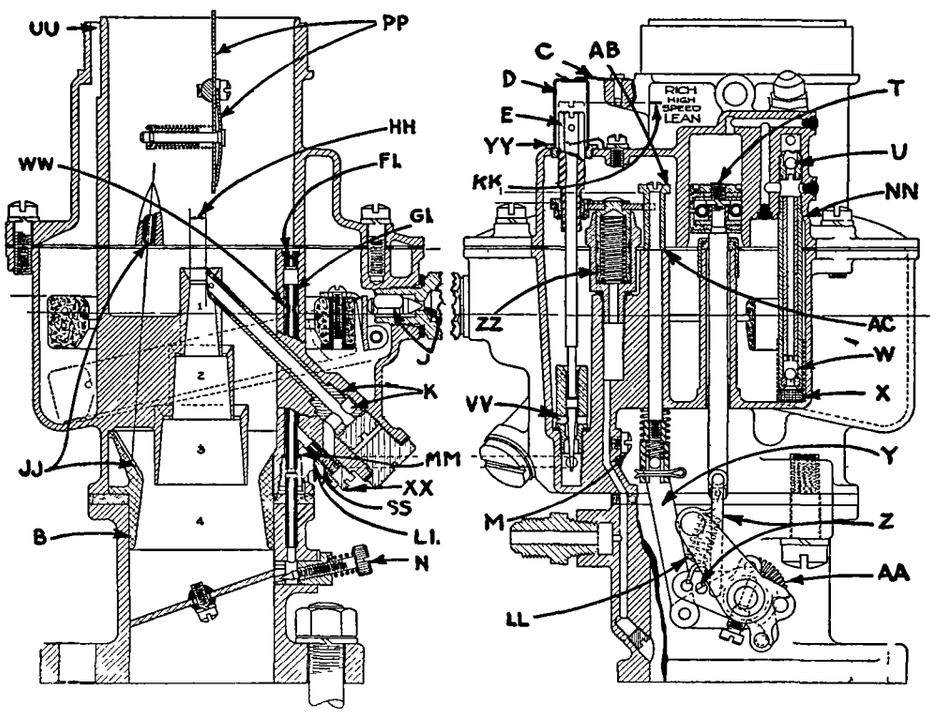
Float Bowl Vent. Pitot tube type opening into air horn at upper end and open to atmosphere at lower end beside float bowl. For extremely dusty operating conditions, lower end of tube may be closed off by using plug not to exceed 1/4" in length unless engine runs lean with plug in place. Plug length must not exceed 1/4" or vent to bowl will be cut off.

Accelerating Pump. New piston and stem assembly Part No. 42-21602. Has spring assembled above piston. Interchangeable with old assembly. When installing new type pump, piston must be held up in pump cylinder against piston spring pressure while upper body is being assembled on float body to prevent spring forcing piston out of cylinder and damaging piston leathers (always use loading tool when installing piston to avoid damage to leathers).

Accelerating Pump Lever Assembly. Part No. 173-22272. Provides a heavy initial pump discharge which tapers off toward close. May be used to replace old assembly with either old or new type pump piston assembly. Use new pump link. See accelerating pump adjustment below for adjustment instructions.

TYPE:—Plain tube, downdraft type with throttle operated accelerating pump and vacuum controlled economizer (metering pin and jet). Venturi system is four-driving-range type consisting of main venturi in carburetor body and triple auxiliary venturi assembly extending upward from main venturi throat. Main nozzle discharges into throat of smallest venturi. Float bowl is circular and entirely surrounds carburetor body with circular float hinged at point directly below float needle valve seat.

Fuel System (First Type Idling System):—Fuel taken from main nozzle well through coil-spring type filter 'SS' and idle feed plug (metering jet) 'L1' into chamber surrounding idle tube 'G1.' From this chamber the fuel is drawn upward and enters the tube through the small hole at the upper end where it is mixed with air admitted through idle air bleed plug 'F1.' From this point the fuel mixture flows down through the idle tube to the discharge ports at the throttle edge. For closed throttle idling, fuel mixture is discharged through lower port and is controlled by idle adjusting screw 'N.' Upper idle ports above throttle serve as additional air bleeds. When the throttle is opened for low speed running, additional fuel is discharged through these ports also.



(New Type Idling System):—New type idling tube is open at upper end and feed hole has been discontinued (first type tube was tight ft in body at top and bottom and feed hole served as auxiliary metering device; when new type tube used all metering is done by idle feed plug). Idle tube now has restriction 'WW' at upper end. New type idle air bleed plug which is screwed in vertical hole in body also used (first type tipped toward barrel). Old type idle tubes should be replaced by new type and idle feed plug changed at the same time (furnished as a unit).

Driving Range:—Fuel for main nozzle 'K' flows through metering orifice 'VV' and is metered by metering pin 'E.' Metering pin is controlled by vacuum piston 'ZZ' and will be held down in the orifice, providing maximum economy, at speeds below 60 M.P.H. except when throttle is opened for acceleration. Whenever the throttle is opened suddenly, the drop in vacuum allows the spring to force the vacuum piston upward, lifting the metering pin, and allowing a greater fuel flow to the nozzle.

Power Range:—At speeds above approximately 60 M.P.H. or whenever the manifold vacuum drops to 5" or less, the spring within the vacuum piston forces the piston up to the limit of its stroke (shown as 'RR') until the metering pin arm strikes the power plunger stop 'AB.' This raises the metering pin in the orifice and permits maximum fuel flow to the nozzle. On some models the power plunger is connected to the throttle lever by the link 'Y' so that the plunger is raised to increase the vacuum piston stroke when the throttle is opened wide for maximum power. See Power Setting section below for vacuum piston stroke adjustment.

IDLING ADJUSTMENT:—Warm up engine before making adjustments. With engine hot and idling with throttle closed and manual spark control retarded, adjust throttle stopscrew so that idling speed is not less than 5-6 M.P.H. Turn idle adjusting screw 'N' out until engine begins to roll (too rich), then turn screw in until engine begins to miss or die (too lean), finally turn screw out approximately 1/4 turn so that engine fires smoothly. Readjust throttle stopscrew for correct idling speed.
NOTE—Final setting of idle adjusting screw should be 1/2 - 1 1/2 turns open from the inner seated position.

HIGH SPEED ADJUSTMENT:—All models fitted with high speed (metering pin) adjustment and factory setting should be followed. To check setting (engine must not be running), slide spring 'C' to one side and remove dust cap 'D.' Top of metering pin should be even with line 'KK' on air horn and metering pin slot should be in line with punch marks on float bowl cover (not shown).

Metering pin setting can be varied slightly to improve car performance but must not be turned as much as one turn from factory setting. Turn metering pin in (clockwise) for leaner mixture or out (counter-clockwise) for richer mixture. Metering pin is kept from turning in service by spring tension on guide washer 'YY.'

VACUUM ECONOMIZER:—No adjustment required. To check vacuum economizer action with engine idling and dust cap 'D' removed, snap throttle open approximately one-fourth. Metering pin 'E' will immediately rise to top of travel. Action should be fast and metering pin should not stick. Replace dust cap. See Power Setting Adjustment below.

POWER SETTING ADJUSTMENT:—Full power mixture determined by height of power plunger sleeve below stop 'AB' which controls vacuum piston stroke 'RR.' To change factory setting (shown in table below), add shims at lower end of plunger sleeve (point 'AC') for longer piston travel and richer power mixture, or reduce length of sleeve at this same point for shorter travel and leaner power mixture. On standard 1 1/4" and 1 1/2" carburetors with 1 9/32" venturi and #6 metering pin (marked by six rings on rod), minimum metering pin travel should be .050" (#55 drill approximately) and maximum travel must never exceed .106" (#36 drill). Minimum travel provides power mixture slightly richer than range mixture (power mixture must never be leaner than range mixture). Maximum travel provides standard full power mixture.

Throttle Control type. When throttle control of the power plunger is used, metering pin travel 'RR' is relatively short and additional travel is provided near the wide open throttle position by the lifting of the plunger. With this type control, power mixture setting is changed in same manner as directed above and same limit applies to maximum travel (.106").

ACCELERATING PUMP:—Pump piston 'T' is inverted and linked to throttle lever by link 'Z.' Fuel is drawn through screen 'X,' inlet ball check valve 'W' and tube 'NN' into pump chamber on the downstroke of the piston and is discharged through outlet ball check valve 'U' and pump discharge jet 'CC' into groove 'JJ' in main venturi on the upstroke of the piston when the throttle is opened for acceleration. Accelerating charge is determined by pump link setting, and rate of delivery controlled by pump discharge jet.

Adjustment (First Type). Connect pump link 'Z' in inner hole of throttle lever (as shown) for minimum charge, or in center hole for greater charge. Wear take-up spring 'LL' must always be connected in outer hole. Check spring action to see that last ⅛" of pump lever travel before throttle closes, opens spring coils. If spring tension is greater (coil open sooner), carburetor will not return to idle uniformly or excessive accelerator pedal spring tension will be required. If spring has less tension, play in linkage will not be taken up and pump action will be sluggish.

Adjustment (Later Type). See that entire pump mechanism operates freely without sticking and that pump piston spring returns piston to lower end of stroke so that pump link moves outward away from throttle shaft until it is stopped by the stopscrew in the lever when the throttle is closed. This stopscrew is normally assembled in the middle hole providing medium initial pump discharge. Move stopscrew to inner hole (nearer throttle shaft) for less pump discharge or to outer hole for greater pump discharge.

Discharge Jet Setting—Pump discharge jet stream must strike groove 'JJ' in main venturi 'B.' Check by sighting down barrel with air cleaner removed while operating pump. To correct stream aim, remove cap at upper end of jet, mark top of jet on side toward which tip must be bent to correct stream, remove jet, bend slightly at point about ¼" above tip being careful not to deform tip, replace jet and check action. See that gasket is in place under cap and that cap is tightened securely to prevent leaking at this point.

NOTE—Special loading tool must be used to install pump piston in cylinder and pump should not be dismantled except when necessary. When carburetor is being dismantled, disconnect pump link and spring so that pump piston and stem can be lifted off with the top assembly. See instructions in servicing section for pump piston installation.

FLOAT LEVEL:—Top of float at free end 'A' should be 9/16" (all carburetors with old type Nozzle), ⅝" (carburetors with new Nozzle—see note above) below top edge or gasket seat of bowl with float needle valve seated. To check float level, see that valve seat is tight in body (hold with wrench while tightening), and press lever against valve stem. To correct float height, bend float lever. Do not press or pull up on float as this will break float lever joint.

CHOKE:—Offset type fitted with poppet type relief valve. Throttle lever stopscrew stop lever linked to choke valve so that lever is tilted and opens throttle slightly when choke valve closed for cold starting. No adjustment required.

VACUUM SPARK CONTROL & GOVERNOR:—Connections provided on some models for vacuum spark control line connection. See table below for size of vacuum control hole in carburetor wall 'AD' and portion of hole not covered by throttle valve when in closed position 'AE.'

Connection for vacuum line around governor (necessary for vacuum economizer operation when governor installed) provided on all models. When governor installed, vacuum line should be connected between manifold and connector 'P' on carburetor, blank plug at 'P' should be removed, and plug installed at 'S' (as shown) to block off passage below throttle.

SERVICING:—Use special screwdrivers ground to fit the idle feed plug, idle tube, idle air bleed plug, main nozzle plug, accelerating pump outlet check valve, and metering pin orifice when removing and replacing these parts to avoid damage or burrs which will restrict fuel flow or metering pin travel.

Idle Feed Plug Spring. Spring compression with plug tight is designed to form fuel passage between coils small enough to trap all dirt. Plug 'XX' below the spring should extend 1/32" out from body casting when in tight for correct spring compression. Shellac should be used on plug threads but not on the inner end of the plug.

Idle Tube. First type idle tube crimped at upper end so that tight connection made in casting at upper and lower end when tube pulled up tight against gasket 'MM.' Check these joints when assembling this type tube. Leaks will cause rich idle mixture.

Main Nozzle. To remove nozzle after taking out nozzle plug, drive tapered punch or drift into lower end of nozzle lightly, pull nozzle out. When installing nozzle see that longer point is upward and that correct gasket is installed in body so that nozzle clearance 'HH' in venturi is correct (first type only).

Vacuum Economizer. Fiber gasket in suction cylinder below piston acts as stop for piston travel. This gasket must be in place when piston is installed.

Accelerating Pump. Piston assembly consists of two leathers (cupped in opposite directions), expanding spring and spacing washers. To dismantle assembly, insert ⅛" rod or drill in link hole to hold stem, use Model R metering pin wrench to unscrew top washer. Replace parts in same order (see illustration). If new leathers used, install extra spacing washer under lockwasher. Clearance between pump leathers when compressed to cylinder diameter must be 1/64 - 3/64". Check by installing one pump loading tool on each leather, cupping leathers toward each other. This loading tool, Part 112-11752, must be used to install pump piston in cylinder to avoid incorrect positioning of the leathers which will interfere with pump action.

Pump Check Valves. Inlet check valve assembly is screwed into upper carburetor casting and must be tight. Use shellac sparingly on last few threads only. Outlet check valve must be screwed tightly in casting. Use extreme care to keep all dirt out of pump chamber and check valve assembly.

TROUBLE SHOOTING:—Idle Lean. Idle feed plug too small, idle air bleed plug too large, idle tube hole (first type) too small, idle feed plug spring compression too great, idle passages clogged, or air leak at joint between body castings. To clean passages, take out idle adjusting screw 'N' and blow out channel with compressed air, or disassemble carburetor and blow out all passages and jets. See that two special 1/16" gaskets used between throttle barrel casting and bowl casting and that this joint tight to prevent air leaks.

NOTE—If idle adjusting screw must be set leaner than standard for satisfactory idle and mixture is too lean at the 'Off-idle' point (just before main nozzle comes in), do not correct this condition by a richer metering pin (high speed) adjustment but change the idle air bleed plug to a smaller (#54 or 55 drill) size.

Idle Rich. Idle feed plug too large, idle air bleed plug too small, idle tube (first type) hole too large or tube loose in casting at upper end.

Range and Power Performance Lean. Incorrect metering pin setting, spacer gasket left out of vacuum piston cylinder or vacuum piston stroke too short, metering pin orifice burred or clogged, main nozzle fuel channels clogged. Blow out all fuel channels and examine air cleaner to see that dirt or charred felt has not dropped into float bowl through vent (bowl is vented into air cleaner around air horn).

Range and Power Performance Rich. Metering pin setting incorrect, vacuum piston stroke too great, metering pin orifice lose in casting, float level incorrect.

Model Number	Venturi	Metering Pin Number First	Metering Pin Number Later	Power Plunger Assembly	Idle Air Bleed Plug Old Style Size	Idle Air Bleed Plug Old Style No.	Idle Air Bleed Plug New Style Size	Idle Air Bleed Plug New Style No.	Metering Pin 'RR' Spacing (Drill Size)

NOTE—Metering pin numbers were changed on July 25, 1936. Numbers given above as 'First' type apply prior to this date, and 'Later' type subsequently.

(†) These models fitted with throttle operated power plunger (Link 'Y') which provides .078" (#47 drill) additional travel.

Model	Flange Size	For Use On:
F Standard	1¼"	Chevrolet 1932-39, Plymouth 1933-38 etc.
F Oversize	1¼"	Dodge, Pontiac, Oldsmobile etc.
G	1½"	Dodge, Plymouth 1939, DeSoto, etc.

TYPE:—Mechanical air valve, single barrel, downdraft type. Air valve (above venturi, similar to choke valve in conventional plain tube carburetor—see illustration) is linked to throttle valve by spring-loaded connector so that both valves open and close together. This action results in a higher suction in the mixing chamber at all speeds and throttle openings so that satisfactory atomization of the fuel is secured with a single jet or main nozzle (separate idling system, power jets, etc. not used). Spring-loaded feature of air valve connector link provides slight richening action (drop in vacuum will allow spring to close air valve slightly) for warming up and part throttle acceleration. With warm engine and constant throttle opening, spring is collapsed so that air valve and throttle valve operate together mechanically.

Fuel System:—All fuel for main nozzle is metered by a variable-slot type metering pin operated mechanically by the throttle valve (pin linked to throttle valve and lifted in well as throttle is opened so that deeper section of slot permits greater fuel flow through channel to nozzle). Nozzle bar (controlled by 'Altitude Adjustment' screw) has two discharge openings and is normally set for richest or maximum discharge with openings horizontal in venturi. Turning the nozzle bar tends to lessen flow from one of the openings and leans the mixture (see Altitude Adjustment below). All fuel is discharged through these main nozzle bar openings.

IDLING ADJUSTMENT:—Idle speed controlled by throttle lever stopscrew. Adjust by turning screw in (clockwise) for faster idling speed, out for slower idling speed. If carburetor being installed, or if performance unsatisfactory, check Air Valve Adjustment and adjust metering pin as follows:

METERING PIN ADJUSTMENT:—Remove spring type metal plug on top of air horn above metering pin, operate engine at idling speed, insert screwdriver through metering pin plug hole, turn metering pin adjusting screw clockwise to richen mixture until engine begins to roll or is rough, then turn screw counter-clockwise slowly to lean mixture until engine fires smoothly. Recheck idling speed after completing this adjustment. Warm up engine and check air valve adjustment as directed below.

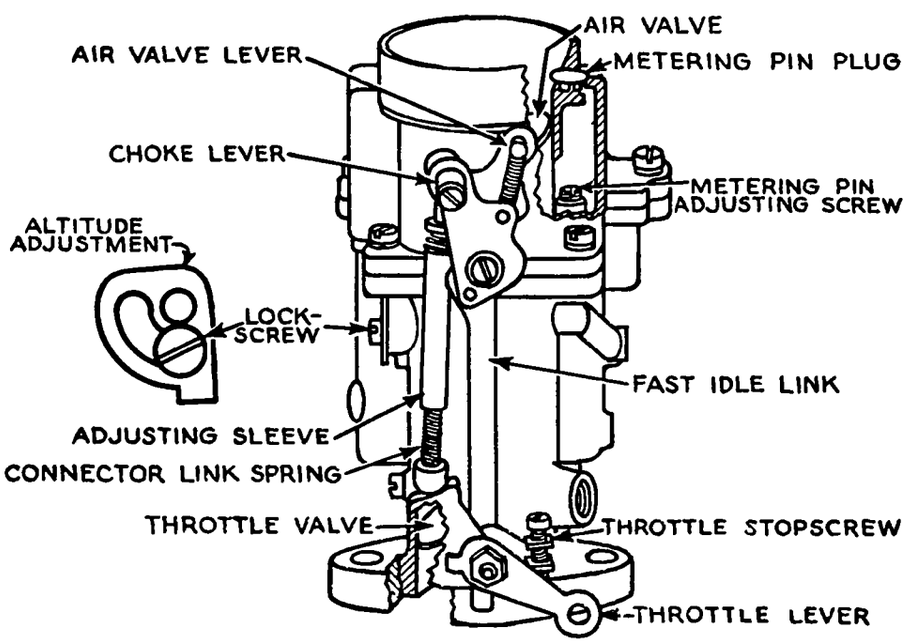
AIR VALVE ADJUSTMENT:—To Check Setting—With engine warm, open throttle so that speed is equivalent to 30 MPH. and note performance. If engine misses and does not run smoothly, air valve setting is too lean and should be adjusted as follows: Loosen locknut, turn knurled adjusting sleeve on air valve connector link counter-clockwise about ¼ turn, recheck performance. This adjustment will lean mixture at idling speed and metering pin adjusting screw should be turned clockwise slightly to compensate for this change. CAUTION—If air valve set too tight, mixture will be too lean for good performance; if air valve set too loose, mixture will be too rich for good economy or gasoline mileage.

Adjustment—Air valve should not require attention unless thrown out of adjustment by tampering or wear. To adjust, back out throttle lever stopscrew so that throttle valve closes completely. Hold throttle valve closed, loosen locknut and turn knurled adjusting sleeve on air valve connector link counter-clockwise (viewed from above) until air valve has appreciable play or lost motion (check by tapping air valve down against connector link spring), then turn sleeve clockwise until this play is taken up and air valve closes lightly against air horn wall, tighten locknut.

NOTE—When carburetor installed on car and throttle stopscrew adjusted to open throttle slightly for correct idling speed, air valve will have slight amount of play (by compressing connector link spring) to provide for proper warming up and acceleration performance. Air valve adjustment should be adjusted only when throttle stopscrew has been backed off so that throttle valve tightly closed.

ALTITUDE OR WIDE OPEN THROTTLE ADJUSTMENT:—Adjusting handle on side of carburetor casting controls position of nozzle bar openings. Standard factory setting with adjusting handle rotated counter-clockwise to limit of lockscrew slot provides maximum nozzle discharge or richest setting. Adjustment may be changed to lean the load and high speed part throttle mixture for operation in high altitudes as directed below. This adjustment tilts nozzle bar so that fuel flow from one opening is restricted (when nozzle bar turned 90° upper opening serves as air bleed for fuel discharged through lower opening).

Adjustment—Loosen lockscrew on adjusting handle, move handle to right (counter-clockwise) slightly to lean mixture, tighten lockscrew. Standard factory setting with handle rotated clockwise to limit of lockscrew slot provides richest mixture.

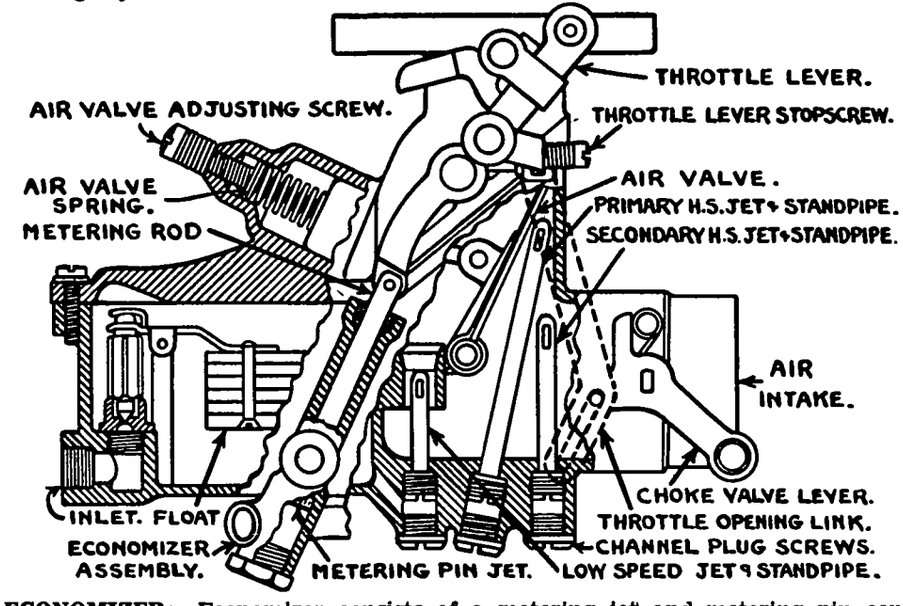


FLOAT LEVEL:—To check float level, remove choke lever, unhook choke spring from air valve lever, remove four screws from air horn and float bowl cover, remove and invert cover so that weight of float holds needle valve closed, measure distance from gasket seat on bowl cover to bottom of float (top when inverted). Distance should be 1⅝" (Model F Std. 1¼" carburetors), 1 17/32" (Model F Oversize & Model G 1½" carburetors). To adjust, bend float lever at point where it is attached to float.

NOTE—Idle may be affected if cover not replaced in exactly same position (clearance at cover screws permits slight cover shifts). Correct by changing metering pin adjustment slightly.

CHOKE CONTROL FOR STARTING:—Consists of a choke lever on the carburetor controlled by a button on the instrument panel. Choke lever is linked to the throttle valve lever by a flat link and to the air valve lever by a spring so that the throttle is opened to a fast idle position (advanced from 7½ MPH. to approximately 17 MPH.) and the spring tension tends to hold the air valve closed when the instrument panel button is pulled out for starting. Choke control is not adjustable.

SERVICING NOTES:—Metering Pin Installation—Make certain that metering pin installed with slot toward outer side of carburetor (it is possible to reverse pin which would prevent correct operation, pin is prevented from turning in well in operation).



Float Bowl Cover Installation—Check metering pin adjustment after installing bowl cover (slight shift in cover position may affect idle performance).

AC-10-1530—CONTINENTAL BEACON, MODEL C-400 (1933).
CONTINENTAL FOUR, MODEL 41 (1934).

TYPE:—Automatic air valve updraft type with fixed jets and thottle operated economizer. Low speed jet is located in small venturi in mixing chamber. Primary and secondary jets are located directly under automatic air valve. All jets are of the 'fixed opening' type and are non-adjustable. Automatic air valve is controlled by a dash pot plunger and spring in the housing directly under the air valve adjusting screw. The air valve adjusting screw regulating the air valve spring tension is the only adjustment on the carburetor.

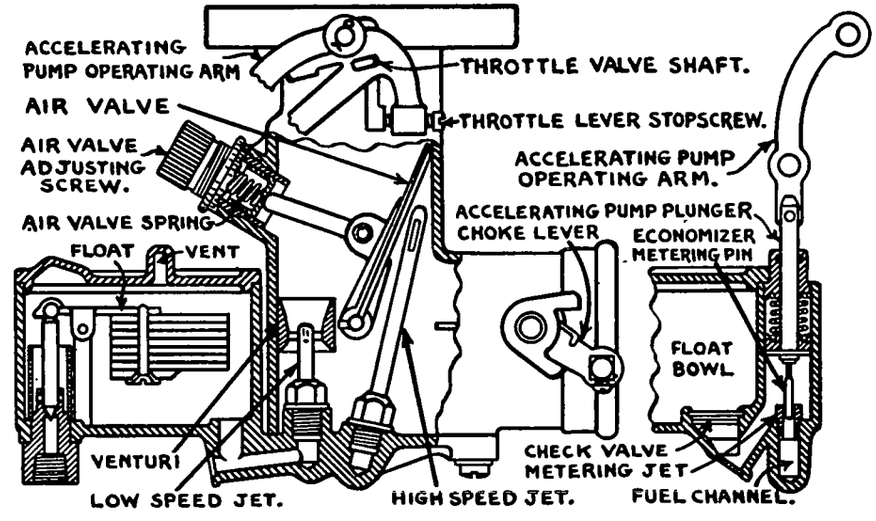
ADJUSTMENT:—Engine should be thoroughly warmed up before adjustment is made. With engine warm and running, adjust throttle stop adjusting screw so that engine runs at approximately 6 M.P.H. (correct idling speed). If engine stops or hesitates and stumbles, turn air valve adjusting screw in slightly. To adjust air valve turn air valve adjusting screw to the left or out slowly until engine begins to miss or hesitate, indicating that mixture is too lean. Then turn adjusting screw to the right or in until engine fires smoothly (turn screw 1/16 turn at a time until correct setting is secured). Check setting by quickly opening throttle about one-half and then allowing it to snap back to closed position. If engine stalls, indicating a too lean mixture, turn air valve adjusting screw to right or in slightly. If engine rolls, indicating a too rich mixture, turn adjusting screw to left or out slightly.

ECONOMIZER:—Economizer consists of a metering jet and metering pin connected to the throttle lever. The fuel supply to the primary and secondary jets is controlled by the economizer at all speeds below 50 M.P.H. to assure maximum economy. At speeds above 50 M.P.H. or with wide open throttle the economizer permits a greater fuel flow for maximum power. Economizer is entirely automatic and requires no attention. No adjustments are provided.

PERFORMANCE AND SPECIFICATIONS:—Performance should be satisfactory throughout entire driving range if air valve adjustment has been made correctly. Jets should be changed only for permanent operation at elevations greater than 3000 feet. See Marvel Jet Specification table for standard and high altitude calibrations. Jet heights and clearances are given in table below:

Carburetor	Jet Heights		Jet Clearance
	H.S. Jet	Inter. H.S. Jet	L.S. Nozzle	H.S Jet from Wall
10-1530	2 3/16"	1 25/64"	59/64"	.020"

CHOKE:—Choke valve is provided with a relief poppet valve and is interconnected with the throttle lever so that throttle is opened slightly when carburetor is choked. Choke linkage should be adjusted so that choke valve is fully closed with choke button on instrument panel pulled out and fully open with choke button pushed in.



FLOAT LEVEL:—Float chamber is sealed and is vented through an air tube in the carburetor air horn. This prevents mixture becoming richer if air cleaner is allowed to become clogged. To check float level, take off float chamber cover (upper carburetor body), being careful not to damage air valve mechanism, measure distance from top of float to top edge of float chamber bowl. Correct setting should be 11/32" with float valve held closed by pressing up on float lever. Float valve and float valve seat should be replaced as matched sets and not individually.

MODEL AA-3S

10-992—PONTIAC, MODEL 402 (1932).

TYPE:—Air valve updraft type with throttle operated accelerating pump and economizer. All jets are 'fixed' type and not adjustable. Low speed jet is located in venturi at one side of the air valve. High speed jet and intermediate high speed jet (10-992 only) are located in mixing chamber directly below air valve and operate when air valve opens. Air valve is controlled by a dashpot plunger and spring in the air valve adjusting screw. Air valve adjusting screw is the only point requiring attention.

ADJUSTMENT:—Engine must be thoroughly warmed up before adjustments are made. Make a preliminary adjustment by turning air screw in or out until outer end is flush with end of ratchet. With engine warm and running,

close throttle, adjust throttle stop screw so that engine idles at about 10 M.P.H., then turn air screw in or clockwise until engine rolls (mixture too rich), turn screw out or counter-clockwise until engine begins to miss (mixture too lean), then turn air screw in until engine fires smoothly. Final setting should be midway between the extreme rich and extreme lean positions. Readjust throttle stop screw to secure correct idling speed. Do not idle engine below 5 M.P.H.

ECONOMIZER:—Economizer consists of a metering rod attached to the lower end of the accelerating pump plunger and operated by the throttle. At partial throttle or low speeds (up to approximately 50 M.P.H.) the larger diameter section of the metering pin will partially close the metering pin jet opening so that the fuel flow to the high speed and intermediate high speed jets is restricted, assuring maximum economy. At high speeds or with wide open throttle the metering pin is depressed so that the smaller diameter section of the pin permits a greater fuel flow through the metering pin jet for full power operation. Economizer is not adjustable and should not require attention.

PERFORMANCE AND SPECIFICATIONS:—Performance should be satisfactory throughout entire driving range if air valve adjustment has been made correctly. Jets should be changed only for permanent operation at eleva-

tions greater than 4000 feet. See Marvel Jet Specification table for standard and high altitude calibrations. Jet heights and clearances are given in table below:

Carburetor	Jet Heights		Jet Clearance
	H.S. Jet	Inter. H.S. Jet	L.S. Nozzle H.S Jet from Wall
10-955	2.562-2.596"	———	1 3/8" .084"
10-992	2.733-2.767"	1.826-1.860"	1 3/8" .012"

ACCELERATING PUMP:—Accelerating pump is operated by throttle lever and discharges additional fuel through high speed jets when throttle is opened. A check valve in the bottom of the float chamber prevents the fuel discharged by the pump flowing back into the float bowl. Accelerating pump is not adjustable and should not require attention.

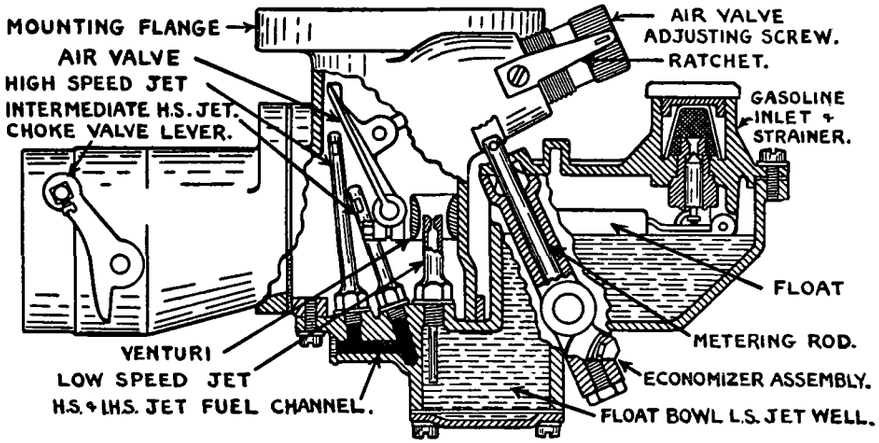
FLOAT LEVEL:—The top of the float should be 11/32" below the top edge of the float bowl. To check float level, take off bowl cover and gasket, see that float needle valve is seated, measure distance from top of float to top edge of bowl.

CHOKE:—Choke valve is held in position on its shaft by a spring which permits choke valve to open slightly when engine begins to fire, preventing over-choking and assisting in warming up. See that choke linkage is adjusted so that choke valve is closed with choke control button on instrument panel pulled out and wide open with choke control button pushed in.

MODELS ED, TD (1932-33)

ED-1S—10-1515—BUICK, MODEL 33-50 (1933).
ED-2S—10-1518—BUICK, MODEL 33-60 (1933).
ED-3—10-1514—BUICK, MODELS 33-80, 33-90 (1933).
TD-1S—10-982 —BUICK, MODEL 32-50 (1932).
TD-2S—10-1501—BUICK, MODEL 32-60 (1932)
TD-3—10-1503—BUICK, MODELS 32-80, 32-90 (1932)

TYPE:—Automatic air valve updraft type with throttle operated economizer and a special Marvel Heat Control. The 1931-32 Buick models have a throttle operated, dash regulated heat control (see description below). The 1933 Buick models are fitted with an automatic thermostatic heat control and the dash regulator is not used (see special article on Heat Controls). Carburetor models 'TD' and 'ED' are dual types with two independent mixing chambers, jet assemblies, air valves and throttle valves (throttle valves will not require synchronization). Both air valves on dual carburetors are controlled by a single air valve screw and instructions given below on adjustment apply to all models.



All jets are 'fixed' type and non-adjustable. Low speed jet is located in venturi at side of air valve and is fed directly from the float chamber (1932 and 1933 models have a deeper well under the jet and jet is provided with a quill which extends down into the well). Primary and secondary high speed jets are located directly under air valve and operate when air valve opens. These jets are fed by fuel metered through economizer metering jet which restricts fuel for partial throttle operation. Air valve is controlled by air valve spring and dashpot built in air valve adjusting screw. Air valve adjustment is only point on carburetor requiring attention.

ADJUSTMENT:—Engine must be warmed up before adjustment is made. On 1930-32 cars place heat control button on dash in 'on' position in warming up engine and leave the control in this position while adjustment is being made. This is important. Make a preliminary adjustment of air valve adjusting screw by turning screw in or out until end of screw is flush with end of ratchet, warm up engine, close throttle, retard spark, adjust throttle stop screw if necessary to keep engine from stalling. Turn air valve adjusting screw to left or counter-clockwise until engine hesitates or misses, indicating that mixture is too lean, then turn screw slowly in or clockwise until engine fires smoothly. Check adjustment by opening throttle part way and then snapping it closed. If engine stalls (mixture too lean), turn screw in or clockwise slightly. If engine rolls (mixture too rich), turn screw out or counter-clockwise slightly.

PERFORMANCE AND SPECIFICATIONS:—Performance should be satisfactory throughout entire driving range if air valve adjustment has been made correctly. Air valve spring length should not be changed and spring should be replaced if it has been tampered with. Jets should be changed only for permanent operation at elevations greater than 3000 feet. See Marvel Jet Specification table for standard and high altitude jet calibrations. Jet heights and clearances are given in table below:

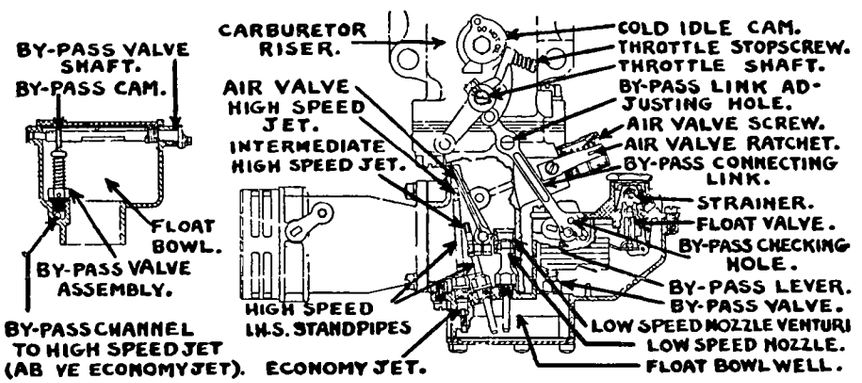
Carburetor	Jet Heights		Jet Clearance
	H.S. Jet	Inter. H.S. Jet	L.S. Nozzle H.S Jet from Wall
10-982	2.424-2.454"	1.614-1.644"	1 9/32" .014"
10-1501	2.332-2.362"	1.866-1.896"	1 9/32" .027"
10-1503	2.9877-3.0189"	1.985-2.015"	1 3/8" .012"
10-1514	2.9877-3.0189"	1.985-2.015"	1 3/8" .012"
10-1515	2.424-2.454"	1.642-1.672"	1 9/32" .014"
10-1518	2.332-2.362"	1.866-1.896"	1 9/32" .027"

ECONOMIZER:—Economizer consists of a metering jet and metering pin connected to the throttle lever. Fuel supply for high speed jets is controlled by economizer for all partial throttle positions to assure maximum economy. At high speeds or with wide open throttle economizer permits a greater fuel flow for maximum power. Economizer is entirely automatic, is not adjustable and requires no attention.

FLOAT LEVEL:—Needle valve assembly on all T & TD carburetor models is mounted in the bottom of the float bowl casting. Float level on these models should be 19/64" below the top edge of the float bowl casting with the gasket removed. Measure distance from top edge of bowl to top surface of float cork with needle valve held closed. On 1933 Type 'ED' carburetors, needle valve assembly is mounted on float bowl cover. To check float level on these models, take off float cover, remove gasket, invert cover and measure distance from gasket seat on cover to top of float (top when not inverted). Correct setting should be 1 3/16". Do not attempt to change float level by bending float lever.

HEAT CONTROL:—Carburetor header on all models is jacketed for exhaust gas heating. Exhaust gas flow through the header is controlled by a throttle operated rod through a cam and lever actuated rod. The amount of heat applied for closed throttle and part-throttle positions is determined by the position of the cam controlled by the dash regulator lever. As the throttle is opened the damper valve is turned so that the heat is gradually decreased. Heat control operation is an operating adjustment and should not require attention except that the dash regulator lever must be placed in the 'Heat On' position when the carburetor is being adjusted.

CHOKE:—Adjust choke linkage so that choke valve is fully closed with choke control button on instrument panel pulled all the way out and wide open with choke control button pushed in.



ED1S 10-1577—BUICK, MODEL 50 (1934-35).
ED2S 10-1579—BUICK, MODEL 60 (1934-35).
ED3 10-1581—BUICK, MODEL 90 (1934-35).

Delco-Remy Carburetor Control Model 498-C (Automatic Choke) used on all models. See separate article for complete data on Automatic Choke.

TYPE:—Automatic air valve, updraft, dual type with 'fast idle', throttle operated economizer, and Marvel Heat Control (automatic thermostatic control). Carburetors have independent mixing chambers, jet assemblies, air valves, and throttle valves (throttle valves are mounted on the same shaft and do not require synchronization). Both air valves are controlled by a single dashpot and adjusting screw assembly so that both carburetor barrels are adjusted simultaneously.

All jets are 'fixed' type and non-adjustable. Low speed jet is located in venturi at side of air valve and is fed directly from the float bowl well. High Speed and Intermediate High Speed jets are located directly under air valve and operate when air valve opens. Intermediate high speed jet is fed directly from the float bowl well in the same manner as the low speed jet. High speed jet is fed with fuel metered by Economy Jet located directly below high speed jet standpipe for all intermediate speeds, but additional fuel is by-passed to the high speed jet by the throttle-operated economizer for high speed or full-throttle operation (economizer is normally closed and does not meter fuel for high speed jets as in previous Buick carburetor designs). Adjust idle screw for correct idling speed of 8 M.P.H. See separate article on 'Fast Idle'.

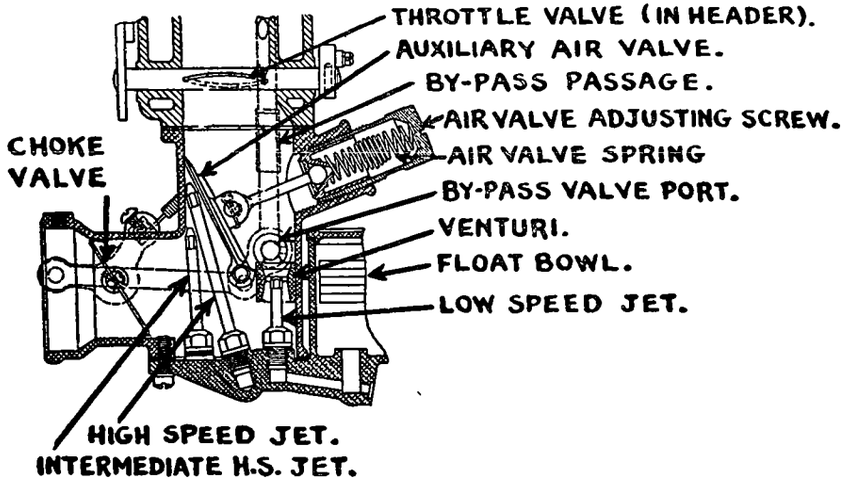
ADJUSTMENT:—Engine must be thoroughly warm when adjustments are made. If necessary, make a preliminary adjustment of air valve screw by turning screw in or out until end of screw is flush with end of ratchet, warm up engine, close throttle, allow engine to idle. Turn air valve adjusting screw to left or counter-clockwise until engine hesitates or misses, indicating that mixture is too lean, then turn screw in or clockwise slowly (three or four notches at a time) until engine runs smoothly. Check adjustment by opening throttle slightly and then snapping it closed. If engine stalls (mixture too lean), turn air screw in or clockwise slightly. If engine rolls (mixture too rich), turn screw out or counter-clockwise slightly.

PERFORMANCE AND SPECIFICATIONS:—Performance should be satisfactory throughout entire driving range if air valve adjustment has been made correctly. Air valve spring length should be exactly 1½". Replace spring if it has been tampered with or if length is not 1½". Jets should be changed only for permanent operation at elevations greater than 3000 feet. See Marvel Jet Specification table for standard and high altitude jet calibrations. Jet heights and clearances are given in table below:

Car Model	Jet Heights				Jet Clearance
	H.S. Jet	Inter. H.S. Jet	L.S. Nozzle		H.S. Jet from Wall
50 (Before 4046593)	2 20/64"	1 20/64"	1 9/32"		.014"
50 (After 4046593)	2 36/64"	1 30/64"	1 9/32"		.014"
60 (Before 4044891)	2 14/64"	1 34/64"	1 9/32"		.027"
60 (After 4044891)	2-21/64"	1 38/64"	1 9/32"		.027"
90 (Before 4043022)	3"	1 44/64"	1 3/8"		.011"
90 (After 4043022)	3"	1 55/64"	1 3/8"		.011"

ECONOMIZER:—Economizer consists of a by-pass valve which supplies additional fuel to the high speed jets when the car is operated at high speeds or with wide open throttle (heavy pulling or acceleration). This fuel from the by-pass valve enters the lower end of the high speed jet standpipe directly above the economy jet which meters all fuel for the high speed jet for part-throttle operation when by-pass valve is closed. Economizer is not adjustable and should not require attention except when carburetor is disassembled and by-pass valve cut-in point setting has been lost.

To set cut-in point, disconnect lower end of by-pass valve connecting link, back off idle screw until it is clear of cold idle control cam, move idle screw lever to extreme idle position. Hold the lever in this position, then turn by-pass valve shaft lever counter-clockwise until the cam on the shaft makes contact with the by-pass valve (this point will be felt as the shaft is turned). Hold the by-pass valve shaft lever in this position and adjust length of connecting link by expanding or contracting the shaft at the hole near the upper end until the checking hole in the lower end of the link (directly above regular shaft hole in link) fits freely over small end of by-pass valve shaft lever stud. Then connect the by-pass lever stud in the regular connecting hole on the link and replace the cotter pin. A special tool is available for adjustment of connecting link. With this tool the hole in the link should be expanded at right angles to link axis to shorten the link length, or parallel to the link axis to lengthen the link.



FLOAT LEVEL:—To check float level, take off float cover, invert and measure distance from gasket seat on float cover to top of float cork (bottom when not inverted). This distance should be 1 7/32".

CHOKE:—Choke valve is conventional butterfly type mounted in air horn (off-center pivot) and is controlled by the automatic choke mechanism. See special article on Delco-Remy Carburetor Control Model 498-C.

MODELS VE-3, VH4

VE-3—10-995—ESSEX, SUPER SIX MODEL (1932)—FIRST CARS
10-1505—ESSEX SUPER SIX MODEL (1932)—LATER CARS.
10-1533—HUDSON SUPER SIX MODEL (1933).
VH-4—10-989—HUDSON, GREATER EIGHT MODEL (1932)
10-1536—HUDSON GREATER EIGHT MODEL (1933).

TYPE:—Automatic air valve updraft type with throttle operated economizer (all models), accelerating pump (VE-3 only) and Marvel Heat Control. Heat control on Essex and Hudson 1932-33 models is automatic thermostatic type (see Heat Control section below).

ADJUSTMENT:—Make a preliminary adjustment by turning air valve screw in or out until end of screw is flush with end of ratchet spring. Warm up engine thoroughly. With engine warm and running, close throttle and allow engine to idle. Turn air valve screw in or clockwise until engine begins to roll (mixture too rich), turn screw out until engine begins to

hesitate or miss (mixture too lean), then turn screw slowly in until engine fires smoothly. Adjust throttle lever stop screw for correct idling speed (7 M.P.H. on Hudson-Essex models).

PERFORMANCE AND SPECIFICATIONS:—Performance should be satisfactory throughout entire driving range if air valve adjustment has been made correctly. Air valve spring length should not be changed and spring should be replaced if it has been tampered with. Jets should be changed only for permanent operation at elevations greater than 4000 feet. Standard and high altitude jet calibrations are shown in Marvel Jet Specification table. Jet heights and clearances are shown in table below:

Carburetor	Jet Heights		Jet Clearance
	H.S. Jet	Inter. H.S. Jet	L.S. Nozzle H.S Jet from Wall
10-989	2.964-2.997"	2.485-2.515"	1 9/32" .018"
10-995	2.746-2.776"	1.883-1.923"	1 1/4" .030"
10-1505	2.746-2.776"	1.883-1.923"	1 1/4" .030"
10-1533	2.746-2.776"	1.883-1.923"	1 1/4" .030"
10-1536	2.964-2.997"	2.485-2.515"	1 9/32" .018"

ECONOMIZER:—Economizer consists of metering jet and metering pin connected to throttle lever (metering pin is part of accelerating pump plunger assembly on VE-3). Fuel supply for high speed jets is controlled by economizer at all partial throttle positions to assure maximum economy. At high speeds (60 M.P.H. on VE-3 or 65-70 M.P.H. on VH-4) or with wide open throttle, economizer permits greater fuel flow for maximum power. Economizer is not adjustable and does not require attention.

ACCELERATING PUMP:—VE-3 Model. Not adjustable. Accelerating pump is operated by throttle lever and discharges fuel to high speed jets when throttle is opened for acceleration. A check valve in the pump intake channel prevents fuel discharged by the pump flowing back into the float bowl.

FLOAT LEVEL:—To check float level on all models, take off float bowl cover, remove gasket, measure distance from top edge of bowl to top of float with needle valve held closed. Should be 11/32" (Essex), 19/64" (Hudson).

HEAT CONTROL:—Carburetor header on all models is jacketed for exhaust gas heating (exhaust gas flow through jacket controlled by automatic thermostat). No adjustment required.

CHOKE:—Choke valve is held in position on choke valve shaft by a spring which allows choke to open against spring tension when engine begins to fire, preventing over-choking and assisting in warming up. Choke valve shaft also operates by-pass idling valve through a connecting lever. Adjust choke linkage so that choke valve is fully closed when choke control button on instrument panel is pulled all the way out and wide open with button pushed in.

B3—10-1744—GRAHAM SUPERCHARGER, MODELS 116, 120 (1937)

NOTE:—1936 Graham. Production changes made in jet calibrations for all models. These new jets should be installed on earlier carburetors (before Serial No. given) to correct performance complaints as follows:

Crusader Model B2SU-10-1673—Changes made beginning with Serial No. 5093894 (stamped on flange of die casting above idle adjustment). To correct lean part-throttle performance on earlier models, change Idle Air Vent No. 49-79H (.079") to new smaller size No. 49-63H, (.063").

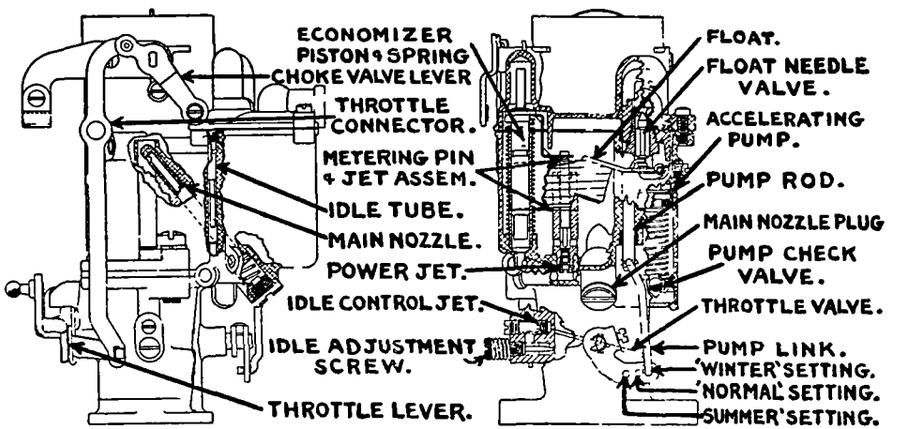
Cavalier Model B2-10-1678—Changes made beginning with Serial No. 5092447. To correct lean part-throttle performance on earlier models, change Idle Air Vent No. 49-79H to new smaller size No. 49-71H and change matched Metering-Pin and Jet No. 280-1108F to new size No. 280-1109F. For better acceleration performance, change standard pump setting from No. 3 hole in pump lever to No. 2 hole.

Supercharger Model B3-10-1680—Beginning with Serial No. 5090942, Power Jet changed from 49-890T to 49-660T and Main Nozzle from 47-100J to 47-125J. Beginning with Serial No. 6002388, Complete Pump Assembly changed from 149-539 to 149-540. To correct lean action at high speeds, change Power Jet and Main Nozzle as above and change pump setting to No. 2 hole in lever (No. 1 standard setting as specified for first cars was incorrect and should have been No. 2). Not necessary to change pump assembly to correct performance. (On cars with new pump assembly, pump standard setting is No. 3 hole). Vacuum Spring No. 24-275 was changed to No. 24-225 after first 300 cars.

Choke Valve on all Models—Choke valve control modified to include double end finger which kicks choke valve off the open position when dash control lever pulled out, and returns choke valve to off position when control pushed in. Not intended to be installed on earlier models but obviates service check to see that spring-controlled choke valves operate freely on first carburetors to insure complete opening and closing.

1937 Graham:—Production changes made for increased gasoline economy. These same changes (new vacuum step-up spring and new power jet) should be installed on cars prior to Serial No. 217175 (Cavalier 95), 132010 (Schgd. 116), 120069 and 110988 (Schgd. 120). Part numbers for each model given below (new spring is light brass color). See Marvel Jet Specification Table for complete jet calibration. Check metering rod when making these changes.

	Vacuum Step-up Spring.		Power Jet.	
Model.	Old Part No.	New Part No.	Old Part No.	New Part No.
95	24-361	24-225	49-700-T	49-600-T
116, 120	24-361	24-225	49-760-T	49-730-T



To install these parts, loosen clampscrew and move air cleaner adapter to one side, disconnect gasoline line at float bowl, take out float bowl screws and remove cover, lift out economizer plunger and spring assembly. Remove metering pin housing from carburetor body, install new power jet in metering pin housing, re-install metering pin housing in carburetor making certain that gasket is in place, use new spring when installing economizer. See that economizer is clean and works freely.

TYPE:—Plain tube, downdraft type with throttle operated accelerating pump and vacuum economizer or 'step-up device'. All fuel is metered by metering pin and jet and power jet (in lower end of metering jet assembly). Metering pin is controlled by vacuum economizer piston (see Economizer Section below). Fuel for idling is taken from the main nozzle channel up through the idle tube to a cross passage in which the idle air vent jet is located. The fuel mixture is then taken down through a passage and discharged through two ports opposite the throttle edge. The lower idle port (controlled by the idle adjusting needle) supplies all fuel for closed throttle idling, the upper port (above the throttle edge when the throttle is closed) acting as an additional air bleed. When the throttle is opened slightly the upper port comes into action and all fuel for car speeds up to approximately 18 M.P.H. is supplied by the idle system. The main nozzle comes into action at about 18 M.P.H. and acts in conjunction with the idle system at speeds up to 35 M.P.H. At speeds greater than 35 M.P.H. all fuel is supplied by the main nozzle. Idling adjusting needle and accelerating pump (seasonal setting) are the only points requiring attention.

ACCELERATING PUMP:—Positively actuated by throttle valve lever. Fuel drawn into pump chamber through ball-check valve on upstroke of piston (when throttle closed) and discharged through ball-check outlet valve and pump discharge jet (in upper mixing chamber) on downstroke of piston (when throttle opened for acceleration). Outlet valve normally held closed by cylindrical plunger in channel above ball. On Graham models, pump piston is spring-loaded and free on shaft so that some lag occurs when throttle opened suddenly and spring action to return piston to seat lengthens pump discharge period. This feature not used on LaFayette carburetor.

Adjustment—Pump lever on throttle valve shaft provided with four holes for pump rod link engagement. Holes numbered 1 to 4 out from shaft (#1 minimum stroke, #4 maximum stroke). See Note above and tune-up data on car model page for standard setting and adjustments for seasonal requirements on each car model.

IDLING ADJUSTMENT:—Idle adjusting screw controls fuel discharge from lower idle port (closed throttle idling fuel feed). Screw should be turned in for leaner mixture and out for richer mixture. See tune-up instructions for each car model for adjustment on engine.

PERFORMANCE & JET SPECIFICATIONS:—Performance should be satisfactory throughout entire operating range if idling adjustment and accelerating pump settings are correct. See Note above and Marvel Jet Specification Table for jet calibrations and changes to improve performance. 'High Altitude Jet' calibrations intended for permanent operation at elevations greater than 3000 feet only.

ECONOMIZER:—Economizer consists of a metering pin and jet controlled by a vacuum piston. The lower end of the vacuum piston chamber is connected to the carburetor barrel below the throttle valve. For all part-throttle positions, manifold vacuum will hold the piston at the lower end of the stroke (against the tension of the piston spring) so that the metering pin is held in position in the metering pin jet, limiting the fuel flow. When the throttle is opened, the fall in vacuum will allow the spring to force the piston upward, lifting the metering pin in the jet and permitting a greater fuel flow to the nozzle for acceleration and full power operation. The spring is calibrated to allow maximum economy (metering pin in jet) for all car speeds up to 65 M.P.H. on level road.

Metering Pin Timing Height. To check metering pin timing height (which controls economizer action), remove float bowl cover, hold vacuum piston down on seat (lower end of stroke with metering pin in metering jet), measure distance from top of metering pin to top of metering pin housing. This should be 13/64". Adjust by bending metering pin fork or lifter.

FLOAT LEVEL:—To check float level, remove float bowl cover, remove cover gasket, invert cover, measure distance from gasket seat on cover to bottom of float at free end. Should be 1 27/64" (B—Continental), 1⅜" (all others).
Float Valve & Seat Assembly:—Part No. 233-524 (B, B2, B2SU), 233-527 (B3-10-1680), 233-530 (B3-10-1744). Furnished only as matched sets.

MODELS B, B2, B2SU, B3 CONT.

THROTTLE VALVE SETTING:—Manufacturer recommends replacement of Throttle valve Body Assembly, Part No. 227-45 (B-10-1549), 227-49 (B-10-1545), 227-529 (B-10-1603), 227-551 (B2SU-10-1673), 227-557 (B2SU-10-1690), 227-552 (B2-10-1678 & 1691), 227-553 (B3-10-1680), 227-558 (B3-10-1744) whenever throttle valves or shaft require replacement.

CHOKE:—Choke valve offset on shaft. Choke lever linked to shaft by coiled spring so that choke valve action is spring-controlled and automatic during warming up period. See that choke valve operates freely throughout range to insure choke valve following lever when dash control is manipulated.
NOTE—On Graham models two fingers are incorporated in choke lever, one of which 'kicks' choke valve off the open position when dash control lever pulled out, and the second returns choke valve to open position when dash control pushed all the way in.

FAST IDLE LINKAGE:—Throttle lever stopscrew stop-plate pivoted on throttle shaft and linked to choke valve lever so that throttle is opened to fast idle position when choke valve is in use. Linkage should not require adjustment.

MODELS BB, BD, BD1S

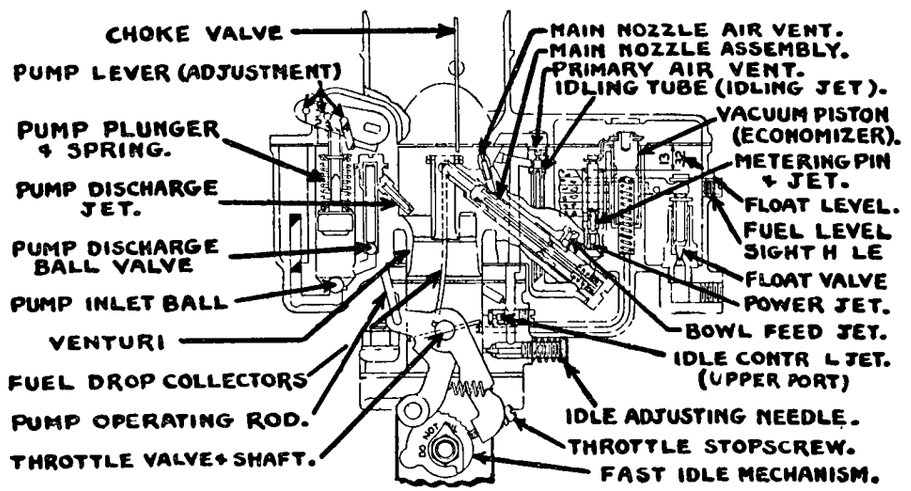
BB-1—10-1633—BUICK, MODEL 34-40 (1934).
BD-1—10-1749—BUICK, MODEL 40 (1937)—STANDARD AIR CLEANER.
10-1750—BUICK, MODEL 40 (1937)—HEAVY DUTY AIR CLEANER.
BD-1S—10-1751—BUICK, MOD. 60, 80, 90 (1937)—STANDARD AIR CLEANER.
10-1752—BUICK, MOD. 60, 80, 90 (1937)—HEAVY DUTY AIR CLEANER.

NOTE:—These carburetors not interchangeable as different jet calibrations used when equipped with Heavy Duty (oil-bath) Air Cleaner. Whenever air cleaners are changed in the field, matched Metering Pin-and-Jet and Power Jet must be changed. See Marvel Jet Specification Table for standard and high altitude jet calibrations for each model.

TYPE:—Plain tube, downdraft, dual type with 'Cold Idle' (fast idle) control, throttle operated accelerating pump, and vacuum economizer or 'step-up' device. Carburetors have two independent mixing chambers, main nozzle systems, idle systems, and throttle valves (valves mounted on same shaft and will not require synchronization). A single accelerating pump and vacuum economizer (metering pin and metering jet) serve both carburetor barrels.

Fuel System:—The main nozzles are fed directly from the float bowl through the 'bowl feed jet' and also through the metering pin-and-jet (economy device). Main nozzle is air-bled through a separate nozzle air vent within the mixing chamber. Fuel for idling is taken from the main nozzle channel below the metering pin and jet through the idle fuel channel and is metered by the idle jet. This fuel is mixed with air admitted through the primary air vent in the cross passage and the fuel mixture is then taken down through a passage to the idle ports opposite the throttle valve. The lower idle port below the throttle (when throttle is closed) is controlled by the idle adjusting needle and supplies all fuel for closed-throttle idling, the secondary idle air vent and upper idle port (in which the idle control jet is located) acting as additional air-bleeds. As soon as the throttle is opened slightly, the upper idle port discharges additional fuel. All fuel for car speeds up to 18 M.P.H. is supplied by the idle system. At this point the main nozzle comes into action and supplies more fuel progressively up to 40 M.P.H. when fuel delivery from the idle ports ceases, the main nozzle then supplying all fuel. At speeds above 75 M.P.H. or whenever the throttle is wide open, fuel supply for main nozzles is automatically increased by the economizer action (see economizer below).

Fuel Drop Collectors (BB-1 only):—Mounted on main nozzle (see illustration). Designed to even out nozzle delivery so that main nozzle action is smoother at speeds below 25 M.P.H.



IDLE ADJUSTMENT:—Needle valve type controlling fuel mixture. Engine must be warm when adjustments are made (cold idle not operative). With engine thoroughly warm and running, close throttle, adjust throttle stop screw so that engine speed is equivalent to 7-8 M.P.H. Adjust idle adjusting needle for each carburetor barrel in turn. Turn idle adjusting needle in or clockwise until engine hesitates or misses (mixture too lean), then turn needle out or counter-clockwise until engine rolls (mixture too rich), finally turn needle in just enough to eliminate rolling. This will give the richest setting possible without rolling and will give smoother road performance than a leaner setting. Correct setting should be ½-¾ turn open. After adjusting both idle adjustment needles, check idling speed and readjust throttle stop screw to correct idling speed (7-8 M.P.H.). See tune up data on car model pages.

PERFORMANCE:—Performance should be satisfactory throughout entire driving range if idling adjustment has been correctly made and accelerating pump setting and vacuum economizer operation are correct. All metering jets are 'fixed' type and non-adjustable. Jets should be changed only for permanent operation at elevations greater than 3000 feet.

ACCELERATING PUMP:—Accelerating pump is operated by the throttle valve lever and discharges fuel through a pump discharge jet into the mixing chamber when the throttle is opened. The pump follow-up spring above the pump plunger prolongs the pump discharge.

Adjustment:—Pump outer lever on countershaft above accelerating pump has four holes (numbered 1-2-3-4) for pump link connection. #1 (outer) provides maximum stroke, #4 (inner) minimum stroke. See tune up data on car model page for recommended setting and seasonal changes.

ECONOMIZER:—Economizer consists of a metering pin and jet controlled by a vacuum piston. The lower end of the vacuum piston chamber is connected to the carburetor barrel below the throttle valve. For all part-throttle positions, manifold vacuum will hold the piston down at the lower end of its stroke (against the tension of the piston spring) so that the metering pin is held in position in the metering jet, limiting the fuel flow for maximum economy. When the throttle is opened, the fall in vacuum allows the spring to force the piston upward, lifting the metering pin in the jet and permitting a greater fuel flow for acceleration and full power operation. This fuel metered by Power Jet located in the bottom of the metering pin and jet assembly. Spring is calibrated to provide maximum economy (metering pin in the jet) for car speeds up to 75 M.P.H.

Metering Pin Timing Height. To check metering pin timing height (which controls economizer action), remove float bowl cover, hold vacuum piston down on seat (lower end of stroke with metering pin in metering jet), measure distance from top of metering pin to top of metering pin guide and jet assembly. This distance should be 13/64". Adjust by bending metering pin fork or lifter.

FLOAT LEVEL:—With engine idling, fuel level in float bowl should be ¾" below top face of bowl, or 1/16" below the center of the sight hole in the side of the bowl (sight hole closed normally by a plug). To check float level, remove float bowl cover, hold float up by hand with needle valve seated, measure distance from top face of float bowl to top of float cork. Distance should be 13/32".

Float Valve & Seat Assembly. Part No. 233-525 (BB-1, BD-1), 233-531 (BD1S). Furnished only in matched sets.

THROTTLE VALVE SETTING:—Manufacturer recommends replacement of throttle valve body assembly, Part No. 227-527 (BB-1), 227-543 (BD-1), 227-564 (BD-1S) whenever throttle valves or shaft require servicing due to wear or damage.

CHOKE:—Choke valves offset type. Stop pin in air horn limits travel in wide open position. All models fitted with Delco-Remy Carburetor control (automatic choke) and Buick Cold Idle Control. See articles in Carburetion Equipment Section for complete adjustment instructions.

C-2—10-1802 NASH AMBASSADOR SIX, MODEL 3820 (1938)
10-1808—GRAHAM, STD. & SPEC. MODEL 96 (1938-39)
C-3—10-1809—GRAHAM, SUPERCHARGER MODEL 97 (1938-39)

TYPE:—Plain tube, Downdraft, single barrel type with throttle operated accelerating pump and vacuum economizer or 'step-up' device. These models have improved mixing chamber design and triple venturi with main nozzle discharging into throat of top (smallest) venturi. Clearance between nozzle tip and opposite wall of small venturi should be .083" (Graham), .060" (Uash) plus or minus .010".

Fuel System (Idling & Low Speed):—Fuel for idling taken from lower end of main nozzle through Idle Fuel Passage and up through Idle Tube to Idle Emulsion Passage in which it is mixed with air admitted through Primary Idle Air Inlet (above tube) and Idle Air Vent Jet (at end of passage and opening into air horn above venturi). Fuel mixture then taken down through Idle Emulsion Channel and discharged through Primary Idle Delivery Port below throttle valve. This port is controlled by Idle Adjusting Needle. As soon as the throttle valve is opened slightly additional fuel is discharged through Secondary Idle Delivery Port above the throttle edge. Idle system supplies all fuel for closed throttle idling and car speeds up to 18 M.P.H. except when engine operated under load.

18-65 M.P.H.—At 18 M.P.H. (or at lower speed if throttle opened sufficiently to reduce manifold vacuum), the greater suction at the main nozzle brings this nozzle into operation and the idle discharge decreases so that at car speeds of approximately 35 M.P.H. and above all fuel is discharged by the main nozzle. Fuel for main nozzle is metered by metering pin-and-jet (vacuum economizer) and in addition a definite amount of fuel is by-passed directly to the nozzle by the Range Adjustment Needle Valve (Graham models only—Range adjustment not used on Nash carburetor).

High Speed, Full Throttle, or Heavy Load Operation:—Whenever manifold vacuum decreases due to these conditions, vacuum piston step-up spring forces piston up, lifting metering pin from jet and permitting greater fuel flow to nozzle. Fuel is then metered by Power Jet at lower end of nozzle. Springs are calibrated to allow metering pin to remain in jet for car speeds up to 65 M.P.H. under normal conditions to insure maximum economy.

IDLE ADJUSTMENT:—Idle adjusting needle controls fuel mixture and should be turned in for leaner mixture, out for richer mixture. Idle speed controlled by throttle stopscrew and should be set for 6-7 M.P.H. idling speed. Adjust carburetor only when engine warmed up so that choke valve is wide open (On Graham models, throttle cracking or fast idle mechanism linked to choke valve so that throttle valve is opened slightly when choke valve in use). See Tune up data on car model page for complete adjustment data.

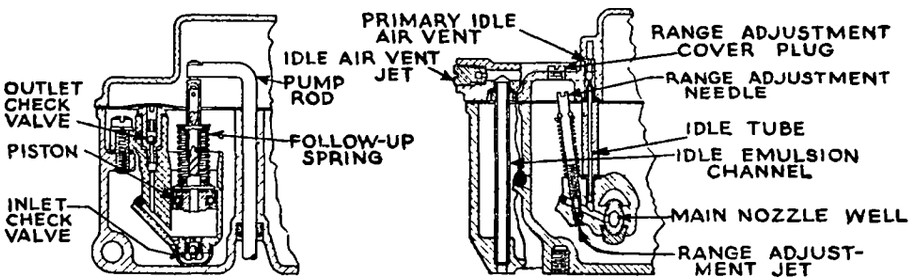
PERFORMANCE:—Should be satisfactory throughout entire operating range if idle adjustment and accelerating pump setting are correct (See Range Adjustment for Graham). Jets are non-adjustable and should be changed only for permanent operation at elevations greater than 3000 feet. See Marvel Jet Specification Table for standard jet calibrations and recommended altitude changes on all models.

ACCELERATING PUMP:—Operated by rod and link connected to pump lever on throttle shaft. Fuel drawn into pump cylinder through inlet screen and inlet ball check valve at bottom of cylinder and discharged through outlet ball check valve and pump discharge jet in carburetor mixing chamber wall when throttle opened for acceleration. Pump plunger is spring loaded on rod so that it lags when throttle opened very suddenly and spring provides follow up to prolong pump delivery. On Nash model, a return spring is located in the pump cylinder below the plunger.

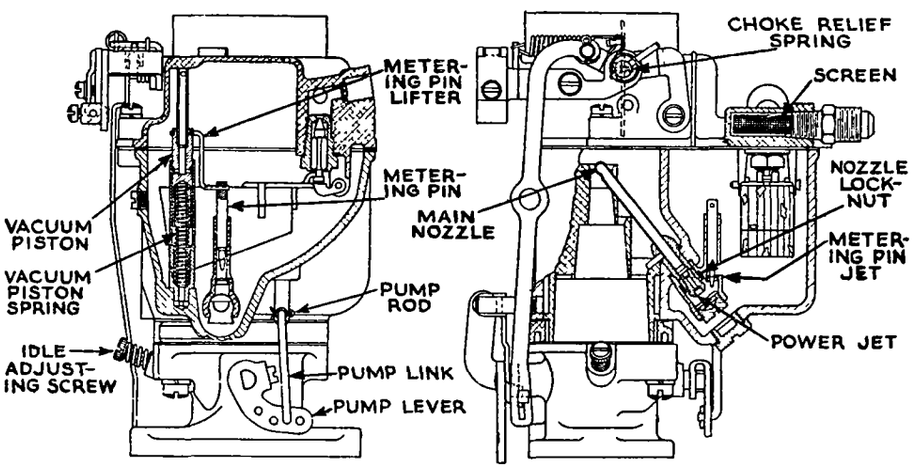
Adjustment (Graham)—Pump lever on throttle shaft has four holes for pump link engagement. #2 hole is standard for normal temperatures. Connect link in inner (#1) hole for minimum stroke in extremely hot weather or with high-test fuel, #3 hole for cold weather, #4 (outer) hole for maximum accelerating charge in extremely cold weather.

Adjustment (Nash)—Pump lever on throttle shaft has three holes for pump link engagement. Center (#2) connection is standard for normal temperatures. Connect link in inner (#1) hole for minimum stroke for extremely hot weather or high test fuel, or in outer (#3) hole for maximum stroke for extremely cold weather or low test fuel.

ECONOMIZER:—Consists of metering pin-and-jet assembly operated by vacuum piston in float bowl. Vacuum piston normally held down in cylinder against tension of vacuum step-up spring (in cylinder below piston) so that metering pin restricts fuel flow through jet. When manifold vacuum decreases, spring forces piston up and lifts metering pin out of jet.



Adjustment—To check metering pin timing height, remove bowl cover, hold vacuum piston down on seat against spring tension, measure distance from top of metering pin to top of guide housing. Should be 13/64". Adjust by bending metering pin lifter.



RANGE ADJUSTMENT (Graham Models Only):—Consists of an adjustable needle valve in the float bowl. Accessible by removing air cleaner and taking out small plug on top of bowl cover. Use special adjusting tool M-70 or small screwdriver inserted through plug hole to turn range needle.

Adjustment:—Wide open position approximately 1 turn off seat. Set at factory at two turns open. To secure leaner-than-standard setting, turn range needle down until it is seated (do not use excessive force or needle and seat will be damaged), turn needle back to one turn open position, then turn down slightly to secure desired setting as directed below.

Normal Altitude Setting (Up to 3000 ft.)—Range needle setting should be approximately one-half turn open.

High Altitude (Over 3000 ft.)—Setting should be less than one-half turn open and needle may be closed entirely if necessary. Above 6000 ft. and on Pacific Coast, next size leaner metering pin can be installed (see Jet Specification Table).

FLOAT LEVEL:—Fuel Level—With engine idling, fuel level in float bowl should be even with the lower edge of the fuel level inspection hole in the side of the float bowl (remove screw in inspection hole to check fuel level).

Float Height—To check, remove bowl cover and float assembly with gasket, invert and measure from gasket surface to nearest point on float. Should be 19/32" (all models). Float should be level (equal height across entire float). NOTE—For high temperatures or high-test fuel, float height may be set at 5/8".

Float Valve & Seat—Furnished only as matched sets as follows: No. 233-540 (Graham, all models), 233-539 (Nash).

CHOKE VALVE:—Offset type. Fitted with spring loaded flapper type relief valve to prevent overchoking. On Graham models choke valve operates throttle cracking or fast idle mechanism.

Fast Idle (Graham)—Throttle lever stopscrew stop plate pivoted on throttle shaft and linked to choke valve so that throttle is opened slightly when choke valve is in use. Should not require adjustment.

MODELS C2, C3 CONT.

TROUBLE SHOOTING:—Hard Starting when Hot—May be caused by fuel collecting on throttle valves due to leak at nozzle seat. Make certain that float bowl vents are clear and that nozzle is tight (see nozzle servicing below).

Poor Acceleration Performance—If acceleration unsatisfactory at 10-15 MPH. with wide open throttle, dismantle accelerating pump and check for free plunger travel. If plunger does not move freely examine pump bore for roughness particularly at lower end and refinish with finest grade of emery cloth (wrap emery cloth on ½" round wooden stick). Clean out dirt before reassembling.

Rich Mixture—May be caused by loose metering pin housing, loose nozzle, or cracked nozzle retaining nut which will allow fuel to leak past metering jet. See nozzle servicing below.

SERVICING:—Throttle Valves. Throttle valve should not be replaced separately (except as emergency) as upper idle discharge port originally located after throttle valve installed and distance above valve is important. Throttle valve and shaft assembly is furnished for service.

Main Nozzle—When installing nozzle see that retainer gasket is in place between nozzle flange and seat in body. Use tool H-63 to tighten retaining nut at lower end of nozzle being careful that excessive force is not used which will crack nut and permit leaks at this point. Clearance between nozzle tip and opposite wall of small venturi should be .083" (Graham models), .060" (Nash) plus or minus .010". Greater clearance indicates that nozzle gasket left out, less clearance that nozzle not tight on seat.

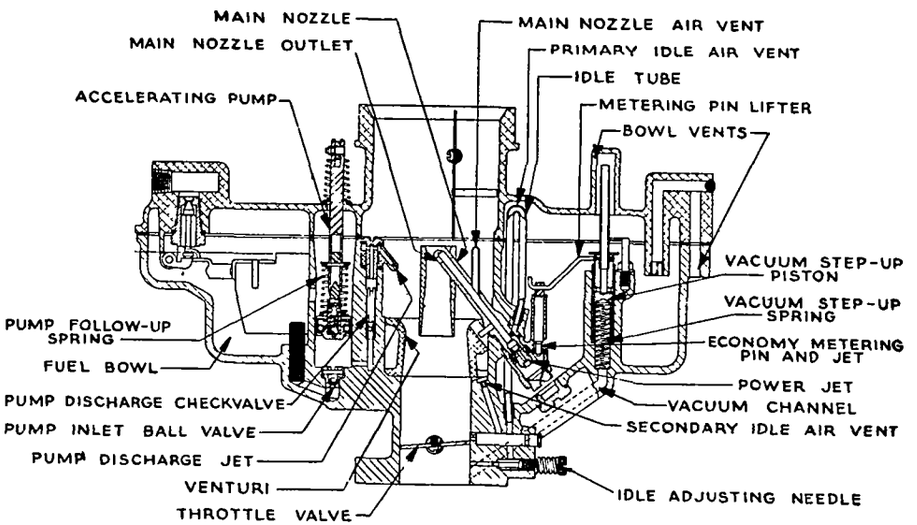
Metering Pin Housing & Jet—Jet is part of assembly and is not ordinarily changed (metering pin only changed for altitude correction). To tighten or replace housing, use special tool M-68 to press assembly in place. See that nozzle retainer gasket is in place around nozzle in body recess when installing housing. Check metering pin timing height.

MODELS CD-1B, CD-2B

CD-1B—10-1796 BUICK, MODEL 40 (1937-38) STD. AIR CLEANER
10-1797 BUICK, MODEL 40 (1937-38) HEAVY DUTY AIR CLEANER
CD-2B—10-1798 BUICK, MODELS 60, 80, 90 (1938) STD. AIR CLEANER
10-1799 BUICK, 60, 80, 90 (1938) HEAVY DUTY AIR CLEANER

NOTE:—These models not interchangeable (special jet calibration used with heavy duty air cleaners). See Marvel Jet Specification Table for complete jet data.

Buick 40 (1937)—Late 1937 cars equipped with this CD carburetor. All data same as for 1938 model except for float level.



TYPE:—Plain tube, Downdraft, Duplex or dual type with throttle operated accelerating pump, vacuum economizer or 'step-up' device, and special double float design. These carburetors have double mixing chambers with independent main nozzle and metering systems, throttle valves, and idling systems. A single vacuum piston operates both metering rods (economizer), and a single accelerating pump is used with a double discharge jet assembly. Carburetors are fitted with Buick Cold Idle Control (fast idle) and Delco-Remy Carburetor Control (automatic choke).

Fuel System (Idling & Low Speed):—Fuel for idling taken from lower end of main nozzle through Idle Fuel Orifice and flows up Idle Tube (inverted 'U' design) where it is mixed with air admitted through Primary Idle Air Vent (at top of idle tube 'U'). Fuel mixture then flows down through idle tube to Idle Emulsion Channel where additional air is admitted through Secondary Idle Air Vent (in carburetor wall at lower edge of venturi). For closed throttle idling, this fuel mixture is discharged through Primary Idle Delivery Port below the throttle and is controlled by the Idle Adjusting Needle. As soon as the throttle valve is opened slightly, additional fuel is discharged through the Secondary Idle Delivery Port at the throttle edge (a third discharge port is located directly above the Secondary Port on the Model CD-1B only). Idle system supplies all fuel for closed throttle idling and car speeds up to 18 M.P.H. except when engine operating under load.

18-75 M.P.H.—At 18 M.P.H. (or at lower speeds if throttle opened sufficiently to reduce manifold vacuum), the greater suction at the main nozzle brings this nozzle into operation and the idle discharge decreases so that at speeds of 40 M.P.H. and above all fuel is discharged by the main nozzle. Fuel for main nozzle is metered by metering pin-and-jet (vacuum economizer) and is mixed with air admitted to the nozzle bore through the Main Nozzle Air Vent which projects up into the air stream. Main nozzle tip is closed and the outlet is located on the underside of the tip in the small auxiliary venturi. Clearance between nozzle tip and wall of small venturi should be .100-.120".

High Speed, Full Throttle, or Heavy Load Operation:—Whenever manifold vacuum decreases due to these conditions, vacuum piston spring forces piston up, raising metering pins from jets and permitting greater fuel flow to nozzles. Fuel is then metered by Power Jet at lower end of nozzle. Springs are calibrated to allow metering pin to remain in jet for car speeds up to 75 M.P.H. under normal conditions to insure maximum economy.

IDLE ADJUSTMENT:—Idle adjusting needles control fuel mixture and should be turned in for leaner mixture, out for richer mixture. Setting should be approximately ¾-1 turn open (if screws turned in to determine 'closed' position, use light pressue only to avoid ringing seats which will prevent correct operation). Idle speed controlled by throttle stopscrew and should be set for 7-8 M.P.H. hot or slow idling speed (cold idle control and automatic choke inoperative). Make adjustments only with engine warmed up so that Cold Idle and Automatic Choke inoperative. See Tune Up data on car model page for complete instructions. For Fast Idle data, see Buick Cold Idle article in Carburetion Equipment Section.

Buick 40 With Self-Shifting Transmission—Idle speed should be set at 5-6 MPH. in third gear. Transmission throttle control lever linkage must be checked whenever carburetor throttle linkage is disconnected or changed. See adjustment instructions in Buick Self-Shifting Transmission article in Mechanical Equipment Section.

PERFORMANCE:—Should be satisfactory throughout entire operating range if Idling Adjustment, Accelerating Pump Setting, and Metering Pin Timing Height are correct. Jets are non-adjustable and should be changed only for permanent operation at elevations greater than 3000 feet. See Marvel Jet Specification Table for complete standard and altitude jet calibrations.

ACCELERATING PUMP:—Operated by walking beam and lever connected to throttle lever. Fuel drawn into pump chamber through inlet screen and ball check valve at bottom of cylinder when throttle valve closed and discharged through outlet check valve and pump discharge jet assembly into each mixing chamber when throttle opened for acceleration. Pump plunger is spring loaded on rod so that it lags when throttle opened suddenly and spring provides follow up to prolong pump delivery. A spring loaded ball check valve in the pump plunger opens and by-passes some fuel back into float bowl when pump is operated rapidly preventing excessive delivery which would load up engine (by-pass valve normally remains seated so that all fuel is discharged through pump jets).

Adjustment—Walking beam provided with three holes for throttle lever rod connection. Center (#2) hole is normal setting for all year operation. Connect rod to outer (#3) hole for minimum stroke when using high test fuel or for extremely hot weather, inner (#1) hole for maximum stroke when using low test fuel or for extremely cold weather when performance is unsatisfactory with standard setting.

ECONOMIZER:—Consists of twin metering pin-and-jet assemblies operated by vacuum piston in float bowl. Vacuum piston normally held down in cylinder against tension of vacuum step-up spring (below piston in cylinder) so that metering pins restrict fuel flow through jets. When manifold vacuum decreases, spring forces piston up lifting metering pins out of jets.

MODELS CD-1B, CD-2B CONT.

Adjustment—To check Metering Pin Timing Height, remove bowl cover, hold vacuum piston down on seat against step-up spring tension, measure distance from top of each metering pin to top of metering pin guide. Should be 13/64" and groove on pin should line up with top of guide housing. Adjust by bending metering pin lifter. Both pins must be adjusted alike.

FLOAT LEVEL:—Fuel Level—With engine idling, fuel level should be 11/16" (CD-1B), ¾" (CD-2B) below top edge of bowl or even with lower edge of fuel level inspection hole in left front face of bowl (remove screw from inspection hole to check fuel level).

Float Height—To check, remove bowl cover and float assembly, invert cover, measure from bowl cover gasket to closest surface of float. Should be ¼" (Buick 40 '37), 3/16" (Buick 40 '38), ¼" (Buick 60, 80, 90). See that floats are centered in bowl and that all burrs and rough edges which might interfere with free float travel are removed. Both floats must be set alike.

Float Valve & Seat—Furnished only as matched sets, Part No. 233-537 (CD-1B), 233-538 (CD-2B).

Float Bowl Vent:—Bowl vented to outside through port on side of vacuum piston stem housing on bowl cover and also through two inverted 'U' channels in cover which are open to atmosphere through holes in gasket and main body casting flange (baffle located at inner end of channels in bowl). These bowl vents must be kept clear and open.

TROUBLE SHOOTING:—Lean Idle—May be caused by dirt in idle fuel channels. Can be cleaned by opening throttle so that engine runs at about 35 MPH., removing one idle adjusting needle and quickly closing needle hole with a finger. This will increase suction so that dirt on needle seat will be removed. Wipe off adjusting needle, replace and adjust, repeat for second needle.

Hard Starting when hot—May be caused by percolation or fuel collecting on throttle valves due to leak at nozzle seat. Make certain that float bowl vents are clear (see Float section above) and that nozzle is tight (see nozzle servicing below).

Poor Acceleration—If acceleration is unsatisfactory at 10-15 MPH. with wide open throttle, dismantle accelerating pump by removing bowl cover, pump discharge jets, pump discharge check valve, metering pins and vacuum piston assembly and check pump for free travel. If pump plunger does not move freely, examine pump bore for rough finish particularly at lower end. If wall is not perfectly smooth, refinish with finest grade of emery cloth (use stick ½" in diameter with emery cloth wrapped around one end). Wash out all dirt before reassembling. Check metering pin setting (see Economizer above) and pump discharge jet position (see servicing directions below).

Throttle Sticking—May be caused by insufficient clearance between automatic choke and throttle shaft. Can be corrected by installing extra gasket between carburetor body and choke housing.

No Fuel in Float Bowl—Check idle tubes to see that they are down tight on seats (leak at seat will allow fuel to drain from bowl to throttle chamber). See Idle Tube servicing below.

Rich Mixture—May be caused by loose metering pin housing, loose nozzle or cracked nozzle retaining nut which will allow fuel to leak past metering jet. See nozzle servicing below.

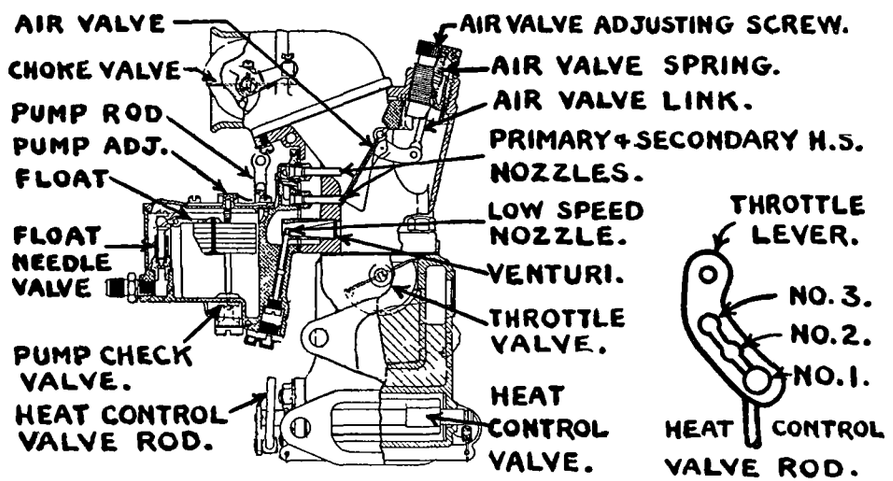
SERVICING:—Main Nozzles. Nozzles stamped 'R' or 'L' and must be installed in correct barrel. See that nozzle retainer gasket is installed between nozzle flange and seat in body. Use tool H-63 to tighten retaining nut at lower end of nozzle being careful that excessive force is not used which will crack nut and permit leaks at this point. Clearance between nozzle tip and opposite wall of auxiliary venturi should be 7/64" or .100-.120" (all Buick models). If this distance too great, gasket under nozzle has been left out. If distance too small, nozzle is not down tight on seat.

Metering Pin Housing & Jet—Jet is part of assembly and is not ordinarily changed (metering pin change only for altitudes). To tighten or replace housings, use special tool M-68 to press assembly in place. Make certain that nozzle retainer gasket is in place around nozzle in body recess when installing housing assembly. Check metering pin timing height.

Idle Tubes—Inverted 'U' type. Tube ends which seat in recesses in body casting must be firmly seated (for correct tube height) and tight (to prevent leaks which will drain bowl). When renewing idle tubes see that all traces of original lead washer used to seal tubes are removed, use special Idle Tube Peening Tool M-62 and Idle Tube Seating Tool M-69 to insure tight seat. Check tube height which should be 37/64" over-all above gasket seat on top of body casting.

Pump Discharge Jets—Consists of a single die-casting with double discharge holes and is held in place by screw at top. When installing, make certain that gasket is in place under screw head, see that discharge holes are open and clean, check delivery hole position with special gauge tool M-64.

MODEL DO



10-993—PONTIAC EIGHT, MODEL 302 (1932).

TYPE:—Air valve downdraft type with throttle operated accelerating pump and economizer and Marvel heat control (adjustable throttle control). Carburetor header in which throttle valve is located is divided by a central wall and a vane on the throttle valve so that fuel mixture is divided between the two sections of the intake manifold, each section supplying four cylinders (V or line 8 type engines). Header is jacketed for exhaust gas heating, the amount of exhaust deflected through the header jacket being controlled by the throttle operated heat control valve.

All jets are 'fixed' type and non-adjustable. Primary and secondary high speed jets or nozzles are located in upper part of mixing chamber above the air valve. Low speed or idling nozzle is located below the air valve in a venturi or fixed air opening. Automatic air valve is controlled by a dash pot plunger and spring assembled in the air valve adjusting screw.

ADJUSTMENT:—Heat control must be placed in No. 1 position (see instructions below) and engine thoroughly warmed up before adjustment is made. Make a preliminary adjustment of the air valve screw by turning screw in or out until end is flush with the end of the ratchet. With engine warm and running, close throttle and allow engine to idle. Adjust throttle stop screw so that idling speed is approximately 5-6 M.P.H. Turn air valve adjusting screw in or clockwise until engine begins to roll (rich mixture), then turn screw out or counter-clockwise until engine begins to miss (lean mixture), finally turn screw in slowly until engine fires smoothly. Check adjustment by quickly opening throttle about halfway and then closing it. If engine misses or stalls, setting is too lean and adjusting screw should be turned in slightly. If engine rolls, setting is too rich and adjusting screw should be turned out slightly. Final setting should be with adjusting screw approximately flush with the end of the ratchet.

ECONOMIZER:—All fuel for primary and secondary discharge nozzles is metered by metering pin jet. For all partial throttle positions (car speeds below 55-60 M.P.H.) the larger diameter section of the metering pin attached to the lower end of the accelerating pump plunger will partially close the metering pin jet and restrict the fuel flow. At high speed or with wide open throttle the metering pin will be pressed down so that a smaller diameter section is in the metering pin jet and the fuel flow will be increased. Economizer is not adjustable and does not require attention.

PERFORMANCE:—Carburetor performance should be satisfactory throughout entire driving range if air valve adjustment (above) is correct and heat control setting is correct. Jets should be changed only to compensate for high altitudes when car is operated permanently at elevations greater than 4000 feet. See Marvel Jet Specification table for standard and high altitude jet calibrations. Jet heights and clearances are shown in table below:

Carburetor	Jet Heights		
	Primary (with Jet)	Secondary (with Jet)	L.S. Standpipe
10-993	3 5/32"	2 29/32"	2 3/64"

ACCELERATING PUMP:—Accelerating pump plunger shaft and piston disc are forced down when throttle is opened, discharging a portion of the fuel in the pump chamber through the primary and secondary high speed jets. Some of the fuel is allowed to escape through holes in the disc into the upper pump cylinder. This fuel is discharged by the pump plunger which falls freely on the plunger shaft by reason of its weight, thus prolonging the pump discharge. The pump discharge is controlled by the check valve in the channel between the float chamber and the pump. When pump adjustment is in 'summer' position this check valve remains open so that the fuel discharged by the accelerating pump flows back into the float chamber. With pump adjustment in 'winter' position this check valve is closed so that pump discharges through the jets into the mixing chamber.

Adjustment:—Accelerating pump check valve control lever is located on float chamber cover adjacent to pump plunger shaft. Control lever should be turned so that pointer is opposite 'Winter' on cover for winter driving or cold temperature ranges. For summer driving pointer should be turned to 'Summer' position so that practically all the pump discharge is by-passed back to the float chamber.

FLOAT LEVEL:—Float level should be 15/32" below top edge of float chamber with cover and gasket removed. To check level, measure distance from top edge to top of float on mixing chamber side (away from needle valve).

HEAT CONTROL:—Heat control valve is operated by throttle valve lever so that heat control valve is always open with wide open throttle. Position of heat control valve (amount of heat) at closed throttle and rapidity with which valve opens is controlled by engagement of control valve operating rod on throttle valve lever. Control valve rod should be engaged in end hole on lever (No. 1 position) providing maximum heat for winter driving or cold weather. Center hole on lever (No. 2 position) should be used for moderate temperature ranges. Inner hole on lever (No. 3 position) should be used for extremely hot weather or high test gasoline.

CHOKE:—Choke valve is held in position on its shaft by a spring which will allow choke to open slightly against spring tension when engine begins to fire, preventing over-choking. Choke linkage should be adjusted so that choke valve is closed when choke control button is pulled all the way out and wide open when choke control button is pushed in.

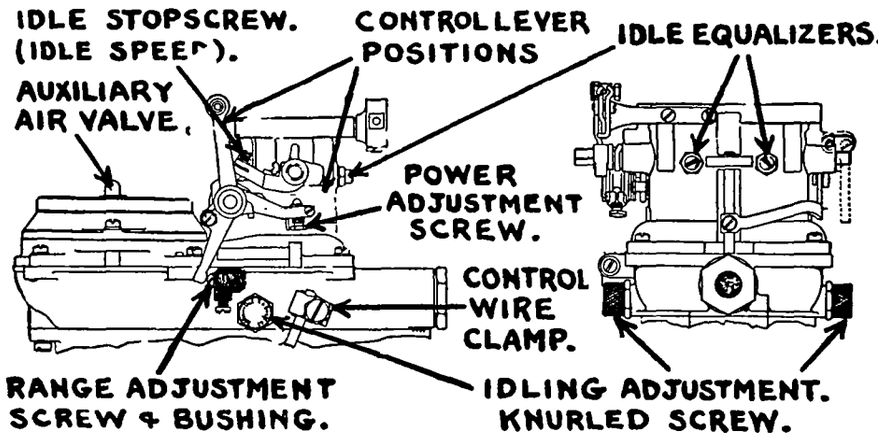
DUESENBERG, MODEL J (1931-32-33)

REO ROYALE EIGHT, MODELS 8-31, 35, 52 (1932), N-1, N-2 (1933)

STUTZ, MODEL DV-32 (1933)

TYPE:—Duplex or dual updraft air valve type with throttle operated accelerating pump. Main nozzle is located in venturi (fixed air intake) and is fed by fuel metered by lift needle valve. Needle valve lift lever is controlled by auxiliary air valve and needle valve is lifted in valve seat as air valve opens, permitting a greater fuel flow to the nozzle. For starting and warming up the dash control shifts the pivot upon which the lift lever rotates so that the needle valve is lifted, resulting in a richer mixture. There is an idle adjustment for each carburetor barrel and these adjustments must be carefully equalized when the carburetor is adjusted. On later models separate 'equalizing' adjustments are provided (see illustration). The range adjustment and power adjustment control both carburetor barrels.

IDLING ADJUSTMENT:—Engine must be thoroughly warmed up before adjustments are made. Each idling adjustment must be made separately. With the engine properly warmed up, disconnect spark plug wires leading to plugs in the four end cylinders (1, 2, 7, 8) and ground these leads to the engine block. Turn up the throttle stop screw (idling speed adjustment) slightly so that engine will not stall and allow engine to idle on the other four cylinders (3, 4, 5, 6). Retard spark, check idling adjustment by depressing air valve 1/32-1/16". If engine stops immediately, setting is too lean. If engine speeds up, setting is too rich. Adjust inner idling adjustment screw (controlling barrel feeding the four middle cylinders) and repeat test. With correct setting, engine should turn over several revolutions when air valve is depressed 1/32-1/16" before beginning to stop. Idling adjustment screw raises and lowers needle valve seat through a gear-and-worm engagement and should be turned clockwise for leaner mixture and counter-clockwise for richer mixture. After completing adjustment, connect spark plug wires on cylinders 1, 2, 7, 8 and disconnect spark plugs in cylinders 3, 4, 5, 6, grounding the cables to the engine block. Repeat the test as given above and adjust outer idling adjustment screw controlling the barrel feeding the end cylinders.



After adjusting each idling adjustment screw, connect all the spark plugs and idle the engine on all eight cylinders. Adjust throttle stop screw for correct idling speed (approximately 5-6 M.P.H.). With the engine idling at the correct speed and firing on all eight cylinders, check idling setting by depressing air valve 1/32-1/16". If setting is too rich, turn both idling adjustment screws in or clockwise slightly. If setting is too lean, turn both screws out or counter-clockwise slightly. Both screws should be turned the same amount (one or two notches) and the test repeated.

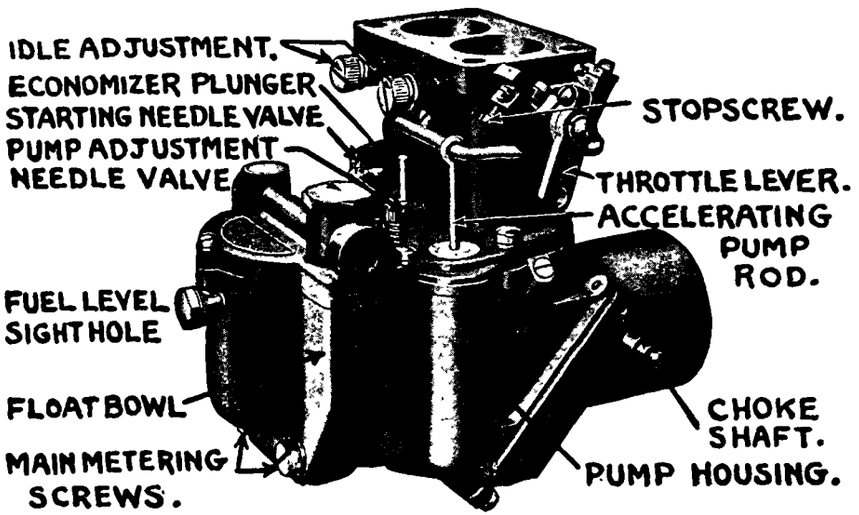
Idling Equalizers. On some models with the idling adjustment screws placed on the side of the carburetor barrel, as shown, or on the bottom of the carburetor body, equalizing adjustments are provided (see illustration). On Reo models where this adjustment is provided, the engine should be idled on four cylinders (as above) with throttle closed and spark advanced. After the idling adjustment for the barrel feeding the cylinders which are firing has been made (adjustment screws on bottom of carburetor are limited to less than one turn—do not try to force screws beyond this point), one of the disconnected spark plug wires should be arranged so as to form a small spark gap to the head and the engine speed noted by counting the number of sparks occurring in 30 seconds. The correct number of sparks should be 60 in 30 seconds and if the number counted is not within two of this figure, the lock nut on the equalizing adjustment should be loosened and the equalizing screw turned out or counter-clockwise to increase the number or in or clockwise to decrease the number. When the number of sparks is within two of the correct number (60 in 30 seconds) and the idling adjustment is correct, the second carburetor barrel should be adjusted in the same manner.

RANGE ADJUSTMENT:—This adjustment affects performance in the driving range (20-40 M.P.H.). Carburetor setting in this range is made leaner by turning the range adjustment screw to the left or counter-clockwise and richer by turning the screw to the right or clockwise. The correct factory setting is with the screw turned in so that the head of the screw is flush with the end of the bushing. Whenever the range adjustment is changed it will be necessary to check the idling adjustment.

POWER ADJUSTMENT:—On first models (without reference pin) correct setting of power adjustment screw is secured when the head of the screw is 7/32" from the arm in which the screw is mounted. On later models a reference pin is located at the side of the screw and the screw should be turned in so that the head of the screw is flush with the end of the pin. Power adjustment screw should be turned to the right or clockwise for a richer mixture and to the left or counter-clockwise for a leaner mixture. For high altitudes the power adjustment screw can be turned down (counter-clockwise to lean mixture) 3-5 turns.

ACCELERATING PUMP:—Accelerating pump is operated by the throttle lever and raises fuel in the pump cylinder when the throttle is opened. This fuel is discharged through a cross-passage to a port in the throat of the small venturi. Pump discharge is metered by the size of this cross-passage and the height of the pump overflow which permits excess fuel to flow back into the float bowl. Pump discharge can be changed only by changing the cross-passage and pump cylinder. Pump does not require attention.

FLOAT LEVEL:—Distance from top of float to carburetor body should be 25/64-27/64" with float needle valve seated. Float level can be changed by bending the float lever slightly.



DASH CONTROL:—Dash control linkage should be adjusted so that control lever on carburetor is down as far as it will go when the dash control button on the instrument panel is pulled all the way out. When the control lever is up as far as it will go (running position) the dash control button should be slightly out from the instrument panel (1/16-1/8").

U-3—FRANKLIN, SERIES 16 (1932)
UU-3—DUESENBERG, SUPERCHARGED MODEL SJ (1933-37)

NOTE:—Model U-3 is single barrel, UU-3 dual or double barrel model. Both types adjusted alike except that only one idle adjusting screw used on U-3.

TYPE:—Twin updraft plain tube type with positively operated accelerating pump and economizer (connected to throttle lever) and auxiliary control needle valve connected to choke lever for starting. There are two carburetor barrels with independent main discharge jets, main metering jets, throttle valves, and idling adjustments. Throttle valves operate on the same shaft and will not require synchronization. All fuel for main discharge jets is metered by main metering jets under float bowl (except for high speed or wide open throttle operation). Metering jets are 'fixed' type. Idling adjstments and accelerating pump adjustment (needle valve type) are the only points requiring attention.

IDLING ADJUSTMENT:—Needle valve type operating on fuel mixture. There are two idling ports in each barrel. The upper idling port (controlled by idling adjusting screw) is above the throttle and supplies the fuel for idling with closed throttle. The lower idling port (non-adjustable) operates in conjunction with the upper port at low car speeds of approximately 10-18 M.P.H.

Adjustment:—Engine must be thoroughly warmed up before idling adjustment is made. With engine warm and running, close throttle and allow engine to idle (adjust throttle lever stop screw if necessary to keep engine running). Turn inner idling screw (toward engine) down until it seats, cutting off fuel supply for four cylinders and allowing engine to idle on remaining four cylinders. Adjust idling screw of the other carburetor barrel until engine fires smoothly. Then turn inner adjusting screw out until engine fires smoothly on all eight cylinders.

Idling adjustment can be made without cutting out four cylinders by adjusting each idling screw individually by turning idling screw in until engine begins to miss or is rough and then turning the screw out until engine fires smoothly. This point can also be determined by turning screw in until engine begins to miss and out until engine begins to roll and finally setting the screw midway between these points. Idling screws operate on fuel mixture and should be turned in to secure leaner mixture and out for richer mixture. Throttle lever stop screw should be readjusted after idling adjustment has been completed to secure correct idling speed if necessary.

HIGH SPEED ADJUSTMENT AND ECONOMIZER:—Main metering jets are of the 'fixed' type and not adjustable. Metering jet size is stamped on the outer face of the jet in decimal fractions of an inch. Jets should be changed only to compensate for special fuels or operating conditions, such as high altitudes.

Economizer is operated by accelerating pump lever. At all positions of partial throttle economizer needle valve will be closed so that all fuel for main discharge jets will be supplied by main metering jets. When the throttle is opened the pump lever depresses the economizer needle plunger, opening the economizer valve and allowing additional fuel to flow through the economizer by-pass jet to the main discharge jets. Economizer should not require adjustment but setting may be checked by noting throttle opening when economizer needle valve begins to open. To check, close throttle valve on drill rod of size indicated in table below, inserting drill between edge of throttle valve and carburetor wall, so that throttle is held open. Note whether economizer needle valve begins to open at this point.

Car Model	Economizer Setting (Throttle Opening)
Franklin 16	11/32" drill
Duesenberg SJ	5/32" drill

ACCELERATING PUMP (U-3):—Accelerating pump operated by lever on throttle shaft. When the throttle is opened the pump piston sleeve is forced down, discharging the initial quantity of fuel required for acceleration through the central hollow stud and the pump metering jet to the main discharge jet. At the same time the pump piston is forced down on the central stud, compressing the pump piston spring and the pump discharge is prolonged for several seconds by the piston returning to its seat at the top of the stud and discharging the remaining fuel in the pump chamber. Standard pump capacity in cubic centimeters (cc.) per 10 strokes of the pump plunger is 8-11 cc.

Adjustment:—Pump discharge is metered by pump reducer (pump metering jet). This jet is of the 'fixed' type and is not adjustable so that pump discharge can be changed only by replacing this jet. To determine whether pump discharge is satisfactory for the particular operating conditions of the engine, run engine until it is well warmed up, close throttle and allow engine to idle. Open throttle quickly and note engine performance. If engine hesitates or misses, pump discharge may be too small. If engine stumbles in picking up speed, pump discharge may be too large. A more satisfactory check may be made by running car at about 5 M.P.H. in high gear on a level road and noting performance when quickly accelerated.

ACCELERATING PUMP (UU-3):—Accelerating pump operated by throttle lever supplies an extra charge of fuel to the main discharge jet when the throttle is opened. Accelerating pump discharge is regulated by a needle valve in the pump discharge channel. Needle valve adjusting screw is located on float bowl cover adjacent to pump.

Adjustment:—Average setting for accelerating pump adjusting screw is ½ turn open (summer) to 3 turns open (winter). To check pump setting, run engine until well warmed up, close throttle and retard spark. Accelerate engine by opening throttle quickly and note engine performance. If engine hesitates, pump setting is too small and adjusting screw should be turned out slightly. If engine stumbles in picking up speed, pump setting is too large and adjusting screw should be turned down (or in) slightly. Check setting by operating car in high gear on a level road at approximately 5 M.P.H. and open throttle suddenly. Ir car hesitates, setting is too small. If car stumbles, setting is too large. This will be particularly noticeable as engine warms up.

FLOAT LEVEL (U-3):—Fuel level in float bowl set exactly 9/16" below top edge of float chamber (without gasket) when engine is not running. Float level can be changed to correct fuel level by bending float lever at the corner between the float and the needle valve. To check float level measure distance from gasket seat on float chamber cover (with gasket removed) to top of float at center. This distance should be 3/64" on all carburetors.

FLOAT LEVEL (UU-3):—Fuel level in float bowl must be even with bottom of the sight hole in the float chamber casting with the engine not running. To check fuel level, remove plug in sight hole directly above metering jets and see that fuel level is ¾" below top edge of float bowl or distance from top edge of float to gasket seat on cover is 15/64". Float level can be changed if necessary to correct fuel level by bending the float lever at the corner between the float and the needle valve.

CHOKE:—Choke valve linkage should be adjusted so that choke valve is closed tight when choke control button on instrument panel is pulled all the way out and wide open with choke control button pushed in. The choke valve is connected to an auxiliary control valve for starting. This linkage should be checked to see that clearance between choke lever cam and operating lever is sufficient so that needle valve is seated when choke valve is open. Auxiliary needle valve should start to open when choke valve is 10-15° from the wide open position.

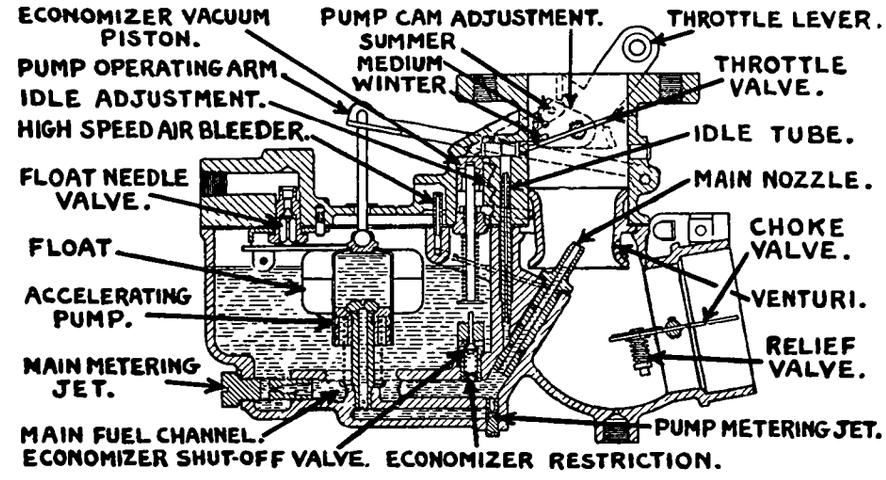
UR-23—STUDEBAKER DICTATOR, MODEL A (1934).
URO-2—AUBURN, MODEL 8-100 (1932), 8-101 (1933).
FRANKLIN, SERIES 16-B (1933), 19-A, B (1934).
FRANKLIN, SERIES 18 (1933), 18-B, C (1934).
GRAHAM STANDARD EIGHT, MODEL 67 (1934).

NOTE:—See separate articles on Stromberg Automatic Choke and Fast Idle mechanisms for complete data where they are used. Model UR-23 Studebaker Dictator fitted with built-in automatic choke and fast-idle. In all cases where fast-idle mechanisms are used, carburetor adjustments should not be made until engine is thoroughly warmed up and idling speed has returned to hot or 'slow' idle with choke valve wide open.

TYPE:—Plain tube updraft type with positively operated accelerating pump and vacuum economizer. Some models are fitted with a 'throttle-cracking' device connected to the choke valve lever for starting (see data below). Main discharge jet is air bled to control mixture so that fuel flow through jet is restricted at partial throttle (high vacuum) and increased at open throttle (low vacuum). All fuel for main discharge jet is metered by main metering jet under float bowl (except for high speed or open throttle when additional fuel is by-passed through economizer by-pass jet). Idle adjustment and accelerating pump adjustment (summer-normal-winter setting) are the only points requiring attention.

IDLING ADJUSTMENT:—Air bleed type operating on air. Engine must be thoroughly warmed up before idling adjustment is made. With engine warm and running, close throttle and allow engine to idle (adjust throttle lever stop screw if necessary to keep engine from stalling). Turn idling adjusting screw out until engine begins to hesitate or miss, then turn screw in until engine fires smoothly and maximum speed is attained. Idling screw operates on air and should be turned out for leaner mixture and in for richer mixture. After idling adjustment has been completed readjust throttle stop screw if necessary to secure correct idling speed.

If correct idling adjustment cannot be secured, take out idle discharge hole plug and clean out idling ports with compressed air. The idling tube can also be taken out and cleaned with air if the carburetor is disassembled.



HIGH SPEED ADJUSTMENT AND ECONOMIZER:—Main metering jet is of the 'fixed' type and is not adjustable. Jet size is stamped on outer face of jet in decimal fractions of an inch. Jets should be changed only to compensate for special fuel or operating conditions of the engine such as high altitudes.

Economizer is controlled by a vacuum piston. At intermediate speeds below 60 M.P.H. or partial throttle positions, economizer valve remains closed so that all fuel for main discharge jet is metered by main metering jet. When the throttle is opened the economizer needle plunger is forced down, opening the economizer valve, and allowing additional fuel to flow through the economizer restriction (by-pass jet) to the discharge jet. Economizer is not adjustable and should not require attention.

ACCELERATING PUMP:—Accelerating pump is operated by a lever and cam on the throttle valve shaft. The pump reducer or metering jet located on the bottom of the carburetor meters the fuel discharged by the pump. Pump capacity in cubic centimeters (cc.) per 10 strokes, with pump adjustment set as indicated is given in table below.

Car Model	Carburetor	Pump Setting	Pump Capacity
Auburn 8-100, 101	URO-2	Maximum	10-14 cc.
Franklin 16, 18	URO-2	Maximum	10-14 cc.
Graham 67	URO-2	Maximum	13-17 cc.
Rockne 65, 75, 10-31	UR-2	Maximum	7-10 cc.
Studebaker 55, Dict. A	UR-2	Medium	7-10 cc.
Studebaker Dict. A	UR-23	Medium	7-10 cc.

Adjustment:—Pump operating cam on throttle valve lever has three holes to secure varied pump stroke. The center hole providing a medium pump stroke should be used for ordinary temperature ranges and ordinary gasoline. The upper connecting hole providing a minimum pump stroke should be used for hot weather or high test gasoline. Lower connecting hole providing maximum pump stroke should be used for very low temperatures.

FLOAT LEVEL:—Fuel level in float chamber is set at exactly 9/16" below the top edge of the float chamber (gasket removed) with engine not running. Float level can be changed to correct fuel level by bending float lever at the corner between the float and the needle valve. To check float level, measure distance from gasket seat on float chamber cover (gasket removed) to top of float at the center (when lever is attached to top of float) or to bottom of float at the center (where lever is attached to bottom of float). Models marked 'T' (top) and 'B' (bottom) in table below.

Car Model	Carburetor	Float Height
Auburn 8-100, 101	URO-2	9/32" (T)
Franklin, 16, 18	URO-2	1 11/32" (B)
Graham 67	URO-2	11/64" (T)
Rockne 65, 75, 10-31	UR-2	1 5/16" (B)
Studebaker 55	UR-2	23/64" (T)
Studebaker Dict. A	UR-2, UR-23	1 5/16" (B)

THROTTLE-CRACKING DEVICE:—On some URO-2 carburetors choke valve and throttle are connected so that throttle valve is opened slightly with choke valve fully closed to facilitate starting. This can be checked by fully closing choke valve and noting throttle position. To set 'throttle-cracking' linkage, insert a drill rod between the edge of the throttle valve and the carburetor barrel, close throttle against the drill, loosen adjusting screws on linkage, close choke tightly and tighten adjusting screws. Check adjustment to make certain that choke valve opens completely.

Car Model	Throttle-Cracking (drill size)
Auburn 8-100, 101	#56 drill
Graham 67	#58 drill go—#54 no go

CHOKE:—Choke valve is fitted with relief poppet valve to prevent over-choking. Adjust choke valve linkage so that choke valve is closed tightly with choke control button on instrument panel pulled all the way out and wide open with control button pushed all the way in.

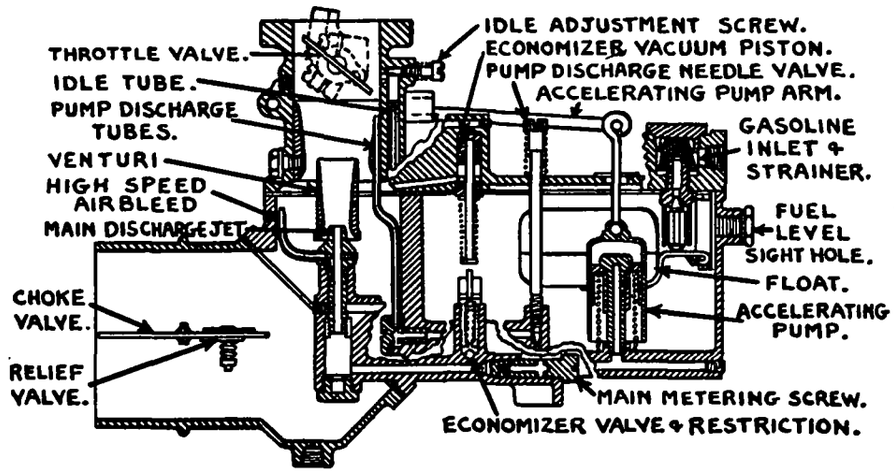
STUDEBAKER DICTATOR 8, MODEL 72 (1932)
STUDEBAKER COMMANDER 8, MODEL 82 (1932)
STUDEBAKER PRESIDENT 8, MODELS 81, 91 (1932)

TYPE:—Twin updraft type with accelerating pump and vacuum economizer. There are two carburetor barrels with independent main discharge jet assemblies and throttle valves (throttle valves operate on the same shaft so that synchronization of throttles is not necessary). Barrels are fed from the main metering jet channels so that all fuel for main discharge jets is metered by main metering jets (under float bowl) and controlled by the vacuum economizer. Main discharge jets are air bled (by tubes on discharge jets in mixing chamber) to control mixture so that fuel flow through jets is restricted at partial throttle (high vacuum) and increased at open throttle (low vacuum). An independent idle adjustment is provided for each carburetor barrel. The idle adjustment and accelerating pump adjustment are the only points requiring attention.



IDLE ADJUSTMENT:—Needle valve type operating on gasoline. There are two idle ports in each carburetor barrel, an upper port (controlled by idle adjustment needle valve) which supplies fuel for car speeds of 5-10 M.P.H. and a lower port (non-adjustable) which operates in conjunction with the upper port to supply fuel for car speeds of 10-20 M.P.H. Both idle ports operate in conjunction with the main discharge jet to supply fuel for speeds of 20 M.P.H. to appproximately 30 M.P.H. when all fuel is supplied by the main discharge jet.

Adjustment:—If carburetor is out of adjustment, turn both idling adjustment screws in until they seat and then back off 2 or 3 turns. Start engine and adjust throttle lever stop screw until engine runs at approximately 5-6 M.P.H. Run engine until it is thoroughly warmed up. Turn in idling screw on inner carburetor barrel until it seats. This will cut off fuel supply to four cylinders on eight cylinder engines so that engine will fire on four cylinders. Adjust idling screw of outer barrel until engine fires smoothly. Then turn out idling screw on inner barrel until engine fires smoothly on all eight cylinders. Readjust throttle lever stop screw if necessary to secure correct idling speed.

If is not desired to adjust one barrel at a time with engine firing on four cylinders, adjust each idling adjustment individually by turning idling screw in until engine begins to miss or is rough and then turn screw out until engine fires smoothly. This point can also be determined by turning screw in until engine begins to miss and then out until engine begins to roll. The correct setting should be midway between these points. Idling screws operate on gasoline mixture and turning screw in or clockwise causes a leaner mixture and out or counter-clockwise a richer mixture.

HIGH SPEED ADJUSTMENT AND ECONOMIZER:—Main metering jets are fixed and cannot be adjusted. Metering jet size is stamped on the outer face of the jet in decimal fractions of an inch. To determine whether jet size is too small for particular operating conditions of the engine, with engine running at speed above 20-30 M.P.H., gradually close choke valve and note whether engine speed increases. If engine picks up speed as choke is closed the main metering jet is clogged or is too small. Clean jet with compressed air and repeat test.

At speeds up to 60 M.P.H. vacuum in economizer piston chamber (chamber is connected to carburetor barrel) will be sufficient to hold piston up against economizer spring tension so that economizer valve will remain closed. At speeds of 60-70 M.P.H. the drop in vacuum will allow spring to force piston downward, opening economizer valve and allowing additional fuel to flow past the economizer valve seat and through the economizer jet to the main metering jet channels. Economizer does not require attention.

ACCELERATING PUMP:—Pump is operated through a cam-and-lever arrangement by the throttle shaft and discharges fuel through the pump discharge tube in each carburetor barrel when the throttle is opened. Pump discharge is controlled by an adjustable needle valve located in the pump discharge channel so that all fuel discharged by the pump passes through this valve. Standard pump capacity with adjustment needle valve open 2 turns is 16-19 cubic centimeters per 10 strokes. Pump travel is 21/32". Pump capacity on models which are not standard is given in table below.

Car Model	Pump Capacity	Pump Travel	Adjusting Valve
Hupmobile C, 226 ('32)	14-17 cc	½"	1¼ turn open
Hupmobile 222-F ('32)	14-18 cc	21/32"	1½ turn open
Hupmobile L (1932)	16-19 cc	½"	2 turns open
Hupmobile 322, 422	14-18 cc	21/32"	1 turn open
Hupmobile 326, 426	14-18 cc	21/32"	1 turn open
Nash 980, 1080, 1180	———	21/32"	2 turns open
Nash 8, 9, 10, 11, 1290	11-12 cc	21/32"	1⅛ turn open
Studebaker 62, 72 ('32)	11-13 cc	25/32"	¾ turn open
Studebaker 81, 91 ('33)	7-10 cc	25/32"	½ turn open

Adjustment:—Accelerating pump adjusting needle valve is located on float chamber cover directly below idling adjustments. Correct setting for normal conditions should be 1-1½ turns open. To check throttle pump setting, retard spark, run engine at idling speed and note performance when throttle is opened. If engine hesitates opening is too small and needle valve

should be backed out or opened slightly. If engine stumbles in picking up speed opening is too large and needle valve should be turned down slightly. Check adjustment by operating car at speed of 5 M.P.H. on level road in high gear. Open throttle suddenly and note performance. If car hesitates, setting is too small. If car stumbles, setting is too large. This will be particularly noticeable as engine warms up.

FLOAT LEVEL:—There is a float level sight hole closed by a plug on the side of the float chamber. With the engine not running gasoline level in float chamber should be even with the lower edge of the sight hole. To correct float level, take off top half of carburetor body by taking out body connecting screws and accelerating pump adjusting needle valve. To raise float level, bend float lever arm at the corner where it touches float and float needle valve so that float is raised the desired amount. To lower float level, hold float lever tight against needle valve and bend float downward. Top of float should be approximately 15/64" below top face of float bowl cover (gasket removed) with float needle seated.

CHOKE:—Choke valve is fitted with a relief poppet valve which opens when engine begins to fire so that engine will continue to run. Choke linkage should be adjusted so that choke valve is fully closed with choke button on instrument panel pulled all the way out and fully open when button is pushed all the way in.

DXR-2—HUPMOBILE SIX, SERIES 216 (1932).
NASH EIGHT, MODEL 9-70 (1931-32).
DXR-3—CHRYSLER EIGHT, MODEL CP (1932).
DODGE EIGHT, MODEL DK (1932).

TYPE:—Plain tube downdraft type with positively operated accelerating pump and vacuum controlled economizer. Main discharge jet is located at an angle in the venturi and is air bled by means of a high speed air bleed tube mounted vertically on the jet near the tip. Main metering jet is located under float chamber and meters all fuel for main discharge jet except for high speed or wide open throttle operation (when economizer by-pass jet valve is open). Idle adjustment and accelerating pump adjustment (summer and winter setting) are the only points requiring attention.

IDLE ADJUSTMENT:—Needle valve type operating on air. Engine must be thoroughly warmed up before adjustment is made. With engine warm and running, close throttle and allow engine to idle. Adjust idling adjustment screw until engine fires smoothly and speed is at maximum for the throttle position (turn idling screw out until engine begins to miss and then turn screw in until engine fires smoothly). Idling screw operates on air and should be turned out or counter-clockwise for leaner mixture and in or clockwise for richer mixture. Adjust throttle lever stop screw after completing idling adjustment, if necessary, to secure correct idling speed.

NOTE:—If correct idling adjustment cannot be secured take out idle discharge plug and blow out idle ports with compressed air. The idling tube can also be removed and cleaned with compressed air if carburetor is disassembled.

HIGH SPEED ADJUSTMENT AND ECONOMIZER:—All fuel metered by main metering jet and auxiliary jet. Jets are "fixed" type and not adjustable. Jet size is stamped on outer face of jet in decimal fractions of an inch. Jets should not be changed except to compensate for special fuels or operating conditions, such as high altitude.

Economizer needle valve remains closed, preventing any fuel flowing through economizer restriction (by-pass jet) for partial throttle operation. At high speed or wide open throttle the drop in vacuum will allow the economizer plunger spring to force the plunger down, opening the economizer needle valve, and allowing additional fuel to flow through the by-pass jet to the main discharge jet. Economizer is not adjustable and does not require attention.

ACCELERATING PUMP:—Pump is similar in design to that used on 'U' type carburetors except that pump lever is positively connected to throttle lever and operates when throttle is opened. Throttle valve plate has two (DXC) or three (DXR) holes for engagement of pump operating rod to provide varied pump stroke. Center hole providing medium pump stroke should be used for standard gasoline and normal temperature ranges. Engage pump rod in end hole (right hand) to provide minimum pump stroke for summer operation in hot climates. Engage pump rod in end hole (left hand) to provide maximum pump stroke for winter operation or extremely cold temperatures. The nut on the upper end of the pump rod is used to adjust the automatic shut-off valves on the Model DXC-3 carburetors.

Pump Capacity (CC. per 10 strokes)

Car Model	Carburetor	Pump Capacity	Setting
Chrysler CP	DXR-3	25 cc.	Maximum
Dodge DK	DXR-3	25 cc.	Maximum
Hupmobile 216	DXR-2	15-17 cc.	Medium
Nash 9-70	DXR-2	27 cc.	Medium

FLOAT LEVEL:—Fuel level in float bowl is set at 5/8" below the top edge of the float chamber with engine not running. To check float level with carburetor disassembled, measure distance from gasket seat on float bowl cover (with gasket removed) to top of float at center. This distance should be 13/64". Float level can be changed by bending float lever at the corner between the float and the needle valve. To lower float level, bend float down. To raise float level, hold lever tight against needle valve and bend float up toward cover.

CHOKE:—Choke valve is fitted with a relief poppet valve which will open when engine begins to fire. Adjust choke linkage so that choke valve is fully closed when choke button on instrument panel is pulled all the way out and wide open when choke button is pushed all the way in.

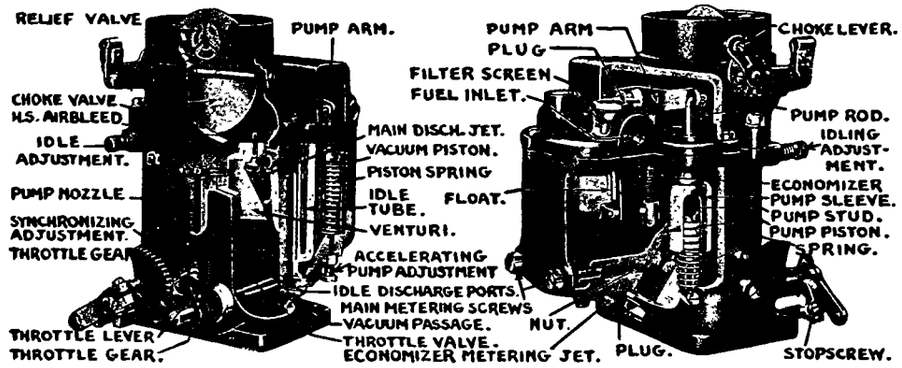
DD-3—CHRYSLER, IMPERIAL EIGHT MODEL CH (1932)
CHRYSLER CUSTOM IMPERIAL, MODEL CL (1932).
LINCOLN V-8 MODEL (1931). V8 MODEL (1932-33).
LINCOLN MODEL V12 (1932), V-12-145 (1933).
DDR-3—MARMON, SIXTEEN CYLINDER MODEL (1931-32-33).

TYPE:—Dual barrel plain tube downdraft type with vacuum controlled accelerating pump and economizer. There are two carburetor barrels with independent main metering jets, auxiliary jets (Lincoln), main discharge jets, throttle pump jets, throttle valves and idling adjustments. Throttle valves operate on separate shafts and are geared together so that both throttles are operated by a lever on one shaft (throttle valves will not require adjustment until factory setting has been tampered with). Main metering jets and auxiliary jets (when used) are located at bottom of float chamber and meter all fuel flowing to main discharge jets except for high speed or wide open throttle operation (when economizer will by-pass additional fuel). Main discharge jets are mounted at an angle in the venturi and are air bled by high speed air bleed tubes mounted vertically on the jets near the tip. Idle adjustments and accelerating pump adjustment are the only points requiring attention.

IDLING ADJUSTMENT:—Needle valve type operating on air. Engine must be thoroughly warmed up before idling adjustment is made. With engine warm and running, close throttle and allow engine to idle. Adjust inner idling adjusting screw (left hand) until fastest and smoothest running position is found (turn screw out until engine begins to hesitate or miss and then turn screw in until engine fires smoothly). Adjusting screws operate on air and should be turned out for leaner mixture and in for richer mixture. Adjust outer or right hand idling adjustment screw controlling the other carburetor barrel similarly. If necessary readjust inner idling screw slightly to secure smooth running. Idling adjustments should be set slightly rich. Correct idling adjustment cannot be secured if throttles are not synchronized. If engine does not fire smoothly with both idling adjustments correctly set, the adjusting screw on the right hand barrel throttle shaft should be turned clockwise to open right hand barrel throttle valve, or counter-clockwise to close throttle valve (relative to throttle valve in left hand barrel). It will not be necessary to change this adjustment unless factory setting has been tampered with. After idling setting has been completed, adjust throttle lever stop screw, if necessary, for correct idling speed.

On engines with two ignition coils where ignition for four cylinders or one bank of 'V' type engines is provided by one coil, ignition can be cut off for the cylinders fed by one carburetor barrel by disconnecting one coil primary lead or grounding the coil high tension lead to the engine block. The engine will then idle on the remaining cylinders fed by the second carburetor barrel and the idling adjustment for this barrel can then be made. After each carburetor barrel has been adjusted in this manner, engine should be idled on all cylinders and any necessary readjustment made to secure smooth running.

If correct idling adjustment cannot be secured, remove idle discharge plugs and blow out idle ports with compressed air. Idling tubes can also be removed and cleaned with compressed air if carburetor is disassembled.



HIGH SPEED ADJUSTMENT AND ECONOMIZER:—All fuel for speeds up to approximately 60 M.P.H. is metered by main metering jet or main metering jet and auxiliary jets on Lincoln. Jets are of the 'fixed' type and are not adjustable. Jet size is stamped on outer face of jet in decimal fractions of an inch. Jet sizes should be changed only to compensate for fuel changes or operating conditions, such as high altitude. Lincoln jets have been changed in service and on some models main metering jet is plugged and all fuel is metered by auxiliary jets in bottom of float chamber (see Lincoln Specifications below).

At car speeds up to approximately 60 M.P.H. economizer needle plunger is held against its seat by the tension of the spring on the plunger so that no fuel can flow through by-pass jet (economizer restriction) and all fuel for main discharge jets is metered by main metering jets and auxiliary jets. At speeds above 60 M.P.H. or with wide open throttle, the drop in vacuum in the vacuum piston chamber will allow the vacuum piston spring to force the piston up, depressing the economizer needle plunger, opening the economizer valve and permitting additional fuel to flow through the by-pass jet to the main discharge jets. Economizer is not adjustable.

ACCELERATING PUMP:—Accelerating pump design and operation is exactly the same as on 'D' type carburetors (see article on DX-3 Carburetor) except on Marmon Model DDR-3, where accelerating pump is positively connected to throttle shaft lever. Pump capacity in cubic centimeters (cc.) per 10 strokes is given in table below:

Car Model	Carburetor	Pump Capacity	Pump Stroke
Chrysler CH, CL	DD-3	20 cc.	23/64"
Lincoln V-8	DD-3	25 cc.	23/64"
Lincoln V-12	DD-3	22 cc.	23/64"
Marmon 16	DDR-3	25 cc.	¾"

Adjustment:—For all DD Carburetors. Accelerating pump stroke is adjustable by means of an adjusting screw and lock nut on the bottom of the vacuum piston housing. Pump stroke is set for normal operating conditions at the factory. To increase pump stroke for cold weather operation, loosen lock nut and turn adjusting screw down or counter-clockwise. To decrease pump stroke for hot weather, loosen lock nut and turn adjusting screw up or clockwise. Tighten lock nut after making adjustment. To check pump setting, run engine at idling speed with retarded spark, open throttle quickly and note engine performance. If engine hesitates, pump stroke should be increased by turning adjusting screw down slightly. If engine stumbles in picking up speed, pump stroke should be decreased by turning adjusting screw up slightly. In making this adjustment, adjusting screw should be changed one turn at a time and setting checked. A more satisfactory test can be made by running the car in high gear on a level road at approximately 5 M.P.H. and noting performance when quickly accelerated.

FLOAT LEVEL:—Fuel level in float bowl is set exactly 1" below top edge of float chamber on Chrysler models. To check float level with carburetor disassembled, measure distance from gasket seat on float bowl cover (with gasket removed) to the top of the float at the center. Correct setting should be 13/32" (Chrysler) or 15/32" (Lincoln). Float level can be corrected by bending float lever at the corner between the float and the needle valve.

CHOKE:—Choke valve is fitted with a relief poppet valve which opens when engine begins to fire. Choke linkage should be adjusted so that choke valve is fully closed with choke button on instrument panel pulled all the way out and wide open with choke button pushed all the way in.

LINCOLN SPECIFICATIONS:—On 1931 Lincoln carburetors main metering jet size was changed from .043 to .030. The Lincoln factory advised that on early carburetors (marked .043) where trouble was experienced, the hole in end of the main metering jets should be closed with solder and the auxiliary jets changed from .070 to .054 (auxiliary jets are located in the bottom of float chamber under float). Main discharge jet plugs were also replaced with a plug having a tube extending down into the well. This change was made by replacing the retainer plug with one threaded on the inside so that the main discharge jet tube could be screwed in place. These tubes were drilled with a #60 hole on the side directly below the threaded end. First cars equipped with the discharge jet tubes did not have this hole and these tubes should be replaced where vapor lock is experienced. Lincoln Part Nos. for these parts are as follows:

Main Discharge Jet Retainer Plug.....Part K-2222—2 required.
Main Discharge Jet Tube (#60 hole).....Part K-2223—2 required.
Auxiliary Metering Jet (Size .054).....Part K-2189—2 required.

On 1932 Lincoln models the carburetor used on the V-8 engine is equipped with main metering jets and auxiliary jets in the bottom of the float chamber. On the V-12 model the main metering jets are replaced with blank plugs (not marked) and all fuel is metered through the auxiliary jets (called main metering jets).

EX-2—AUBURN TWELVE, MODEL 12-160 (1932).
AUBURN TWELVE, MODEL 12-161 (1933).
AUBURN TWELVE, MODEL 12-165 (1933).

TYPE:—Twin installation consisting of two single barrel, downdraft, plain tube carburetors with inter-connected throttle and choke controls. Each carburetor supplies one bank of the 'V' type engine. Carburetors are similar to other 'E' type carburetors in design, operation and adjustment except that throttles must be synchronized as part of idle adjustment and choke control must be adjusted so that both choke valves open and close together.

IDLE ADJUSTMENT:—Throttle shaft connecting throttles of right and left hand carburetors is provided with an adjustment so that throttles can be synchronized. This is part of idling adjustment. Engines must be warmed up before idling adjustment is made. With engine warm and running, close throttle, disconnect primary lead of coil supplying ignition for right hand cylinder bank (or ground high tension lead to engine), adjust throttle lever stop screw of left hand carburetor so that engine idles somewhat fast, unlock adjusting screw at right hand end of throttle connecting shaft, back out adjusting screw and throttle lever stop screw of right hand carburetor until throttle valve of right hand carburetor is closed, then adjust idling adjusting screw of left hand carburetor by turning screw in or out until smoothest running position is found. Idling screw operates on fuel mixture and should be turned in to secure leaner mixture and out for richer mixture. Then unlock adjusting screw at left hand end of throttle connecting shaft and turn screw out until compression of spring under this screw is sufficient to hold right hand carburetor throttle valve closed, lock adjusting screw. Connect ignition for right hand cylinder bank and disconnect ignition for left hand bank. Adjust throttle lever stop screw of right hand carburetor for correct engine speed, adjust idling screw of right hand carburetor by turning screw in or out until smoothest running position is found. Then turn up adjusting screw at right hand end of connecting shaft until it just touches the throttle lever. Note speed of right hand cylinder bank, cut off ignition for right hand bank, connect ignition for left hand bank and note idling speed. If speed is not the same for both banks this should be equalized by turning throttle lever stop screws on each carburetor, being careful that the adjusting screw at the right hand end of the connecting shaft is in contact with the throttle lever at all times. After adjustment is completed this screw should be locked.

1933 Auburn Model 12-165. On this model a new type throttle connecting shaft is used consisting of an independently mounted cross shaft connected to the throttle valve of each carburetor through a short adjustable rod with ball and socket connections. On this type throttles are synchronized by increasing or decreasing the length of the left hand rod (adjusting the idle for each bank separately as above).

HIGH SPEED ADJUSTMENT AND ECONOMIZER:—Metering jets are of the 'fixed' type and are not adjustable. See Stromberg Jet Specification table for standard jet sizes. Jets should be changed only to compensate for special operating conditions such as high altitudes or special fuels.

Economizer is built in lower end of accelerating pump and is operated by pump piston as in other 'E' type carburetors. Economizer should not require adjustment but setting can be checked by noting throttle opening at instant pump piston rests on seat of economizer by-pass jet (less over-travel). Throttle opening should be 3/8". Check by inserting 3/8" drill rod between edge of throttle valve and carburetor wall. Pump must be set for maximum stroke.

ACCELERATING PUMP:—Similar in design and operation to pump used on other 'E' type carburetors. Throttle shaft lever has two holes for engagement of pump rod to provide for varied pump stroke. Pump rod should be connected in inner hole (shorter radius) providing shorter pump stroke for normal temperatures or summer operation. Outer hole (longer radius) providing maximum pump stroke should be used for winter operation.

Pump capacity should be 11-14 cubic centimeters for 10 strokes with pump set for maximum stroke (winter setting).

FLOAT LEVEL:—Fuel level in float chamber is set at exactly 9/16" below top edge of float bowl with gasket removed. Float level can be changed to correct fuel level by bending float lever at the point where it is connected to the float.

CHOKE:—Choke valves must be synchronized so that they open and close together. With choke valves wide open and choke control button pushed in toward dash, connect choke control operating wire securely to each choke valve lever. Pull out control button to limit of travel and see if both choke valves are closed tightly. If one valve is not closed, loosen the clamp screw, close choke valve tightly and tighten screw.

EX-2—PIERCE ARROW 12, MODELS 51, 52, 53 (1932).
EX-32—PIERCE ARROW 12, MODELS 1236, 42, 47 (1933), 1240A, 48A (1934), 1245, 55 (1935), 1602, 3 (1936), 1702, 3 (1937), 1802, 3 (1938).

This is a double installation with one carburetor being used for each cylinder bank (Twelve cylinder, Vee type engine). Carburetors are fitted with Fast Idles and Automatic Choke.

TYPE:—Single barrel, plain tube, downdraft type. Design and operation entirely similar to other 'E' type carburetors. Special adjustment instructions are necessary in order to equalize idle setting and idle speed on each carburetor and to synchronize throttle valves and choke valves. Complete directions are given below. Engine must be warmed up so that choke valve is wide open and engine idling at hot or slow idling speed when adjusting.

IDLING ADJUSTMENT:—Adjust one carburetor at a time. Cut out the six cylinders of the other bank by grounding the high tension lead of the coil firing that bank. Idle adjustment screw controls fuel mixture (turn screw in or clockwise for leaner mixture, out or counter-clockwise for richer mixture). Turn adjusting screw on carburetor feeding cylinders which are firing in or out until engine fires smoothly. Then check idling speed by taking out plug in exhaust manifold and counting explosions or form small gap by disconnecting one high tension lead at spark plug and count sparks. Adjust throttle lever stopscrew so that there are 37-39 explosions in 15 seconds. Recheck idling adjusting screw setting (this must be reset if idling speed has been changed). After adjusting each carburetor for smoothest firing position of idling screw and correct idling speed of 37-39 explosions in 15 seconds, connect both coils, idle engine on all twelve cylinders and check throttle valve synchronization.

Throttle Valve Synchronization—Use mercury tube equalizing gauge, Pierce Arrow Part #HMJ-477, or pull throttle open slightly and note whether both throttle valves leave the idle stop at the same instant. If they do not, turn the adjusting screw located on the upper right hand side of the cross shaft connecting the two carburetor throttle valves in or out until throttles open simultaneously (if throttles do not open together the increased tension on the rod as the second throttle begins to open can be felt.

HIGH SPEED ADJUSTMENT AND ECONOMIZER:—Metering jets are of the fixed type and are not adjustable. See Stromberg Jet Specification Table.

Economizer is built in lower end of accelerating pump and is operated by pump piston as in other 'E' type carburetors. Economizer should not require adjustment but setting can be checked by noting throttle opening at point where pump piston rests on seat of economizer by-pass jet (less over-travel). Check by inserting drill rod of size noted in table below between throttle valve edge and carburetor wall. Pump must be set for maximum stroke.

Carburetor Model	Economizer Setting
EX-2	3/8"
EX-32	27/64"

Adjustment—Take out cotter pin and turn adjusting nut at top of pump piston stem. See that cotter pin replaced to lock adjustment.

ACCELERATING PUMP:—Adjustable in usual manner by shifting pump rod to inner or outer hole in throttle valve lever. Use inner hole for normal summer temperatures and outer hole, providing maximum pump stroke, for winter temperatures. See tune up instructions on car model page for recommended settings. Pump capacity in cc. per 10 strokes with pump set for maximum or minimum stroke is noted below.

Carburetor	Pump Capacity	Pump Setting
EX-2	11-14 cc	Maximum
EX-32	12-14 cc	Minimum

FLOAT LEVEL:—Fuel level in float bowl is set at 9/16" below top edge of bowl. Adjustable by bending lever at point where it is attached to the float.

Needle Valve & Seat Assembly:—Furnished only as matched sets.

Carburetor	Part Number	Size
EX-2	P-17237	.130"
EX-32	P-18913-K	.113"

CHOKE:—Type 'C' automatic choke control is used (see separate article). Choke valve fitted with relief poppet valve to prevent over-choking. Check choke valves to see that both valves are fully closed for cold starting (if one valve is not closed, loosen clampscrew, close valve, tighten clampscrew).

THROTTLE VALVE SETTING:—Throttle valve type and setting shown in table below. Upper lip of throttle valve should be this distance below lower edge of upper idle port with valve fully closed.

Carburetor	Throttle Valve	Setting
EX-2	P-6454—18½°	.012"
EX-32	P-5436—20°	.012"

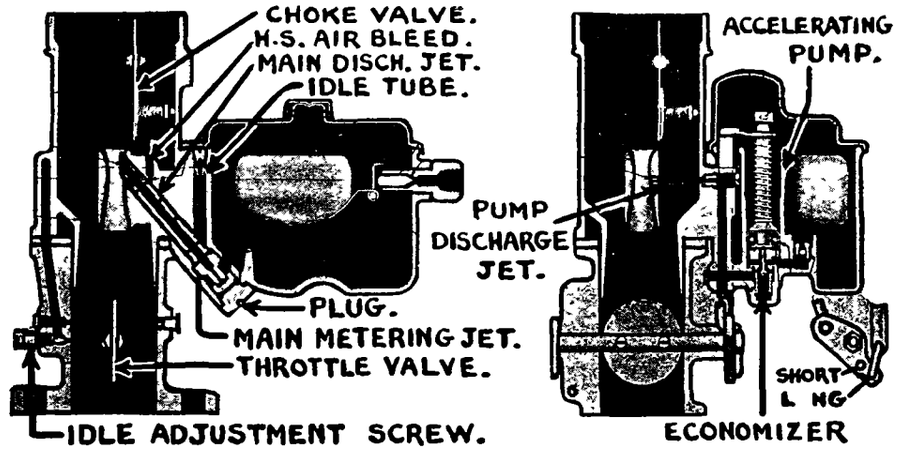
REO FLYING CLD., MODELS S-2, 3, 4 (1932-33-34), ROYALE S-7 (1935).

NOTE:—Where Automatic Chokes or any type fast-idle mechanism is used, see separate articles for complete data. In all cases where fast-idle mechanisms are used, carburetor adjustments should not be made until engine is thoroughly warmed up and idling speed has returned to hot or 'slow' idle with choke valve wide open. Adjustments on the Supercharged Auburn and Graham models are made in same manner as on other car models.

TYPE:—Plain tube downdraft type with positively operated accelerating pump and economizer (connected to throttle valve). Main discharge jet is located at an angle in the venturi and is air bled by means of an air bleed hole drilled in the auxiliary venturi support. Main metering jet is located directly under main discharge jet and meters all fuel for discharge jet. Accelerating pump and economizer discharge fuel into mixing chamber through pump discharge nozzle located within primary venturi. Idling adjustment and accelerating pump adjustment (summer and winter setting) are the only points requiring attention.

IDLING ADJUSTMENT:—Needle valve type controlling fuel mixture (screw turned in for leaner mixture and out for richer mixture). Engine must be thoroughly warm and idling at slow or hot idle speed with choke valve wide open when adjustments are made. With engine warm, close throttle, adjust throttle lever stopscrew until engine speed is approximately 6-7 M.P.H. Turn idling adjustment screw in or clockwise until engine lags or fires irregularly, turn screw out until engine begins to roll, then turn screw in slowly until engine fires smoothly and speed is at maximum. Check idling speed, and, if necessary, readjust throttle stopscrew. See tune-up data on each car model page for complete instructions.



NOTE:—There are two idling ports, an upper idling port (for low speed) above the throttle valve, and a lower port (for idling with closed throttle) below the throttle valve. The idling adjusting screw controls the fuel mixture supply for the lower port. If correct idling adjustment cannot be secured or if low speed operation is unsatisfactory, take out idling adjustment screw and upper idling port plug and blow out ports with compressed air. The idle tube located in the carburetor body can also be taken out and cleaned with compressed air.

HIGH SPEED ADJUSTMENT AND ECONOMIZER:—Main metering jet which meters all fuel for main discharge jet is of the 'fixed' type and is not adjustable. Jets should not be changed except for special fuels or to compensate for special operating conditions such as high altitude (permanent operation at elevations greater than 3000 feet). See table at end of Stromberg section for standard jet calibration.

Economizer is built in lower end of accelerating pump and is operated by pump piston. At speeds above 60 M.P.H. or with wide open throttle, economizer needle valve pin will be forced down, opening the economizer valve, and allowing additional fuel to flow through the valve and be discharged into the mixing chamber through the pump discharge nozzle. Economizer is correctly set at the factory and the adjustment should not be changed. If carburetor is disassembled, the position of the adjustment nut (at upper end of pump piston rod) should be noted so that adjustment will not be changed when pump is reassembled. Economizer setting can be checked by noting throttle valve opening when pump piston rests on by-pass valve seat (less over-travel) with pump set for maximum stroke. Check throttle opening by placing a 3/8" drill (EX-22), 27/64" drill (EX-32) between throttle valve edge and carburetor wall. Exceptions to these standard settings are given in table below:

Car Model	Carburetor	Economizer Setting	Pump Setting
Graham Six 74	EX-22	11/32"	Max.
Nash 9-70, 1060	E-2	3/8"	Max.
Nash 3540, 3640	EX-22	23/64"	Max.
Oldsmobile F-32	EC-2	11/32"	Max.
Oldsmobile F-33	EC-22	7/16"	Max.
Oldsmobile F-34, F-35	EX-22	27/64"	Max.
Reo S-1	EX-2	11/32"	Max.

Adjustment—Take out cotter pin in adjusting nut at top of pump piston stem, turn nut, see that cotter pin replaced to lock adjustment.

ACCELERATING PUMP:—Accelerating pump piston rod is connected to a pump operating rod under float cover (pump in float bowl). On the upstroke of the pump piston gasoline is drawn from the float chamber through the pump check valve into the pump chamber. On the downstroke of the piston when the throttle is opened, this fuel is forced out through the economizer needle valve and discharged through the pump discharge nozzle into the mixing chamber. The closing of the check valve prevents fuel flowing back into the float chamber. When the throttle is held open the economizer needle valve is opened by the pump piston and additional fuel is discharged through the pump nozzle. This fuel is metered by the pump discharge nozzle. Standard pump capacity is 19-21 cubic centimeters per 10 strokes with pump set for maximum stroke. Exceptions to this standard capacity are shown in table below. Letter 'S' indicates that pump should be operated slowly.

Car Model	Carburetor	Pump Capacity	Pump Setting
Auburn 653, 654	EX-22	17-19 cc.	Max.
Chrysler CO, CU, CZ, C-1	EX 32	17-19 cc.	Max.
Dodge DP	EX-22	17-19 cc.	Max.
Dodge DR, DS	EX-22	12-14 cc.	Medium
Dodge DU	EX-22	15-19 cc. (S)	Medium
Graham 68, 74	EX-22	17-19 cc.	Max.
Graham 67, 69, 75	EX-32	20-25 cc.	Max.
Nash 9-70, 10-60	E-2	11-14 cc.	Max.
Nash 11-30, 12-20, 3520	EX-22, 32	17-19 cc.	Max.
Nash 3540, 3640	EX-22	18-22 cc.	Max.
Nash 3620	EX-32	17-19 cc.	Max.
Nash 3720	EX-32	13-17 cc. (S)	Min.
Oldsmobile F-32	EC-2	13 cc.	—
Oldsmobile F-34	EX-22	13-15 cc.	Max.
Oldsmobile F-35	EX-22	13-15 cc. (S)	min.
Reo S-1	EX-2	20-23 cc.	Max.
Reo S-2, 3, 4, 7	EX-32	17-19 cc.	Max.
Studebaker 56	EX-22	17-19 cc.	Max.

E-2, EC-2, EC-22, EX-2, EX-22, EX-32 CONT.

Adjustment—Throttle lever has two or three holes for engagement of pump rod link to provide minimum (inner hole), medium (center hole), maximum (outer hole) stroke. See tune-up data on car model page for recommended settings and changes for seasonal requirements.

FLOAT LEVEL:—Fuel level in float bowl (distance from surface of fuel to top edge or gasket seat on bowl) is set at the factory at 9/16" (E, EC, EX-2, (EX-32), 5/8" (EX-22). Exceptions to these standard settings are given in table below. Float height can be changed to correct fuel level by bending float lever at the point where it is attached to the float.

Car Model	Carburetor	Fuel Level
Auburn 850X, 851, 852	EX-32	5/8"
Chrysler CU	EX-32	5/8"
Chrysler CZ, C1	EX-32	5/8"
Hupmobile 417-W, 517-W	EX-32	5/8"
Hupmobile 421-J, 521-J	EX-32	5/8"
Nash Six 1220, 3520	EX-32	5/8"
Nash 3720	EX-32	3/4"
Oldsmobile F-35	EX-32 (second type)	19/32"

THROTTLE VALVE SETTING:—When installing throttle valves, see that "setting" shown in table below (distance from upper lip of throttle valve to lower edge of upper idle port) is correct with throttle valve tightly closed.

Car Model	Carburetor	Throttle Valve	Setting
Auburn Six	EX-22	P-6454—18½°	.012"
Auburn Eight	EX-32	P-5436—20°	.012"
Chrysler (all)	EX-32	P-5436—20°	.012"
Dodge (all)	EX-22	P-6454—20°	.018"
Graham	EX-22	P-6454—20°	.018"
Graham	EX-32	P-5436—20°	.012"
Hupmobile (all)	EX-32	P-5436—20°	.012"
Nash	E-2	P-6454—18½°	.012"
Nash	EX-22	P-6454—18½°	.012"
Nash	EX-32	P-5436—20°	.012"
Oldsmobile	EC-2	P-6454—18½°	.012"
Oldsmobile	EC-22	P-6454—18½°	.012"
Oldsmobile	EX-22	P-6454—18½°	.018"
Reo	EX-2	P-6454—18½°	.012"
Reo	EX-32	P-5436—20°	.012"
Studebaker	EX-22	P-6454—18½°	.012"

NOTE—All Settings are plus or minus .004".

THROTTLE CRACKING DEVICE:—On some models a linkage between the throttle valve and choke valve is provided so that the throttle valve is opened slightly when the choke valve is completely closed. Adjust linkage to provide the throttle valve opening in table below with carburetor fully choked (wire drills should be inserted between throttle valve and carburetor wall, throttle valve closed against drill, linkage adjusted so that choke valve is completely closed).

Car Model	Carburetor Model	Throttle Opening
Graham Model 68	EX-22	.060" (#53 drill)
Graham Model 74	EX-22	.073" (#49 drill)
Graham Model 69, 75	EX-32	#52 drill (go) #48 drill (no go)

Auburn 654—Throttle stopscrew stop-cam pivoted above valve shaft. Should not require adjustment. See that stopscrew rests on high point of cam with choke valve fully closed.

Auburn Schgd. 852—Adjust linkage so that when choke valve fully closed, #52 drill may be passed between throttle valve edge and carburetor wall but #48 drill will be 'no go'.

CHOKE:—Valve is provided with a relief poppet valve which will open when engine begins to fire and will prevent over-choking. On cars with conventional choke control, see that choke linkage is adjusted so that choke valve is fully closed with choke button pulled all the way out and wide open with choke control button pushed all the way in.

SERVICE PARTS:—Gasket Sets—No. J-4182-G (E-2, EC-2, EX-2), J-4362-G (EC-22), J-4362-G (EX-22 except Auburn, Dodge DR, DS, DU), J-4533-G (EX-22—Auburn), J-4387-G (EX-22—Dodge DR, DS, DU), J-4364-G (EX-32 except Chrysler C1), J-4537-G (EX-32—Chrysler C1).

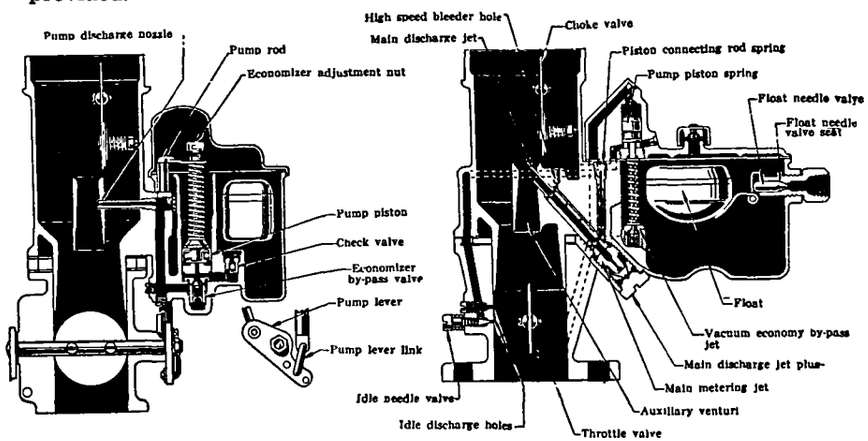
MODELS EXV-2, EXV-3

EXV-2—DODGE SIX, MODEL DU (1935).
DODGE SIX, MODELS D2 (1936), D5 (1937), D8 (1938)
GRAHAM SIX, MODEL 74 (1935).
EXV-3—CHRYSLER AIRSTREAM EIGHT, MODEL CZ (1935).
CHRYSLER AIRSTREAM EIGHT, MODEL C8 (1936).
CHRYSLER AIRFLOW EIGHT, MODEL C9 (1936).

NOTE:—Dodge 1937-38. Leaner metering jets for altitudes greater than 3000 ft. as follows: 5%—.057", 10%—.055", 15%—.054", 20%—.052". These leaner jets may be used at lower altitudes for greater fuel economy with material reduction in speed and power although this is not recommended by factory.

TYPE:—Plain tube downdraft type with positively actuated accelerating pump (connected to throttle lever) and vacuum controlled by-pass or economizer.

Fuel System (Idling & Low Speed):—Fuel for idling taken from main jet well up through idling tube which meters the fuel into cross channel in which it is mixed with air admitted through the Idle Air bleeder. From this cross channel fuel mixture is taken down through channel to discharge ports at throttle edge.



Driving Range:—As the throttle is opened, the idling system drops out and all fuel is discharged by the main discharge jet located directly above the main metering jet and discharging into the small auxiliary venturi. Main jet is air bled by the high speed air bleed passage drilled in the auxiliary venturi support directly above the discharge jet.

High Speed and Wide Open Throttle Running:—At speeds above 65 M.P.H. or whenever the throttle is held open, the drop in vacuum above the spring loaded vacuum piston allows the spring to force the piston down, opening the economizer by-pass valve, so that additional fuel metered by the by-pass jet flows to the main discharge jet.

IDLE ADJUSTMENT:—Adjusting screw controls fuel discharge from lower port and should be turned in for leaner mixture and out for richer mixture. Adjustment should not be made until engine is warmed up so that choke valve is wide open (automatic choke used). See tune-up data on car model page for complete adjustment instructions.

METERING JETS:—Main metering jet is non-adjustable fixed type and should be changed only for special operating conditions such as high altitudes (see Note above and Stromberg Jet Specification Table for standard jet calibrations).

ECONOMIZER:—Consists of by-pass valve and jet controlled by special vacuum piston with vacuum chamber connected through channel in carburetor body to manifold below throttle. By-passes fuel around main metering jet to main discharge jet for wide open throttle or high speed operation. No adjustment provided.

ACCELERATING PUMP:—Pump piston rod linked positively to throttle lever. Fuel is drawn into pump cylinder through check valve in intake channel from float bowl on upstroke of piston and is discharged through outlet (by-pass) valve to pump jet located in side of auxiliary venturi on downstroke of piston when throttle valve opened for acceleration. Pump capacity in cc. per 10 strokes when set for medium stroke (middle hole) and operated slowly is shown in table below.

Car Model	Carburetor	Pump Capacity
Dodge (all models)	EXV-2	15-19 cc.
Chrysler CZ ('35), C8, C9 ('36)	EXV-3	15-19 cc.
Graham 74 (1935)	EXV-2	10-14 cc.

MODELS EXV-2, EXV-3 CONT.

Adjustment—Throttle lever provided with three holes for engagement of pump rod link to provide varied pump stroke as follows: inner hole—minimum stroke; center hole—medium stroke; outer hole—maximum stroke. See tune-up data on car model page for recommended setting on each car model.

FLOAT LEVEL:—Fuel level in float bowl set at 5/8" below top edge or gasket seat of bowl. Float level can be changed to correct fuel level by bending lever at the point where it is attached to the float.

Needle Valve & Seat Assembly—Furnished only as matched sets. Type and size for each model as follows:

Model	Part No.	Size
EXV-2	P-20774	.093"
EXV-2 (Graham)	P-18916	.093"
EXV-3	P-20887	.101"

CHOKE:—Choke valve provided with relief poppet valve to prevent over-choking. When Sisson Automatic Choke used with this carburetor, see article in Carburetion Equipment Section for Automatic Choke adjustment.

THROTTLE CRACKER:—Graham Model 74—On this model, throttle lever stop-screw stop-cam is linked to choke valve so that throttle is opened to fast-idle position when carburetor is choked for starting. Linkage should not require adjustment. Throttle lever stopscrew should rest on high point of fast idle cam with throttle valve cracked open .073" when choke valve is fully closed.

THROTTLE VALVE SETTING:—Throttle valve type and setting (distance from top lip of valve to lower edge of upper idle port with valve closed) is shown in table below. Vacuum spark control hole should be flush with the upper lip of throttle valve or the distance shown in the table above the valve.

Carburetor	Throttle Valve Part No.	Setting	Vacuum Spark Hole Size	Location
EXV-2	P-6454—20°	.018"	#50	Flush
EXV-3	P-5436—20°	.012"	#50	Flush

SERVICE PARTS:—Gasket Set—J-4608G.

MODELS EX-23, E-33

EX-23—GRAHAM SPECIAL SIX, MODEL 73 (1935).
OLDSMOBILE SIX, MODEL F-34 (1934).
STUDEBAKER DICTATOR, MODELS 1A, 2A (1935). 3A, 4A (1936).
STUDEBAKER DICTATOR, MODELS 5A, 6A (1937).
E-33—STUDEBAKER COMMANDER, MODEL B (1934).

NOTE:—On Studebaker models, for increased fuel economy with slight performance loss, main metering jet may be replaced with one-size-smaller metering jet. The two-size-smaller jet should be used only for high altitude operation. See table below. Metering jet must be changed to smaller size as indicated whenever standard Copper-mesh type Air Cleaner is replaced by Heavy Duty Oil-bath type.

Model	Carburetor	Main Metering Jet Standard	1st Lean	2nd Lean
Comm. B (1934)	E-33	.061"	.059"	.057"
Dict. 1A, 2A ('35)	EX-23	.058"	.056"	.054"
Dict. 3A, 4A ('36)	EX-23	.058"	.056"	.054"
Dict. 5A, 6A ('37)†	EX-23	.057"	.056"	.054"
Dict. 5A, 6A ('37)‡	EX-23	.055"	.054"	.052"

†—Standard Air Cleaner. ‡—Heavy Duty Oil-Bath Air Cleaner.

This model is fitted with a built-in Automatic Choke (vacuum piston in throttle valve body, thermostatic spring coil mounted separately on manifold) and a Fast Idle. See separate article in 'Stromberg Automatic Choke and Integral Fast Idle' for complete data on these units.

TYPE:—Single barrel, plain tube, downdraft type. Design and operation entirely similar to other 'E' type carburetors except for Automatic Choke and Fast Idle mechanism. Engine must be warmed up so that choke valve is wide open and engine idling at slow or hot idling speed when adjustments are made. Fast Idle design requires that throttle be opened to 20 M.P.H. position before starting a cold engine in order to allow choke valve to close and Fast Idle mechanism to become operative.

IDLING ADJUSTMENT:—With engine warm and idling at slow or hot idling speed, set throttle lever stopscrew for 7-8 M.P.H. idling speed. Idle adjustment controls fuel mixture and should be turned in for leaner mixture or out for richer mixture. Turn screw in until engine begins to miss or run irregularly, turn screw out until engine begins to roll, then turn screw in slowly until engine fires smoothly and speed is at maximum. Check idling speed and, if necessary, readjust throttle stopscrew for 8 M.P.H. idling speed. See tune-up chart on car model page for specific instructions.

HIGH SPEED ADJUSTMENT AND ECONOMIZER:—Metering jets are of the 'fixed' type and are not adjustable. See Stromberg Jet Specification table for standard jet sizes. Jets should be changed only to compensate for special operating conditions such as high altitudes or special fuel.

Economizer is built in lower end of accelerating pump and is operated by pump piston. Economizer should not require adjustment but setting can be checked by noting throttle opening (insert a drill rod of proper size between edge of throttle valve and carburetor wall) when pump piston rests on economizer by-pass jet seat (less over-travel) with pump set for minimum or maximum stroke as noted.

Car Model	Carburetor	Economizer Setting	Pump Setting
Graham 73 (1935)	EX-23	3/8" drill	Maximum
Oldsmobile F-34 ('34)	EX-23	27/64" drill	Maximum
Studebaker Dict. ('35)	EX-23	3/8" drill	Maximum
Studebaker Dict. ('36)	EX-23	7/16" drill	Maximum
Studebaker Dict. ('37)	EX-23	7/16" drill	Maximum
Studebaker Comm. ('35)	E-33	7/32" drill	Minimum

Adjustment. Remove cotter pin in adjustment nut at upper end of pump piston stem, turn nut. Be sure that cotter pin replaced to lock adjustment. When dismantling pump for servicing, do not disturb this nut to avoid necessity of resetting Economizer.

ACCELERATING PUMP:—Similar in design to that used on other 'E' type carburetors. Fuel is drawn into pump chamber through intake ball check valve on upstroke of piston and is discharged through outlet (by-pass) valve and pump discharge nozzle opening into side of small auxiliary venturi when the throttle is opened for acceleration. Pump capacity in cc. per 10 strokes when pump is operated slowly is shown in table below. Pump should be set for maximum or minimum stroke, as noted, when making this test.

Car Model	Carburetor	Pump Capacity	Pump Setting
Graham Model 73	EX-23	17-19 cc.	Maximum
Oldsmobile F-34	EX-23	13-15 cc.	Maximum
Studebaker Dict. '35	EX-23	13-15 cc.	Maximum
Studebaker Dict. '36-37	EX-23	17-19 cc.	Medium
Studebaker Comm.	E-33	11-13 cc.	Minimum

Adjustment. Three holes provided in throttle valve lever for pump rod link engagement. Center hole providing medium stroke is normal setting. Inner hole provides minimum stroke and outer hole maximum stroke. See tune-up data on car model page for recommended settings.

FLOAT LEVEL:—Fuel level in float bowl with engine idling (3 lbs. pressure) is shown in table below. Float level can be changed to correct fuel level by bending float lever at the corner where it is attached to the float.

Car Model	Carburetor	Fuel Level
Graham Model 73	EX 23	5/8"
Oldsmobile F-34	EX-23	19/32"
Studebaker Dict.	EX-23	5/8"
Studebaker Comm.	E-33	3/4"

Needle Valve & Seat Assembly—Furnished only as matched sets. Assembly part number and size for each model as follows:

Model	Part Number	Size
EX-23 (Graham, Oldsmobile)	P-18916	.093"
E-33 (Studebaker Comm.)	P-18916	.093"
EX-23 (Studebaker Dict)	P-21518	.093"

CHOKE:—Choke valve fitted with poppet type relief valve. See article in Carburetion Equipment Section for complete data on the built-in Automatic Choke and integral Fast idle.

THROTTLE VALVE SETTING:—Throttle valve type and setting (distance from upper lip of valve to lower edge of upper idle discharge port with throttle valve fully closed shown in table below.

Car Model	Carburetor	Throttle Valve	Setting
Graham 73 (1935)	EX-23	P-6454-18½°	.018"
Oldsmobile F-34 ('34)	EX-23	P-6454-18½°	.018"
Studebaker Comm. ('35)	E-33	P-5436 -20°	.012"
Studebaker Dict. ('35-36)	EX-23	P-6454-18½°	.012"
Studebaker Dict. ('37)	EX-23	P-22673-18½°	.012"

STUDEBAKER PRESIDENT, MODELS 1C (1935), 2C (1936), 3C (1937)

NOTE:—1936 Ford—Carburetor changed in production from Ford Part No. 48-9510-D to Part No. 67-9510-A. This new carburetor has smaller main metering jet and venturi and gives better fuel economy. An additional model (Ford Part No. SE-67-9510) is available as optional equipment and has smaller main metering jet and venturi than regular 67-9510-A. This model intended for light work such as house-to-house delivery. See Stromberg Jet Specification table.

1937-38. Part numbers for carburetors used on '60' and '85' and service for which intended listed below. Carburetors with same prefix (52 or 67) are similar except for main metering jet size. See Stromberg Jet Specification Table

Service	'60' Models	'85' Models
Normal Altitudes	52-9510-B	67-9510-A
5000-10000 ft.	52-9510-C	67-9510-B
10000-15000 ft.	52-9510-D	67-9510-C
Over 15000 ft.	52-9510-E	67-9510-D

1938 Ford '85' & Lincoln Zephyr. Chandler-Groves dual carburetors also used on these models. See Chandler-Groves Carburetor article for data.

1939 Ford '60' Model. Chandler-Groves (Ford) carburetor used on some cars. See article on Chandler-Groves AA-1 Dual Carburetor for data.

Buick Model 40—The standard main metering screw (.048—Part No. 19442) must be replaced with slightly smaller (.044") metering jet when installing the optional Triplex Air Cleaner.

Nash Ambass. 3780—Smaller main metering jet used when optional Heavy duty Oil-bath Air Cleaner installed. Main metering jets should be changed when this cleaner installed in the field.

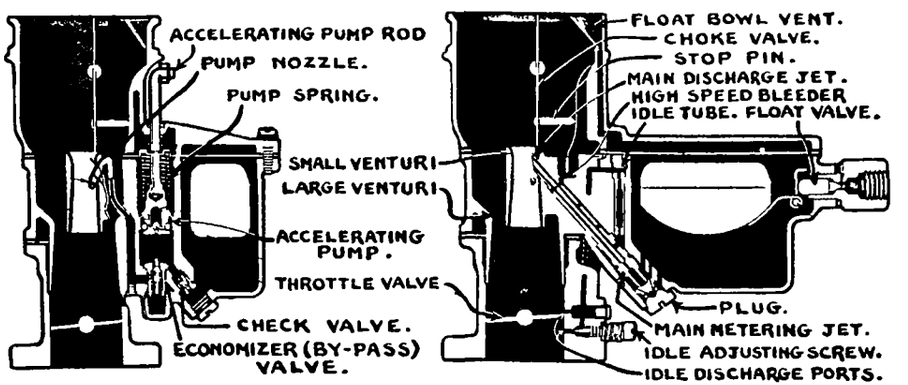
Studebaker 2C, 3C. For increased fuel economy with slight performance loss, standard main metering jet (.047"—Part No. P-19442) may be replaced by one-size-smaller (.045") metering jet. The two-size-smaller jet (.043") should be used only for high altitudes. Main metering jets for both carburetor barrels must be same size and should be replaced as a unit.

Automatic Chokes & Fast Idles—See separate article for data on these units

TYPE:—Duplex or dual barrel, plain tube, downdraft type. Similar in design to other 'E' type carburetors except that each carburetor barrel has independent main discharge jets, main metering jets, throttle valves and idling adjustments. Throttle valves are mounted on the same shaft and do not require synchronization. Accelerating pump is positively operated by the throttle lever through a 'walking beam' linkage on the carburetor body casting. Idling adjustment and accelerating pump adjustment (some models only) are the only points requiring attention.

IDLING ADJUSTMENT:—Needle valve type controlling fuel mixture. Adjusting screws control discharge through lower or closed throttle discharge ports below throttle valves (upper ports also discharge fuel when throttle is opened slightly) and should be turned in for leaner mixture or out for richer mixture. Engine must be warmed up when adjustments are made. With engine warm and idling with closed throttle (adjust throttle stopscrew, if necessary so that idle speed is approximately 5-7 MPH), adjust each idle adjusting screw in turn by turning screw in until engine begins to hesitate or miss, and out until engine begins to roll, and then turning screw in slowly until engine fires smoothly. Final setting should be approximately midway between the missing (lean) and rolling (rich) positions. After adjusting both screws, recheck idling speed. See tune-up data on car model pages for complete adjustment instructions on each car model.

NOTE—On Nash model, idle speed should be set not lower than 7 MPH., and if engine tends to stall when coasting (when cruising gear used continuously), speed can be advanced up to 9 MPH.



If correct idling adjustment cannot be secured, take out idling adjusting screws and upper idling port plugs and clean out idling ports with compressed air. The idling tubes located in the upper carburetor body can also be taken out and cleaned with compressed air.

METERING JETS:—Main metering jets (2 used) are non-adjustable fixed type and should be changed only for special operating conditions such as high altitudes. See Notes above for special recommendations and Stromberg Jet Specification Table for standard jet calibrations. Both main metering jets must be the same size and should be changed as a unit.

ECONOMIZER:—Built in lower end of the accelerating pump and is operated by the pump piston. At speeds above 65 M.P.H. or with wide open throttle, economizer needle valve is forced down, opening the economizer valve so that additional fuel flows through this valve and is discharged through the pump discharge nozzle. Economizer should not require attention but setting can be checked by noting throttle opening when pump piston contacts by-pass valve seat (economizer). Throttle valve opening at this point as checked by drill passed between throttle valve edge and carburetor wall is shown in table below.

Car Model	Economizer Setting
Auburn (all models)	21/64"
Buick 40 ('34-35-36)	21/64"
Ford (all models) EE-7/8 Carb.	9/32"
Ford (all models) EE-1 Carb.	5/16"
Lincoln Zephyr	15/32"
Nash (all models)	7/32"
Oldsmobile (all models)	21/64"
Studebaker (all models)	21/64"

Adjustment—No adjustment provided but pump arm (walking beam) may be bent slightly to correct economizer action.

ACCELERATING PUMP:—Accelerating pump is operated through a walking beam linkage by the throttle valve lever. Pump chamber is filled with fuel (flowing through check-valve) when throttle is closed. When the throttle is opened, this fuel is discharged through the pump discharge nozzle in each carburetor barrel. The check-valve prevents the fuel flowing back into the float bowl. When the throttle is held open, the pump piston opens the economizer by-pass valve so that fuel flows straight through the pump chamber to the discharge nozzles. No adjustment is ordinarily provided for the accelerating pump but on some models a summer and winter setting is provided (see adjustment below). Pump capacity in cc. per 10 strokes when operated slowly is shown in table below. Pump setting should be as indicated.

Car Model	Pump Capacity	Pump Setting
Auburn (all models)	17-21 cc	Maximum
Buick (all models)	18-22 cc	Not Adj.
Ford 1934-35-36	13-17 cc	Not Adj.
Ford '60' EE-7/8	9-13 c.c	Max.
Ford '85' EE-1	17-21 c.c	Max.
Lincoln Zephyr (1936-37)	18-22 cc	Not Adj.
Lincoln Zephyr (1938)	15-19 cc	Maximum
Nash (1935-37)	21-25 cc	Maximum
Nash-Lafayette 3910	23-27 cc	Minimum
Nash (1938)	10.5-21.5 c.c.	Max.
Oldsmobile (all models)	17-21 cc	Not Adj.
Studebaker (all models)	14-18 cc	Not Adj.

MODELS EE-7/8, EE-1 CONT.

Adjustment:—Two holes (ball studs on Ford and Lincoln Zephyr) provided on throttle lever for pump rod connection. Inner hole (short radius) provides minimum stroke, outer hole (long radius) maximum stroke. See tune up data on car model page for recommended setting and seasonal changes.

NOTE—First Ford carburetor not provided with accelerator pump adjustment.

FLOAT LEVEL:—Fuel level in float bowl set at 15/32" below top edge or gasket surface of bowl with 3 lbs. pressure (engine idling) for all models except as noted below. Float height can be changed to correct fuel level by bending float lever at the point where it is attached to the float.

Car Model	Carburetor	Fuel Level
Nash 35, 36, 37, 38-80	EE-1	½"

Needle Valve & Seat Assembly—Furnished only as matched sets. Assembly number for each model as follows:

Car Model	Part No.	Size
Auburn (all)	19867	.113"
Buick (all)	P-21659	.093"
Ford (all Carb.)	P-20287	.098"
Lincoln Zephyr	P-20287	.098"
Nash (all)	P-19867	.113"
Nash-Lafayette 3910	P-20256	.093"
Oldsmobile (all)	P-19867	.113"
Studebaker 1935-36	P-21519	.101"
Studebaker 1937	P-21519	.101"

CHOKE:—Choke valves offset type. Check hand choke controls to see that choke valve is fully closed when dash control button pulled and is wide open when control button pushed all the way in.

THROTTLE VALVE SETTING:—Throttle valves for all models are 5° type and should be set so that upper lip of valve is .030" plus or minus .004" below lower edge of upper idle port with throttle valve closed (all models except Oldsmobile 1935), .010" (Oldsmobile 1935). Vacuum port height above throttle valve should be .041" plus or minus .004" on Buick models. On Studebaker models, the two #50 vacuum ports should be flush with the throttle valve.

SERVICE PARTS:—**Gasket Set.** Part No. J-4780-G (Studebaker 1936-37), J-4383-G (Auburn, Ford '85', Lincoln Zephyr 1936-37, Nash 1935-36, Oldsmobile 1934, Studebaker 1935), J-4539-G (Nash 1937-38), J-4599-G (Buick), J-5334-G (Lincoln Zephyr 1938).

MODELS EE-14, EE-15, EE-25

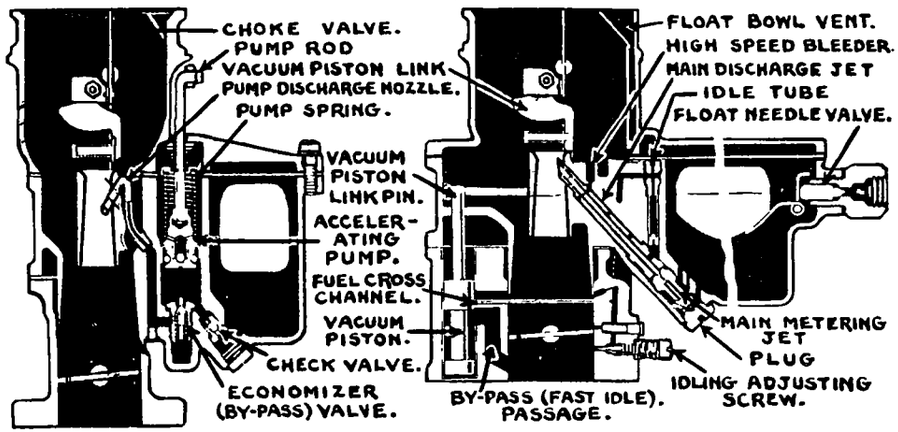
EE-14—GRAHAM EIGHT, MODEL 72 (1935)
PACKARD, MODELS 120 (1935), 120B (1936), 120C (1937)
PACKARD EIGHT, MODELS 1601, 1A, 2 (1938)
EE-15—CORD, MODELS 810 (1936), 812 (1937)
LA SALLE, MODELS 35-50 (1935), 36-50 (1936)
EE-25—CADILLAC V8, MODELS 36-60, 70, 75 (1936)

NOTE—These models fitted with an Automatic Choke (thermostatic coil mounted on manifold, vacuum piston built in carburetor body), and a new type Fast Idle incorporating a by-pass passage around the throttle valve controlled by the vacuum piston. See Fast Idle paragraph below and separate article on Automatic Choke for complete data. Engines must be warmed up so that choke valve is wide open and Fast Idle by-pass closed by vacuum piston when adjustments are made.

TYPE:—Duplex or dual barrel, plain tube, downdraft type. Similar in design to other EE type carburetors except for fast idle and choke control vacuum piston and by-pass passage (see note under Fast Idle paragraph for special directions necessary for disassembling carburetor to avoid damage to vacuum piston linkage). All specifications and adjustments for these models same as given for Model EE-1 (preceding article) except as noted below.

IDLE ADJUSTMENT:—Idle adjusting screw provided for each carburetor barrel. Operation and adjustment same as for EE-1 (previous article). See tune-up data on car model page for adjustment instructions on each car model.

FAST IDLE MECHANISM:—The vacuum piston in the cylinder in the carburetor body casting is linked to the choke valve. When the engine is cold, the vacuum piston is raised to the upper end of its stroke by the closing of the choke valve, so that the by-pass passage around the throttle valve is open and the cross channel from the idle fuel channel which terminates in the by-pass passage is uncovered. In this position an extra quantity of fuel mixture will be drawn from the idle fuel channel and discharged into the manifold below the throttle valve, providing a fast idle when the engine begins to fire. When vacuum builds up in the manifold, the vacuum piston will be drawn down until the side port in the piston is uncovered, admitting air into the cylinder below the piston and stopping the further movement. This partial stroke of the piston opens the choke valve slightly when the engine begins to fire but does not cut off the fuel mixture flow through the by-pass passage. As the engine warms up and the choke valve opens, the vacuum piston completes its stroke, cutting off the cross-channel and closing the by-pass passage so that fuel is supplied in the usual manner by the lower idling port (with throttle closed) and the upper idling port (when throttle is opened).



NOTE—In disassembling carburetor, when the air horn and float bowl cover is to be removed, take out cover screws, raise upper assembly straight up until the pin in the upper end of the vacuum piston is exposed, take out this pin. Upper assembly can then be removed. Do not disturb the nut at the upper end of the vacuum piston link (on choke valve bracket). This is set at the factory and must not be changed.

METERING JETS:—Main metering jets (2 used) are non-adjustable type and should be changed only for special operating conditions such as high altitudes. See Stromberg Jet Specification Table for standard jet calibration.

ECONOMIZER:—To check Economizer setting, check throttle valve opening with wire drill passed between edge of throttle valve and carburetor wall with throttle at point where pump piston contacts economizer by-pass valve seat less over-travel). Settings shown in table below (On Cadillac Model EE-25, pump rod must be engaged in end hole in pump lever). No adjustment provided but pump lever may be bent slightly to correct operation.

Car Model	Carburetor Model	Economizer Setting
Cadillac V8	EE-25	21/64"
Cord	EE-15	21/64"
Graham	EE-14	21/64"
La Salle 35-50	EE-15	9/32"
La Salle 36-50	EE-15	21/64"
Packard	EE-14	21/64"

ACCELERATOR PUMP:—Similar in design to type used on other EE carburetors. Fuel is drawn into pump chamber through intake ball check valve on upstroke of piston and discharged through outlet (by-pass) valve and pump discharge nozzle in auxiliary venturi on the downstroke of the piston when throttle valve opened for acceleration. Pump capacity in cc. per 10 strokes when operated slowly is shown in table below. No adjustment provided.

Car Model	Carburetor Model	Pump Capacity
Cadillac V8	EE-25	18-22 cc.
Cord	EE-15	17-21 cc.
Graham	EE-14	17-21 cc.
La Salle 35-50, 36-50	EE-15	15-19 cc.
Packard	EE-14	17-21 cc.

FLOAT LEVEL:—Fuel level in float bowl is 15/32" with 3 lbs. pressure (EE-14, EE-15), ⅝" with 5 lbs. pressure (EE-25) below top edge of bowl. Float height can be changed to correct fuel level by bending float lever at the point where it is attached to the float.

NOTE—See special instructions in note under Fast Idle section to avoid damaging vacuum piston linkage when removing float bowl cover.

Needle Valve & Seat Assembly—Furnished only as matched sets. Part number and size for each type as follows:

MODELS EE-14, EE-15, EE-25 CONT.

Model	Part Number	Size
EE-14 (Graham, Packard '35)	P-22090	113"
EE-14 (Packard 1936-37)	P-22089	101"
EE-14 (Packard 1938)	P-23509	101"

EE-15 (LaSalle 35-50)	P-19867	113"
EE-15 (LaSalle 36-50)	P-22487	113"
EE-25 (Cadillac)	P-19867	113"

CHOKE:—(EE-14)—Thermostatic spring coil mounted separately on manifold and linked to choke valve shaft lever by rod. See separate article for adjustments.

(EE-15, EE-25)—Thermostatic spring coil mounted on carburetor at end of choke valve shaft and liked directly to shaft. Spring coil controlled by electric heating coil in case which is connected to ignition switch. The 'Triple-Range' hand choke control is not used on Cord. See separate article for adjustments.

THROTTLE SETTING:—Throttle valve type and setting (distance from upper lip of throttle valve to lower edge of upper idle port with valve closed) shown in table below. Vacuum Spark Control Port location indicates height of lower edge of hole above throttle valve lip when closed.

Model	Throttle Valve Part No.	Throttle Valve Setting	Vacuum Spark Control Port Size	Vacuum Spark Control Port Location
EE-14 (Graham)	P-20720-5°	.030"	#58	.040"
EE-14 (Packard 1935)	P-20874-5°	.030"		
EE-14 (Packard 1936)	P-20874-5°	.020"		
EE-14 (Packard '37)	§P-20874-5°	.030"	#50	Flush
EE-14 (Packard '38)	‡P-23357-5°	.030"	#50	Flush
EE-15 (Cord)	P-19435-5°	.030"		
EE-15 (LaSalle)	(†) P-20720-5°	.010"	#58	.041"
EE-25 (Cadillac)	P-19850-5°	.030"	#56	.031"

(†)—Throttle valve has #53 hole. Vacuum spark control used only in 1936.
(§)—Right hand only. Left hand throttle valve P-22735-5°.
(‡)—Right hand only. Left hand throttle valve P-23347-5°.

SERVICE PARTS:—Gasket Set—J-4540G (EE-14, EE-15), J-4609G (EE-25).

MODEL EE-16

A-18341—PACKARD '120' EIGHT, MODELS 1701, 1A, 2 (1939)

THROTTLE GUARD NOTE:—All cars with Overdrive Transmission fitted with vacuum diaphragm type throttle guard designed to prevent engine stalling when free-wheeling in the 0-20 MPH. range. See separate article for complete Throttle Guard adjusting and servicing data.

TYPE:—Duplex or dual barrel, plain tube, downdraft type similar in design to 'EE' carburetor used on previous Packard model except for entirely new design Automatic Choke and Fast Idle as follows:

Automatic Choke—Thermostatic coil and vacuum piston type with assembly mounted directly on carburetor air horn and linked to choke valve lever within choke housing (no external linkage used as on previous model). Thermostat actuated by exhaust manifold heat through external heat tube connected between thermostat cover and hot air stove on manifold.

Fast Idle—Consists of a special stepped fast idle cam linked to the choke valve and serving as a stop for the fast idle lever adjusting screw (on opposite end of throttle shaft from regular throttle lever and stopscrew which regulates hot or slow idling speed).

IDLING ADJUSTMENT:—Adjust only with engine warm so that Automatic Choke and Fast Idle inoperative (choke valve wide open, fast idle screw on lowest step of fast idle cam) and engine idling at hot or slow idling speed. Make certain that some clearance exists between fast idle adjusting screw and fast idle cam (on opposite end of throttle shaft from idling speed adjusting screw). Set throttle lever stopscrew for correct 6 MPH. idling speed. Turn idling adjusting screw for each carburetor barrel (both screws must be adjusted alike) in for leaner mixture or out for richer mixture. These screws control fuel discharge from lower (closed throttle) idling ports. Recheck idling speed adjustment. See car model tune up page for complete adjustment instructions. Check Fast Idle setting (below).

METERING JETS:—Main metering jets are non-adjustable type located under plug at lower end of each discharge jet. Jets should be changed only for special operating conditions such as high altitudes. See Stromberg Jet Specification table for complete jet data.

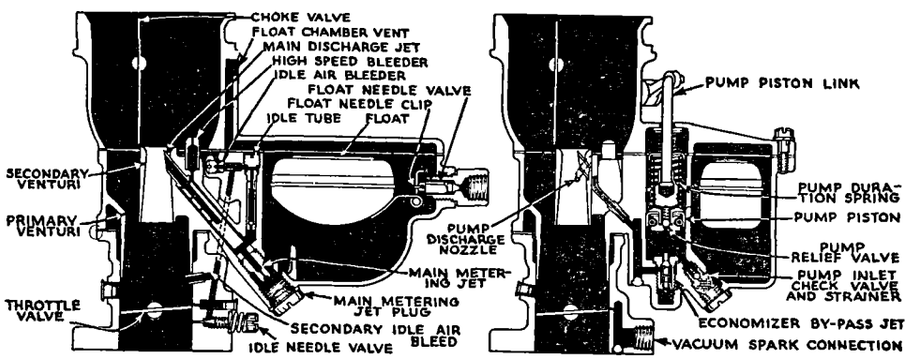
ECONOMIZER:—By-pass valve and jet located at bottom of pump cylinder which is operated by pump piston so as to permit continuous discharge from pump nozzle when throttle valve is wide open. Should not require attention but setting can be checked by noting throttle opening when pump piston rests on by-pass valve seat (less over-travel). Throttle opening should be 7/32" (plus or minus 1/64"). Check by inserting drill rod of correct size between throttle valve edge and carburetor wall.

Adjustment—Loosen locknut and turn adjusting clevis on pump rod (linking throttle lever and pump 'walking beam') slightly.

ACCELERATING PUMP:—Similar to design used on previous 'EE' carburetors with spring-loaded relief valve in piston head and duration spring on rod above piston (light spring above duration spring is dust washer retainer). A strainer screen has been added below the intake check valve (see Note below).

Capacity—17-21 cc. (slow), 11-15 cc. (Fast) per 10 strokes of the pump.

Adjustment—No adjustment provided.



Pumping Servicing Note—Strainer screen located in plug below pump intake check valve should be removed and cleaned frequently to insure satisfactory pump operation.

FAST IDLE & CHOKE RELEASE:—Check and adjust as directed below. See article in Carburetion Equipment Section for complete servicing directions.

Fast Idle Speed—With throttle lever stopscrew set for correct hot or slow idle speed of 6 MPH., turn fast idle adjusting screw (on fast idle lever—do not confuse this screw with throttle lever stopscrew on opposite end of throttle valve shaft) in until it just contacts lowest step of fast idle cam, being careful not to exert pressure on screw or fast idle lever, then back screw out exactly ½ turn.

Fast Idle Setting—After setting both slow idle speed (throttle lever stopscrew adjustment) and fast idle speed (fast idle adjusting screw adjustment above), see that choke valve is wide open and close throttle valve completely so that throttle stopscrew is against stop on body. Hold throttle valve in this position and close valve by hand until fast idle screw strikes step on fast idle cam (do not force choke valve beyond this position which will bind fast idle rod or distort fast idle cam spring). Measure choke valve opening at this point by inserting drill rod between upper edge of valve and air horn wall. Opening should be 35/64". Adjust by bending fast idle rod at elbow near upper end.

Choke Release—Open throttle to wide open position so that choke valve is opened by ear on fast idle lever which contacts lug on fast idle cam. Measure choke valve opening by inserting drill rod between valve edge and air horn wall. Distance should be .156-.187" (11/64" drill). Adjust by bending ear on fast idle lever using extreme care not to damage fast idle rod and fast idle cam spring.

FLOAT LEVEL:—Fuel Level—Should be 15/32" below top edge of float bowl with engine running idling. Adjust by bending float lever arm at point where it is attached to the float.

Float Needle Valve & Seat—Part No. P-23509. Furnished only in matched sets. When installing assembly make certain that needle valve has one corner down and is clipped to float lever.

Float Bowl Vent—Bowl vented to atmosphere through opening on side of air horn wall directly below air cleaner collar.

THROTTLE VALVE SETTING:—Throttle valves are No. P-23347 (Left), P-23357 (Right) 5° type. To check throttle valve setting, back off throttle stopscrew so that valves are tightly closed, measure distance from upper edge of throttle valve to lower edge of upper idle port. Should be .030" plus or minus .004".

CHOKE:—Stromberg automatic integral type. See article in Carburetion Equipment Section for complete servicing directions.

Choke Setting—Inverted 'V' mark on thermostat cover scale should coincide with reference mark on top of choke housing. To adjust, loosen three cover screws and rotate thermostat cover assembly.

CAUTION—When connecting heat tube to thermostat cover, do not use excessive pressure which may rotate cover and change setting.

PIERCE ARROW EIGHT, 1601 ('36), 1701 ('37), 1801 ('38)
STUTZ, MODEL DV-32 (1932-33-34)

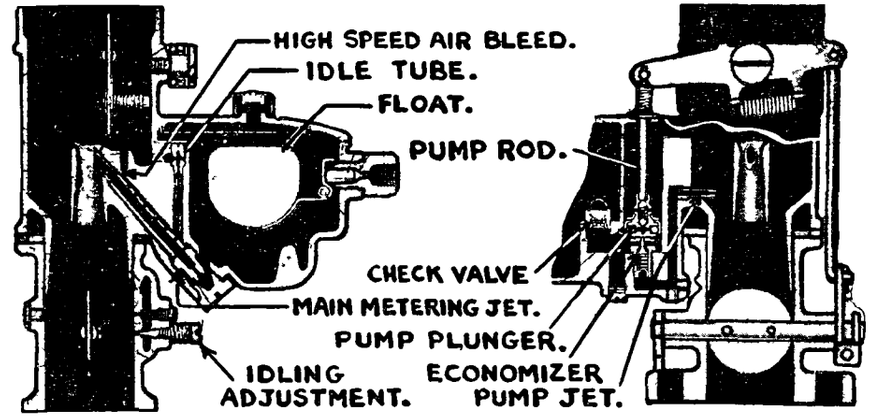
NOTE:—On Buick models, standard main metering jets (.052"—Part No. P-17004) must be replaced by smaller (.051") jets when optional Triplex Air Cleaner is installed.

SPECIAL SERVICE NOTES:—**Packard Twelve.** On early 1938 and all previous 12 cylinder models, idling performance can be improved by installing tapered 3° shim Part No. 242311 between carburetor and manifold so that carburetor float bowl is level. Install shim with thin end toward radiator with gasket No. 242312 on top and bottom of shim. All cars after Engine No. A-600166 have carburetor flange on manifold machined at an angle to secure this effect.

TYPE:—**Dual barrel plain tube downdraft type. These models are similar in design to other 'E' type carburetors except that each carburetor barrel has independent main discharge jets, main metering jets, throttle valves and idling adjustments. Throttle valves are mounted on a single shaft and will not require synchronization. Accelerating pump is positively operated by the throttle through a 'walking beam' connection mounted on the carburetor upper body. Idling adjustment and accelerating pump adjustment (summer and winter setting) are the only points requiring attention.**

NOTE—Some models are fitted with Automatic Chokes and Fast Idles. See separate articles for complete data on Stromberg Fast Idles and Type 'C' Automatic Choke, and Sisson Automatic Choke. On these models engines must be thoroughly warmed up so that choke valve is wide open and engine idling at slow or hot idling speed when adjustments are made.

IDLING ADJUSTMENT:—Two needle valves controlling fuel mixture. Engine must be thoroughly warmed up before idling adjustment is made. With engine warm and running, close throttle and allow engine to idle. Adjust inner (left hand) idling adjustment screw for smoothest and fastest running position by turning idling screw in until engine begins to miss and speed decreases, then turn screw out until engine begins to roll, finally turn screw in until engine fires smoothly (final setting should be approximately half way between missing and rolling points). Adjust outer (right hand) idling adjustment screw in the same manner. Idling screw operates on fuel mixture and should be turned in for leaner mixture and out for richer mixture. See tune-up data on car model page for complete adjustment instructions on each car model.



On 'V' type engines with two ignition coils where one coil furnishes ignition for one bank, ignition can be cut off for one bank by disconnecting the coil primary or grounding the coil high tension lead to the engine block so that the engine will idle on the remaining cylinders. The idle adjustment for the carburetor barrel feeding the cylinders which are firing can then be adjusted. The coil should then be reconnected and the other coil disconnected so that the engine will fire on the cylinders of the other bank. The idle adjustment for the carburetor barrel feeding this bank can then be adjusted. After both idling adjustments have been completed in this manner, engine should be idled on all cylinders and any necessary readjustment made to secure smooth running. The throttle stop screw can then be adjusted to secure correct idling speed.

Pierce Arrow—Manufacturer recommends that idling speed be set at 37-39 explosions in 15 seconds (check by removing inspection plug in exhaust manifold) and idling adjustment then made by disconnecting and grounding spark plug cables on end cylinders (1, 2, 7, 8) while inner barrel adjustment is made. Then ground cables on cylinders 3, 4, 5, 6 while adjusting outer barrel. Finally idle engine on all eight cylinders and recheck idling speed. This same method of adjustment may be used on other car models.

Chrysler—Manufacturer recommends that an initial setting be made by turning both screws in until they seat and then backing screws off exactly one turn. Adjustment should then be made by turning both screws in or out simultaneously and exactly the same amount. This method may be used on other car models.

If correct idling adjustment cannot be secured, take out idle adjusting screw and upper idling port plug and clean out idling ports with compressed air. The idling tubes located in the carburetor body can also be taken out and cleaned with compressed air.

HIGH SPEED ADJUSTMENT AND ECONOMIZER:—Main metering jets which meter all fuel for main discharge jets are of the 'fixed' type and not adjustable. Jet size is stamped on the jet in decimal fractions of an inch. Jets should be changed only to compensate for special fuels or operating conditions such as high altitudes.

Economizer is built in lower end of accelerating pump and is operated by pump piston. At speeds above 70 M.P.H. or with wide open throttle, economizer needle valve is forced down, opening the economizer valve, so that additional fuel flows through the valve and is discharged into the mixing chamber through the pump discharge nozzle. Economizer should not require attention but setting can be checked by noting throttle opening (pass wire drill of correct size between edge of throttle valve and carburetor wall) at point where pump piston contacts economizer by-pass valve seat with pump set for maximum stroke. Settings are as follows:

Car Model	Carburetor	Economizer Setting
Buick (first cars)	EE-22	3/16"
Buick (after No. 2873362)	EE-22	15/64"
Chrysler CU, CV, C2, C3	EE-22	21/64"
Chrysler CL*, CW, CW*	EE-3	7/32"
Chrysler C10, C11, C17	EE-22	21/64"
Duesenberg J	EE-3	7/32"
Franklin 17, 17B	EE-2	9/32"
Hupmobile 427, 527	EE-22	1/4"
Lincoln, all Twelves	EE-22	21/64"
Nash 1070, 1170	EE-2	13/64"
Nash 1280, 3580	EE-22	1/4"
Oldsmobile L-32	EE-2	13/64"
Oldsmobile L-33	EE-22	1/4"
Packard, all Eights	EE-22	21/64"
Packard, all Twelves	EE-3	7/32"
Pierce Arrow, all Eights	EE-3	7/32"
Studebaker 73, 82, Pres. C	EE-22	1/4"
Studebaker Speedway Pres. 92	EE-22	21/64"
Stutz DV-32	EE-3	3/16"

NOTE—On Buick carburetors, economizer is adjusted by loosening locknut and turning pump operating rod in or out of connector at throttle lever.

ACCELERATING PUMP:—Accelerating pump is operated through a walking beam arrangement by the throttle lever. Pump chamber is filled with fuel from the float chamber (flowing through the pump check valve) when the throttle is closed. When the throttle is opened, this fuel is discharged through the economizer valve and the pump discharge nozzle into the mixing chamber. Check valve prevents fuel being discharged back into the float chamber. When the throttle is held open, the piston opens the economizer needle valve so that fuel flows straight through the pump and is discharged through the pump nozzle. The pump discharge nozzle meters this fuel. Pump capacity in cc. per 10 strokes when pump is operated slowly is given in table below. Pump should be set for maximum (Max.) or minimum (Min.) stroke as indicated.

Car Model	Carburetor	Pump Capacity	Pump Setting
Buick 60, 80, 90	EE-22	23-27 cc.	Max.
Chrysler CU, CV, C2, C3	EE-22	20-24 cc.	Min.
Chrysler CL*, CW, CW*	EE-3	20-22 cc.	Min.
Chrysler C10, C11, C17	EE-22	20-24 cc.	Max.
Duesenberg J	EE-3	20-22 cc.	Min.
Franklin 17, 17B	EE-2	28-32 cc.	Max.
Hupmobile 427, 527	EE-22	20-24 cc.	Max.
Lincoln, all Twelves	EE-22	20-24 cc.	Max.
Nash 1070, 1170	EE-2	14 cc.	—
Nash 1280	EE-22	20-24 cc.	Max.
Nash 3580	EE-22	17-22 cc.	Max.
Oldsmobile L-32	EE-2	17 cc.	Min.
Oldsmobile L-33	EE-22	17 cc.	Min.
Packard, all Eights	EE-22	20-24 cc.	Max.
Packard, all Twelves	EE-3	22-24 cc.	Min.
Pierce Arrow, all Eights	EE-3	14-18 cc.	Max.
Studebaker 73, 82, Pres. C	EE-22	18-22 cc.	Max.
Studebaker Spdwy. Pres. 92	EE-22	20-24 cc.	Max.
Stutz DV-32	EE-3	20-22 cc.	Min.

Adjustment:—Throttle lever has two holes for engagement of pump rod to provide varied pump stroke. Inner hole (shorter radius) providing short pump stroke should be used for average temperatures or summer operation. Outer hole providing maximum pump stroke should be used for winter operation. See tune-up data on car model page for specific settings and recommended seasonal changes.

FLOAT LEVEL:—Fuel level in float bowl is set at 9/16" below top edge of float bowl with 3 lbs. pressure (engine idling). See table below for exceptions to this standard setting. Float level can be changed to correct fuel level by bending float lever at the point where it is attached to the float.

Car Model	Carburetor Model	Fuel Level
Buick 60, 80, 90	EE-22	5/8"
Chrysler CU, CV, C2, 3, 10, 11, 17	EE-22	5/8"
Nash 1280, 3580	EE-22	5/8"
Oldsmobile L-33	EE-22	21/32"
Studebaker 73, 82, Pres. C	EE-22	5/8"
All others	EE-22, EE-3	9/16"

CHOKE:—See special article on Stromberg Automatic Choke. Choke valve is provided with a relief poppet valve to prevent over-choking. On cars with conventional choke control, see that choke valve is fully closed with choke control button on instrument panel pulled all the way out and wide open with choke button pushed in.

THROTTLE VALVE SETTING:—Throttle valve type number (2 used) and setting (distance from upper lip of throttle valve to lower edge of upper idle port with valve closed) as follows. On Chrysler model, lower edge of #56 Vacuum Spark Control Port should be .031" plus or minus .004" above throttle valve when closed.

Carburetor.	Throttle Valve No.	Setting.
EE-2 (all except below)	P-17018	.003"
Franklin 17, 17B	P-17018 #53 hole	.003"
EE-22 (all except below)	P-17018—5°	.030"
Chrysler (all)	P-17018—5°	.040"
EE-3 (all except below)	P-17371—5°	.030"
Packard ('37-38-39)	P-17371—5°	.053"

SERVICE PARTS:—Gasket Set—J-4363G (EE-22), J-4469G (EE-22 Chrysler), J-4365G (all EE-3).

EE-23—LA SALLE, MODEL 350 SERIES 50 (1934-35) PACKARD EIGHT, MODELS 1200, 1, 2 (1935), 1400, 1, 2 (1936) PACKARD SUPER EIGHT, MODELS 1203, 4, 5 (1935), 1403, 4, 5 (1936) PACKARD SUPER EIGHT, MODELS 1500, 1, 2 (1937) PACKARD SUPER EIGHT, MODELS 1603, 4, 5 (1938) PACKARD SUPER EIGHT, MODELS 1703, 3A, 5 (1939) REO ROYALE EIGHT, MODEL N-2 (1934)

NOTE—These models are fitted with a built-in Automatic Choke (vacuum piston in throttle valve body, thermostatic spring coil mounted separately on manifold) and an integral Fast Idle. See separate article for complete data on these units. Engines must be thoroughly warmed up so that choke valve is wide open and engine idling at slow or hot idling speed when adjustments are made.

TYPE:—Duplex or dual barrel, plain tube, downdraft type. Similar in design to other 'EE' type carburetors except for Fast Idle and vacuum piston in carburetor body (see separate articles). All specifications and adjustments for these models same as given for Models EE-22 carburetors (following article) except as noted below. Fast Idle design requires that throttle be opened to 20 M.P.H. position before starting a cold engine in order to allow choke valve to close and fast idle mechanism to operate.

IDLING ADJUSTMENT:—Idle adjusting screw provided for each barrel. Operation and adjustment same as for EE-22 (following article). See tune-up data on car model page for adjustment instructions.

METERING JETS:—Main metering jets (2 used) are non-adjustable type and should be changed only for special operating conditions such as high altitude. See Stromberg Jet Specification Table for standard jet calibration.

ECONOMIZER:—To check economizer setting, check throttle valve opening by passing wire drill between edge of throttle valve and carburetor wall with throttle at point where pump piston just contacts economizer by-pass valve seat. Throttle openings are shown in table below.

Car Model	Economizer Setting	Pump Setting
La Salle 350	3/16"	Max.
Packard all models	9/32"	Max.
Reo Royale 8	21/64"	Max.

ACCELERATING PUMP:—Adjustable in usual manner by changing position of pump link rod in throttle valve lever. Engage rod in inner hole (minimum pump stroke) for normal summer temperatures, or in outer hole (maximum pump stroke) for winter temperatures. Pump capacity in cc. per 10 strokes when operated slowly is shown in table below. Pump should be set for minimum (Min.) or maximum (Max.) stroke as noted.

Car Model	Pump Capacity	Pump Setting
La Salle 350	12-14 cc.	Min.
Packard all models	14-18 cc.	Min.
Reo Royale 8	18-22 cc.	Max.

FLOAT LEVEL:—Fuel level in float bowl is set at 5/8" below top edge of bowl with 3 lbs. pressure (engine idling). Float height can be changed to correct fuel level by bending float lever at point where it is attached to the float. NOTE—When installing float needle valve, one corner of the triangular needle valve should be placed down.

Needle Valve & Seat Assembly—Furnished only as matched sets. Assembly part number and size for each model as follows:

Car Model	Part Number	Size
LaSalle	P-20256	.093"
Packard (all models)	P-22091	.130"
Reo	P-18914	.130"

CHOKE:—Choke valves are fitted with a relief poppet valve. See separate article for data on Automatic Choke mechanism.

THROTTLE VALVE SETTING:—Throttle valves (2 used) are Part No. P-17018—5° and should be set so that upper lip of valve is .030" plus or minus .004" below lower edge of upper idle port when closed. Vacuum Spark Control Port (#56 hole) lower edge should be .015" plus or minus .004" above throttle lip when closed. NOTE—Throttle valve setting for Packard Super Eight (1937-38-39) models should be .020" plus or minus .004".

SERVICE PARTS:—Gasket Set—J-4385G.

AX-2 —LAFAYETTE, MODEL 3610 (1936)
NASH '400', MODEL 3640-A (1936)
NASH-LAFAYETTE, MODEL 3710 (1937)
NASH-LAFAYETTE, MODEL 3810 (1938)

TYPE:—Single barrel, plain tube, downdraft type with throttle operated accelerating pump and economizer. AX type similar in design to previous EX type with minor differences in construction (see illustration).

Fuel System (Idling and Low Speed):—Fuel for idling taken from main jet well up through idling tube which meters the fuel and into a cross-channel in which it is mixed with air admitted through idle air bleeder opening. Fuel mixture then taken down through channel to the discharge ports. For closed throttle idling, fuel is discharged through lower port below throttle valve and is controlled by the idle adjusting screw. In this position, upper port above throttle valve serves as an additional air bleed. When the throttle is cracked open for low speed running, fuel is discharged through the upper port also.

Driving Range (15-65 M.P.H.):—At approximately 15-20 M.P.H., the idling system drops out and all fuel is supplied by the main discharge jet located directly above the main metering jet and discharging into the small auxiliary venturi. Main discharge jet is air bled by the high speed air bleeder located in the air passage in the auxiliary venturi support above the discharge jet.

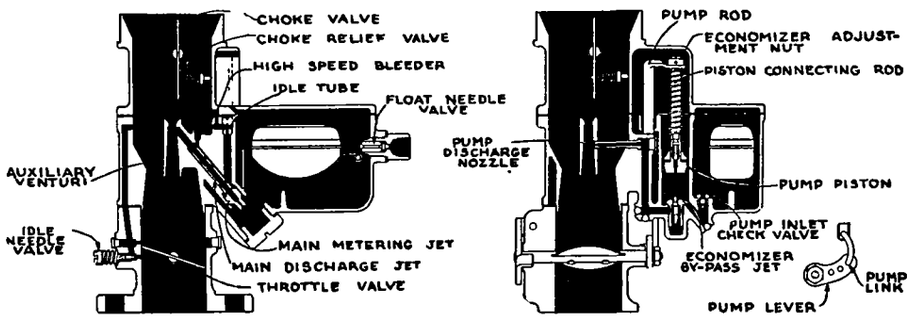
High Speed and Wide Open Throttle:—At speeds above 65 M.P.H. or whenever the throttle is held open, the economizer by-pass valve located at the bottom of the accelerating pump well is opened by the pump piston and additional fuel, metered by the by-pass jet, is discharged through the pump discharge nozzle in the side of the auxiliary venturi.

IDLING ADJUSTMENT:—Idle adjusting screw controls fuel discharge from lower idle port and should be turned in for leaner mixture, or out for richer mixture. Idle speed controlled by throttle lever stopscrew. See tune up instructions on car model page for adjustment instructions on car.

METERING JETS:—Main metering jet is non-adjustable fixed type and should be changed only for special operating conditions such as high altitudes. See Jet Specification Table for standard jet calibration.

ECONOMIZER:—Consists of by-pass valve and jet at lower end of accelerating pump well. Should not require adjustment but setting can be checked by noting throttle valve opening when pump piston rests on seat of by-pass jet (less overtravel) with pump set for maximum (Max) or minimum (Min) stroke as noted. Check by passing wire drill of size noted between edge of throttle valve and carburetor wall.

Car Model	Economizer Setting	Pump Setting
Lafayette 3610	5/16"	Max.
Nash 3640-A	21/64"	Max.
Nash-Lafayette	27/64"	Max.



Adjustment—Take out cotter pin in adjusting nut at top of pump piston stem, turn nut. Be sure that cotter pin replaced to lock adjustment. Do not disturb this nut when disassembling carburetor to avoid necessity of resetting economizer.

ACCELERATING PUMP:—Similar in design to type used on previous carburetor models. Fuel is drawn into pump chamber through inlet ball check valve on up-stroke of piston and is discharged through outlet (by-pass) valve and pump discharge nozzle on the downstroke of the pump piston when the throttle is opened for acceleration.

Capacity—Capacity in cc. per 10 strokes with pump set for maximum (Max) or minimum (Min) stroke is noted in table below. Letter (S) indicates pump should be operated slowly.

Car Model	Pump Capacity	Pump Setting
Lafayette 3610	22-26 cc. (S)	Max.
Nash 3640-A	18-22 cc. (S)	Max.
Nash-Lafayette	18-22 cc. (S)	Max.

Adjustment—Three holes provided in throttle valve lever for pump rod link engagement. Inner hole (short radius) provides minimum stroke, center hole normal stroke, outer hole (long radius) maximum stroke. See tune up instructions on car model page for recommended settings and seasonal changes.

FLOAT LEVEL:—Fuel level in float bowl set at 5/8" below top edge of bowl with 3 lbs. pressure (engine idling). Float height can be changed to correct fuel level by bending lever at the point where it is attached to the float.

Needle Valve & Seat Assembly—Furnished only as matched sets, Part No. P-21918. Intake hole size—.093".

CHOKE:—Choke valve fitted with poppet type relief valve. Adjust linkage so that choke valve is fully closed with choke button pulled out and wide open with button pushed all the way in.

THROTTLE VALVE SETTING:—Throttle valves should be set so that upper lip of valve is .012" plus or minus .004" below lower edge of upper idle discharge port with valve fully closed.

Carburetor Type	Throttle Valve Part No.
AX-2	P-6454—18½°

SERVICE PARTS:—**Gasket Set—J-4611-G** (all AX-2 models).

TROUBLE SHOOTING:—**Poor Idling Performance.** Take out idle adjusting screw, blow out discharge ports and fuel channel. If carburetor disassembled, blow out cross-channel, clean idling tube.

Poor Acceleration. Check pump setting (see recommended setting on car model page), examine pump inlet check valve and outlet by-pass valve. Clean pump discharge nozzle and blow out channel.

Poor Running Performance. Remove plug below metering jet, clean metering jet and main discharge nozzle. See that high speed air bleeder is open. Check metering jet size (see Jet Specifications).

NUMBER **MODEL AAO-161**

A-18371—STUDEBAKER PRESIDENT, MODELS 4C (1938), 5C (1939)

NOTE:—This carburetor has a built-in Fast Idle and Automatic Choke (thermostatic coil mounted on air horn and connected directly to choke valve shaft). See Fast Idle section below and article in Carburetion Equipment section for complete data on Automatic Choke.

Jet Changes for Increased Fuel Economy:—If greater fuel economy is desired, standard main metering jets may be changed to first smaller size (.045") with slight loss in performance. Second smaller size jets (.043") should only be used for operation at high altitudes. Both main metering jets should be changed at the same time and must be same size. See Stromberg Jet Specification Table for complete jet data.

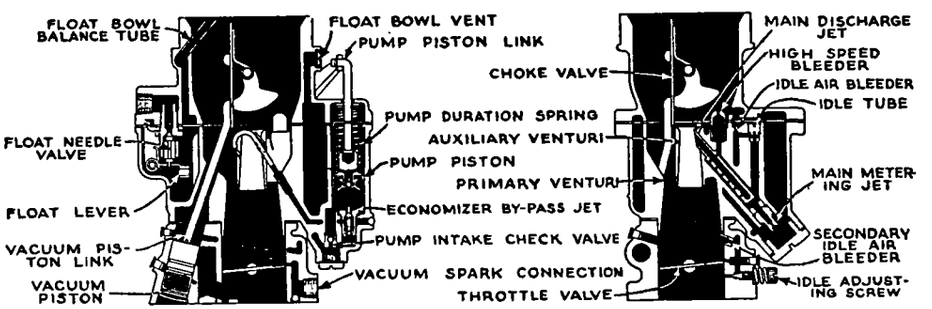
TYPE:—Aircraft, duplex, downdraft type with throttle operated accelerating pump and economizer. Carburetor has single air intake, accelerating pump, economizer, and float bowl but has two independent mixing chambers or barrels. Venturi, main discharge jet, main metering jet, throttle valve, accelerating pump discharge nozzle, and idling system duplicated for each barrel. Float bowl is aircraft type (encircling carburetor barrels) with baffles to prevent surging and twin floats mounted at opposite ends of bowl. Float valve is clipped to lever midway between floats.

Fuel System (Idling & Low Speed):—Fuel for idling taken from main jet well up through Idle Tube (which meters this fuel) to cross-passage in which it is mixed with air admitted through Idle Air Bleeder opening into mixing chamber above venturi. Fuel mixture then taken down through channel to Fast Idle cross-channel (see Fast Idle) and idle discharge ports (Secondary Idle Air Bleeder opening into mixing chamber below venturi admits additional air into fuel mixture channel). For closed throttle idling all fuel is discharged through lower port below throttle edge and is controlled by the idle adjusting screw (upper port serves as additional air bleed). As soon as the throttle valve is opened, fuel is discharged through upper port also.

Driving Range (Below 75 MPH). At about 20 MPH. idling system drops out and all fuel then metered by main metering jets and discharged through main discharge jets opening into small auxiliary venturis. Main discharge jets are air-bled by High Speed Bleeder located directly above discharge jets in auxiliary venturi supports.

High Speed & Wide Open Throttle Operation. At speeds above 75 MPH. or whenever throttle held wide open, economizer by-pass jet located at bottom of accelerating pump well is held open by the pump piston and additional fuel, metered by the by-pass jet, is supplied by the pump discharge nozzles.

IDLING ADJUSTMENT:—Must be made only with engine warmed up so that Fast Idle and Automatic Choke inoperative. Idle adjusting screws (one for each barrel) control fuel discharge and should be turned in for leaner mixture, out for richer mixture. Idle speed controlled by throttle stopscrew and should be set for 7-8 MPH. hot or slow idle. See tune up instructions on car model page for complete data.



FAST IDLE MECHANISM:—Similar to design used on other models (air passage around throttle valve controlled by vacuum piston linked to choke valve) but does not operate in same manner. Air passage opens into side of vacuum piston cylinder so that air is by-passed around throttle valve whenever port on side of piston registers with air passage opening (piston is hollow with open end at top, upper end of cylinder opens into mixing chamber above venturi). The cross-passage from the idle fuel channel through which fuel is drawn for fast idling opens into the side of the vacuum piston cylinder at the upper end (piston slotted at this point) and is never closed off (serves as idle air bleeder when fast idle not operating). Vacuum chamber is located at lower end of cylinder below piston and is connected to the carburetor barrel below the throttle by a special drilled passage. When the choke is closed for cold starting, the vacuum piston is drawn up to the top of its stroke, opening the fast idle passage, so that air and fuel mixture (drawn through cross-passage from idle channel) are delivered below the throttle valve. When the engine begins to fire, manifold vacuum draws the piston down partially, opening the choke valve slightly against the tension of the automatic choke thermostatic spring, but without closing off the fast idle passage around the throttle. Air flow through fast idle passage restricts air bleed action of the idle fuel cross-passage so that idle discharge is richer than normal to compensate for this additional air flow. When the engine warms up and the thermostatic spring unwinds, opening of the choke valve allows vacuum piston to complete its stroke, cutting off fast idle passage so that all air flows past throttle valve, and air bleed action of cross-passage reduces idle fuel discharge to normal richness. Engine then idles at hot or slow idle speed. No adjustment required.

IMPORTANT NOTE—Whenever air horn and float bowl cover assembly is removed, take out choke valve screws first, freeing valve from shaft, so that valve, link and piston assembly is not disturbed. If this is not done, vacuum piston link assembly may be damaged. When vacuum piston removed, see that it is installed with slot on side toward idle fuel cross-passage port.

METERING JETS:—Main metering jets are non-adjustable type. See Note above for recommended changes for increased fuel economy and Stromberg Jet Specification Table for complete jet calibrations.

ECONOMIZER:—By-pass valve and jet located at bottom of accelerating pump cylinder and operated by pump piston. Should not require adjustment but setting can be checked by noting throttle valve opening when pump piston rests on seat of by-pass valve (less over-travel) with pump set for minimum stroke. Should be 5/16" (plus or minus 1/64"). No adjustment provided but pump 'walking-beam' lever can be bent slightly to correct opening. NOTE—When re-installing lever make certain that ball end is toward carburetor.

ACCELERATING PUMP:—Operated by throttle lever through 'walking-beam' linkage. Fuel is drawn into pump chamber through inlet ball check valve when throttle is closed and is discharged through outlet check valve (economizer by-pass valve) and pump discharge nozzle in each carburetor barrel when throttle opened for acceleration. Piston is spring-loaded on pump rod to prolong pump discharge (sudden throttle opening will compress spring allowing piston to lag, subsequent expansion of spring prolongs piston movement and pump discharge). A spring loaded relief valve located in the piston head will by-pass some fuel and prevent engine loading up when throttle opened suddenly (this valve normally closed).

Capacity—16-20 cc. per 10 strokes when operated slowly with pump set for minimum stroke.

Adjustment—Two holes provided in throttle lever for pump link engagement. Inner hole (short radius) provides minimum stroke, outer hole (long radius) maximum stroke. See tune up instructions on car model page for recommended settings.

FLOAT LEVEL:—**Fuel Level.** Should be 5/8" below top surface of float bowl with 3 lbs. pressure (engine idling) or even with the lower edge of the inspection hole on the side of the bowl (take out plug to check level).

Float Height—Use special service tool, T-24971, to set floats. Remove air horn and float cover assembly (see Note in Fast Idle section for instructions to avoid damage to fast idle mechanism), invert cover, install tool on gasket. Tool guid will also check float travel (floats must be free and not rub on bowl). Adjust floats by bending float lever. If tools not used, top of floats should be 1 11/32" above gasket on cover.

Float Valve & Seat—Part No. P-22499. Furnished only as matched set.

Float Bowl Vents—Bowl vented to outside through screened opening on side of air horn. Also vented through balance tube in air horn directly below air cleaner.

THROTTLE VALVE SETTING:—When installing valves see that distance from top edge of valve to lower edge of upper idle port is .020" plus or minus .004".

CHOKE:—Valve is offset type, operated by thermostatic spring coil coupled directly to choke valve shaft. See article in Carburetion Equipment Section for complete data.

SERVICE PARTS:—Gasket Set—No. J-5318-G.

AA-1—BUICK SPECIAL, MODEL 37-40 (1937)
AA-2—BUICK CENTURY, MODEL 37-60 (1937)
BUICK ROADMASTER, MODEL 37-80 (1937)
BUICK LIMITED, MODEL 37-90 (1937)

NOTE:—Smaller main metering jets must be used on all models when equipped with optional Heavy Duty oil-bath type Air Cleaners. See Metering Jet section below.

Cold Idle Control:—Buick type similar to design used on previous models. See article in Carburetion Equipment Section for adjustment instructions.

Automatic Choke:—New type Delco-Remy Model 490-A Carburetor Control. Not similar to type used on previous models. See article in Carburetion Equipment Section for adjustment instructions.

TYPE:—Aircraft type, duplex downdraft carburetor with throttle actuated accelerating pump and economizer. Carburetor has single air intake, float chamber and accelerating pump but has two independent mixing chambers or barrels. Venturi, main discharge jet, main metering jet, throttle valve, accelerating pump discharge nozzle and idling system duplicated for each barrel. Float bowl is new design fitted with baffles to prevent surging and has twin floats mounted at opposite ends of bowl chamber. Float valve is clipped to lever midway between floats.

Fuel System (Idling and Low Speed):—Fuel for idling is taken from the main jet well up through the idling tube which meters the fuel and is mixed with air admitted through the upper (small) hole in the idling tube. From this point the fuel mixture is taken down through a channel to the discharge ports. Additional air is admitted through the idle air bleeder in the passage leading from the lower end of the primary venturi. For closed throttle idling, fuel mixture is discharged through lower discharge port below the throttle and is controlled by the idle adjusting screw. In this position, the upper port above the throttle edge serves as an additional air bleed. When the throttle is opened for low speed running, additional fuel is discharged through this upper port also.

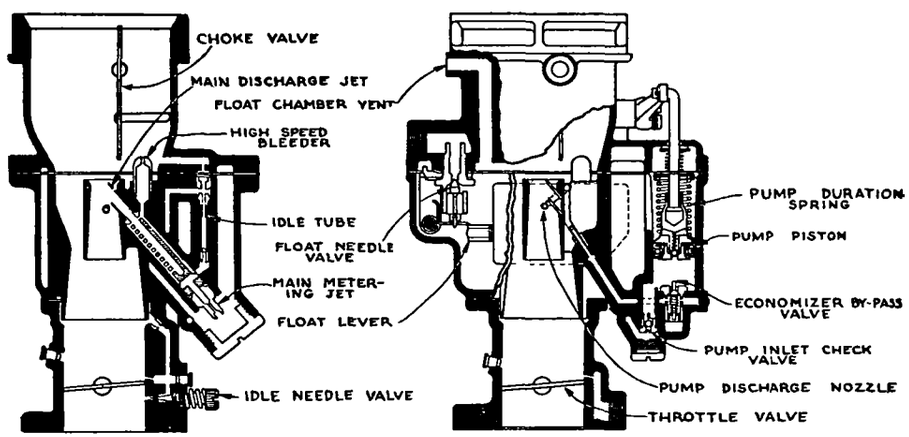
Driving Range (22-75 M.P.H.):—At approximately 22 M.P.H. the idling system drops out and all fuel is supplied by the main discharge jet located directly above the main metering jet and discharging into the small auxiliary venturi. Main nozzle is air bled by the high speed air bleeder located directly above the nozzle in the auxiliary venturi support.

High Speed & Wide Open Throttle Running:—At speeds above 75 M.P.H. or whenever the throttle is held open, the economizer by-pass valve located at the bottom of the accelerating pump well is held open by the pump piston and additional fuel, metered by the economizer by-pass jet, is discharged through the pump discharge nozzle.

IDLING ADJUSTMENT:—Idle adjusting screw for each barrel controls fuel discharge from lower idling port. Screws should be turned in for leaner mixture and out for richer mixture. Approximate settings are 1⅜ turns open (Series 40), 1¼ turns open (Series 60, 80, 90) from inner or closed position. Both screws must be set alike. Idle speed controlled by throttle lever stopscrew and should be set for 7-8 M.P.H. idling speed with engine warmed up (choke valve open and Cold Idle Control inoperative). See tune up instructions on car model page for complete adjustment instructions on car.

METERING JETS:—Main metering jets are non-adjustable fixed type. Jets should be changed only for special operating conditions such as high altitude. Smaller main metering jets must be used on all models when equipped with optional Heavy Duty oil-bath type Air Cleaner. Standard and altitude calibrations for each model and each type air cleaner are as follows (see Jet Specification Table for other parts):

Model	Air Cleaner	Under 3500 ft.	3500 to 9000 ft.	9000 ft. and over
37-40	Std.	.049"	.046"	.044"
37-40	Heavy Duty	.045"	.042"	.040"
37-60, 80, 90	Std.	.052"	.049"	.047"
37-60, 80, 90	Heavy Duty	.051"	.048"	.046"



These jets are new type (Part No. P-22660) and must not be interchanged with other types. May be identified by groove on jet shank. Use special wrench T-24924 to assemble jets.

NOTE—Whenever main discharge jet located above main metering jet is removed, new lead gasket must be used in carburetor body to insure a good seal when the jet is replaced.

ECONOMIZER:—Consists of by-pass valve and jet at lower end of accelerating pump well. Should not require adjustment but setting can be checked by noting throttle valve opening when pump piston rests on seat of by-pass jet (less over-travel) with pump set for maximum stroke. Throttle opening should be 9/64" (Series 40), 13/64" (Series 60, 80, 90) plus or minus 1/64". Check opening by passing wire drill between edge of throttle valve and carburetor wall.

ACCELERATING PUMP:—Similar in design to type used on previous models. Fuel is drawn into pump chamber through ball check valve on upstroke of piston and is discharged through by-pass valve and pump discharge nozzle on downstroke of piston when throttle is opened for acceleration.

Capacity:—Capacity in cc. per ten strokes with pump set for maximum stroke should be 22-28 cc. (Series 40), 28-32 cc. (Series 60, 80, 90) when pump is operated slowly.

Adjustment:—Pump should be set for maximum stroke (rod connected in long radius or left hand hole in throttle lever) for normal operation. When highly volatile fuels are used and acceleration charge is too rich causing 'staggering', pump rod may be shifted to right hand or short radius hole providing shorter pump stroke. This setting does not affect economizer action.

FLOAT LEVEL:—Fuel level in float bowl is set at 5/8" below top surface of bowl with 3 lbs. pressure (engine idling). A sight hole closed by a plug is provided on the side of the bowl to check fuel level which should be even with the bottom of the threads in the sight hole with the engine idling. To check float level with carburetor disassembled, use special service tool SER-292, inverting cover and installing tool on cover gasket. Top of floats when inverted should be even with tops of guides. Guides also locate floats so that they will not rub on sides of bowl when reassembled. Float level can be corrected by bending float lever arm. If special tool not used, top of float should be 1 11/32" above gasket surface.

NOTE—Float height on first carburetors set at 1 13/32". Specifications changed to 1 11/32" due to variation in float weights.

CHOKE VALVE:—Offset type with stop pin to limit travel in full open position. No relief valve used. Choke valve shaft linked directly to Automatic Choke by flexible shaft protected by housing.

THROTTLE VALVE SETTING:—Throttle valves are 5° type Part No. P-20874 (Series 40), P-22447 (Series 60, 80, 90). Must be set so that upper lip of valve is .022" plus or minus .004" below lower edge of upper idle discharge port. Lower edge of vacuum spark control port should be .041" (Series 40), .085" (Series 60, 80, 90) plus or minus .004" above upper edge of throttle valve with valve fully closed.

SERVICE PARTS:—Gasket Set—No. J-4781-G (AA-1), J-4782-G (AA-2).

AA-25—CADILLAC V-8, SERIES 37-60, 65, 70, 75 (1937)
CORD, SUPERCHARGED MODEL 812 (1937).
LA SALLE V8, SERIES 37-50 (1937)

NOTE:—This type carburetor fitted with built-in Fast Idle and Automatic Choke. See Fast Idle section below and separate article in Carburetion Equipment Section on Stromberg Automatic Choke for adjustment instructions.

TYPE:—Aircraft type, duplex downcraft carburetor. Similar in design to other AA types (see previous article) except for Fast Idle and Automatic Choke. Separate Idle Air Bleeder and air bleed hole in idle tube not used, idle system is air bled by bleed hole drilled in air horn casting above idle fuel channel.

IDLING ADJUSTMENT:—Idle adjusting screw for each barrel controls fuel discharge from lower idle port. Screws should be turned in for leaner mixture and out for richer mixture and should be set alike. Idle speed controlled by throttle lever stopscrew and should be set for 7-8 M.P.H. idling speed with engine warmed up so that choke valve wide open and Fast Idle inoperative. See tune up instructions on car model page for complete adjustment with carburetor in car.

METERING JETS:—Main metering jets are non-adjustable fixed type and should be changed only for special operating conditions such as high altitudes. See Jet Specification Table for standard jet calibration. These jets are new type, Part No. P-22660, and must not be interchanged with other types. May be identified by groove on jet shank. Use special wrench T-24924 when assembling jets.
NOTE—Whenever main discharge jet located directly above main metering jet is removed. New lead gasket must be used in carburetor body to insure a good seal when jet is replaced.

ECONOMIZER:—Similar to design used on other AA carburetor types. Check setting by noting throttle opening when pump piston rests on by-pass jet seat (less over-travel) with pump set for maximum stroke. Thottle opening should be 21/64" plus or minus 1/64". Check by passing wire drill between edge of throttle valve and carburetor wall.

ACCELERATING PUMP:—Similar to design used on other AA carburetor types.
Capacity—18-22 cc. per 10 strokes with pump set for minimum stroke.
Adjustment—Two holes provided in throttle lever for pump rod connection. Inner hole (short radius) provides minimum stroke, outer hole (long radius) maximum. See car model tune up page for recommended settings.

FAST IDLE MECHANISM:—Consists of an air passage around the throttle valve and a cross-channel from the idle fuel channel opening into this passage so that additional fuel for idling is discharged at this point (providing a fast idle without opening the throttle valve) whenever the vacuum piston is up far enough to open the passage. Vacuum piston is linked to choke valve and will be raised to the top of its stroke when the choke valve is closed for cold starting. When the engine begins to fire, the manifold vacuum pulls the piston down partially (vacuum chamber below piston connected to lower end of passage below throttle by hole in piston wall), opening the choke valve slightly but not cutting off the fast idle passage and fuel port. As the engine warms up and the automatic choke thermostatic spring unwinds, the opening of the choke valve allows the vacuum piston to complete its stroke, cutting off the fast idle passage. All fuel is then supplied by the regular idling ports and the engine idles at the warm or slow idling speed. No adjustment is required.
NOTE—Whenever carburetor is to be disassembled, take out choke valve screws freeing valve from shaft before removing air horn. This is necessary to prevent damage to vacuum piston link assembly.

FLOAT LEVEL:—Fuel level in float bowl set at 5/8" below top surface of bowl with 3 lbs. pressure (engine idling) or even with the bottom of the threads in the bowl sight hole (on side of bowl, closed normally by a plug). To check level with carburetor disassembled, use special service tool SER-292 inverting cover and installing tool on cover gasket. Top of floats when inverted should be even with top of guides. Guides also locate floats so that they will not rub on sides of bowl when reassembled. Correct float level by bending float lever arm. If special tool not used, top of float should be 1 11/32" above gasket surface (first carburetors set at 1 13/32" but specifications changed to allow for float weight variations).
NOTE—See note under Fast Idle above for special directions when removing float bowl cover to avoid damage to choke valve and fast idle vacuum piston

THROTTLE VALVE SETTING:—Throttle valves are 5° type, Part No. P-22752. Must be set so that upper lip of valve is .022" (Cadillac, LaSalle), .040" (Cord) plus or minus .004" below lower edges of upper idle discharge port. No vacuum spark control port is used on this model.

CHOKE:—Automatic Choke is special built-in type with electrical heating coil. See article in Carburetion Equipment Section for complete data.

SERVICE PARTS:—Gasket Set—No. J-4387-G.

NUMBER MODEL AAV-25

A-18672—CADILLAC V8, SERIES 37-60, 65, 75 (1938)

NOTE:—This carburetor has a built-in Fast-Idle and Automatic Choke (thermostatic coil mounted on air horn and connected directly to choke valve shaft). See Fast Idle section below and article in Carburetion Equipment section for complete data.

TYPE:—Aircraft type, duplex downdraft carburetor. Same design as other AAV types (see previous article) except for Fast Idle and Automatic Choke.

IDLING ADJUSTMENT:—Idle adjusting screw for each barrel controls fuel discharge from lower idle port. Screws should be turned in for leaner mixture, out for richer mixture, and should be set alike. Idle speed controlled by throttle lever stopscrew and should be set for 6 MPH. idling speed with engine warmed up so that fast idle and automatic choke are inoperative. See tune up instructions on car model page for complete data.

METERING JETS:—Main metering jets are non-adjustable type and should be changed only for special operating conditions such as high altitudes. See Jet Specification table for complete jet data.
NOTE—Whenever main discharge jet (located directly above main metering jet) is removed, new lead gasket must be used in carburetor body on discharge jet seat to insure a god seal when jet is replaced.

ECONOMIZER:—Vacuum controlled by-pass jet type. Same design as on other AAV carburetor types. No adjustment required.

ACCELERATING PUMP:—Same design as on other AAV carburetor types (see previous article).
Capacity—18-22 cc. per 10 strokes with pump set for minimum stroke.
Adjustment—Two holes provided in throttle lever for pump link engagement. Inner hole (short radius) provides minimum stroke, outer hole (long radius) maximum stroke. See tune up instructions on car model page for recommended setting.

FAST IDLE MECHANISM:—Consists of an air passage around the throttle valve (controlled by vacuum piston in passage) and a cross-channel from the idle fuel channel opening into this passage so that additional fuel is discharged below the throttle valve providing a fast idle without opening the throttle whenever the passage is open. Vacuum piston is linked to choke valve and will be raised to the top of its stroke when choke valve is closed for cold starting. This opens fast idle passage. When engine begins to fire, manifold vacuum pulls piston down slightly (vacuum chamber below piston open to manifold through hollow piston and port at lower end of relieved portion of piston, piston will stop when large port at upper end of piston is uncovered). This action opens the choke valve slightly but does not cut off the fast idle action. As the engine warms up and the thermostatic spring coil unwinds (coil operated by electric heating element), the opening of the choke valve allows the vacuum piston to complete its stroke closing off the fuel channel and fast idle passage. All fuel is then supplied by the regular idle discharge ports and the engine idles at warm or slow idle speed. No adjustment is required.
IMPORTANT NOTE—Whenever air horn and float bowl assembly is removed, take out choke valve screws freeing valve from shaft first so that valve, link, and vacuum piston assembly is not disturbed. If this is not done, vacuum piston link assembly may be damaged.

FLOAT LEVEL:—Fuel Level. Should be 5/8" below top surface of float bowl with 3 lbs. pressure (engine idling) or even with the bottom of the sight hole on the side of the float bowl (take out inspection hole plug to check level).
Float Height—Use special service tool, T-24971, when setting float heights. Remove air horn and bowl cover assembly, invert, install tool on cover gasket. Tops of tool vertical guides should be flush with tops of floats. Guides will also check float travel (float must not rub on sides of bowl and must have free travel throughout range). Adjust float height by bending float lever. If tool not used, top of float should be 1 11/32" above gasket on cover.
Float Valve & Seat—Part No. P-22499. Furnished only as matched sets.
Float Bowl Vent—Bowl vented to outside through hooded opening at upper end of overflow pipe on bowl cover beside air horn. Also vented through channel and port opening into air horn above choke valve.

THROTTLE VALVE SETTING:—Part No. P-23537. Set valves so that distance from upper lip of valve to lower edge of upper idle discharge port is .030" (plus or minus .004").

CHOKE:—Choke valve offset type. Automatic choke control is special Stromberg built-in type with new spring linkage to hold choke valve closed for starting. See article in Carburetion Equipment section for complete data.

SERVICE PARTS:—Gasket Set—No. J-5320-G.

NUMBER **MODEL AAV-1.**

A-18681—BUICK, MODEL 40 (1938) STD. AIR CLEANER
A-18691—ABOVE MODEL WITH HEAVY DUTY AIR CLEANER

MODEL AAV-2.

A-18692—ABOVE MODEL WITH HEAVY DUTY AIR CLEANER
A-18782—CHRYSLER IMPERIAL, MODEL C-19 (1938)
A-18792—CHRYSLER CUST. IMPERIAL, C-20 (1938)
A-18792—CHRYSLER IMPERIAL, MODEL C23 (1939)
CHRYSLER CUSTOM IMPERIAL, MODEL C24 (1939)

MODEL AAOV-1.

A-18431—CHRYSLER IMPERIAL, MODEL C-14 (1937)
A-18441—CHRYSLER CUST. IMPERIAL, C-15 (1937)

NOTE:—Buick carburetors not interchangeable as special jet calibrations used when heavy duty air cleaners are installed. See Stromberg Jet Specification Table for complete jet specifications for each type.

Buick Model 40 with Self-shifting Transmission—Idle speed should be set at 5-6 MPH. in third gear. Transmission throttle control lever linkage setting must be checked whenever carburetor throttle linkage is disconnected or changed. See adjustment instructions in Buick Self-shifting Transmission article in Mechanical Equipment Section.

Chrysler Metering Jets—These jets are new type, Part No. P-22660, and must not be interchanged with other types. May be identified by groove on shank. Use special wrench T-24924 to install these jets.

TYPE:—Aircraft type, duplex downdraft carburetor with throttle actuated accelerating pump and vacuum controlled economizer. Carburetor has single air intake, float chamber and accelerating pump but has two independent mixing chambers or barrels. Venturi, main discharge jet, main metering jet, throttle valve, accelerating pump discharge nozzle, and idling system duplicated for each barrel. Float bowl is new design fitted with baffles to prevent surging and has twin floats mounted at opposite ends of bowl chamber which encircles carburetor body. Float valve is clipped to lever midway between floats.

Fuel System (Idling and Low Speed):—Fuel for idling is taken from the main jet well up through the idling tube which meters the fuel and is mixed with air admitted through the idle air bleed hole in the cross channel. From this point the fuel mixture is taken down through a channel to the discharge ports. For closed throttle idling, the fuel mixture is discharged through the lower port below the throttle and is controlled by the idle adjusting screw. In this position the upper port above the throttle valve serves as an additional air bleed. When the throttle is opened for low speed running, additional fuel is discharged through this upper port also.

Driving Range (22-75 M.P.H.):—At approximately 22 M.P.H. the idling system drops out and all fuel is supplied by the main discharge jet located directly above the main metering jet and discharging into the small auxiliary venturi. Main nozzle is air bled by the high speed air bleeder located directly above the nozzle in the auxiliary venturi support.

High Speed and Wide Open Throttle Running:—At speeds above 75 M.P.H. or whenever the throttle is held open, the drop in vacuum above the spring loaded vacuum piston allows the spring to force the piston down so that the piston stem opens the by-pass valve located directly below the piston assembly. This allows additional fuel, metered by the by-pass jet, to flow to the main discharge nozzle.

IDLING ADJUSTMENT:—Idle adjusting screw for each barrel controls fuel discharge from lower idling port. Screws should be turned in for leaner mixture and out for richer mixture and must be set alike. Idle speed controlled by throttle lever stopscrew and should be set for 7 M.P.H. idling speed with engine warmed up (choke valve wide open and fast idle inoperative). See tune up instructions on car model page for complete adjustment instructions on car.

METERING JETS:—Main metering jets are non-adjustable fixed type. Jets should be changed only for special operating conditions such as high altitude. See Jet Specification Table for standard jet calibrations for all models.

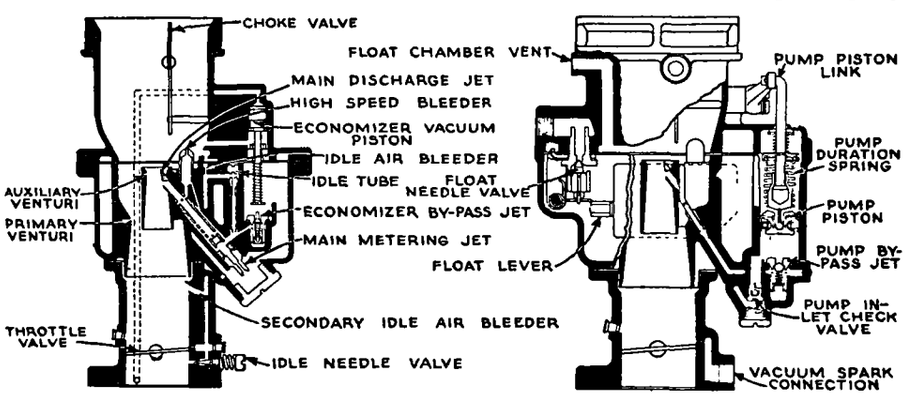
NOTE—Whenever main discharge jet located directly above main metering jet is removed, new lead gasket must be used in carburetor body to insure a good seal when jet is replaced.

ECONOMIZER:—Consists of by-pass valve and jet controlled by special vacuum piston and by-passes fuel to main discharge jet around main metering jet when vacuum drops sufficiently to allow spring to force piston down. Economizer is set to open by-pass valve when vacuum drops to 5-7" of HG. corresponding to car speed of 70-75 M.P.H. No adjustment provided (replace vacuum piston and spring assembly).

ACCELERATING PUMP:—Operated by throttle lever through 'walking beam' linkage. Fuel is drawn into pump chamber through inlet ball check valve when throttle is closed and is discharged through outlet check valve and pump discharge nozzle in each carburetor barrel when throttle is opened for acceleration. Piston is spring loaded on pump rod to increase duration of pump discharge (sudden throttle opening will cause piston to lag, compressing pump spring, expansion of spring prolongs piston movement and pump discharge). A spring loaded relief valve located in head of pump piston will by-pass some fuel if accelerating pump operated rapidly to prevent loading up engine (this valve normally closed so that all fuel is discharged to nozzles).

SERVICE PARTS:—**Gasket Set**—No. J-5320-G.

Capacity—With pump link connected as indicated, and pump operated slowly (S), fast (F), capacity in cc. per 10 strokes should be as follows:



Car Model	Carburetor	Pump Capacity	Setting
Buick	AAV-1	9-12 (F), 17-20 (S)	Medium
Buick	AAV-2	15-18 (F), 21-24 (S)	Medium
Chrysler	AAOV-1	21-25 (F), 27-31 (S)	Maximum
Chrysler C19	AAV-2	7-11 (F), 23-27 (S)	Maximum
Chrysler C20, C23, C24	AAV-2	21-25 (F), 27-31 (S)	Maximum

Adjustment (Buick)—Three holes provided in throttle lever for pump link engagement. Center hole (medium stroke) is standard for normal fuels and temperatures. No. 1 (upper hole) provides minimum stroke, No. 3 (lower hole) maximum stroke. See tune up data on car model page for recommended settings.

Adjustment (Chrysler)—Two holes provided in throttle lever for pump link engagement. Inner hole (short radius) provides minimum stroke, outer hole (long radius) maximum stroke. See tune up data on car model page for recommended settings.

FAST IDLE:—**Buick Models**—Buick Cold Idle Control. See article in Carburetion Equipment Section for complete data.

Chrysler Models—Consists of a rotary cam linked to the choke valve which serves as throttle lever stopscrew stop. Cam is rotated to fast idle position when choke valve closed for cold starting so that throttle valve is held open slightly.

Adjustment—To check setting, hold stopscrew against first step of fast idle cam and check choke valve opening with ⅛" drill rod inserted between edge of choke valve and air horn wall. If opening not correct, adjust rod length (turn ball joint end on rod). Open throttle wide and again check choke valve opening with 7/32" rod. If opening not correct, bend extended arm of fast idle cam slightly.

FLOAT LEVEL:—**Fuel Level.** Should be 19/32" (Buick), 5/8" (Chrysler) below top edge of float bowl with 3 lbs. pressure (engine idling) or approximately even with bottom of inspection hole on side of bowl (take out plug).

Float Height—Use special service tool, T-24971 when setting floats. Remove air horn and float cover assembly, invert, mount tool on cover gasket. Tool guides will also check float travel (floats must be free and not rub on bowl). Adjust floats by bending float lever. If tool not used, top of floats should be 1 11/32" above gasket on cover.

Float Valve & Seat—Part No. P-22499 (all models). Furnished only as matched sets.

Float Bowl Vent:—Bowl vented to outside through opening in side of air horn directly below air cleaner collar.

MODELS AAV-1, AAV-2, AAOV-1 CONT.

THROTTLE VALVE SETTING:—When installing throttle valves, they must be set so that distance from upper edge of throttle valve to lower edge of upper idle port is correct as shown in table below.

Car Model	Throttle Valve Part No.	Setting
Buick 40 (AAV-1)	P-20874—5°	.022"
Buick 60, 80, 90 (AAV-2)	P-22447—5°	.022"
Chrysler (all AAV-2)	P-22752—5°	.022"
Chrysler C14 (AAOV-1)	P-22806—5°	.040"
Chrysler C15 (AAOV-1)	P-22806—5°	.030"

Allowable variation for settings is plus or minus .004".

CHOKE—Buick Models. Choke valve is offset type with stop pin to limit travel in wide open position. Automatic choke is Delco-Remy type linked directly to choke valve shaft. See article in Carburetion Equipment Section for complete data.

Chrysler Models. Sisson Automatic Choke is standard equipment. See article in Carburetion Equipment Section for complete data.

SERVICE PARTS:—Gasket Set—No. J-5317-G (Buick AAV-1), J-5321-G (Buick AAV-2), J-4784-G (Chrysler AAOV-1), J-5316-G (Chrysler AAV-2).

Number MODEL—AAV-26

A-18972—BUICK, MODELS 39-60, 39-80, 39-90 (1939)

A-18982—ABOVE MODELS WITH HEAVY DUTY AIR CLEANER.

A-18962—CADILLAC V8, SERIES 39-60S, 61, 75 (1939)

NOTE:—Buick Models. Carburetor used on cars with heavy duty (oil-bath type) air cleaner has special jet calibration and is not interchangeable with standard model. See Stromberg Jet Specification table for complete jet calibrations for each model.

TYPE:—Aircraft type, duplex, downdraft carburetor. Similar in design to 'AAV' carburetors used on previous Buick and Cadillac models except for the new design Automatic Choke and Fast Idle as follows:

Automatic Choke—Thermostatic coil and vacuum piston type. Assembly is mounted on carburetor air horn and linked to the choke valve lever within the choke housing. Thermostat actuated by exhaust manifold heat through external heat tube connected between thermostat cover and hot air stove on manifold. No electric coil used (as on previous Cadillac models).

Fast Idle—Consists of a special fast idle lever and adjusting screw mounted on the throttle valve shaft and a fast idle cam linked to the choke valve.

See Article in Carburetor Section for complete Automatic Choke and Fast Idle servicing directions.

IDLING ADJUSTMENT:—Adjust only with engine warmed up so that Automatic Choke and Fast Idle inoperative (choke valve wide open, stopscrew on lowest step of fast idle cam) and engine idling at hot or slow idling speed. Make certain that some clearance exists between fast idle adjusting screw and fast idle cam (on opposite end of throttle shaft from regular idling speed adjusting screw). Set throttle lever stopscrew for correct 7-8 MPH. (Buick), 7-8 MPH. (Cadillac) idling speed. Turn idle adjusting screw for each carburetor barrel (both screws must be set alike) in for leaner mixture or out for richer mixture. These screws control fuel mixture discharge from lower (closed throttle) idle discharge ports. Recheck idle speed adjustment. See car model tune up page for complete adjustment instructions. Check Fast Idle setting (see below).

Buick Note—If vacuum gauge used for idle adjustment, turn both idle adjusting screws out evenly in the 'rich' direction until vacuum reading is 1" lower than maximum.

METERING JETS:—Main metering jets are non-adjustable type located under plug at lower end of each nozzle. Jets should be changed only for special operating conditions such as high altitude (see Buick note above and Stromberg Jet Specification Table for complete jet data).

NOTE—Whenever main discharge nozzles are removed, use extreme care to remove all traces of old lead gasket from carburetor body and shoulder on nozzle. Use new lead gasket when installing nozzle to insure good seal between nozzle and body.

ECONOMIZER:—Consists of a by-pass valve and jet in the carburetor main body controlled by a vacuum piston in a cylinder in the air horn casting. Economizer by-passes fuel around main metering jets to main nozzles when vacuum in manifold decreases sufficiently so that piston is forced down by spring. No adjustment required.

NOTE—Use special tool T-24733 to remove vacuum power piston No. P-22803.

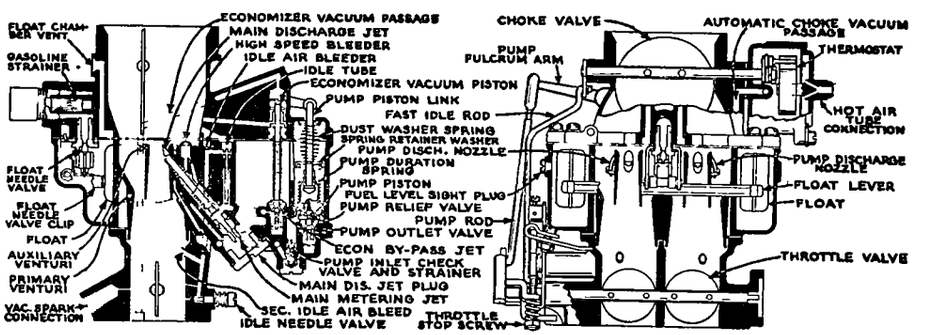
Setting—Vacuum piston opens valve with manifold vacuum of 5-6" of HG. corresponding to car speed of 70-75 M.P.H.

ACCELERATING PUMP:—Similar to design used on other 'AAV' carburetors with spring-loaded relief valve in piston head and duration spring on rod above piston (light spring above duration spring in dust washer retainer) except that strainer has been added below intake check valve (see Note below).

Capacity—Pump capacity per 10 strokes fast (F), slow (S) is shown in table below. Pump must be set for correct stroke (see Adjustment) as shown in table.

Car Model	Carburetor	Pump Capacity	Pump Setting
Buick	AAV-26	15-18 cc. (F), 21-24 cc. (S)	Center
Cadillac	AAV-26	14-18 cc. (F), 18-22 cc. (S)	Minimum

Adjustment (Buick)—Three holes provided in throttle lever for pump rod engagement. Center hole is recommended setting for normal operating conditions. Engage rod in inner hole (short radius) for minimum pump discharge, outer hole (long radius) for maximum discharge.



Adjustment (Cadillac)—Two holes provided in throttle lever for pump rod engagement. Inner hole (minimum stroke) is normal setting. Outer hole provides maximum stroke and should be used when greater acceleration discharge required.

Pump Servicing Note—Strainer screen located in plug below pump intake check valve should be removed and cleaned frequently to insure satisfactory pump operation.

FAST IDLE & CHOKE RELEASE:—Check and adjust as directed below. See article in Carburetion Equipment Section for complete servicing directions.

Fast Idle Setting—After setting the slow idle speed (as given above), see that choke valve is wide open and close throttle valves completely so that throttle stopscrew is against stop on body. Hold throttle valve in this position and close choke valve by hand until stopscrew strikes first step on fast idle cam (do not force choke valve beyond this position which will bind fast idle rod or distort fast idle cam spring), measure choke valve opening at this point by inserting drill rod between upper edge of valve and air horn wall. This distance should be 5/16" (Buick), .102"-#38 drill (Cadillac). Adjust by bending fast idle rod slightly.

Choke Release—Open throttle to wide open position so that choke valve is opened by ear on fast idle lever contacting lug on fast idle cam. Measure choke valve opening with special gauge T-25057 (Buick), T-25056 (Cadillac) or by inserting drill rod between upper edge of choke valve and air horn wall. Distance should be .156-.187" (11/64" drill) on all models. Adjust by bending ear on fast idle lever using extreme care not to damage fast idle rod and fast idle cam spring.

FLOAT LEVEL:—**Fuel Level**—Should be 19/32" (Buick), 5/8" (Cadillac) below gasket surface of float bowl or 1/32" above bottom of level sight hole on side of bowl (Buick), even with bottom of hole (Cadillac). Remove plug to check fuel level.

Float Height—Use special service tool T-24971 to check floats. Remove air horn and bowl cover assembly, invert cover and place tool on gasket. Top of floats should be 1/32" below tops of vertical guides (Buick), even with tops of guides (Cadillac) and sides of floats should be tangent to tool guides without any drag (to provide clearance between floats and bowl). Use extreme care to adjust both floats alike.

Float Valve & Seat—Part No. P-22499. Furnished only as matched sets. When installing, make certain that needle valve is clipped to float lever.

Float Bowl Vent—Bowl vented through opening on side of air horn directly below air cleaner collar.

MODEL AAV-26 CONT.

THROTTLE VALVE SETTING:—Throttle valves are No. P-24169—5° (Buick), No. P-24172—5° (Cadillac). To check valve setting, back off throttle stopscrew so that valves are tightly closed, insert #58 drill in idle port and in vacuum port (Buick), #56 drill in idle port only (Cadillac—no vacuum spark port used), measure distance from throttle valve edge to drill. See table below for settings—all figures are plus or minus .004".

Car Model	Carburetor	Idle Port Distance	Vacuum Spark Port
Buick	AAV-26	.020"	.055"
Cadillac	AAV-26	.040"	None

CHOKE:—Stromberg automatic integral type. See article in Carburetion Equipment Section for complete servicing directions.

Choke Setting—Inverted 'V' mark on thermostat cover scale should coincide with reference mark on top of choke housing. To adjust, loosen three cover screws, rotate thermostat cover assembly.
CAUTION—When connecting heat tube to thermostat cover connection, do not use excessive pressure which may rotate cover and change choke setting.

NUMBER MODEL BXO-26

A-18652—STUDEBAKER, SIX MODEL 7A, COMMANDER 8A (1938)
STUDEBAKER, COMMANDER MODEL 9A (1939)

NOTE:—This model fitted with integral Fast Idle and Automatic Choke (thermostatic coil mounted on air horn and linked directly to choke valve shaft). See article in Carburetion Equipment Section for complete data.

Jet Changes for Increased Fuel Economy—Where greater fuel economy is desired, standard main metering jet may be changed to first smaller size (.058") with slight loss in performance. Second smaller size (.056") should only be used for high altitudes. See Stromberg Jet Specification Table for complete jet data.

TYPE:—Plain tube, downdraft type with throttle operated accelerating pump and economizer.

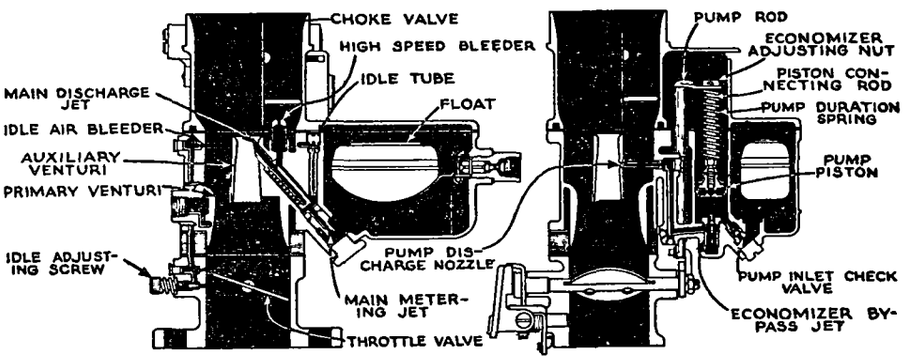
Fuel System (Idling & Low Speed):—Fuel for idling taken from main jet well up through Idle Tube (which meters the fuel) to cross-passage in which it is mixed with air admitted through Idle Air Bleeder (located at opposite end of cross-passage). Fuel mixture is then taken down through channel to discharge ports at throttle edge. For closed throttle idling, all fuel is discharged through lower port below throttle and is controlled by Idle Needle Valve or adjusting screw (upper port serves as an air bleeder). When the throttle is opened for low speed running, additional fuel is discharged through this port also.

Driving Range (Below 65 MPH.)—As throttle is opened and suction on main discharge jet increases, this jet begins to supply fuel and the idle system drops out. Fuel for main discharge jet is metered by main metering jet located at lower end of discharge jet. Discharge jet is air bled by High Speed Bleeder located directly above jet in auxiliary venturi support.

High Speed & Wide Open Throttle Operation—At speeds above 65 MPH. or whenever throttle held wide open, economizer by-pass valve located at bottom of accelerating pump cylinder is held open by the pump piston so that additional fuel (metered by the by-pass jet) is discharged through the pump discharge nozzle opening in the throat of the small auxiliary venturi.

IDLING ADJUSTMENT:—Must be made only when engine warmed up so that Fast Idle and Automatic Choke inoperative. Idle adjusting screw controls fuel mixture and should be turned in for leaner mixture, out for richer mixture. Idle speed controlled by throttle stopscrew and should be set for 7-8 MPH. idling speed. See tune up data on car model page for complete instructions.

METERING JETS:—Main metering jet is non-adjustable type. See Note above for recommended changes for increased fuel economy and Stromberg Jet Specification Table for complete jet calibrations.



ECONOMIZER:—By-pass valve and jet located at bottom of accelerating pump cylinder and operated by pump piston. Should not require attention but setting can be checked by noting throttle opening when pump piston rests on seat of by-pass valve (less over-travel) with pump set for medium stroke (link engaged in middle hole on lever). Should be 13/32" (plus or minus 1/64").

Adjustment—To adjust, remove cotter pin and turn adjusting nut at upper end of pump piston stem. Make certain that cotterpin replaced to lock setting. NOTE—When dismantling carburetor, do not disturb this nut to avoid necessity of resetting economizer when carburetor is assembled.

ACCELERATING PUMP:—Operated by throttle lever through vertical pump rod concealed under float bowl cover. Fuel is drawn into pump chamber through inlet screen and ball check valve when throttle is closed and is discharged through outlet check valve (economizer by-pass valve) and pump discharge nozzle in throat of auxiliary venturi when throttle is opened for acceleration. Pump rod is spring loaded on pump stem so that with sudden throttle openings piston will lag slightly, compressing the spring, and the subsequent expansion of the spring will prolong pump delivery. A spring-loaded relief valve in the piston head will by-pass some fuel to prevent loading up engine when throttle is opened suddenly (this valve normally closed).

Capacity—17-22 cc. per 10 strokes when operated slowly with pump set for medium stroke (pump link in center hole).

Adjustment—Three holes provided in throttle lever for pump link engagement. Inner hole (short radius) provides minimum stroke, center hole medium stroke, outer hole (long radius) maximum stroke. See tune up data on car model page for recommended settings.

FLOAT LEVEL:—Fuel Level. Set at 5/8" below top edge of float bowl with 3 lbs. pressure (engine idling). Can be adjusted by bending float arm at point where it is attached to float. NOTE—Float fulcrum pin is retained by clip seated in float seat recess. When installing pin, see that clip is seated and engages notches at each end of fulcrum pin.

Float Valve & Seat—No. P-21918. Furnished only in matched sets.

Float Bowl Vent—Bowl is vented to outside atmosphere through slot at upper end of pump rod housing on bowl cover.

THROTTLE VALVE SETTING:—Valve is No. P-23282. Should be set so that distance from upper edge to lower edge of upper idle port is .010" plus or minus .004".

CHOKE:—Valve is offset type fitted with stop pin to limit motion in wide open position. Operated by thermostatic spring coil connected directly to choke valve shaft. See article in Carburetion Equipment Section for complete data.

SERVICE PARTS:—**Gasket Set**—No. J-5319-G.

Number **MODEL—BXV-3**
A-18073—DODGE, MODEL D11 (1939)

TYPE:—Single barrel, plain tube, downdraft type with throttle operated accelerating pump and vacuum controlled economizer. Float bowl is vented through tube in air horn below air cleaner.

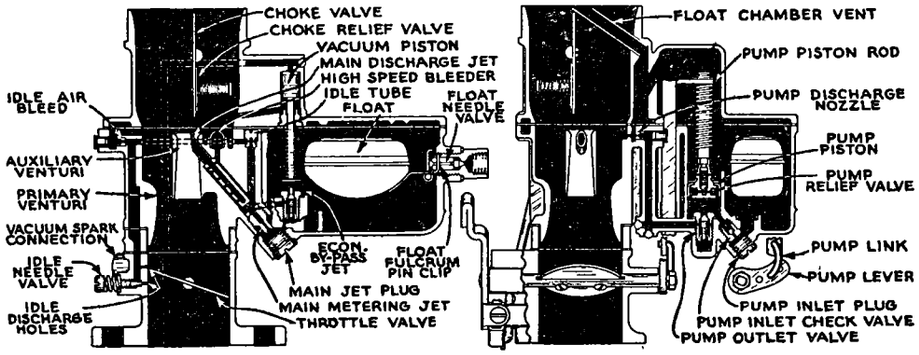
Fuel System (Idling and Low Speed):—Fuel for idling taken from main jet well up through Idling Tube which meters the fuel to a cross-channel in which it is mixed with air admitted through Idle Air Bleed (air bleed passage opens into carburetor barrel below choke valve). Fuel mixture then taken down through channel to discharge ports at the throttle edge. For closed throttle idling, fuel discharged through lower port below throttle valve and controlled by idle adjusting screw (uppor port above throttle valve serves as additional air bleed). As soon as throttle is cracked open for low speed running, additional fuel is discharged from this upper port also.

Driving Range (Below 65 MPH.)—As throttle is opened, suction increases on main discharge jet and this jet supplies fuel, the idling system dropping out. Fuel for main discharge jet is metered by main metering jet located at lower end of discharge jet. Discharge jet is air bled by High Speed Bleeder located directly above jet on auxiliary venturi support.

High Speed and Wide Open Throttle Operation—At speeds above 65 MPH. or whenever throttle held wide open so that manifold vacuum falls off, spring on vacuum piston forces piston down and opens by-pass valve. Fuel metered by the by-pass jet then flows directly to the main discharge jet.

IDLING ADJUSTMENT:—Idle adjusting screw controls fuel discharge from lower idle port and should be turned in for leaner mixture, out for richer mixture. Adjust only with engine warmed up so that choke valve wide open and fast idle inoperative. Idle speed controlled by throttle lever stopscrew and should be set for 7-8 MPH. hot idle speed. See car model tune up page for adjusting instructions.

METERING JET:—Main metering jet is non-adjustable type and should be changed only for special operating conditions such as high altitude. See Stromberg Jet Specification table for complete jet data.



ECONOMIZER:—Vacuum piston type. Consists of a vacuum piston in a cylinder in the air horn casting which controls the by-pass valve and jet assembly in the main body casting. No adjustment required. Economizer is set to open valve with vacuum of 4-6" of HG. in manifold.

ACCELERATING PUMP:—Operated by throttle lever through vertical pump rod under float bowl cover. Fuel is drawn into pump chamber through strainer screen and inlet ball check valve and is discharged through outlet valve and pump discharge nozzle located in side of mixing chamber above main venturi when throttle opened for acceleration. Pump piston has ball type relief valve in piston head and duration spring on piston rod (spring compressed on sudden throttle openings, subsequent spring expansion prolongs pump discharge).

Capacity—Pump capacity in cc. per 10 strokes with pump set for medium stroke (link in center hole of throttle lever) should be 11-14 ccs.

Adjustment—Three holes provided in throttle lever for pump link connection. Link engaged in center hole provides normal setting, outer hole (long radius) provides maximum pump discharge, inner hole (short radius) minimum discharge. See car model tune up page for recommended seasonal changes.

Pump Servicing Note—Strainer screen located in pump inlet in bottom of float bowl should be cleaned at frequent intervals to insure satisfactory pump performance.

FAST IDLE:—Consists of a cam pivoted directly below the throttle lever shaft and linked to the choke valve. Cam serves as stop for throttle lever stopscrew and opens throttle to fast idle position when choke valve is closed for starting. No adjustment required but stopscrew should be at high point of cam with choke valve fully closed.

FLOAT LEVEL:—Fuel Level—Should be 5/8" below top edge of float bowl with engine idling. Adjust by bending float lever arm at point where it is attached to float.

Needle Valve & Seat Assembly—Part No. P-24063. Furnished only as matched set. When installing float or needle valve make certain that spring clip is properly engaged in notches on float fulcrum pin.

CHOKE:—Valve is offset type with poppet type relief valve.

Automatic Choke—Sisson. See article in Carburetion Equipment Section for adjustment and servicing instructions.

THROTTLE VALVE SETTING:—Part No. P-24059 (20° type).

SERVICE PARTS:—Gasket Set—No. J-5409-G.

M-10A—AUSTIN, BANTAM MODEL (1932-33-34-35)
M-10B—BANTAM, MODEL 60 (1937-38)
M-10BX—BANTAM, MODEL 60 (1939)

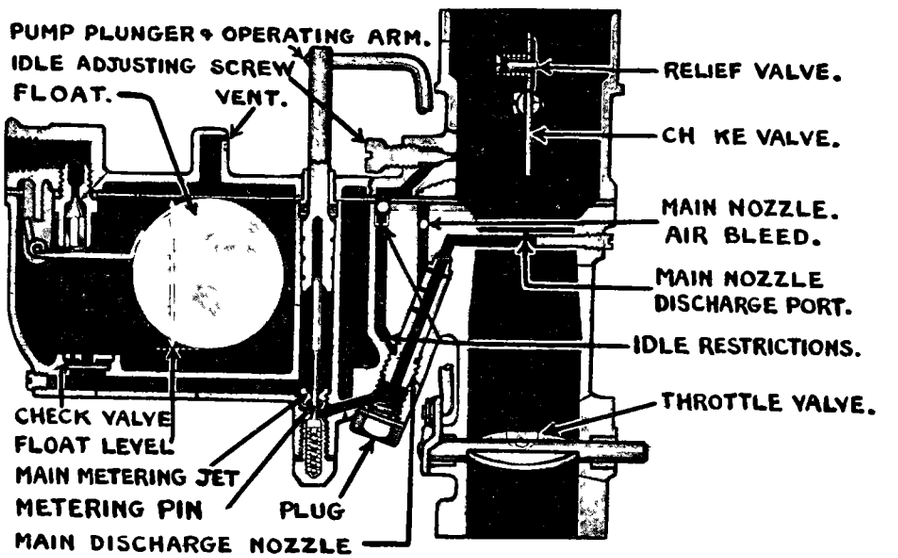
NOTE:—Models M-10B and M-10BX are same general design as Model M-10A and are adjusted in the same manner.

TYPE:—Plain tube updraft type. Carburetor has two adjustments. The main or high speed needle valve controls the fuel for the main nozzle. The idle or low speed adjustment screw controls the fuel mixture for the idle discharge ports in the wall of the mixing chamber opposite the throttle edge. Adjustments should be made in the order given below.

PRELIMINARY ADJUSTMENT:—Turn main or high speed adjustment needle valve in or clockwise until it is seated, then open or back off needle valve exactly 1½ turns. Turn idling or low speed adjusting screw in or clockwise until it is seated, then back off adjusting screw ½ turn. Start engine and run until it is thoroughly warmed up.

MAIN (HIGH SPEED) ADJUSTMENT:—With engine warm and running, open throttle until engine speed is approximately 30 M.P.H. Turn main adjusting needle valve in or clockwise until engine begins to slow down for want of fuel. Then slowly turn adjusting handle out or counter-clockwise until engine runs smoothly. The correct setting should be approximately ⅛-¼ turn from the first position. This adjustment should be made slowly and needle valve should not be opened beyond the point where smooth running and power is secured in order to assure maximum economy.

IDLING (LOW SPEED) ADJUSTMENT:—With engine running, close throttle and adjust throttle lever stop screw so that idling speed is somewhat faster than normal. Turn idling adjustment screw in or clockwise until engine begins to miss, then turn screw slowly out or counter-clockwise until engine fires smoothly. Adjusting screw controls fuel mixture and should be turned in for leaner mixture and out for richer mixture. After completing adjustment, adjust throttle lever stop screw to secure correct idling speed.



CHOKE CONTROL:—Choke valve is held in place on choke valve shaft by a spring which allows choke valve to open slightly when engine begins to fire, preventing over-choking. Adjust choke linkage so that choke valve is closed (engine not running) when choke control button on instrument panel is pulled all the way out and wide open with control button pushed in.

MODELS D-1A, D-1D

D-1A—WILLYS FOUR, MODEL 77 (1933-34).
D-1D—WILLYS FOUR, MODEL 77 (1935).

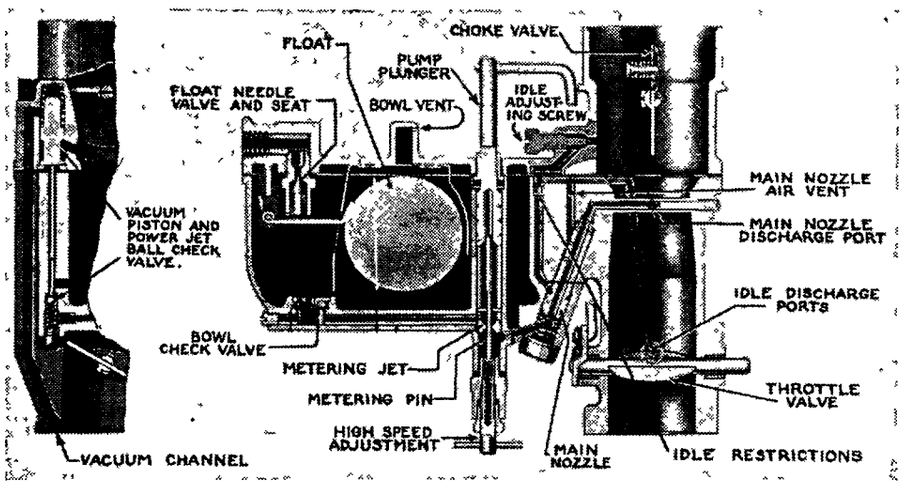
TYPE:—Plain tube downdraft type with throttle operated accelerating pump and economizer (metering rod and metering jet assembly). Fuel for main nozzle (located above a plug at the side of the barrel) is metered by a metering pin and jet assembly at the bottom of the accelerating pump. Metering pin is pressed down by accelerating pump piston, permitting an increased fuel flow for high speed or wide open throttle operation. Main nozzle is air bled by a vent tube and hole in the carburetor body casting. Fuel for idling is taken from the main nozzle well up through the idle channel riser and is metered by restrictions at the bottom and top of the channel. The idle passage at the top of the idle channel is air bled by a vent in the carburetor barrel below the choke valve. This vent is controlled by the idle adjustment screw. Fuel mixture is taken down through a passage in the body casting and discharged through two ports opposite the throttle edge (closed throttle position). Idle adjustment is the only point requiring attention.

IDLE ADUSTMENT:—Make a preliminary adjustment of the idle adjusting screw by turning screw in or clockwise until it is seated, then turn screw out or counter-clockwise exactly 1¼ turns. Run engine until it is thoroughly warmed up, close throttle, adjust throttle lever stop screw so that engine runs at correct idling speed. Turn idle adjusting screw out or counter-clockwise until engine begins to miss (mixture too lean), then turn screw in slowly until engine fires smoothly. Idle screw operates on air and should be turned out for leaner mixture and in for richer mixture. Check idling speed and readjust throttle stop screw if necessary. Correct idling speed should be 7 M.P.H.

ACCELERATING PUMP:—Accelerating pump cylinder is supplied with fuel from main fuel channel under float bowl and discharges through metering jet to main nozzle when throttle is opened. A check valve in the bottom of the float chamber prevents fuel being discharged back into the float bowl. Accelerating pump should not require adjustment.

ECONOMIZER:—Metering pin in metering jet is pressed up by a spring below the pin for partial throttle operation so that the larger diameter section of the pin restricts the fuel flow through the jet. The upper end of the metering pin stem is engaged in a hole in the accelerating pump plunger so that the metering pin is pressed down when the throttle is opened, the smaller diameter section of the metering pin then permitting a larger fuel flow through the metering jet. Metering pin and jet assembly is not adjustable and should not require attention.

FLOAT LEVEL:—To check float level, take off float bowl cover (upper casting), invert cover, measure distance from gasket face to bottom of float (bottom when not inverted). This distance should be 1 25/32". Float level can be corrected by bending float lever. See that float lever stop permits full travel f float.



CHOKE:—Choke valve is fitted with relief poppet valve to prevent over-choking. Check choke linkage to see that choke valve is fully closed when choke control button on dash is pulled all the way out and wide open when choke control button is pushed in.

D-1E—WILLYS, MODEL 77 (1936).

NOTE:—New power jet permits leaner settings than used previously.

TYPE:—Plain tube downdraft type with positively actuated accelerating pump connected to throttle lever and vacuum controlled power jet. Similar in design to type used previously on this model except that metering pin adjustment and power jet have been added. Fuel for main nozzle metered by adjustable metering pin and jet (high speed adjustment handle below carburetor). Additional fuel by-passed to nozzle when vacuum controlled power jet ball check valve open. Fuel for idling taken from main nozzle up through channel in which idle metering restrictions located to cross passage connected to idle air vent and then down through channel to discharge ports at throttle edge. Idle adjusting screw controls idle air vent opening. Adjustments should be made in order given below.

PRELIMINARY ADJUSTMENT:—If carburetor out of adjustment, make a preliminary setting by turning main high speed adjustment handle out or counter-clockwise two full turns. Turn idle adjusting screw in or clockwise until it is seated, then back screw off one turn. This will allow engine to be started and warmed up so that adjustments can be made correctly.

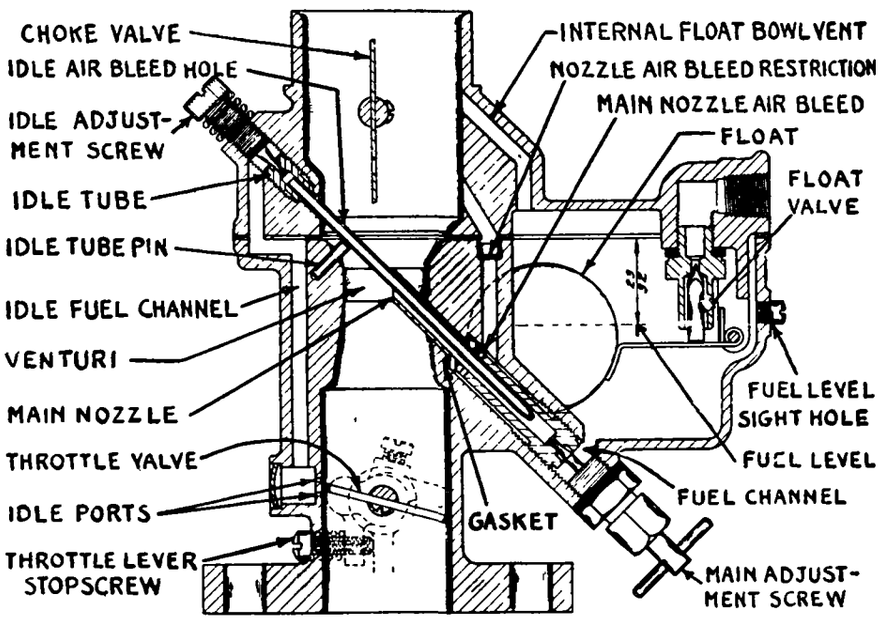
HIGH SPEED ADJUSTMENT:—Open throttle so that engine speed is 25-30 M.P.H., turn main adjustment handle up or clockwise until engine slows down, then back adjustment off until engine speed is at maximum, finally turn adjustment up approximately three quarters of a turn to insure maximum economy. See tune-up instructions on car model page.

IDLING ADJUSTMENT:—After completing high speed adjustment, close throttle and allow engine to idle, turn idle adjusting screw out or counter-clockwise until engine misses, then turn screw in until engine fires evenly. Check by opening throttle momentarily to clear manifold and then noting performance. Adjust throttle stopscrew for 7 M.P.H. idling speed. See tune-up instructions on car model page.

POWER JET:—Power jet vacuum piston normally held at upper end of stroke by manifold vacuum so that spring-loaded ball check valve is closed. Drop in vacuum when throttle opened wide allows spring to force piston down, opening check valve, and allowing fuel to flow through power jet to main nozzle. Power jet should not require attention.

ACCELERATING PUMP:—Pump plunger located in metering jet well and connected to throttle lever so that plunger is forced down discharging fuel in well through main nozzle and main nozzle discharge port. When throttle is held open plunger contacts metering pin extension depressing metering pin (metering pin spring mounted in high speed adjustment handle to permit this action) allowing greater fuel flow through metering jet to main nozzle for full power operation. Accelerating pump should not require adjustment.

FLOAT LEVEL:—To check float level, remove float bowl (integral with air horn), invert cover, measure from gasket seat on cover to bottom of float. This distance should be 1 25/32". Float level can be corrected by bending float lever at point where it is attached to float.



CHOKE:—Choke valve provided with relief poppet valve to prevent over-choking. Check linkage to see that valve opens and closes fully.

DY-1A—CROSLEY, MODEL A (1939-40)

TYPE:—Single barrel, plain tube, downdraft type with high speed (Main) and low speed (Idle) adjustments.

Fuel System (Idling & Low Speed):—Fuel is metered by restriction at lower end of Idle Tube and flows up through tube (located in main nozzle—see illustration) where it is mixed with air admitted through Idle Air Bleed hole in side of idle tube. Fuel mixture is controlled by Idle Adjusting Screw (at upper end of tube) and flows through Idle Fuel Supply Channel in carburetor casting to Idle Discharge Ports at the throttle edge. For closed throttle idling, all fuel is discharged through lower port. As soon as the throttle is opened for low speed running, additional fuel is discharged through upper port also. Idle system supplies all fuel for car speeds up to approximately 18 M.P.H.

Speeds above 18 M.P.H.—At approximately 18 M.P.H., throttle valve opening causes reduced suction on idle ports and increased suction on main nozzle so that fuel is discharged at main nozzle and idle system drops out. Fuel for main nozzle is metered by Main Adjustment Screw and is mixed with air admitted through holes in nozzle from main nozzle air bleed channel opening into air horn above choke valve. This air is metered by Main Nozzle Air Bleed Restriction located in air bleed channel at top of carburetor main casting.

ADJUSTMENT:—Make adjustments in order as listed below. Preliminary adjustment will allow engine to be started and warmed up (other adjustments should not be made until engine thoroughly warm).

Preliminary Adjustment:—Close Main Adjustment Screw by turning to right (clockwise) until it is lightly seated, then back screw out exactly two complete turns. Close Idle Adjustment Screw by turning to right (clockwise) until it is lightly seated, then back screw out exactly one complete turn. Start engine and run until thoroughly warmed up.

Main (High Speed) Adjustment:—With engine warm and running, open throttle so that engine speed is 30-35 M.P.H. Turn Main Adjustment Screw in or clockwise slowly (¼ turn at a time) until engine slows down due to lack of fuel, then back screw out very slowly (⅛ turn at a time) until maximum speed is secured. Correct setting will be approximately 1½ turns open (first 1000 cars), 1¾-2 turns open (later cars) of screw from inner seated position.

Idle (Low Speed) Adjustment:—Set throttle lever stopscrew so that engine runs at faster than normal idling speed. Close throttle. Turn Idle Adjustment Screw in or clockwise to lean mixture until engine begins to miss, then back screw out slowly until engine fires smoothly. Clear manifold by opening throttle momentarily, then recheck idle setting. Correct setting will be approximately ¾-1¼ turns of the screw from the inner seated position. Set throttle lever stopscrew for idling speed of 7 M.P.H. when pulling car in high gear.

MODEL DY-1A CONT.

PERFORMANCE:—Should be satisfactory for operation at altitudes less than 5000 feet if adjustments correctly made as directed above. If performance not satisfactory, check adjustments and tune up engine (see car model T&E page for tune up data). See Trouble Shooting Section below.

FLOAT LEVEL:—**Fuel Level**—Should be 23/32" below top edge of float bowl or just below lower edge of inspection hole on side of float bowl (remove inspection hole plug to check level).

Float Level—To check, invert upper body assembly (air horn and float bowl cover with complete float mechanism), measure from face of body gasket to top of raised seam on each float. Distance should be 1 27/64". To adjust, bend each float lever arm **using extreme care to secure equal setting for both floats.** DISASSEMBLY CAUTION—Before taking off Upper Body Assembly (to check or adjust float level), remove Idle Adjustment Screw, Spring and Idle Tube to avoid damage to tube and main nozzle when upper body assembly lifted off.

Inlet Needle Valve & Seat—Part No. 06287 (matched set).

CHOKE:—Plain butterfly type. Adjust choke linkage so that choke valve is wide open when dash control button is pushed all the way in.

TROUBLE SHOOTING:—**Engine Stalls**—Check idle speed setting, tighten throttle stop retaining screw, check idling or low speed adjustment, see that idle adjustment screw not ringed, clean idle tube and idle fuel channels with air, check float level (see Fuel Level Note below).

Flatness on Acceleration—Check Idle (Low Speed) and Main (High Speed) Adjustments, check float level (if engine loads up, see Fuel Level Note below), clean idle tube and idle fuel channels with air.

Performance Unsatisfactory—Tune up engine (see car model T&E page for tune up data), check all carburetor adjustments.

Fuel Level Note—If fuel level in float bowl rises above setting, dismantle needle valve, clean needle valve and seat with a soft clean cloth, reseat needle valve by tapping with finger several times while turning needle around. Reset float level. If level not maintained, install new needle valve and seat.

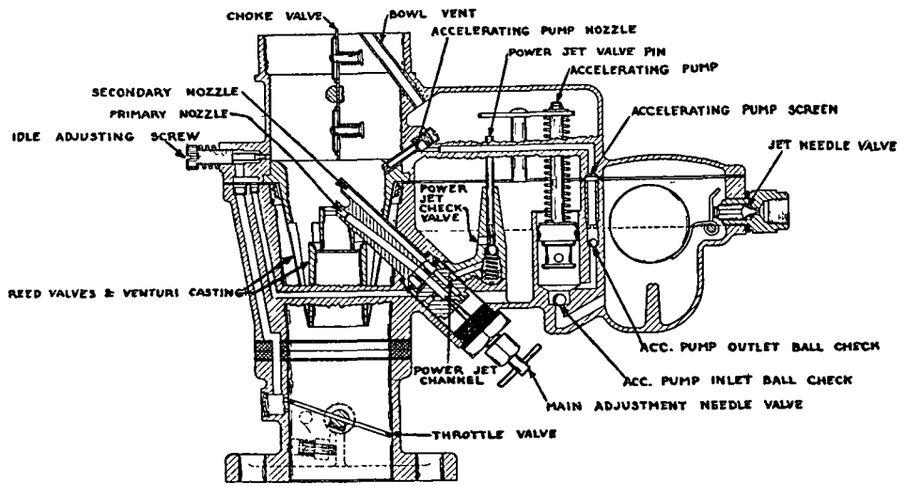
SERVICING:—Before removing Upper Body Assembly (air horn and float bowl cover), remove Idle Adjustment Screw and spring, unscrew and remove Idle Tube through adjusting screw hole—this is important to avoid damage to tube and nozzle when upper assembly lifted off. Idle tube positioning pin in main body casting is not removable. Main nozzle outlet and gasket are staked in main body casting and cannot be removed (nozzle base can be removed through main adjustment screw plug hole after adjustment screw assembly removed). Blow out all jets and channels with compressed air—do not use wires or drills to clean passages. See that float bowl vent to air horn is open and clean.

Reassembly—Replace all worn or damaged parts with genuine Tillotson service parts. Use all new gaskets and replace parts in same order as removed. See that nozzles and plugs are tight. Set float level and adjust carburetor.

MODEL U-1A

U-1A—WILLYS, MODEL 37 (1937), 38 (1938), 48 (1939).

TYPE:—New design, Triple Flexible or Expanding Automatic Venturi, downdraft type. Venturi system consists of a three stage or triple venturi system which insures high velocity at nozzles for all speeds. Air flow through main venturi is cut off at speeds below 35 M.P.H. by the flexible reeds which close against the outer wall of the intermediate venturi so that all air flows through small venturi and intermediate venturi and velocity at tip of primary nozzle (in throat of small venturi) is at maximum. With reeds closed, no suction is applied to secondary nozzle. When reeds open, secondary nozzle comes into action and fuel is discharged through both nozzles.



Fuel System (Closed Throttle Idling & Low Speed):—Fuel is taken from primary nozzle well up through fuel channel to cross-passage at air horn flange and mixed with air admitted through air intake port located in carburetor wall at top edge of main venturi. Idle adjusting screw controls this air port. Fuel metered by restriction at top of fuel channel, and fuel mixture metered by restriction at top of channel leading to discharge ports at throttle edge. For closed throttle idling, fuel mixture is discharged through lower port below the throttle. When throttle is opened for low speed running, additional fuel is discharged through top (low speed) port also.

Driving Range (20 M.P.H. & Above):—At approximately 20 M.P.H. when air velocity through small venturi is at maximum, fuel metered by the main adjustment needle valve in the nozzle base is drawn up through nozzle passage and discharged through primary (lower) nozzle. At approximately 35 M.P.H. air velocity flexes the four Velocity Control Reeds to the open position so that air flows through main venturi and suction at tip of secondary (upper) nozzle in main air stream is sufficient to bring this nozzle into action supplementing the discharge of the primary nozzle. Fuel for secondary nozzle is metered by restriction in fuel channel in nozzle base.

High Speed & Full Power Operation:—When throttle opened beyond ¾ open position, power jet valve pin is depressed by extension on accelerating pump stem yoke, opening power jet ball check valve, and permitting additional fuel to flow through power jet channel to secondary nozzle.

ADJUSTMENT:—For complete carburetor adjustment, Main adjustment needle valve and Idle adjusting screw must be adjusted in order as given below. If carburetor completely out of adjustment so that engine can not be warmed up, make preliminary adjustment as follows.

Preliminary Adjustment:—Close main adjustment needle valve by turning clockwise or in, lightly, until seated, then back out exactly 3 full turns. Close idle adjusting screw by turning clockwise or in until seated, then back out exactly ¾ turn. Start engine and run until warm.

Main Adjustment:—Open throttle valve so that engine speed is 30-35 M.P.H., turn main adjustment in or clockwise slowly until engine speed falls off due to lack of fuel, then turn main adjustment slowly out until engine picks up and maximum speed is obtained, finally turn main adjustment in ⅜ turn (this setting will give best performance and economy). Final setting is approximately 2⅜ turn open.

Idle Adjustment:—Close throttle, adjust throttle stopscrew so that idling speed is slightly faster than normal. Turn idle adjusting screw counter-clockwise or out until engine begins to miss, then turn screw in until engine fires smoothly. Open throttle momentarily to clear manifold and recheck idle setting. Final setting should be approximately 1 turn open. Set throttle stopscrew so that idling speed is 7 M.P.H.

PERFORMANCE:—Should be satisfactory if carburetor correctly adjusted as directed above. No changes required for operation at altitudes up to 5000 feet.

POWER JET:—Consists of ball type check valve operated by accelerating pump and supplying additional fuel to secondary nozzle (see Fuel System above). No adjustment required.

ACCELERATING PUMP:—Fuel drawn into pump chamber through intake ball check valve (at lower end of pump cylinder) on upstroke of piston and discharged through outlet ball check valve and pump channel screen to pump nozzle on downstroke of piston when throttle opened for acceleration. Pump nozzle located in carburetor wall at upper edge of main venturi. Accelerating pump is not adjustable and should not require attention.

FLOAT LEVEL:—Fuel level in float bowl set at ¾" below top edge of bowl or approximately even with the top of the float lever pivot pin with the engine idling. To check float level, remove air horn casting and gasket. Correct float level by bending float lever.

NOTE—Bowl is vented in air horn and float bowl cover must be tight.

CHOKE VALVE:—Manual control type. Fitted with two spring-controlled poppet-type relief valves to prevent overchoking. See that choke valve is fully closed with dash control button pulled out and wide open when dash control button pushed all the way in.

U-1B—WILLYS-OVERLAND, MODEL 39 (1939)

TYPE:—High velocity, triple flexible expanding or automatic venturi type with venturi and reed design similar to that used on Model U-1A (Willys). Main nozzle and metering jet design (fixed type—no high speed adjustment) is new and operates as follows:

Fuel System (Closed Throttle Idling & Low Speed):—Fuel for idling is taken through side holes in main metering jet and channel to mixing chamber at idle adjusting screw (fuel metered by restriction at top of channel) where is mixed with air admitted through two bleeder openings (upper hole has restriction and leads to air horn above venturi assembly, lower hole leads to mixing chamber below venturi—see illustration) and controlled by the idle adjusting screw. Fuel mixture is then taken down through vertical channel (with restriction at upper end) to idle discharge ports at the throttle edge. For closed throttle idling, fuel mixture is discharged through lower port only. As soon as throttle is cracked open, additional fuel is discharged through top port. Idle system supplies fuel for car speeds up to 18 M.P.H.

Driving Range (18-60 M.P.H.):—At speeds above approximately 18 M.P.H., air velocity at nozzle tip in small venturi is suffcient to bring this nozzle into action, the fuel discharged through this nozzle being metered by the fixed metering jet at the nozzle base. The flexible reed valves are calibrated to maintain maximum velocity at nozzle tip (closed at low speed, open automatically at higher speeds) and correct air-fuel ratio throughout the entire driving range. Whenever throttle is opened for acceleration, additional fuel is discharged through accelerating pump nozzle above venturi (see Accelerating Pump below).

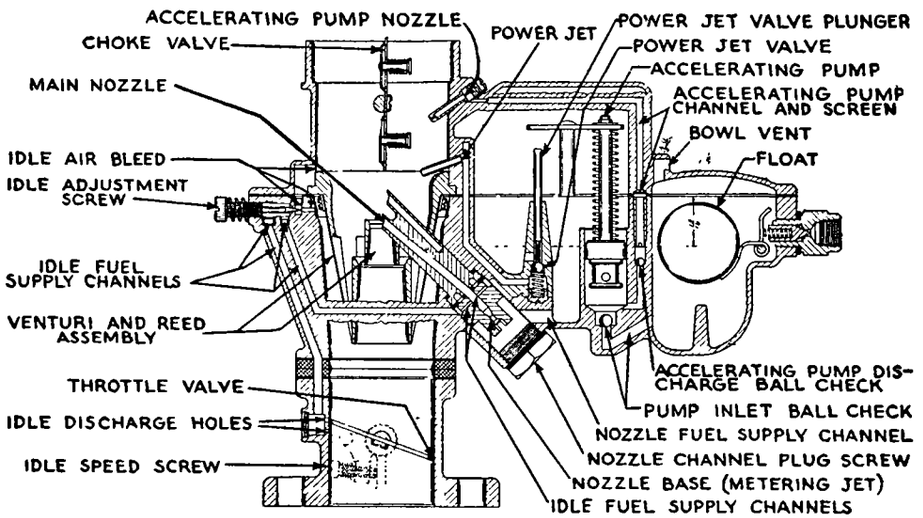
High Speed or Wide Open Throttle Operation:—At speeds above 60 M.P.H. or when throttle more than ¾ open, power jet valve plunger depressed by pump arm and opens power jet valve so that additional fuel is discharged through power jet in carburetor wall at top of venturi assembly. There is an air bleed at the top of the power jet fuel channel.

Main Nozzle Note—All fuel discharged by main nozzle through lower opening in nozzle tip. Upper opening in nozzle tip is not used. Use great care not to damage either opening in nozzle tip when servicing main nozzle as change in shape will alter air flow past nozzle and change discharge characteristics.

IDLE ADJUSTMENT:—With engine warmed up and choke valve wide open, set throttle lever stopscrew for slightly faster than normal idle speed, turn idle adjusting screw counter-clockwise (out) until engine begins to miss, then turn screw clockwise slowly until engine fires smoothly. Final setting should be approximately 1 turn open from inner seated position. Adjust throttle lever stopscrew for idle speed of 7 M.P.H. in high gear. See car model 'T&E' page for complete carburetor tune up instructions.

NOTE—If carburetor out of adjustment, turn idle screw in until it is seated, then back screw out exactly ¾ turn. Warm up engine and adjust as directed above.

PERFORMANCE:—Should be satisfactory if idle adjustment correctly made. Main metering jet is fixed type and no high speed adjustment provided. Standard metering jet should be satisfactory for operation at altitudes up to 3000 feet. For permanent operation at altitudes greater than 3000 ft., install high altitude metering jet (nozzle base) marked 'ALT'.



ACCELERATING PUMP:—Fuel is drawn into pump cylinder through intake ball check valve (in bottom of cylinder) when throttle is closed, and is discharged through outlet ball check valve, strainer (in plug at bowl cover flange) and pump jet in air horn when throttle is opened for acceleration. Upper section of pump piston is spring-loaded on stem to provide a prolonged pump discharge. **Adjustment**—On models where two holes provided in pump lever, engage link in hole nearest throttle shaft if flatness encountered on acceleration.

POWER JET:—Consists of a ball check valve controlling fuel discharge through power jet in carburetor wall above venturi and operated by accelerating pump arm (see Fuel System 'High Speed' above). No adjustment required.

FLOAT LEVEL:—Should be 13/16" below top edge (gasket seat) of bowl with engine running. To check float level, remove air horn and bowl cover assembly, remove gasket, use height gauge to measure actual fuel level below top edge of bowl. Do not press on float lever when checking (valve needle is spring-loaded which will permit some float movement with valve closed). To adjust, bend float lever slightly.
NOTE—When installing needle valve or float make certain that small spring is in place in hollow stem of valve needle. This spring is intended to minimize float movement and float level changes on rough roads.

CHOKE:—Manual control type, fitted with two poppet type relief valves. See that choke linkage properly adjusted to open and close choke valve fully.

SERVICING:—When servicing carburetor, blow out all channels and jets with compressed air (do not use wires or drills in jets or restrictions). Use extreme care not to bend valve reeds (if necessary to remove reeds, install short thick reed first and longer thin reed on outside). See that power jet valve ball seats tightly to prevent fuel discharge through power jet at intermediate speeds (check by

noting jet with engine running) and that plunger installed with small end down against valve ball. Make certain that pump plunger leather is good condition and contacts pump cylinder wall at all points (replace complete plunger assembly if leather worn or damaged). To remove nozzle, take out plug below metering jet, clean threads in casting thoroughly with compressed air, use socket wrench to remove metering jet, then remove nozzle from below taking great care not to damage threads in casting (if necessary, tap nozzle lightly on solid portion between upper and lower nozzle openings on upper end).

Reassembly—Replace all worn or damaged parts with genuine Tillotson service parts, use all new gaskets and re-install parts in same order as removed. Check gasoline level and idle adjustment as directed above.

TROUBLE SHOOTING:—**Motor stalls when idling**—Tighten throttle lever retaining screw and locknut, check idle adjustment. Remove idle adjusting screw, blow out all idling system channels and restrictions, clean metering jet with compressed air. Check fuel level. Tighten air horn and bowl cover retaining screws and carburetor mounting bolts, see that gaskets at these points are in good condition.

Flat Spots—Remove pump jet plug, clean pump jet and channels with compressed air. Remove air horn and bowl cover assembly, clean pump strainer (in pump outlet channel at air horn flange).

MODEL J

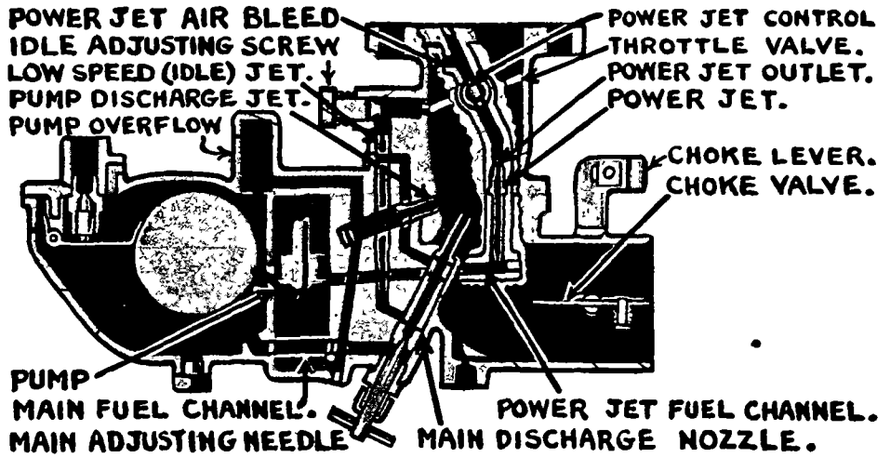
J-1A—WILLYS SIX, MODELS 97, 98-D (1931).
J-1B—WILLYS SIX, MODEL 6-90 (1932).
WILLYS SIX, STREAMLINE MODEL 6-90A (1932-33).
J-3B—WILLYS KNIGHT, MODEL 95 (1931).

TYPE:—Plain tube updraft type with throttle operated accelerating pump and power jet. Fuel for main discharge nozzle (mounted at an angle in the venturi) is metered by the main adjustment needle valve on the bottom of the carburetor. Main nozzle is air bled through an external air vent in the carburetor wall. Fuel for idling is taken from the main discharge nozzle well up through the idling tube (low speed jet) and is discharged through two ports in the mixing chamber opposite the throttle edge. Upper or idling discharge port is located above the throttle (closed position), while lower or low speed port is located under the throttle edge. Idling discharge passage is air bled through an air vent controlled by the idling adjustment screw. Idling adjustment screw and main adjustment needle are the only points requiring attention. Adjustment should be made in the order given below.

For idling with closed throttle, all fuel is supplied by the upper (idling) discharge port. At car speeds up to 10 M.P.H. fuel is supplied by both the idling and low speed discharge ports (upper and lower ports). At car speeds from 10-18 M.P.H. fuel is supplied by these ports and by the main discharge nozzle. For car speeds from about 18 M.P.H. up to approximately ¾ throttle, all fuel is supplied by main nozzle. With wide open throttle the main nozzle discharge is supplemented by the power jet outlet located in the side of the venturi.

PRELIMINARY ADJUSTMENT:—Turn main adjustment needle valve (high speed adjustment) up or clockwise until it is seated, then turn back or counter-clockwise exactly 2½ complete turns. Turn idling screw in or clockwise until it is seated, then turn screw out or counter-clockwise ¾ turn. Start engine and run until thoroughly warmed up.

HIGH SPEED ADJUSTMENT:—Open throttle until engine speed is approximately 30 M.P.H., see that spark control is advanced. Turn main adjustment needle up or clockwise until engine begins to slow down for want of fuel, then turn needle slowly down (counter-clockwise) until engine picks up speed and runs smoothly. This adjustment must be made slowly so that needle will not be turned beyond point where smooth running is secured in order to assure maximum economy.



IDLING ADJUSTMENT:—Close throttle, retard spark, adjust throttle lever stop screw so that idling speed is slightly faster than normal. Turn idling adjustment screw out or counter-clockwise until engine begins to miss (mixture too lean), then turn screw slowly in or clockwise until engine fires smoothly. Set throttle stop screw for correct idling speed of approximately 5 M.P.H. Open throttle momentarily, close throttle and check idling adjustment.

ACCELERATING PUMP:—Accelerating pump is operated by the throtle lever and discharges fuel through a pump discharge nozzle in the wall of the venturi when the throttle is opened. Pump discharge is metered by the nozzle and excess fuel delivered by the pump flows into an overflow chamber at the top of the float bowl, from which it is returned to the float chamber. Pump should not require adjustment.

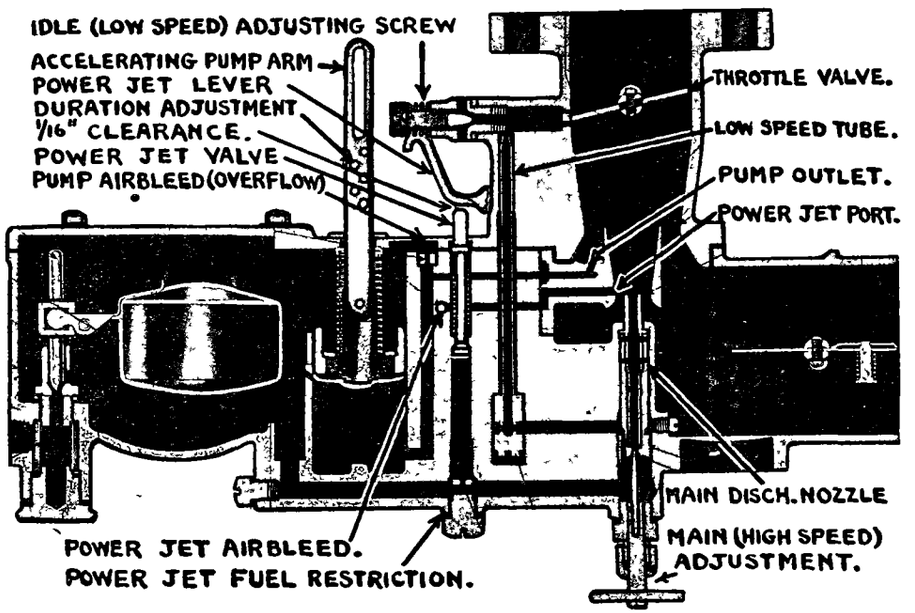
POWER JET:—Fuel for the power jet is taken from the float bowl and is metered by the power jet located in the fuel channel riser. The power jet discharge port is located in the venturi wall directly above the power jet. Power jet riser passage has an air bleed or vent hole controlled by the throttle shaft (a hole drilled through the throttle shaft acts as a valve in the air passage). With throttle less than ¾ open, the power jet discharge port is air vented so that no fuel is discharged through the power jet. With throttle from ¾ to wide open, the hole in the throttle shaft is turned so that the air vent is shut off and additional fuel is discharged through the power jet discharge port. Power jet is not adjustable.

FLOAT LEVEL:—To check float level, take off float bowl cover (upper casting), invert cover, measure distance from face of gasket to bottom of float (bottom when not inverted). This distance should be 1 13/16". To set float level bend float lever. See that float travel is 5/16" and bend float lever stop so that float is free to move this distance.

CHOKE:—Choke valve is fitted with relief poppet valve to prevent over-choking. Adjust choke linkage so that choke valve is fully closed with choke control button on instrument panel pulled all the way out, and wide open with choke button pushed in.

MODEL W

W-5D—WILLYS EIGHT, MODEL 8-88 (1932)
WILLYS EIGHT, STREAMLINE MODEL 8-88A (1932-33).



TYPE:—Plain tube updraft type with throttle operated accelerating pump and power jet. All fuel for main discharge nozzle in small venturi is metered by main nozzle restriction and main adjusting screw located at bottom of carburetor. Main nozzle is air bled by an air passage with three air vents. These air vents are located in the throat of the main or large venturi, in the mixing chamber below the venturi, and in the carburetor wall (outside vent hole through a plug). Idling fuel is taken through a by-pass hole in the lower end of the main nozzle to the low speed tube or by-pass and is discharged through two ports in the carburetor wall opposite the throttle edge (closed throttle position). The idling passage at the upper end of the low speed tube is air vented and this air vent is controlled by the idling adjusting screw. The idling screw adjustment and the main adjusting needle position (high speed adjustment) are the only points requiring attention. Adjustments should be made in the order given below.

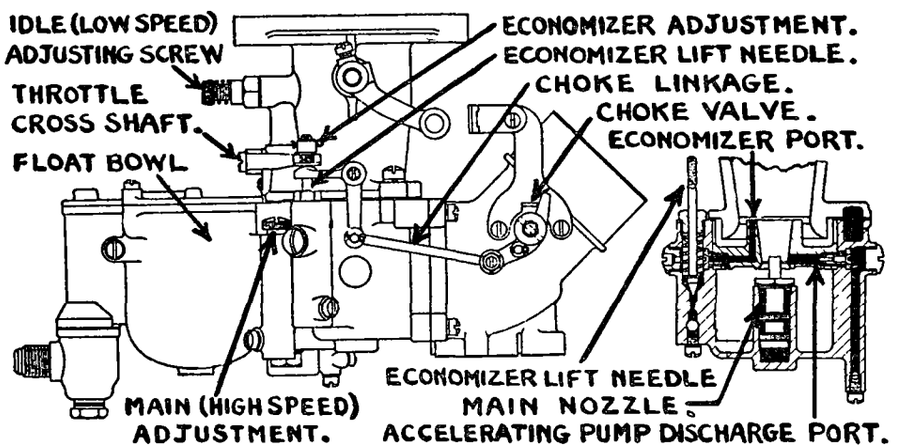
PRELIMINARY ADJUSTMENT:—Before starting the engine, close the main adjusting needle (under carburetor) by turning to the right or clockwise until it is seated, then back off or open needle by turning to the left or counter-clockwise exactly 2½ full turns. Close idling adjustment screw by turning to the right or clockwise until it is seated, then open by turning screw to the left or counter-clockwise exactly ¾ turn. Start engine and run until it is thoroughly warmed up.

HIGH SPEED ADJUSTMENT:—Retard spark, open throttle until engine speed is equivalent to 25 M.P.H. Turn the main adjusting needle up or clockwise until engine begins to slow down. Then turn needle down or counter-clockwise until speed picks up and engine runs smoothly (this should not be more than ⅛-¼ turn from first position. This adjustment must be made slowly and the needle should not be turned beyond the point where good power and free running is secured in order to assure maximum economy.

IDLING ADJUSTMENT:—After completing high speed adjustment, close throttle, adjust throttle stop screw so that idling speed is somewhat fast. Turn idling adjustment screw to left or out until engine begins to miss (mixture too lean), then turn screw slowly in or clockwise until engine fires smoothly. Adjust throttle stop screw for correct idling speed. Open throttle and speed up engine, close throttle, recheck idling adjustment.

ACCELERATING PUMP:—Accelerating pump plunger and piston is operated by the throttle lever and discharges fuel through a discharge hole in the small venturi support arm when the throttle is opened. Pump discharge riser passage is connected to the float chamber at its upper end and excess fuel delivered by the pump flows through the air bleed restriction (at the top of the passage) back to the float chamber. This vent also serves as an air bleed for the discharge port when the pump is not operating. Accelerating pump should not require adjustment. Pump plunger link is provided with a series of holes (duration adjustment) on some types or the connector link has an adjustable stop screw.

POWER JET:—Clearance between face of operating lever and power jet valve plunger should be 1/16" with throttle closed and choke valve wide open. The operating lever is connected to the choke valve so that the power jet valve is open with the choke valve closed (at all positions of choke valve except when wide open). This assists in starting and warming up the engine. Power jet valve is also opened by the throttle lever when throttle is wide open, permitting an extra fuel discharge for full power operation. Fuel for the power jet is taken from the main fuel channel through a metering restriction and up through the power jet valve to a discharge port in the throat of the small venturi. The discharge passage is air bled to control the fuel discharge through the power jet. Power jet is not adjustable except for clearance between operating valve plunger and operating lever (above).



FLOAT LEVEL:—Gasoline level in float bowl should be ¾" below top edge of bowl. To check level, take off bowl cover, remove gasket, measure fuel level from top edge of bowl. Float level can only be changed by changing position of the spool on the needle valve stem. Float lever should not be bent.

CHOKE:—Choke valve is connected to power jet valve operating lever so that power jet valve is opened when choke valve is closed (see Power Jet for adjustment of linkage). Choke valve is fitted with a relief poppet valve to prevent over-choking. Check choke control linkage to see that choke valve is fully closed with choke control button on instrument panel pulled out and wide open with button pushed in.

MODEL V

V-5B—WILLYS KNIGHT, MODEL 66-D (1932)
WILLYS KNIGHT, STREAMLINE MODEL 66-E (1932-33).

TYPE:—Plain tube updraft type with throttle operated accelerating pump and economizer (power jet). All fuel for main discharge nozzle is metered by high speed adjusting needle (located on top of carburetor at left of economizer valve plunger or lift needle). Main nozzle is air bled by an air passage with three air vents. Air vents are located in the mixing chamber below the large venturi, in the large venturi slightly above the venturi throat, and in the carburetor wall (external air vent). Fuel for idling is taken from the lower end of the main nozzle through a cross passage to the low speed or by-pass tube and is discharged through two ports in the carburetor wall opposite the throttle edge (closed throttle position). Upper idling discharge port is above the throttle edge while the lower port is practically closed by the throttle edge with the throttle closed tight. Idling passage at the upper end of the low speed tube is air bled and this air vent is controlled by the idling adjustment screw. Idling screw adjustment and high speed adjustment are the only points requiring attention. Adjustments should be made in the order given below.

PRELIMINARY ADJUSTMENT:—Turn high speed adjusting needle down or clockwise until it is seated, then open needle by turning to left or counterwise exactly 2¾ full turns. Turn idling adjustment screw in or clockwise until it is seated, then back off screw by turning to left or counter-clockwise exactly ¾ turn. Start engine and run until thoroughly warmed up.

HIGH SPEED ADJUSTMENT:—Retard spark, open throttle until engine speed is equivalent to 25 M.P.H. Turn the main adjusting needle down (clockwise) until engine begins to slow down for want of fuel, then turn needle slowly back (counter-clockwise) until engine picks up speed and runs smoothly. This adjustment must be made slowly and needle should not be turned beyond the point where good power and free running is secured in order to assure maximum economy.

IDLING ADJUSTMENT:—Close throttle, adjust throttle stop screw so that idling speed is faster than normal. Turn idling adjustment screw to left or out until engine begins to miss (mixture too lean), then turn screw to right or in until engine fires smoothly. Adjust throttle stop screw for correct idling speed (8 M.P.H.).

ACCELERATING PUMP:—Accelerating pump piston is operated by the throttle lever and discharges fuel through a discharge port in the throat of the small venturi when the throttle is opened. Pump discharge is metered by acceleration well nozzle and excess fuel delivered by pump flows into an expansion chamber in the carbruetor body directly above the nozzle. Pump should not require adjustment.

TILLOTSON MODEL V CONTINUED

ECONOMIZER (POWER JET):—Economizer lift needle (shut-off valve stem) is connected to choke valve and throttle valve so that valve is opened when carburetor is choked (to assist in starting and warming up engine) and also when throttle is wide open (providing extra fuel for full power operation). Fuel for power jet is taken from main fuel channel and is metered by economizer fuel restriction below the economizer valve. Economizer passage (above the valve) has an external air vent or air bleed to control fuel discharge through the discharge port in the top edge of the small venturi.

Adjustment:—Clearance between throttle operated cross lever and adjusting nut must be .040" with throttle closed and choke valve wide open. To adjust, close throttle, see that choke is wide open and that economizer lift needle is seated, turn adjustment nut on upper end of lift needle to right or left until clearance between lower face of adjusting nut and upper surface of throttle operated cross lever is .030-.040".

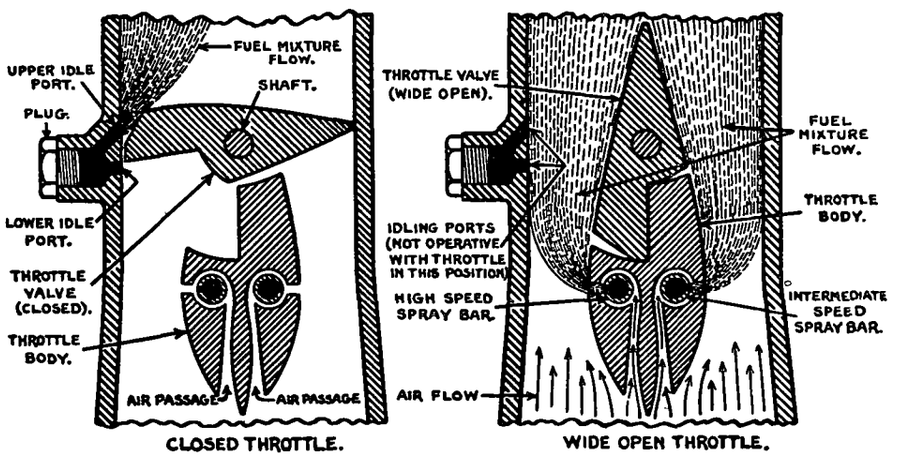
FLOAT LEVEL:—Gasoline level in float bowl should be 15/16" below top edge of float bowl. To check level, take off bowl cover, remove gasket, measure fuel level from top edge of bowl. Float level can only be changed by shifting position of spool on needle valve stem. Do not bend the float lever.

CHOKE:—Choke valve is interconnected with economizer lift needle (power jet shut-off valve) so that valve is opened when carburetor is choked. There must be suficient play in the connecting levers so that lift needle is seated when choke valve is wide open. Adjust choke valve linkage so that choke valve is fully closed when choke control button on instrument panel is pulled out, and wide open when choke button is pushed in.

WINFIELD MODELS S, SR

DESCRIPTION:—Winfield carburetors are made in both updraft and downdraft types. These models are entirely similar in throttle chamber and fuel metering system design, the principal difference being that an individual float bowl design is used for each type. The fuel system is made up of a conventional idling system and a unique type of intermediate and high speed discharge jets or spray bars built in the carburetor throat at the throttle valve. The hollow spray bars through which the fuel is fed are located at right angles to the air flow in concentric recesses within the throttle body. An air duct for each spray bar is located at the nose of the throttle body and some of the air is diverted through this duct, around the spray bars, and then out through the discharge port in the side of the throttle body with the atomized fuel. The throttle valve is mouned at the end of the throttle body and is roughly wedge-shaped so that fuel discharge from the intermediate spray bar begins before the high speed spray bar comes into action. Fuel is discharged by both spray bars with the throttle wide open.

Idling:—The idling system has two discharge ports opposite the blunt end of the throttle valve. When the throttle is fully closed, the lower discharge port is cut off by the throttle valve so that fuel is discharged only by the upper port. When the throttle is cracked open, additional fuel is discharged by the lower port and as the throttle is opened, the intermediate spray bar comes into action. Idling fuel mixture is controlled by the idling adjusting screw and idling speed is controlled by the throttle stopscrew in the usual manner. Adjustment directions are given below.



Accelerating Pump:—An accelerating pump is installed on Model SR carburetors. See adjustment directions below.

Float Level:—A sight hole closed by a plug is located on the float bowl. To check fuel level, remove plug with car standing on level floor. Fuel level should be even with the bottom of the inner thread in the sight hole.

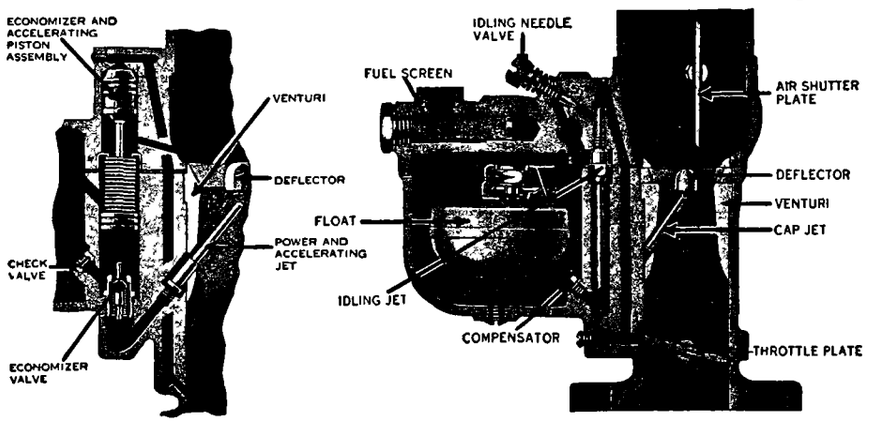
ADJUSTMENT:—Model SR. This data furnished through courtesy of Winfield Carburetor Company, Ltd., 3053 Treadwell Street, Los Angeles.

Accelerating Pump Adjustment:—The pump adjustment governs the accelerating mixture. It operates just the reverse of the other three adjustments Turning to the right gives a richer rather than leaner mixture. The richest accelerating mixture is obtained when the pump adjustment is screwed completely against its seat. This setting should rarely, if ever, be used. The leanest setting is obtained when the adjustment is open about three complete turns. The correct setting is usually about one-half to one and one-half complete turns open. The leanest pump adjustment setting that gives positive and smooth acceleration without hesitation or spitting back should be used. In cold weather a richer pump adjustment may be used to advantage than in hot weather.

Idling Adjustments. Open idling adjustment one-half turn. Before any attempt is made at adjustments, the motor must have been running until it is thoroughly warmed up. Check the float level to see that the gasoline level is at the bottom of the inner thread of the inspection hole; otherwise the adjustment will be incorrect. The idling adjustment consists of two settings; the idling mixture and the idling speed, which are considered separately. With the spark fully retarded and the throttle closed, keep turning the idle adjustment in or out until a point is reached where the engine idles smoothly. For a richer idling mixture, screw the idle adjustment out. For a leaner idling mixture, screw the idle adjustment in. The idling speed is regulated by the throttle stop adjusting screw. Set the idling speed of the motor with the spark advanced.

WINFIELD THROTTLE CHAMBER.

Intermediate Adjustments. After the idling speed adjustment has been made, the intermediate speed adjustment should be made. Open the intermediate needle approximately two turns. The intermediate adjustment is made from this point. Set the throttle at approximately one-third open. Have the spark retarded about one-half or set at a point where there is an appreciable slowing down of the motor. This adjustment should be made at approximately 1800 R.P.M. of the motor. The intermediate and high speed adjustments control the amount of gasoline admitted to the spray bar and not the amount of air. Turning the needle down or clockwise cuts down the supply of gasoline and turning it up or counter-clockwise increases the supply of gasoline. The most efficient intermediate adjustment will be obtained when the adjusting needle is set four notches under the number of notches that will still give the greatest number of revolutions per minute of the motor with the hand throttle set in a fixed position.



High Speed Adjustment. After the idling and intermediate adjustments have been completed, the high speed adjustments should be set. The high speed adjustment should be opened approximately two turns for 4 cyl. motors, 2½ turns for 6 cyl. motors, and 3 turns for 8 cyl. motors. It will generally be found when setting the adjustment by notches that on 4 cyl. motors the high speed adjustment should be set approximately four notches more than the intermediate adjustment. On 6 cyl. motors, set the high speed needle 8 notches more than the setting of the intermediate, and on all eight cylinder motors set the high speed adjustment 12 notches more than the setting of the intermediate adjustment.

MODELS IN154½X, IN155, IN155½, IN156B, IN157.

IN155½—REO FLYING CLOUD SIX, MODEL S (1932).

TYPE:—Plain tube downdraft type with vacuum controlled accelerating pump and economizer. Discharge jets are located in venturi directly under a cone shaped deflector and fuel is discharged against the concave lower surface of the deflector and is then carried into the air stream. Main jet is fed directly from the float bowl. Idle jet located in idle well is fed by fuel flowing through compensator jet. Fuel for idling is metered by idling jet. The idle passage at the top of the idle jet is air bled by a vent leading to the float chamber and this vent is controlled by the idling adjustment screw. From this idle passage the fuel mixture is taken down through a passage in the carburetor body and discharged opposite the throttle edge. The idle operates only with closed throttle or at low speeds and the fuel from the idle well is discharged through the cap jet in the mixing chamber with the throttle open. Idle adjustment is the only point requiring attention.

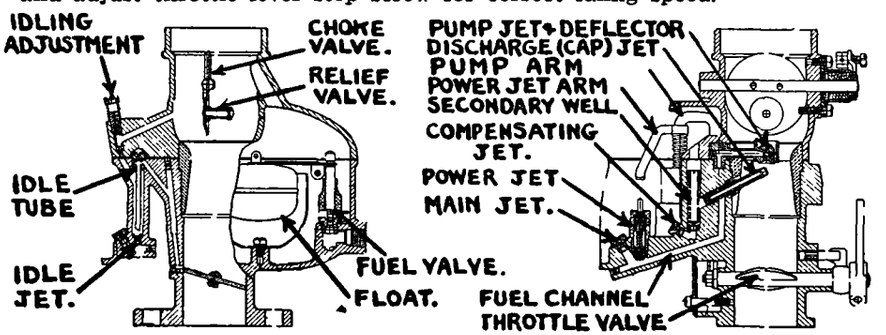
IDLING ADJUSTMENT:—Engine must be thoroughly warmed up before adjustment is made. With engine warm and running, turn idling adjustment out or counter-clockwise until engine begins to miss or is rough (mixture too lean), then turn screw slowly in or clockwise until engine fires smoothly. Adjusting screw controls air and should be turned out for leaner mixture and in for richer mixture. Adjust throttle lever stop screw for correct idling speed. Recheck idling adjustment. Correct setting should be between 1-3 turns open. If carburetor is entirely out of adjustment a preliminary setting may be made by turning idling screw in until it is seated and then backing screw off 1½ turns. This will allow engine to be warmed up.

ACCELERATING PUMP AND ECONOMIZER:—Accelerating pump and economizer are controlled by vacuum piston. The chamber above the vacuum piston is connected to the carburetor barrel below the throttle so that the vacuum in the manifold will hold the piston up for all partial throttle positions. When the throttle is opened for acceleration the collapse of the vacuum will allow the piston to fall, discharging the fuel in the pump cylinder through the economizer valve to the power and accelerating jet in the mixing chamber. A check valve prevents the fuel flowing back into the float bowl.

Economizer valve at lower end of accelerating pump is spring loaded and prevents fuel being discharged through the power jet when the throttle is closed. When the throttle is opened for acceleration or is held open for full power operation the economizer valve is opened by the piston, allowing fuel to flow to the power jet. Accelerating pump and economizer discharge is metered by the discharge jet. Accelerating pump and economizer are not adjustable and do not require attention.

FLOAT LEVEL:—Fuel level in float bowl is set at ⅝" below the top edge of the bowl. This can be checked by a special gauge, Part No. C-4088, which is designed to be attached to the drain hole at the bottom of the bowl. Float level should not require adjustment. Float hinge must not be bent.

CHOKE CONTROL:—Choke valve is offset and is held in position with relation to choke valve lever by a spring. The spring allows the choke valve to open slightly when engine begins to fire, preventing over-choking and assisting in warming up. Adjust choke linkage so that choke valve is fully closed when choke control button is pulled all the way out (engine not running) and wide open with choke control button pushed in.



MODELS IN175, IN175½, IN175½XI.

IN175—REO FLYING CLOUD, MODELS S-1, S-3, S-5 (1932).

IN175½XI—REO FLYING CLOUD, MODELS S-1, S-3, S-5 (1933).

TYPE:—Plain tube updraft type with throttle operated accelerating pump and power jet. Discharge jets (cap jet) are located in venturi directly under a cone shaped deflector and fuel is discharged against the concave lower face of the deflector. Main jet is located in float bowl. On some models a main jet adjusting needle valve by-passes some fuel past the main jet. Compensating jet (in float bowl) meters fuel flowing to secondary well and idling tube. Secondary well is air vented at the top. Fuel for idling is taken up through the idling tube located in the idling well and is discharged through ports opposite the throttle edge. The idling well is air bled by a vent in the upper part of the carburetor barrel (below the choke valve) and this vent is controlled by the idling adjustment screw. This idling adjustment is the only point requiring attention.

IDLE ADJUSTMENT:—Engine must be thoroughly warmed up before adjustment is made. With engine warm and running, close throttle, turn idling adjustment screw out or counter-clockwise until engine begins to miss or is rough, then turn screw slowly in or clockwise until engine fires smoothly. Adjusting screw controls air and should be turned in for richer mixture and out for leaner mixture. After completing adjustment, check idling speed and adjust throttle lever stop screw for correct idling speed.

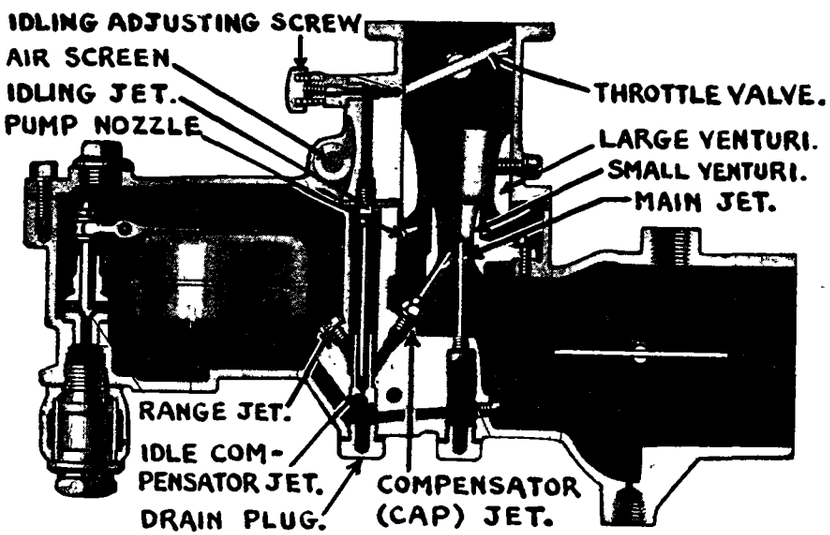
POWER JET:—Power jet consists of a shut-off valve in the float chamber which is opened by an arm on the accelerating pump rod when the throttle is wide open. This permits fuel to be by-passed through the valve past the main jet for full power operation. This fuel is metered by the restriction in the lower end of the power jet assembly. Power jet should not require attention.

ACCELERATING PUMP:—Accelerating pump is operated by the throttle lever. Fuel is drawn into the pump cylinder through a ball-check valve from the float bowl when the throttle is opened and is discharged through another ball-check valve to the discharge port in the deflector assembly in the venturi. Pump discharge is metered by the discharge opening in the deflector. Pump should not require attention.

FLOAT LEVEL:—Fuel level in float bowl should be 45/64" below the top edge of the float bowl when tested with a 6' head on the intake. This is equivalent to 1½ pounds pressure.

CHOKE CONTROL:—Choke valve is fitted with a relief poppet valve to prevent over-choking and to assist in warming up. See that choke linkage is adjusted so that choke valve is closed with choke control button on instrument pulled all the way out and wide open with control button pushed in.

STUTZ SIX, MODEL LAA (1932-33)
STUTZ EIGHT, MODEL SV-16 (1932-33-34)



TYPE:—105-DS.—Dual barrel or duplex updraft plain tube type with accelerating pump connected to throttle lever. Carburetor barrels have independent metering and discharge jet assemblies, idle adjustments, and throttle valves (throttle valves are mounted on the same shaft and will not require synchronization). All jets are fixed or non-adjustable type. Main jet (high speed jet) located in secondary venturi is fed by fuel flowing directly from float chamber through a channel to a well under the jet. Idle jet located in idle well is fed by fuel from main jet channel through the idle compensator jet (forming the bottom of the well) and also by the range compensator jet (in float chamber). Cap jet located in secondary venturi is fed from the idling well and will take all fuel from range compensator jet and overflow from idle compensator jet at driving speeds (idle jet discharge is operative only during closed throttle idling and low speed driving). Idle discharge tube (above idling jet) is air bled and the air bleed is controlled by the idling adjustment screw. This is the only point requiring attention.

IDLING ADJUSTMENT:—Engine must be warmed up before idling adjustment is made. With engine warm and running, close throttle and allow engine to idle, adjust throttle lever stop screw if necessary to keep engine from stalling. Then adjust each idling screw, turning screw out or counterclockwise until engine begins to miss or speed falls off, and then turning screw in or clockwise until engine fires smoothly. Idle adjustment screws operate on air and must be turned out to secure leaner mixture and in for richer mixture. After each idling screw has been adjusted and engine fires smoothly on all eight cylinders, adjust throttle lever stop screw to secure correct idling speed.

If correct idling adjustment cannot be secured, clean out idle compensator jet (under plug on bottom of carburetor) with compressed air, take out idle adjustment screw assembly and blow out idle port. Idle jet can also be cleaned with compressed air if carburetor is disassembled (jet is screwed in upper carburetor body). If low speed operation is unsatisfactory clean out range compensator jet in float chamber.

PERFORMANCE:—All jets are of the 'fixed' type. Jets should not be changed except to compensate for special fuel or operating conditions, such as high altitude. Manufacturer recommends that jets not be changed unless car is operated permanently at elevations greater than 6000 feet.

ACCELERATING PUMP:—Not adjustable. Accelerating pump discharges fuel into pump discharge chamber when throttle is opened. This fuel feeds the pump discharge jet located below the primary venturi in each carburetor barrel. Discharge jet or nozzle is air vented. Excess fuel discharged into pump discharge chamber when throttle is quickly opened overflows and escapes back into float chamber. Pump discharge chamber will maintain fuel level until fuel is all discharged through pump jet or until throttle is closed when fuel remaining in discharge chamber will be sucked back into the pump cylinder by the pump plunger. Accelerating pump is not adjustable.

FLOAT LEVEL:—Fuel level in float chamber should stand ¾" below top edge of float bowl with engine not running. Float level should not require adjustment. Float level can only be changed by changing position of spool on float needle valve stem and float lever should not be bent.

CHOKE CONTROL:—Choke linkage should be adjusted so that choke valve is fully closed when choke control button on instrument panel is pulled all the way out and wide open when choke control button is pushed all the way in.

MODEL A (1928-29-30-31).

MODEL B (1932-33).

TYPE:—Plain tube updraft type with main jet and compensating jets located in venturi and power jet. All jets non-adjustable except dash-controlled main jet adjusting valve. All fuel for main, compensating and idling jets passes through a cap jet located in the bottom of the float chamber. The main jet adjusting valve is located in a channel which by-passes fuel past the cap jet, providing additional fuel for starting. The compensating jet is

located in a well connected to the idling well and has several holes drilled through the lower end of the jet quill. This acts as an air bleed when the fuel level in the idling well drops below this point. The idling jet is located in a chamber which is air vented. The idle port is directly under the throttle edge (closed throttle position) and the throttle valve is notched at this point. The idling adjusting screw controls the air vent at the top of the idling well in which the idling jet quill projects. This idling adjustment is the only point requiring attention.

IDLE ADJUSTMENT:—With engine thoroughly warmed up, close throttle (push throttle button in) and adjust throttle plate stop screw so that engine idles fast enough to prevent stalling. Adjust idling air adjustment screw until engine fires smoothly without rolling or missing. Adjusting screw operates on air and should be turned in to secure richer mixture and out to lean mixture. Correct setting is 1¼-1¾ turns open. Readjust throttle plate stop screw if necessary to secure correct idling speed. If correct idling adjustment cannot be secured, disassemble carburetor and clean idling jet and cap jet (in float chamber) with compressed air. If idling and low speed performance are unsatisfactory, remove and clean compensating jet.

POWER JET:—Power jet consists of a power jet tube (assembled in upper carburetor body) extending down into a well in the lower casting. Fuel flowing into this well is metered by the power jet located in the side of the float chamber. The upper end of the power jet tube terminates in a port in the carburetor wall directly above the venturi. The tube is air vented past a flat portion of the throttle shaft through a hole in the throttle shaft boss on the carburetor casting. At all points up to 2/3 full throttle this air vent is open and air is drawn through the power jet port into the carburetor barrel. From 2/3 throttle opening to full throttle the flat portion of the shaft is turned away from the hole, closing the air vent and causing gasoline to be drawn up and discharged through the power jet port. This provides the additional fuel required for full-throttle operation. The power jet is not adjustable and requires no attention. If engine performance is not satisfactory at full-throttle, disassemble and clean power jet (in float chamber) and power jet tube with compressed air.

MAIN JET ADJUSTING VALVE:—Main jet adjusting valve (dash-controlled) is combined with choke control. Choke control button should be turned to left or counter-clockwise to open main jet adjusting valve and enrich mixture for starting. Correct opening is approximately one full turn and button should be turned to right to close valve as soon as engine warms up. This is an operating adjustment and does not require servicing.

FLOAT LEVEL:—Fuel level in float bowl should be ⅝" (A), 33/64" (B) below the top edge of the float bowl. Should not require adjustment. Do not bend float lever hinge.

CHOKE:—Choke valve is operated by pulling out choke control button on dash. Choke valve is spring controlled and will open as soon as the control button is released.

420-S—CHEVROLET, ALL PASS, CARS & TRUCKS (1940)—SEE NOTE
434-S—CHEVROLET, ALL MODELS WITH ECON. ENGINE ('40)—SEE NOTE
***398-S—HUPMOBILE, SKYLARK MODEL R (1940)**
*—Vacumeter type Carburetor with Carter Climatic Control.
These Carburetors same as used on corresponding 1939 cars except as noted.

NOTE:—Chevrolet Model 420-S—Economizer jet on 1940 carburetor is .062-.063" (was .059-.060").
Chevrolet Model 434-S—This carburetor same as 1939 type and has stop-pin which limits throttle opening to half-throttle (approximately 45 MPH. top speed).
Chevrolet Cab-over-Engine & Doubl Duti Panel Trucks—These models use Carter (BB) Model 447-S updraft carburetor. See separate article for data.

SPECIAL SERVICE NOTES:—Chevrolet Rich or Lean Complaints, 'Popping-back' through Carburetor (1939-40 Engines)—Caused by bakelite metering rod hold cover sticking to rod or sticking to top of metering rod disc stop (this stop used on late 1939 and all 1940 carburetors—should be installed on first 1939 carburetors as directed in 1939 Supplement) resulting in rich mixture (poor economy) at low speeds and lean mixture or popping-back through carburetor at high speeds. To correct this complaint, remove metering rod disc stop, open throttle wide, disconnect metering rod pin spring, turn metering rod and lift rod and disc out. Clean metering rod and disc thoroughly, clean hole in disc with #47 drill (.078"), reassemble rod, disc, and stop. CAUTION—Disc hole larger than #47 drill will cause rich mixture.
Chevrolet Running Backward (when key turned off)—To correct these complaints, check idle speed and set stopscrew for speed not to exceed 7 MPH. Check throttle valve and make certain that it is not sticking, check throttle valve spring tension. Check manifold heat control valve and thermostatic spring. Make certain that valve is not binding and that spring is wound up not more than enough to slip free end over manifold pin (approx. ½ turn).
Whistling Complaints (all models)—To correct whistle at vacuum spark port, remove vacuum passage plug (on side of body casting near idle adjusting screw), install special bushing No. 38A-35 and new rivet plug.

IDLE ADJUSTMENT:—Adjust only with engine warmed up so that choke valve is wide open and fast idle inoperative. Idle adjusting screw controls fuel mixture and should be turned in for leaner mixture, out for richer mixture. Approximate settings shown in table below. Idle speed controlled by throttle lever stopscrew and should be set for speed shown in table. See car model 'T&E' page for complete carburetor tune up data on each car model.

Car Model	Idle Screw Setting	Idle Speed
Chevrolet	1-2 turns open	7 MPH.
Hupmobile	¾-1¼ turns open	6 MPH.

PERFORMANCE:—Should be satisfactory if idling adjustment and accelerating pump adjustment correctly made. See Carter Jet Specification Table for standard jet calibration and recommended changes for special operating conditions (lean metering jets, etc.).

ACCELERATING PUMP:—Low pressure type positively actuated by throttle lever. Fuel is drawn into pump cylinder through intake check valve and strainer when throttle is closed and is discharged through outlet check valve and pump jet in wall of mixing chamber when throttle opened for acceleration.
Adjustment—Three holes provided in pump arm (under dust cover on float bowl cover) for pump rod link engagement. Inner hole provides minimum stroke, Outer hole medium stroke, upper hole maximum stroke. See car model 'T&E' for recommended settings and seasonal changes.
Note—Lubricate pump countershaft by filling dust cover attaching screw hole with graphite grease at 5000 mile intervals.

METERING ROD (ECONOMIZER):—Metering rod and jet assembly meters all fuel for main nozzle (stepped and tapered rod is lifted out of jet as throttle is opened to provide greater fuel flow through jet to nozzle). Metering rods can be changed for special operating conditions such as high altitudes. See Carter Jet Specification Table for standard and special lean metering rods for each model. Check and adjust metering rods whenever rods removed and replaced or when pump stroke is adjusted (vacumeter types).
Vacumeter Type Note—On these models, metering rod is linked to vacuum piston stem so that rod is controlled by vacuum piston within limits determined by throttle valve opening (pin on pump arm serves as stop for piston stem to prevent piston pulling metering rod down in jet beyond the correct point for the particular throttle opening). These models adjusted in special manner.
Metering Rod Adjustment (Chevrolet)—Take out dust cover screw, remove dust cover, remove pin spring, turn metering rod ¼ turn to disengage it from pump arm pin, lift rod out being careful not to lose metering rod spring and disc (see Special Service Notes above for disc retainer on Chevrolet models). Back off throttle stopscrew so that throttle valve tightly closed, install metering rod gauge T109-25 (2.795") in place of rod being careful that gauge is vertical and tapered end seats in metering rod jet. If metering rod pin does not rest on bottom of notch on gauge with pump arm connector rod centered freely in pump arm hole, remove connector rod and bend until this setting secured. Remove gauge and re-install metering rod, make certain that disc in place on rod and that pin spring properly connected.
Metering Rod Adjustment (Hupmobile Vacumeter Types)—Take out dust cover screw, remove dust cover, disengage pin spring, remove metering rod being careful not to lose metering rod disc. Back off throttle stopscrew so that throttle valve tightly closed, install metering rod gauge T109-25 (2.795") in place of rod being careful that gauge is vertical and tapered end seated in metering rod jet. Push vacuum piston and stem down and bend lip on stem (which contacts stop pin on pump arm) so that metering rod pin on piston stem rests in notch on gauge. Remove gauge and replace metering rod. See that vacuum piston is clean and operates freely in cylinder.

ANTI-PERCOLATOR:—Saxophone Key Type (398-S). Consists of a main nozzle well vent in the float bowl which is controlled by a cap mounted on a rocker arm and actuated by the pump arm so as to open the vent when the nozzle is closed to prevent any 'percolating' discharge from the main nozzle. Valve must be closed when throttle is open (incorrect adjustment will cause flat spots and poor performance.
Adjustment—Open throttle valve exactly .030" (use T109-29 gauge or .030" drill rod placed between lower edge of throttle valve and carburetor wall), bend lip on anti-percolator arm so that clearance between lip and pump arm is .005-.015" (measure with feeler gauge).

FAST IDLE:—**398-S**—Consists of a fast idle cam mounted directly above the throttle lever (serving as a stop for the throttle valve) and linked to the automatic choke mechanism.
Adjustment—Back off throttle lever stopscrew, rotate fast idle cam to normal (slow) idling position, turn stopscrew in so that it is seated against (not on) first step of fast idle cam with throttle valve fully closed, bend offset portion of fast idle link with special tool T109-41 so that clearance between lower edge of choke valve and carburetor wall is ⅝". Make certain that linkage does not bind after adjustment.

FLOAT LEVEL:—To check float level, remove bowl cover and float assembly, invert cover, remove gasket, measure from gasket seat on cover to top of float at free end. Distance should be ½" (Chevrolet 420-S, 434-S), ⅜" (Hupmobile). To adjust, bend lip of float lever at point where it contacts valve needle (do not bend float arm).
Needle Valve & Seat—Furnished only in matched sets, Part No. 25-33S—#48 intake hole (all models).

THROTTLE VALVE SETTING:—When installing valves, use new attaching screws and install screws loosely, tap valve lightly to centralize it in bore, then tighten attaching screws securely.
Setting—Check with stopscrew backed off so that throttle valve tightly closed. Idle port opening is opening of lower port (below throttle valve) except as noted. Vacuum spark port is height of bottom of port above upper edge of throttle valve. Shims furnished .002" thick (2-93), .005" thick (2-94) to adjust throttle valve position.

Car Model	Carburetor	Idle Port Opening	Vacuum Spark Port
Chevrolet	420-S, 34-S	(A) .047-.051"	None
Hupmobile	398-S	.010-.014"	None

(A)—Top of lower idle port above top edge of throttle valve.

CHOKE:—Chevrolet—Semi-automatic type with offset valve (same as for 1939).
Hupmobile 398-S—Carter Climatic Control (automatic choke). See article on Carter Climatic Control in Carburetion Equipment Section for complete servicing data.
Setting—Thermostatic coil housing should be set so that center point of scale is lined up with mark on piston housing.
Unloader—Consists of a cam on the throttle lever which opens the choke valve (when throttle valve wide open) to correct flooding. To adjust, hold throttle wide open, bend cam on throttle lever so that clearance between lower edge of choke valve and air horn wall is ⅜".
Choke Valve Lock—Prevents choke valve closing when throttle valve wide open. To adjust, hold choke and throttle valves wide open, bend lip on fast idle link so that clearance between lip and throttle lever lock is 1/32".

SERVICING:—These carburetors serviced in same manner as previous W1 types. ***See Carter 'Type W1' and 'Type W1 with Climatic Control' carburetor articles in Carburetor Section of manual for complete data.***

468-S—STUDEBAKER CHAMPION, MODEL 2G (1940)
450-S—WILLYS, MODEL 440 SPEEDWAY & DELUXE (1940)

NOTE:—Studebaker Champion Model 453-S (Late 1939) Changes—To improve cold starting and warming up performance on cars equipped with this 453-S carburetor, install the following parts (furnished in Unit Package No. 14-236U); Choke Control Lever & Shaft Assembly No. 14-255S, Choke Valve Screws (2) No. 39-10, Pin Spring 150A-10, Tube Clamp Assembly No. 62-114S, Choke Link No. 117-74, Choke Lever Spring No. 61-213, Inspection Tag No. 107-14. CAUTION—This inspection tag has new model number 453-SA stamped on it and tag should be used to replace old tag to indicate that these new parts have been installed.

Willys Model 450-S—This carburetor can be used for replacement purposes on 1937-38-39 Willys cars.

TYPE:—Same design at previous WO models (as used on 1939 Studebaker Champion).

ADJUSTMENT:—Adjust only with engine warmed up and choke valve wide open (fast idle inoperative). Idle adjusting screw controls fuel mixture and should be turned in for leaner mixture, out for richer mixture. Approximate settings shown in table below. Idle speed controlled by throttle lever stopscrew and should be set for speed shown in table. See car model 'T&E' page for complete carburetor tune up data for each car model.

Car Model	Idle Screw Setting	Idle Speed
Studebaker	¾-1¼ turns open	8 M.P.H.
Willys	½-2½ turns open	8 M.P.H.

PERFORMANCE:—Should be satisfactory if Idling Adjustment and pump stroke setting correct. See Carter Jet Specification Table for standard jet calibrations and special lean metering rods for special operating conditions such as high altitudes. See Trouble Shooting.

ACCELERATING PUMP:—High pressure type (spring operated). Operated by throttle lever through spring connection between pump operating lever and pump arm (under dust cover on bowl cover). Fuel is drawn into pump cylinder through strainer and inlet ball check valve when throttle is closed and is discharged through outlet ball check valve and pump jet location in side of mixing chamber above main venturi when throttle is opened for acceleration. Pump is not adjustable for seasonal changes.

Pump Stroke Adjustment—To check pump plunger travel, remove dust cover on float bowl cover, install Universal Pump Stroke Gauge T109-117S on raised portion of bowl cover so that gauge is vertical and projecting ear rests on top surface of pump shaft. Back off throttle lever stopscrew so that throttle valve tightly closed, note gauge reading. Open throttle wide and again note gauge reading. Difference between two readings is pump stroke (in sixty-fourths of an inch) and should be 12/64" (Studebaker), 17/64" (Willys). To adjust, use special bending tool, T109-41, and bend throttle connector link at lower angle near throttle lever. CAUTION—Check metering rod setting (disturbed by this adjustment).

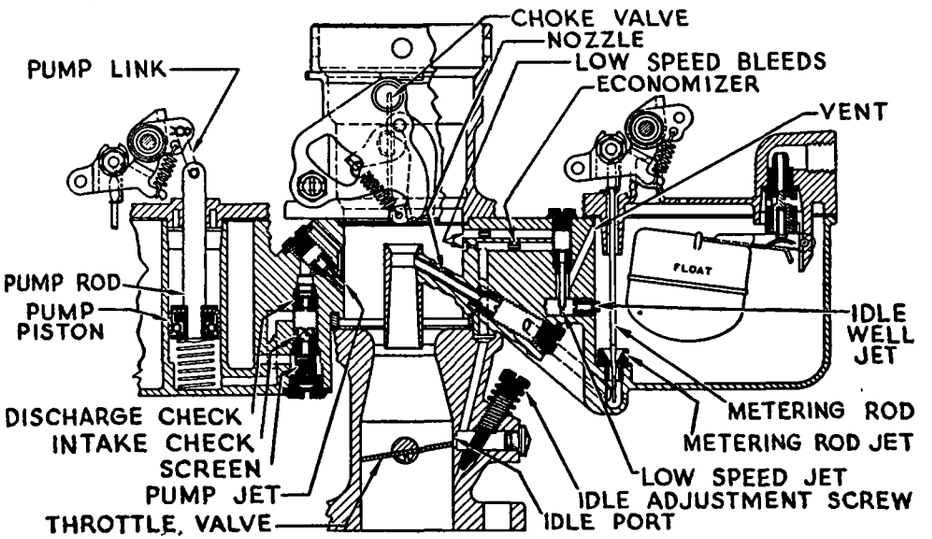
METERING ROD (ECONOMIZER):—Metering rod and jet assembly meters fuel for main nozzle and rod is operated by throttle lever in same manner as on other Carter models. Metering rod mounting on pump operating lever is new and consists of a pin locked in place in a slotted hole in the pump arm by a nut. Metering rods can be changed for special operating conditions such as high altitudes. See Carter Jet Specification Table for standard and lean metering rod calibrations. Check and adjust metering rod whenever rods removed and replaced or when pump stroke setting is changed.

Metering Rod Adjustment—Disconnect choke linkage, take out air horn attaching screws, remove air horn and dust cover. Unhook metering rod spring, remove metering rod being careful not to lose disk on rod at bowl cover. Insert special gauge, T109-26 (2.718") in place of metering rod so that tapered end is seated in metering rod jet and gauge is vertical. Back off throttle lever stopscrew so that throttle valve closes tightly. Metering rod pin on pump operating rod should be even with shoulder of notch in gauge. To adjust, loosen pin nut, shift pin on arm, tighten nut securely (use special wrench T109-76). Remove gauge, install metering rod and disk, install pin spring, connect metering rod spring.

FLOAT LEVEL:—**Note**—Float needle valve stem is hollow and has a spring installed in this hole to take up clearance between valve and float lever. Use extreme care when checking float level not to compress this spring, which would cause float level to bet set too low, and make certain that spring is in place when needle valve and float are installed.

Float Level—To check, remove bowl cover and float assembly, invert cover, turn gasket so that machined surface of bowl cover is exposed, measure distance from this machined surface to top of float at free end. Should be ¼" (Studebaker 468-S), ⅜" (Willys 450-S). To adjust, bend lip of float lever at point where it contacts valve needle (do not bend float arm). CAUTION—Use extreme care not to compress spring in needle valve stem when checking float level. Allow float to hang freely on inverted cover.

Float Travel—To check, hold bowl cover and float assembly in normal position. Free end of float should drop ½". Adjust by bending two small float stop lips at hinge end of float.



Needle Valve & Seat—Furnished only in matched sets as follows:

Car Model	Carburetor	Part No.	Intake Hole Size
Studebaker	468-S	25-94S	#48
Willys	450-S	25-93S	#53

THROTTLE VALVE SETTING:—When installing valves, back off throttle lever stopscrew, see that trademark on valve is on idle port side, use new attaching screws and install screws loosely, tap valve lightly to centralize it in carburetor bore, tighten screws securely, check valve setting.

Setting—With throttle valve closed tightly (stopscrew backed off), idle port opening (above or below valve as noted) and height of vacuum spark port (top of port above valve) should be correct as shown in table below. Shims furnished .002" thick (2-93), .005" thick (2-94) to correct throttle valve location.

Car Model	Carburetor	Idle Port Opening	Vacuum Port Height
Studebaker	468-S	.028-.032" (below valve)	.072-.078"
Willys	450-S	.086-.090" (above valve)	.056-.062"

CHOKE:—Offset type valve with poppet type relief valve. Check choke linkage to see that choke valve closed when control button on instrument panel pulled out and open with control button pushed in (engine not running—choke control is semi-automatic and spring-loaded).

Fast Idle:—Consists of an interconnecting linkage between the choke valve lever and throttle valve lever so that throttle valve is opened to fast idle position with choke valve closed. Should not require adjustment.

TROUBLE SHOOTING:—Poor Idling Performance—If motor stalls while idling, low speed performance is unsatisfactory, or if correct idling adjustment cannot be secured, remove idle well plug and gasket assembly and allow fuel to drain from bowl which will flush out idle well jet. Remove idle well jet and clean with compressed air, remove low speed jet and clean with air, see that jet seats gasoline tight at shoulder in casting when replaced. Check carburetor wall at throttle valve edge for carbon deposits. Remove idle adjusting screw and clean out idle passages with air.

Poor Acceleration—Check pump stroke. Remove and clean or replace pump jet. Examine pump for damaged or worn plunger leather, loose plunger or bent pump arm, sediment or corrosion in pump cylinder, sticking or leaking ball check valves. If pump plunger removed from cylinder, use loading tool to install plunger to avoid damage to plunger leather.

Carburetor Loads up or Performance is Poor—Check float level, see that correct type metering rod installed and check metering rod setting.

SERVICING:—These carburetors serviced in same manner as WO models used on previous car models. ***See 'Carter Downdraft Type WO' carburetor article in Carburetor Section of manual (or 1939 Supplement) for complete data.***

472-S—GRAHAM, CUST. & DELUXE 108 (1940)
473-S—GRAHAM, CUST. & DELUXE SCHGR. 107 (1940)
***454-S—HUDSON SIX, 40T TRAVELER, 40P DELUXE (1940)**
HUDSON COMMERCIAL CARS, MODELS 40, 48 (1940)
435-S—NASH SIX, MODEL 4020 (1940)—SEE NOTE
***466-S—OLDSMOBILE 6, '60' F-40, '70' G-40 (1940) WITH STD. TRANS.**
***467-S—OLDSMOBILE 6, '60' F-40, '70' G-40 (1940) HYDRA-MATIC TRANS.**
463-S—PONTIAC SIX, MODELS 40-25, 40-26 (1940)—SEE NOTE
462-S—PONTIAC EIGHT, MODEL 40-28 (1940)—SEE NOTE
***410-S—STUDEBAKER COMMANDER, MODEL 10A (1940)—SEE NOTE**
*—Vacumeter type carburetor.

These carburetors same as types used on previous models except as noted below.

SPECIAL SERVICE NOTES & PRODUCTION CHANGES:—Nash Loading or Warming up slowly—Check hot air tubing. See that tubing not kinked at bends or pinched at point where it enters coil housing. See that tube tight in coil housing and hot air stove connection.

Hudson Models—Carburetors are installed with **eight** gaskets between carburetor and mounting pad on manifold. When installing carburetor, place four gaskets between manifold and heat deflector, four additional gaskets between deflector and carburetor. NOTE—Governor plate is installed between two top gaskets on new cars during breaking in period—when governor plate removed, gasket between plate and carburetor must be replaced so that total of four gaskets used between heat deflector and carburetor.

Pontiac 463-S, 462-S—To correct complaints of hesitating when starting in second gear, change pump link to lower hole in arm and plunger shaft. **463-SP, 462-SP**—Later carburetors have new type 64-70S accelerating pump rod and plunger (superseding first type 64-67S). These carburetors marked with 'SP' suffix at factory.

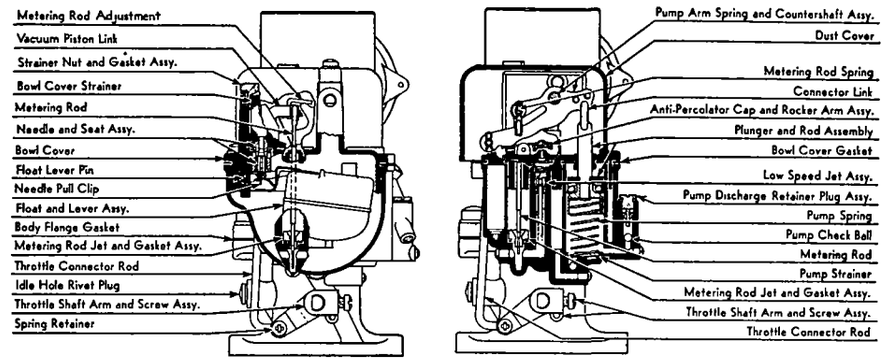
Studebaker Commander—Stromberg Model BXO-26 carburetor also used on this model. See separate article for this Stromberg data.

TYPE:—Same design as previous WA1 models except as noted below. All models have Carter Climatic Control (automatic choke). See Climatic Control article in Carburetion Equipment Section for complete servicing data.

Hudson Model 454-S—This model has special 'Trip Lever' mounted on fast idle link which must be checked after fast idle and other adjustments are made. See Trip Lever Adjustment below.

IDLING ADJUSTMENT:—Adjust carburetor only with engine warmed up and idling at hot or slow idling speed with choke valve wide open and fast idle inoperative. Idle adjusting screw controls fuel mixture and should be turned in for leaner mixture, out for richer mixture. Approximate settings are shown in table below. Idle speed is controlled by throttle lever stopscrew. See car model 'T&E' page for complete carburetor tune up data on each car model.

Car Model	Idle Screw Setting	Idle Speed
Graham 107, 108	½-1½ turns open	7-8 MPH.
Hudson 40, 48	¾-1½ turns open	7 MPH.
Nash 4020	¾-1½ turns open	7-8 MPH.
Oldsmobile F & G-40	½-1½ turns open	6 MPH.
Pontiac 6 & 8	¾-1½ turns open	7 MPH.
Studebaker 10A	½-1¼ turns open	8 MPH.



ACCELERATING PUMP:—Low pressure type. Positively operated by throttle lever through arm and countershaft assembly on bowl cover (except Pontiac which is operated by a spring-loaded arm).

Pump Seasonal Adjustment—Three holes provided in pump arm on countershaft for pump link connection (except Pontiac—2 holes in both arm and pump stem). Inner hole provides minimum stroke, lower hole medium stroke, outer hole maximum stroke. See tune up data on car model 'T&E' page for recommended setting and seasonal changes. This adjustment accessible after taking out screw and removing dust bowl cover.

Pump Stroke Adjustment:—To check pump plunger travel, back off throttle lever stopscrew so that throttle valve closes tightly, adjust pump connector link for correct pump stroke as shown in 'Pump Setting' column of table below (see Pump Adjustment above for this connector link adjustment). Install Universal Pump Stroke Gauge T109-117S on ridged portion of bowl cover so that projecting portion of gauge rests on top surface on connector link at pump shaft. Hold gauge vertical and note reading, then open throttle wide and again note reading. Difference between these two readings is pump stroke (in sixty-fourths of an inch) and should agree with 'Pump Stroke' figure in table below. To adjust, bend throttle connector rod at lower angle near throttle lever. CAUTION—Check metering rod adjustment (disturbed by this adjustment).

Car Model	Carburetor	Pump Stroke	Pump Setting
Graham	472-S, 473-S	19/64"	Medium Stroke
Hudson 40, 48	454-S	12/64"	Short Stroke
Nash 4020	435-S	27/64"	Long Stroke
Oldsmobile F & G-40	466-S, 467-S	13/64"	Short Stroke
Pontiac 6	463-S	11/64"	Short Stroke
Pontiac 8	462-S	14/64"	Short Stroke
Studebaker 10A	410-S	18/64"	Medium Stroke
